Electronic Supplementary Material (ESI) for Chemical Science. This journal is © The Royal Society of Chemistry 2022
1. Materials.
Chemical reagents and solvents for synthesis were obtained from commercial suppliers and were used as received. Unless otherwise specified, the reagents were used without purification. All solvents used were of analytical grade (A.R.). $^1$H NMR and $^{13}$C NMR spectra were recorded on a Bruker AV-400 spectrometer, and chemical shifts are reported in ppm at room temperature. Mass spectra were obtained on a HP 1100 LC-MS spectrometer. UV-vis absorption spectra were acquired on a Varian Cary 100 spectrophotometer.

2. Synthesis.

Scheme S1. The synthesis of aza-BOD-B1 and aza-BOD-B2.

Synthesis of compound 1: A solution of triethylene glycol monomethyl ether (6.42 g, 0.1 mol) in THF (30 mL) was treated with NaOH (33.5 mL, 6 M) under an ice-cooling
condition, followed by dropwise addition of p-methylphenylecyclochloride (19.06 g, 0.1 mol) in THF (50 mL). After stirring in ice bath for 2h, the reaction mixture was extracted with CH$_2$Cl$_2$, washed with aqueous NaOH (1 M) and water. Then, the organic phase was dried with anhydrous Na$_2$SO$_4$, evaporated and concentrated to obtain colorless oily liquid compound1. $^1$H NMR (400 MHz, CDCl$_3$, $\delta$): 7.77 (d, 2 H), 7.34 (d, 2H), 4.14 (t, 2 H), 3.67 (t, 2 H), 3.60-3.58 (m, 6H), 3.51 (d, 2 H), 3.36 (s, 3 H), 2.36 (s, 3 H).

**Synthesis of compound 2:** Compounds 1 (10 g, 0.0314 mol), p-hydroxy benzaldehyde (4.23 g, 0.0314 mol) and K$_2$CO$_3$ (4.33 g, 0.0314 mol) were both dissolved in DMF (25 mL), and the solution was heated under reflux for 6 h. After evaporating the solvent, the residue was dissolved in CH$_2$Cl$_2$, washed with brine, dried over anhydrous Na$_2$SO$_4$, and filtered. The crude mixture was purified by column chromatography on silica gel (PE/EA, 20: 1, v/v) to afford compound 2 as a colorless liquid. $^1$H NMR (400 MHz, CDCl$_3$, $\delta$): 9.90 (s, 1 H), 7.85 (d, 2 H), 7.04 (d, 2 H), 4.24 (t, 2 H), 3.91 (t, 2 H), 3.75 (t, 2 H), 3.70 (t, 2 H), 3.66 (t, 2 H), 3.56 (t, 2 H), 3.39 (s, 3 H).

**Synthesis of compound 3:** Compound 2 (5 g, 0.0186 mol) in ethanol (25 mL) was treated with NaOH (18 mL, 0.05 M) under an ice-cooling condition, followed with 4-N, N-dimethylacetophenone (3.34 g, 0.0205 mol) added into the solution. The mixture was stirred for 6 h at room temperature. Then, the mixture was extracted by CH$_2$Cl$_2$, dried with anhydrous Na$_2$SO$_4$. The organic solvent was removed and the crude product was purified by silica gel column chromatography, in which a yellow solid product compound 3 was obtained. $^1$H NMR (400 MHz, CDCl$_3$, $\delta$): 8.02 (d, 2 H), 7.73 (d, 1 H), 7.57 (d, 2 H), 7.45 (d, 1 H), 6.93 (d, 2 H), 6.72 (d, 2 H), 4.17 (t, 2 H), 3.87 (t, 2 H), 3.74 (r, 2 H), 3.69 (t, 2 H), 3.65 (d, 2 H), 3.55 (t, 2 H), 3.38 (s, 3 H), 3.08 (s, 6 H).

**Synthesis of compound 4:** Compound 3 (3 g, 7.26 mmol) in ethanol (25 mL) was treated with 20% KOH (2.5 mL) aqueous solution and nitromethane (5.7 mL, 0.1089 mol). The reaction mixture was refluxed for 5 h. The organic solvent was removed and the crude product was purified by silica gel flash chromatography to provide compound
**Synthesis of compound aza-BODIPY-1:** Compound 4 (1 g, 2.1 mmol) and ammonium acetate (2.42 g, 31.5 mmol) were dissolved in butyl alcohol (10 mL), and the reaction mixture was refluxed for 4 h. After evaporating the solvent, the residue was washed with cooled methanol, which obtained a green product that was used in the next reaction directly. The green product was dissolved in dry dichloromethane (20 mL), added diisopropylethylamine (1.734 mL, 15 mmol) and boron trifluoride etherate (2.64 mL, 21 mmol) successively. After being stirred overnight at room temperature, the mixture was extracted with CH$_2$Cl$_2$. The organic layer was separated and dried over anhydrous Na$_2$SO$_4$. The organic solvent was removed and the crude product was purified by silica gel column chromatography (DCM/MeOH, 50:1, v/v), which has a red metallic power (aza-BODIPY-1) afforded. $^1$H NMR (400 MHz, DMSO-$d_6$, δ): 8.22 (m, 8H), 7.55 (s, 2H), 7.16 (d, 4H), 6.91 (d, 4H), 4.26 (t, 4H), 3.85 (t, 4H), 3.65 (t, 4H), 3.61 (t, 4H), 3.57 (t, 4H), 3.46 (t, 4H), 3.39 (s, 6H), 3.14 (s, 12H). $^{13}$C NMR (400 MHz, DMSO-$d_6$, δ): 159.25, 154.67, 151.66, 143.75, 139.19, 131.48, 130.14, 125.05, 117.84, 117.05, 114.63, 111.77, 71.23, 70.65, 68.95, 68.90, 67.24, 58.00. HRMS (ESI, m / z) calculated for C$_{50}$H$_{60}$BF$_2$N$_5$O$_8$ [M + Na]$^+$: 930.440, found: 930.4395.

**Synthesis of compound aza-BOD-B1 and aza-BOD-B2:** Compound 5 (200 mg, 0.178 mmol) and 4-bromomethylphenylboronic acid pinacol ester (53 mg, 0.178 mmol) were dissolved in dry acetonitrile (20 mL). The reaction mixture was refluxed for 24 h. After the evaporated solvent, the crude product was purified by column chromatography (H$_2$O/MeOH, 3:7, v/v), which aza-BOD-B1 and aza-BOD-B2 were obtained respectively. aza-BOD-B1: $^1$H NMR (400 MHz, DMSO-$d_6$, δ): 8.41 (d, 2H), 8.26 (d, 2H), 8.18 (d, 2H), 8.08 (d, 2H), 8.00 (d, 2H), 7.98 (s, 1H), 7.74 (d, 2H), 7.29 (s, 1H), 7.17 (d, 2H), 7.11 (t, 4H), 6.91 (d, 2H), 5.09 (s, 2H), 4.21 (d, 4H), 3.80 (t, 4H), 3.64 (t, 4H), 3.61 (t, 4H), 3.56 (t, 4H), 3.54 (t, 4H), 3.44 (t, 6H), 3.24 (s, 6H), 3.20 (s, 6H), 1.23 (s, 12H). $^{13}$C NMR (400 MHz, CDCl$_3$, δ): 134.86, 129.90, 114.60, 111.76, 70.86, 67.38,
69.62, 67.21, 59.01, 45.72, 31.92, 29.52, 29.11, 24.83, 22.70, 14.18. HRMS (ESI, m/z) calculated for C_{63}H_{78}B_{2}F_{2}N_{5}O_{10}^{+} [M]^{+}: 1124.5891, found: 1124.5881. aza-BOD-B2: \textsuperscript{1}H NMR (400 MHz, DMSO-\textit{d}_{6}, \delta): 8.29 (d, 2H), 8.21 (d, 6H), 8.09 (d, 4H), 7.72 (d, 4H), 7.68 (s, 2H), 7.23 (d, 4H), 7.09 (d, 4H), 5.11 (s, 4H), 4.26 (t, 4H), 3.81 (t, 4H), 3.65 (t, 4H), 3.62 (t, 4H), 3.56 (t, 4H), 3.53 (t, 4H), 3.44 (s, 6H), 3.23 (s, 12H). \textsuperscript{13}C NMR (600 MHz, DMSO-\textit{d}_{6}, \delta): 162.37, 161.13, 160.79, 159.18, 154.38, 148.45, 146.62, 145.76, 144.89, 139.72, 134.82, 134.70, 134.41, 132.03, 131.62, 131.33, 130.18, 130.05, 129.89, 128.25, 125.83, 123.00, 122.30, 115.66, 115.31, 115.20, 71.74, 70.44, 70.28, 70.08, 58.52, 46.63. HRMS (ESI, m/z) calculated for C_{64}H_{76}B_{3}F_{2}N_{5}O_{12}^{2+} [M]^{2+}: 588.7863, found: 588.7879.

3 · Cells culture and imaging.

A549 cells and HEK-293T cells were cultured at 37 °C in a humidified atmosphere of 5% CO\textsubscript{2} incubator within Roswell Park Memorial Institute 1640 medium (RPMI-1640) and DMEM medium containing 10% fetal bovine serum (FBS) and 1% penicillin-streptomycin, respectively. All cells were seeded in a cell culture flask and allowed to adhere for 24 hours before the experiment. For examination of cell death induced by aza-BOD-B2 mediated PTT, four groups A549 cells were cultured and treated respectively: 1) cells were incubated with aza-BOD-B2 (20 \textmu M) for 3 h; 2) cells were irradiated with NIR laser (808 nm, 1.2 W cm\textsuperscript{-2}) for 10 mins; 3) cells were incubated with aza-BOD-B2 (20 \textmu M) for 3 h and then exposed to NIR laser light (808 nm, 1.2 W cm\textsuperscript{-2}) for 10 mins; 4) untreated cells; all the four group of cells were stained with Calcein-AM (2 \textmu M) and PI (4.5 \textmu M) for 15 min at 37 °C, and performed by confocal imaging. The excitation wavelengths for Calcein-AM and PI were 488 nm and 561 nm, respectively. And the emission was collected between 490-540 nm and 592-642 nm for Calcein-AM and PI, respectively.

4 · Photothermal cytotoxicity in vitro.

A549 cells or HEK-293T cells seeded into 96-well plates were incubated with aza-BOD-B2 in different concentrations (0, 5, 10, 20, and 30 \textmu M) for 3 h. After washing with a fresh culture medium, A549 cells or HEK-293T were exposed to NIR laser light
(808 nm, 1.2 W cm\(^{-2}\)) for 10 min. The relative cell viability under dark and light irradiation was then assessed by the CCK-8 (10 \(\mu\)L) solution was added to the hatch for 1 h at 37 °C. The absorption spectrum was measured at 450 nm by using a microplate reader. The absorption of cells treated with PBS (control group) was used as the reference value for calculating 100% cellular viability. VR can be calculated using Equation (1)

\[
VR = \frac{A - A_{\text{blank}}}{A_0 - A_{\text{blank}}} \times 100\%
\]

In the above equation, A as an experimental group, A\(_0\) as a control group, A\(_{\text{blank}}\) as a blank group, the cytotoxic effect was obtained.

5. **Animal model.**

All animal experiments were carried out in compliance with the relevant laws and institutional guidelines for the Care and Use of Research Animals established by Fudan University which approved the experimental protocols and procedures. Subcutaneous injection of A549 cells (4.0 \(\times\) 10\(^6\)) suspended in 200 µL to the indicated location in male nude mice (4 - 5 weeks) was performed to establish the xenograft A549 tumor-bearing mouse model. The mice with tumor size at about 40 - 50 mm\(^3\) were used subsequently for PTT experiments.

6. **In vivo PTT.**

A549 tumor-bearing male nude mice were divided into five groups (5 mice per group): 1) untreated mice; 2) mice with aza-BOD-B2 (100 \(\mu\)L, 1.2 mg mL\(^{-1}\)) injection into tumors but no laser irradiation; 3) mice with laser irradiation but no aza-BOD-B2 administration; 4) mice with both aza-BOD-B2 injection into tumors and laser irradiation; 5) normal mice with both aza-BOD-B2 injection and laser irradiation. For PTT, the tumor sites were irradiated with an 808 nm laser (1.2 W cm\(^{-2}\)). IR images of mice were monitored by a thermal imaging camera as irradiation proceeded. After PTT treatment, the tumor size and body weight were monitored for 15 days. The mice were euthanized after 15 d and tumor samples were collected. The width and length of the tumors were measured with Vernier calipers. Tumor volume was estimated using the
following formula: tumor volume = \( \pi/6 \times (\text{length} \times \text{width})^{3/2} \).

7. **HE Analysis.**

Paraffin-embedded sections were deparaffinized and hydrated. Hematoxylin solution was added to cover the slides; after staining for 3 min., the slides were washed with saline to remove excess hematoxylin staining solution. The slides were immersed in the differentiation solution for 3 s, and then washed in running water. The slides were exposed to the blue liquid for a total of 3 s. The slides were incubated with eosin for an additional 3 min. and then rinsed with saline. The nucleus was stained blue with hematoxylin, and the cytoplasm was stained red with eosin. The cells were observed using light microscopy.

8. **Time-dependent absorption changes of aza-BOD-B2 in the presence of \( \text{H}_2\text{O}_2 \).**

![Figure S1. Time-dependent absorption changes of aza-BOD-B2 in the presence of 300 \( \mu\text{M} \text{H}_2\text{O}_2 \). (a) 5 \( \mu\text{M} \), (b) 10 \( \mu\text{M} \), (c) 20 \( \mu\text{M} \), (d) 30 \( \mu\text{M} \).](image)

9. **HMRS analysis.**

10 - The pH and selectivity of aza-BOD-B1.

Figure S3. (a) The absorption intensity of aza-BOD-B2 (5 μM) reacts with H$_2$O$_2$ (100 μM) at 808 nm changes with pH (4 - 9). (b) Absorption intensity comparison of aza-BOD-B2 (5 μM) at λ$_{808}$nm after adding 1 mM H$_2$O$_2$ or other active substances (NO$_2^-$, S$_2$O$_3^{2-}$, Ca$^{2+}$, NO$_3^-$, S$_2$O$_4^{2-}$, Fe$^{3+}$, Cu$^{2+}$, ClO$, ONOO^-$, Gly, L-cys, Gsy, Hey, DHA, LAA).
11、The pH and selectivity of aza-BOD-B2.

Figure S4. (a) The absorption intensity of aza-BOD-B2 (10 μM) reacts with H₂O₂ (200 μM) at 808 nm changes with pH (4 - 9); (b) The absorption intensity comparison of aza-BOD-B2 (10 μM) at λ₈₀₈ nm after adding 1 mM H₂O₂ or other active substances (NO₂⁻, S₂O₅²⁻, Ca²⁺, NO₃⁻, S₂O₄²⁻, Fe³⁺, Fe²⁺, Cu²⁺, ClO⁻, ONOO⁻, Gly, L-cys, GSH, Hcy, DHA). (c) The absorption spectrum of aza-BOD-B2 in the presence of different substances.

12、The limit of detection (LOD) of aza-BOD-B1 and aza-BOD-B2.

Figure S5. The absorbance at λ₈₀₈ nm changes of aza-BOD-B1 (5 μM) (a) and aza-BOD-B2 (10 μM) (b) as a function of H₂O₂ concentrations, which showed a good linear relationship as the concentration of H₂O₂ increased.

13、Photothermal conversion efficiency.
Figure S6. Laser-power-dependent temperature changes of aza-BOD-B1 (20 μM) in the absence of H$_2$O$_2$ (a) and in the presence of H$_2$O$_2$ (100 μM) (b); (c) Temperature elevation for aza-BOD-B1 at different concentrations in the presence of H$_2$O$_2$ (100 μM) under 808 nm laser irradiation (1.3 W cm$^{-2}$); The temperature changes of aza-BOD-B1 (20 μM) (d) and aza-BOD-B2 (20 μM) (e) in the presence of H$_2$O$_2$ (200 μM) upon cyclic photothermal heating and cooling processes; the cycle was performed by laser irradiation for 10 min, then naturally cooling to room temperature. (f) Relationship between t and -lnθ of aza-BOD-B2.

The calculation method of light-to-heat conversion efficiency is as follows:

First, θ is the driving temperature calculated according to Equation (2)

$$\theta = \frac{T - T_{\text{sur}}}{T_{\text{max}} - T_{\text{sur}}}$$  \hspace{1cm} (2)
$T$ is the temperature corresponding to different irradiation time, $T_{\text{max}}$ is the highest temperature of the solution after irradiation for 10 min, and $T_{\text{surr}}$ is the initial temperature of the solution.

Next, $\tau_s$ (the associated time constant of the experimental system), can be calculated according to Equation (3):

$$t = -\tau_s \ln \theta$$  \hspace{1cm} (3)

$t$ is the time period corresponding to the cooling of the system after laser irradiation.

$$hS = \frac{mc}{\tau_s}$$  \hspace{1cm} (4)

$$\eta = \frac{hS(T_{\text{max}} - T_{\text{surr}}) - Q_{\text{dis}}}{I(1 - 10^{-A_\lambda})}$$  \hspace{1cm} (5)

Accordingly, the photothermal conversion efficiency ($\eta$) was determined according to a reported method.\textsuperscript{1} $Q_{\text{dis}}$ represents the heat dissipation of solvent which was measured by a power meter (VLP-2000). $I$ is the laser power and $A_\lambda$ is the absorbance at 808 nm. $hS$ can be calculated according to Equation (4).

14. **Time-dependent temperature change curves of aza-BOD-B1 and aza-BOD-B2 after H$_2$O$_2$ activation.**

Figure S7. The temperature changes of aza-BOD-B1 (a) and aza-BOD-B1 (b) upon reacting with H$_2$O$_2$ at different concentrations under 808 nm laser irradiation (2 W cm$^{-2}$).
The photostability of aza-BOD-B1 and aza-BOD-B2.
