Temporal association between invasive procedures and infective endocarditis

Martin H Thornhill, Annabel Crum, Richard Campbell, Tony Stone, Ellen C Lee, Mike Bradburn, Veronica Fibisan, Mark Dayer, Bernard D Prendergast, Peter Lockhart, Larry Baddour, Jon N. Nicola

ABSTRACT

Objective Antibiotic prophylaxis has been recommended for patients at increased risk of infective endocarditis (IE) undergoing specific invasive procedures (IPs) despite a lack of data supporting its use. Therefore, antibiotic prophylaxis recommendations ceased in the mid-2000s for all but those at high IE risk undergoing invasive dental procedures. We aimed to quantify any association between IPs and IE.

Methods All 14,731 IE hospital admissions in England between April 2010 and March 2016 were identified from national admissions data, and medical records were searched for IP performed during the 15-month period before IE admission. We compared the incidence of IP during the 3 months immediately before IE admission (case period) with the incidence during the preceding 12 months (control period) to determine whether the odds of developing IE were increased in the 3 months after certain IP.

Results The odds of IE were increased following permanent pacemaker and defibrillator implantation (OR 1.54, 95% CI 1.27 to 1.85, p=0.001), extractions/surgical tooth removal (OR 2.14, 95% CI 1.22 to 3.76, p=0.047), upper (OR 1.58, 95% CI 1.34 to 1.85, p=0.001) and lower gastrointestinal endoscopy (OR 1.66, 95% CI 1.35 to 2.04, p=0.001) and bone marrow biopsy (OR 1.76, 95% CI 1.16 to 2.69, p=0.039). Using an alternative analysis, bronchoscopy (OR 1.33, 95% CI 1.06 to 1.68, p=0.049) and blood transfusions/red cell/plasma exchange (OR 1.2, 95% CI 1.07 to 1.35, p=0.012) were also associated with IE.

Conclusions This study identifies a significant association between specific IPs (permanent pacemaker and defibrillator implantation, dental extraction, gastrointestinal endoscopy and bronchoscopy) and subsequent IE that warrants re-evaluation of current antibiotic prophylaxis recommendations to prevent IE in high IE risk individuals.

INTRODUCTION

Infective endocarditis (IE) incidence has increased significantly in the last decade in the UK and the rest of Europe. Responsible factors could include an ageing population, increased intra-cardiac device use (pacemakers, implantable cardioverter-defibrillators, surgical and transcatheter heart valves), vascular interventions (including haemodialysis), injection drug use, greater IE awareness and access to investigations (especially echocardiography), and changes in IE prevention guidelines.

IE has devastating consequences, and prevention has been the focus of guidelines. Previous UK, European and US guidelines recommended AP for moderate or high IE risk patients undergoing various invasive procedures (IPs), including invasive-dental procedures (IDPs) (online supplemental appendix table S1). With the possible exception of IDPs, however, there is scant evidence linking IPs to IE or evidence that AP prevents IE. This, and concerns about adverse drug reactions and the development of antibiotic resistance, led the American Heart Association (AHA) and European Society for Cardiology (ESC) to recommend restricting AP use to IDPs in those at high IE risk and the UK National Institute for Health and Care...
Valvular heart disease

Box 1  Cardiac conditions used to classify individuals as being at high or moderate infective endocarditis (IE) risk

High IE risk.

- Previous history of IE.
- Presence of prosthetic heart valve (including transcatheter valves).
- Prosthetic material used for valve repair (including annuloplasty and transcatheter valve procedures).
- Unrepaired cyanotic congenital heart disease.
- Congenital heart disease treated with palliative shunts or conduits.
- Congenital heart defect repaired with surgical or transcatheter technique using prosthetic material or device (first 6 months postprocedure only).

Moderate IE risk

- Rheumatic heart disease.
- Non-rheumatic valve disease (including mitral valve prolapse).
- Congenital valve anomalies (including aortic stenosis).
- Hypertrophic cardiomyopathy.

Notes: adapted from the European Society of Cardiology and American Heart Association guidelines. More extensive details of all diagnoses and procedures (including relevant ICD-10 diagnosis or OPCS-4 procedure codes) included in the definition of those at high or moderate IE risk are provided in online supplemental tables S2 and S3).

Excellence (NICE) to recommend the complete cessation of AP to prevent IE. This study aimed to investigate any association between specific IPs and subsequent IE in England using a case-crossover methodology during a period when AP prevention of IE was not recommended.

METHODS

IE admissions and IE risk stratification

All hospital admissions in England are recorded in the Hospital Episode Statistics (HES) database. With UK National Research Ethics Service approval (17/SC/0371) and Confidentiality Advisory Group approval, this resource was used to identify all IE admissions between 1 April 2010 and 31 March 2016. An admission was defined as a single continuous hospital stay (which could comprise several consultant episodes), where an International Classification of Diseases 10th Revision (ICD-10) primary or secondary diagnosis code I33.0, I33.9, I39.0, I39.1, I39.2, I39.3, I39.4 or I39.8, or a primary diagnosis code I38.X, was used for any consultant episode. Patients discharged alive with a <3 day length of hospital stay or elective admission were excluded. This study is reported according to Strengthening the Reporting of Observational Studies in Epidemiology guidelines. Each patient’s HES record was retrieved from 1 January 2000. To stratify individuals into high, moderate or low/unknown risk of IE (box 1), records were searched for ICD-10 diagnosis or Office of Population Censuses and Surveys Classification of Surgical Operations and Procedures Revision 4 (OPCS-4) procedure codes occurring before IE admission that placed them into these categories based on ESC and AHA guidelines (box 1, online supplemental tables S1 and 2).

New IE admissions were distinguished from readmissions by only accepting IE admissions >180 days apart. Consistent with the guidelines, individuals with congenital heart disease completely repaired with prosthetic material or a device were considered high-risk for IE for 6 months after the procedure and then considered low risk. Individuals not identified as moderate or high risk were considered at low/unknown risk of IE.

Patient and public involvement

Patients were not directly involved in this study.

Invasive procedures

Each patient’s record was searched for OPCS-4 IP codes of interest (online supplemental tables S4 and S5) for each 30-day period over the 15 months before IE admission (ie, between 1 January 2009 and 31 March 2016). IPs of interest were those previously recommended for AP in the 2004 British Cardiac Society and 2006 British Society for Antimicrobial Chemotherapy guidance or identified as associated with an increased risk of IE in a recent Swedish study (online supplemental table S1). To avoid the possibility of reverse causation (procedures being performed as part of the investigation or management of IE), we excluded procedures undertaken during the IE admission. Because some cardiac IPs, for example, coronary artery bypass grafting, may be performed simultaneously with procedures such as valve replacement or repair, we only included them when they occurred alone. Although an association has been reported between dialysis and IE, the case-crossover methodology is inappropriate for a procedure performed with such regularity, and dialysis was excluded from the study. To ensure we counted the number of individuals exposed to each procedure each month (rather than the number of procedures), we counted the first procedure of each type performed on each individual each month.

Restricting IP data to 1 January 2009 through 31 March 2016, meant all IPs were performed after NICE recommended AP use to prevent IE cease (March 2008) and before any relaxation of this (April 2016). Thus, any association between IPs and IE should have been fully exposed.

Case-crossover study

Primary analysis

Monthly exposure to IPs was quantified over the 15 months before IE-related hospital admissions to determine any temporal association (figures 1 and 2 and online supplemental figure S1). Using a step model case-crossover analysis for each IP,10 we calculated the period-adjusted OR and its 95% CI of that IP having been undertaken during the 3-month case period before IE admission compared with the preceding 12-month control period (months 4–15), using a mixed-effects logistic regression model with the patient as a random effect and a fixed effect step parameter at 3 months. To account for potential temporal bias of increasing numbers of IPs being performed, we also calculated an adjusted OR for each IP using a mixed-effects logistic regression model adjusted for date of IE admission (see online supplemental appendix methods). Statistical analyses were performed in Stata V.17, using core packages, and all p values were corrected upwards for multiple comparisons using the Benjamini-Hochberg method.11

Secondary analysis

Sensitivity analyses were performed using 4-month and 6-month case periods (online supplemental tables S7 and S8), and an alternative ‘hinge-model’ case-crossover analysis was performed (see online supplemental appendix), in which instead of fitting a
step change at 3 months, we fitted a change in the time trend at 3 months before admission (a linear term for months -3 to -1).

**Attributable risk**

Attributable risk (or absolute risk increase) was defined as the additional number of IE cases per 100,000 procedures and was estimated for IPs with a significant positive association with IE. The background IE incidence was estimated by dividing the total number of IE cases identified during the study by (duration of study × 53.4937 million), the latter being the Office of National Statistics figure for the population of England during the middle year of the study (2012). The attributable risk per 100,000 procedures was then calculated as \(100,000 \times \text{background IE incidence} \times (\text{adjusted OR}-1)/4\), where the adjusted OR from the primary analysis in table 1 and was used to approximate the relative risk for the 3-month case period, and the denominator (4) reflected the case period was one-quarter of a year. The attributable risk was estimated separately for patients at high, moderate or low/unknown risk using previously published prevalence data for these populations (figure 3).12 13

**RESULTS**

**Study population demographics**

Between 1 April 2010 and 31 March 2016, there were 14,731 IE admissions (mean age 62.3 years, 66.1% male) in England.
Valvular heart disease

Case-crossover analysis

Case-crossover analysis (table 1) showed that many IPs had no significant IE association. However, our primary step model analysis identified a significant IE association following implantation of cardiac pacemakers/defibrillators (CIEDs) (OR 1.54, 95% CI 1.27 to 1.85, p<0.001), extractions/surgical tooth removal (OR 2.14, 95% CI 1.22 to 3.76, p=0.047), upper GI (OR 1.58, 95% CI 1.34 to 1.85, p<0.001) and lower GI endoscopic procedures (OR 1.66, 95% CI 1.35 to 2.04, p<0.001) and bone marrow biopsy (OR 1.76, 95% CI 1.16 to 2.69, p=0.039). All except extractions/surgical tooth removal were also significantly associated with IE using the alternative hinge model analysis. Hinge model analysis also demonstrated a significant association with IE following blood transfusion/red cell or plasma exchange (OR 1.2, 95% CI 1.07 to 1.35, p=0.012) and bronchoscopic procedures (OR 1.33, 95% CI 1.06 to 1.68, p=0.049). In the sensitivity analyses, extractions and upper and lower gastrointestinal (GI) endoscopy remained significantly associated with IE when a 4-month (but not a 6 month) case period was used (online supplemental tables S6 and S7). The remaining procedures were

Figure 2  Incidence of different GU, haematology, obstetrics and gynaecology, respiratory and skin/wound management invasive procedures over the 15 months before infective endocarditis (IE) hospital admission. Vertical blue dashed line separates case period (months −1 to −3) from control period (months −4 to −15). GU, genitourinary.
neither statistically nor clinically significant, comprising small effects (OR below 1.05) and/or infrequent procedures (<10 per month in control periods).

For IPs with evidence of an association with IE, the absolute risk increase (attributable risk) was small for low/unknown risk and moderate risk patients, with estimated attributable risk below 1 per 100 000 procedures for those at low/unknown IE risk and below 4 per 100 000 for those at moderate IE risk (figure 3). The absolute risk was greatest for those at high IE risk, with the absolute risk being highest for those at high IE risk undergoing dental extractions/surgical removal of teeth (49.5 per 100 000 procedures).

**DISCUSSION**

Previous IE guidelines recommended AP before various IPs (online supplemental table S1). These recommendations have been successively abandoned due to lack of evidence to support
Valvular heart disease

an association between them and subsequent IE. The exception is AP before IDPs in high-risk individuals, which is still recommended outside the UK.14 15 A recent Swedish national study, which will be referred to throughout this discussion, found an association between IE and many IPs previously recommended for AP cover, raising the possibility that withdrawal of AP for these may have been premature.8 To explore this, we performed a case-crossover study to determine any temporal association between these IPs and subsequent IE.

Cardiac procedures

Device infection is a well-recognised complication of CIED implantation, and surveys suggest that most CIED implantations in England were AP covered.16 17 Nonetheless, there was considerable variation in the AP regimens used.16 17 Concerns about this led to the first UK CIED infection prevention guidelines in 2015.18 The incidence of IE following CIED insertion has been calculated at 550 cases/million procedures per year.19 Despite it being likely that most CIED implantations were covered by AP, we identified a significantly increased risk of IE in the first 3 months after CIED implantation. The attributable risk was 23.8 per 100,000 procedures for those at high IE risk and 1.8 per 100,000 procedures for those at moderate IE risk. These data suggest that AP cover of CIED implantation was not complete at the time of the study and more may need to be done to improve the effectiveness of CIED infection prevention protocols. It is notable that despite the introduction of UK-wide CIED infection prevention guidelines shortly before the end of this study,18 current UK IE prevention guidelines contradict these by recommending against the use of AP to prevent IE and failing to mention the IE risk posed by CIED implantation.20

Dental procedures

During the study period, 294,034 IDPs were performed in English hospitals (of which 70.2% were extractions/surgical tooth removal, 23.8% other surgical procedures and 5.6%...
We identified a significant association between upper GI endoscopic procedures and IE. The increase in attributable risk was, respectively, 25.1 and 28.7 per 100 000 procedures for those at high IE risk undergoing upper or lower GI endoscopy and 2.0 and 2.2 per 100 000 procedures for those at moderate risk. A subanalysis identified a significant difference in the association between upper and lower GI endoscopy and subsequent IE between endoscopy procedures that involved an intervention, for example, a biopsy, and those that did not.

AP was previously recommended before GI endoscopy procedures, and they were also significantly associated with IE in the Swedish study.9

Two case series have identified IE following endoscopy,29 30 and elevated IE incidence has been noted in elderly high IE risk patients following colonoscopy.24 Nonetheless, current IE prevention guidelines do not recommend AP in these settings. One explanation for an association between colonoscopy and IE is that *Streptococcus gallolyticus* IE is associated with colorectal cancer in the elderly or immunocompromised. Indeed, clinicians are advised to exclude colorectal cancer in patients with *Streptococcus gallolyticus* bacteraemia.24 However, this does not explain the strong association between upper GI endoscopy and IE and could only explain a small proportion of lower GI endoscopy-associated IE.

We found no association between endoscopic retrograde cholangio-pancreatic (ERCP) and IE. This could be because ERCP patients are frequently already receiving antibiotics for cholangitis or because AP to prevent local infection is recommended in several situations for UK patients undergoing ERCP.26

### Haematology procedures

There was a significant association in both the primary step and alternative hinge-model analyses between bone marrow biopsy and IE. There was also an association between blood transfusion, red cell or plasma exchange and IE in the hinge analysis. Neither procedure has previously been recommended for AP cover (online supplemental table S1). We included them because the Swedish study found both significantly associated with IE (RR 4.67, 95% CI 1.34 to 16.24, and RR 6.69, 95% CI 4.43 to 10.11, respectively).3

Although these associations may be valid, they could also be explained by diagnostic bone marrow biopsy or therapeutic transfusions, particularly if haematological malignancy is suspected in the weeks before an IE diagnosis is confirmed. This is not uncommon since IE may present with features similar to haematological malignancy. Further investigation into this possible association is essential before drawing any conclusions.

### Respiratory procedures

Most early guidelines recommended AP before bronchoscopy, and our alternative hinge analysis and the Swedish study3 identified an association between bronchoscopy and subsequent IE. Furthermore, our attributable risk estimate was 38 additional IE cases per 100 000 procedures for those at high IE risk. Bacteraemia is a recognised complication of bronchoscopy.27 Nonetheless, consistent with NICE guidance,20 current British Thoracic Society guidelines recommend against the use of AP to prevent IE in those undergoing flexible bronchoscopy.28

### Other procedures

We detected no association between ENT, skin or obstetrics and gynaecology procedures and IE. Indeed, the number of these procedures was extremely low over the 15 months before IE admission.
Although cystoscopy and endoscopic prostate procedures were previously recommended for AP cover, and the Swedish study found a significant association between these procedures and IE,\(^8\) we found no significant association. Antibiotic use to prevent postprocedural urinary tract infections is common and could have masked any relationship in our study. Indeed, another study identified a significant association between urological procedures and IE,\(^29\) so further investigation is warranted.

Sensitivity analysis
Sensitivity analysis showed the association between extractions, upper or lower GI endoscopy and subsequent IE was sustained for 4 (but not 6) months. The hinge model analysis confirmed the associations identified with the primary step model analysis but identified two more (bronchoscopy and transfusion/red cell/plasma exchange).

The Swedish study did not investigate IDPs, but most IPs we identified as significantly associated with IE were also identified in the Swedish study.\(^3\) We could not, however, confirm all associations identified in the Swedish study, and the relative risk values they identified were higher than the comparable ORs we found. The reasons for this are: first, the Swedish study screened all inpatient and outpatient IPs to identify associations with IE; we only studied those previously recommended for AP or identified with a positive association in the Swedish study. Second, although both studies used a case-crossover methodology and a 3-month case period, different control periods were used. The Swedish study used a 3-month control period, 1 year before the case period, while we used the preceding 12 months. Sampling the control frequency over an entire year is twice as efficient as sampling equal duration case and control periods.\(^30\) Finally, with increasing numbers of IPs being performed, using a 1-year control period, and adjusting the ORs to take account of the date of each procedure, allowed us to correct for trends in procedure numbers. This means our adjusted ORs are often smaller but may better reflect any actual association between these IP and IE.

CONCLUSIONS
We report a significant association between implantation of CIEDs, upper and lower GI endoscopy, bronchoscopy, and dental extractions (including surgical tooth removal), and subsequent IE. These procedures resulted in an additional 14.3–49.5 IE cases/100,000 procedures in those at high IE risk and an additional 1.1–3.9 IE cases/100,000 procedures in those at moderate risk. These data support a reconsideration of the possible role of preprocedural AP for these procedures in those at high IE risk.

Contributors
MHT and JN conceived the idea of the study and formulated the study design. MD, BDP, PL and LB provided the clinical input needed to identify the data to extract. AC, RC and TS undertook data extraction. JN, MB and ECL performed the statistical analysis. JN and MB supervised the analysis. MHT, JN, MD, BDP, PL and LB interpreted the findings. VF provided logistical coordination and support. MT drafted the manuscript. JN, AC, RC, TS, VF, MD, BDP, PL and LB critically reviewed the manuscript, and MT revised the manuscript for final submission. All authors have approved the final draft of the manuscript. MT is the guarantor. MT and JN accept full responsibility for the work and the conduct of the study, had access to the data and controlled the decision to publish. The corresponding author attests that all listed authors meet the authorship criteria and that no others meeting the criteria were included.

**Abbreviations:**
AHA = American Heart Association
AP = Antibiotic prophylaxis
BCS = British Cardiac Society
BSAC = British Society for Antimicrobial Chemotherapy
CABG = Coronary artery bypass graft
CI = Confidence interval
ENT = Ear nose and throat
ESC = European Society for Cardiology
ERCP = Endoscopic retrograde cholangio-pancreatic procedures
IDPs = Invasive-dental procedures
IPs = Invasive procedures
IE = Infective endocarditis
NICE = National Institute for Health and Care Excellence
OR = Odds ratio
RR = Relative risk
UK = United Kingdom
US = United States of America
Supplementary Methods

Analyses:

Case-Crossover studies compare exposure to possible trigger events (in this case the incidence of invasive procedures [IP]) for an outcome (in this case admission for infective endocarditis [IE]) during an exposure window (in this case the 3-month case-period before hospital admission for infective endocarditis [IE]) when exposure may lead to the outcome and compares this with the exposure in an earlier control-period (in this case the incidence of IP in the 12 months preceding the case-period). In its simplest form this involves comparing the monthly incidence of the IP in the case-period with the incidence in the control period. If a causal relationship exists between the IP and the outcome IE, then one would expect the mean IP incidence in the case-period to exceed the mean IP incidence in the control-period i.e., there would be a step increase in the IP incidence in the control period on transitioning into the case period. Hence the term “step-model”. This is depicted in the figure below by the graph labelled ‘Sep-Model’. The step increase between the control and case period means can be seen. This is what we describe as the unadjusted “step-model”.

Unadjusted step-model analysis:

For each procedure, the binary outcome (procedure occurred, yes/no) was modelled longitudinally. Whilst it is possible to have multiple procedures within the same month, the vast majority of procedures considered here occur only once if at all. Furthermore, multiple procedures within the same month are likely to relate to one episode for these procedures. For both of these reasons, (simplicity and avoidance of double counting) we chose to limit analysis to yes/no incidence. The unadjusted model considers the probability of an invasive procedure during a month within the “case period” (3 months prior to IE), compared to the probability of an invasive procedure in the remaining months of the study (4-15 prior to IE). This is referred to as a “step-model” as the proportion of patients undergoing a procedure is assumed to follow a step-change once the patient enters the case period:

\[ \text{logit}(p_{it}) = \alpha + \beta_{\text{case}} \times I_{(t)} + \gamma_i \]

Where \( p_{it} \) denotes the probability that the \( i^{th} \) patient recorded a procedure in time-period \( t \) (1 to 15), \( I_{(t)} \) is equal to 1 if the current timepoint is within 3 months of the IE and 0 otherwise, \( \beta_{\text{case}} \) is the coefficient (log-odds) for the procedure in the case period compared to the non-case period, \( \gamma_i \) is a Normally distributed random effect specific to the patient. This analysis compares monthly occurrence during “case” periods to “control” periods but is biased (exaggerated) if the incidence of procedures increases with time.

To address this, we defined an adjusted ‘step model’ as our primary outcome. This corrected for the background increase in IP incidence and is represented in the figure below by the graph labelled ‘Adjusted Step-Model’. Despite adjusting for the background increase in IP incidence, there is still a step increase in the incidence between the case- and control-periods caused by any association between the IP and subsequent IE (hence the term adjusted “step-model”). The important thing to note is that the unadjusted “step-model” (that represents most case-crossover studies on this subject e.g., the Janszky study (Janszky et al, J. Am. Coll. BMJ Publishing Group Limited (BMJ) disclaims all liability and responsibility arising from any reliance placed on this supplemental material which has been supplied by the author(s) Heart doi: 10.1136/heartjnl-2022-321519–9.:10 2022;Heart, et al. Thornhill MH
Cardiol. (2018) 71(24)2744-2752) will tend to exaggerate or overestimate the Odds or RR in a situation where the incidence of the potential trigger (IP in this case) is increasing over time. Whereas the adjusted “step-model” (our primary outcome) helps to correct for this but results in a lower OR/RR, – as discussed in the last two sentences of the Discussion section on ‘Sensitivity Analysis’.

Adjusted step-model analysis:

The adjusted model builds on the unadjusted model which also incorporates the association between procedure and calendar time:

\[
\text{logit}(p_{it}) = \alpha + \beta_{\text{case}} \times I(t) + \beta_{\text{time}} \times d_t + \gamma_i
\]

Where \(d_t\) is the calendar date (1\textsuperscript{st} April 2010 to 31\textsuperscript{st} March 2016), \(\beta_{\text{time}}\) is the coefficient (log-odds) for the temporal association, and \(p_{it}, I(t)\) and \(\gamma_i\) are as above. This analysis models associations both temporally and with procedure but models the change as a jump at three months prior to IE and was chosen as our primary analysis.

An alternative approach is to consider the slope of the IP incidence in the case- and control-periods as continuous (i.e., without a step change) but with a change of slope (or trajectory) occurring at the point of transition from the control- to the case-period (i.e., with a hinge point in the slope). This is depicted in the figure below by the graph labelled ‘Hinge-model’.

Hinge-model analysis:

The hinge-model analysis allows a gradual separation of the curves during the case period, as opposed to the step (or “jump”) the previous two models. Like the adjusted step-model, this also incorporates the association between procedure and calendar time:

\[
\text{logit}(p_{it}) = \alpha + \beta_{\text{case}} \times I(t) \times t^* + \beta_{\text{time}} \times d_t + \gamma_i
\]

Where \(t^*\) equal to the study month. This analysis is more biologically plausible and most sensitive to detecting an association where one exists but cannot directly estimate the attributable risk. Since we wanted to estimate this, and since the incidence of many procedures appeared to increase with time, the adjusted step-model analysis was selected as our primary analysis.
Table S1. Invasive procedures identified for antibiotic prophylaxis by previous guidelines or with positive association with subsequent infective endocarditis

| Invasive Procedures (IPs) | BCS 2004[1] | ESC 2004[2] | AHA 1997[3] | Janszky et al. 2018[4] Inpatient IPs RR (95% CI) |

| Scaling of teeth         | ✓ | ✓ | ✓ | - |
| Endodontic treatment     | ✓ | ✓ | ✓ | - |

Notes: This table shows those invasive procedures (IPs) for which antibiotic prophylaxis (AP) was recommended for those at moderate- or high-risk of infective endocarditis (IE) (i) by the 2004 British Cardiac Society (BCS) guidance,[1] (ii) by the 2004 European Society for Cardiology (ESC) guidance,[2] or (iii) the 1997 American Heart Association (AHA) guidelines.[3] It also shows the increased relative risk (RR), with 95% Confidence Intervals, of developing IE after different types of IP that was identified in the 2018 analysis of Swedish national data for hospital admissions between January 1998 and December 2011 by Janszky et al.[4] The 2009 ESC guidelines[5] and the 2007 AHA guidelines[6] recommended against the use of AP for all IPs in those at moderate-IE-risk and for all IPs, except dental IPs, in those at high-IE-risk. The 2008 NICE guidelines in the UK recommended the complete cessation of AP for all IPs, including dental procedures.[7] TOE= Transoesophageal echocardiography, ✓ = antibiotic prophylaxis recommended, ✓† = prophylaxis recommended as optional for high-risk patients, ✓§ = antibiotic prophylaxis recommended in the presence of infection.
### Table S2.
Codes used to identify those at high-risk of IE. Primary and secondary codes used (except I38X for which primary diagnosis code only was used).

| Cardiac Condition | ICD-10 Diagnosis Codes and OPCS-4 Procedure codes For Identifying Those at High-Risk of IE¹ |

Prosthetic heart or ventricular assist device

OPCS-4 Procedure Codes:

K023 Implantation of prosthetic heart
K025 Revision of implantation of prosthetic heart
K541 Open implantation of ventricular assist device

Congenital Heart Condition (CHC) in whom a palliative shunt or conduit has been used

OPCS-4 Procedure Codes:

K041 Repair of tetralogy of Fallot using valved right ventricular outflow conduit
K042 Repair of tetralogy of Fallot using right ventricular outflow conduit NEC
K063 Left ventricle to aorta tunnel with right ventricle to pulmonary artery valved conduit
K171 Total cavopulmonary connection with extracardiac inferior caval vein to pulmonary artery conduit
K173 Aortopulmonary reconstruction with systemic to pulmonary arterial shunt
K174 Aortopulmonary reconstruction with right ventricle to pulmonary arterial valveless conduit
K181 Creation of valved conduit between atrium and ventricle of heart
K182 Creation of valved conduit between right atrium and pulmonary artery
K183 Creation of valved conduit between right ventricle of heart and pulmonary artery
K184 Creation of valved conduit between left ventricle of heart and aorta
K185 Revision of valved cardiac conduit
K186 Creation of valved conduit between left ventricle of heart pulmonary artery
K187 Replacement of valved cardiac conduit
K188 Other specified creation of valved cardiac conduit
K189 Unspecified creation of valved cardiac conduit
K191 Creation of conduit between atrium and ventricle of heart NEC
K192 Creation of conduit between right atrium and pulmonary artery NEC
K193 Creation of conduit between right ventricle of heart and pulmonary artery NEC
K194 Creation of conduit between right ventricle of heart and vena cava
K195 Creation of conduit between left ventricle of heart and aorta NEC
K196 Revision of cardiac conduit NEC
K198 Other specified creation of other cardiac conduit
K199 Unspecified creation of other cardiac conduit
K761 Percutaneous transluminal balloon dilatation of cardiac conduit
K768 Other specified transluminal operations on cardiac conduit
K769 Unspecified transluminal operations on cardiac conduit
L051 Creation of shunt to main pulmonary artery from ascending aorta using interposition tube prosthesis
| Procedure Code | Description |
|----------------|-------------|
| L052           | Creation of shunt to right pulmonary artery from ascending aorta using interposition tube prosthesis |
| L053           | Creation of shunt to left pulmonary artery from ascending aorta using interposition tube prosthesis |
| L054           | Percutaneous transluminal balloon dilatation of interposition tube prosthesis between pulmonary artery and aorta |
| L058           | Other specified creation of shunt to pulmonary artery from aorta using interposition tube prosthesis |
| L059           | Unspecified creation of shunt to pulmonary artery from aorta using interposition tube prosthesis |
| L071           | Creation of shunt to right pulmonary artery from right subclavian artery using interposition tube prosthesis |
| L072           | Creation of shunt to left pulmonary artery from left subclavian artery using interposition tube prosthesis |
| L074           | Percutaneous transluminal balloon dilatation of interposition tube prosthesis between pulmonary artery and subclavian artery |
| L078           | Other specified creation of shunt to pulmonary artery from subclavian artery using interposition tube prosthesis |
| L079           | Unspecified creation of shunt to pulmonary artery from subclavian artery using interposition tube prosthesis |

**ICD-10 Diagnosis Codes:**

- Q200 Common arterial trunk
- Q201 Double outlet right ventricle
- Q202 Double outlet left ventricle
- Q203 Discordant ventriculoarterial connection
- Q204 Double inlet ventricle
- Q205 Discordant atrioventricular connection
- Q212 Atrioventricular septal defect
- Q213 Tetralogy of Fallot
- Q214 Aortopulmonary septal defect
- Q262 Total anomalous pulmonary venous connection

**OPCS-4 Procedure Codes:**

- K091 Repair of defect of atrioventricular septum using dual prosthetic patches
- K092 Repair of defect of atrioventricular septum using prosthetic patch NEC
- K101 Repair of defect of interatrial septum using prosthetic patch
- K111 Repair of defect of interventricular septum using prosthetic patch
- K117 Repair of defect of inter ventricular septal defect using intraoperative transluminal prosthosis
- K121 Repair of defect of septum of heart using prosthetic patch NEC
- K131 Percutaneous transluminal repair of defect of interventricular septum using prosthesis
- K132 Percutaneous transluminal repair of defect of interventricular septum NEC
- K133 Percutaneous transluminal repair of defect of interatrial septum using prosthesis
- K134 Percutaneous transluminal repair of defect of interatrial septum NEC
- K135 Percutaneous transluminal repair of defect of unspecified septum using prosthesis
- K138 Other specified transluminal repair of defect of interatrial septum
- K139 Unspecified transluminal repair of defect of interatrial septum
- K163 Percutaneous transluminal atrial septal fenestration closure with prosthesis
- K165 Percutaneous transluminal closure of patent oval foramen with prosthesis
- L031 Percutaneous transluminal prosthetic occlusion of patent ductus arteriosus
- L101 Repair of pulmonary artery using prosthesis
- L233 Plastic repair of aorta using patch graft

**Unrepaired cyanotic congenital heart condition (CHC)**

**Completely repaired CHC defect with prosthetic material or device, whether placed by surgery or catheter intervention, during first 6 months after the procedure only.**

|                         | I062 Rheumatic aortic stenosis with insufficiency                                            |
|                         | I068 Other rheumatic aortic valve disease                                                     |
|                         | I069 Rheumatic aortic valve disease, unspecified                                             |
|                         | I070 Rheumatic tricuspid stenosis                                                             |
|                         | I071 Rheumatic tricuspid insufficiency                                                        |
|                         | I072 Rheumatic tricuspid stenosis with insufficiency                                          |
|                         | I078 Other rheumatic tricuspid valve disease                                                  |
|                         | I079 Rheumatic tricuspid valve disease, unspecified                                           |
|                         | I080 Disorders of both mitral and aortic valves                                              |
|                         | I081 Disorders of both mitral and tricuspid valves                                            |
|                         | I082 Disorders of both aortic and tricuspid valves                                            |
|                         | I088 Other multiple valve disease                                                             |
|                         | I089 Multiple valve diseases, unspecified                                                     |
|                         | I090 Rheumatic myocarditis                                                                  |
|                         | I091 Rheumatic disease of the endocardium, valve unspecified                                  |
|                         | I098 Other specified rheumatic heart disease                                                  |
|                         | I099 Rheumatic heart disease, unspecified                                                     |
| Non-Rheumatic Valve Disease | ICD-10 Diagnosis Codes:                                                                      |
|                         | I340 Mitral valve insufficiency                                                              |
|                         | I341 Mitral valve prolapse                                                                   |
|                         | I342 Nonrheumatic mitral valve stenosis                                                       |
|                         | I348 Other nonrheumatic mitral valve disorders                                                |
|                         | I349 Nonrheumatic mitral valve disorder, unspecified                                          |
|                         | I350 Aortic valve stenosis                                                                    |
|                         | I351 Aortic valve insufficiency                                                               |
|                         | I352 Aortic valve stenosis with insufficiency                                                 |
|                         | I358 Other nonrheumatic aortic valve disorders                                                |
|                         | I359 Nonrheumatic aortic valve disorder, unspecified                                          |
|                         | I360 Tricuspid valve stenosis                                                                  |
|                         | I361 Tricuspid valve insufficiency                                                             |
|                         | I362 Tricuspid valve stenosis with insufficiency                                              |
|                         | I368 Other nonrheumatic tricuspid valve disorder                                              |
|                         | I369 Nonrheumatic tricuspid valve disorder, unspecified                                       |
|                         | I370 Pulmonary valve stenosis                                                                  |
|                         | I371 Pulmonary valve insufficiency                                                             |
|                         | I372 Pulmonary valve stenosis with insufficiency                                              |
|                         | I378 Other nonrheumatic pulmonary valve disorders                                             |
|                         | I379 Nonrheumatic pulmonary valve disorder, unspecified                                        |
| Condition                          | ICD-10 Diagnosis Codes                                      |
|-----------------------------------|------------------------------------------------------------|
| Hypertrophic cardiomyopathy       | I421 Obstructive hypertrophic cardiomyopathy, I422 Other hypertrophic cardiomyopathy |
| Congenital valve anomalies        | Q221 Congenital pulmonary valve stenosis, Q222 Congenital pulmonary valve insufficiency, Q223 Other congenital malformations of pulmonary valve, Q224 Congenital tricuspid valve stenosis, Q225 Ebstein anomaly, Q228 Other congenital malformations of tricuspid valve, Q229 Congenital malformations of tricuspid valve, unspecified, Q230 Congenital stenosis of aortic valve, Q231 Congenital insufficiency of aortic valve, Q232 Congenital mitral valve stenosis, Q233 Congenital mitral valve insufficiency, Q238 Other congenital malformations of aortic and mitral valves, Q239 Congenital malformations of aortic and mitral valves, unspecified |
Table S4
Summary of Invasive Procedure (IPs) OPCS-4 Codes

| Procedures                                      | Paper (RR)* | OPCS-4 Codes                                      | Most Likely Organisms |
|------------------------------------------------|-------------|---------------------------------------------------|----------------------|
| **Haematology Procedures**                     |             |                                                   |                      |
| Blood transfusion/red cell or plasma exchange  | 7           | X32.1-X34.9 (3 Character – X32–X34)               | Staph                |
| Bone marrow puncture                            | 16          | W36.5, Y66.7 (Must use 4 character codes)         | Staph                |
| **GI Procedures**                               |             |                                                   |                      |
| Oesophageal endoscopic procedures (all)         |             | G14.1-G20.9 (3 Character – G14–G20 + U20.2)       |                      |
| Transoesophageal echocardiography (TOE)         |             | U20.2                                             |                      |
| Oesophageal endoscopic procedures (excluding TOE)|             | G14.1-G20.9 (3 Character – G14–G20)               |                      |
| Upper GI endoscopic procedures (gastric, jejunum, ileum) | 4           | G42.1-G46.9, G54.1-G55.9, G64.1-G65.9, G79.1-G79.9, G80.1-G80.9 (3 Character – G42-G46, G54-G55, G64-G65 + G79-G80) | Enterococci          |
| Lower GI endoscopic procedures (including sigmoid and rectum) | 3           | H20.1-28.9 (3 Character – H20–H28)                | Enterococci          |
| Colonic surgery (incl appendix)                 |             | H01.1-19.9, H29.1-29.9 (3 Character – H01-03 (Appendix), H04–H19 and H29 (Colonic surgery)) |                      |
| Endoscopic Retrograde Cholangio-pancreatic Procedures (ERCP) | | J40-1 - J45.9 (3 Character – J40 - J45) | Enterococci          |
| **GU Procedures**                               |             |                                                   |                      |
| Cystoscopic procedures                          | 4           | M09.1-M11.9, M27.1-M30.9, M42.1-M45.9 (3 Character – M09–M11, M27–M30, M42-M45) | Enterococci          |
| Endoscopic prostate procedures                  |             | M65.1-M68.9, M70.1-M71.9 (3 Character – M65-M68 and M70-M71) |                      |
| **Respiratory Procedures**                      |             |                                                   |                      |
| Bronchoscopic procedures                        |             | E48.1-51.9                                        | ?                    |
| Category                          | Code(s)                                      |
|----------------------------------|----------------------------------------------|
| **ENT procedures**              |                                              |
| Tonsillectomy & Adenoidectomy   | E20.1–E20.9, F34.1-34.9, F36.1–F36.9         |
| Nasal packing/nasal intubation   | E06.1–E06.9 + X56.1                         |
| **Obstetric & gynae procedures**|                                              |
| Abortion/dilatation & curettage  | Q10.1–11.9                                  |
| Vaginal delivery                 | R19.1–24.9                                  |
| Caesarean delivery               | R17.1–18.9                                  |
| **Cardiac Procedures**          |                                              |
| Coronary angiography             | K63.1–63.9, K65.1–K65.9                     |
| Coronary artery bypass           | K40.1–46.9                                  |
| Percutaneous coronary procedures| K49.1–K51.9, K75.1–75.9                     |
| Implantation of cardiac pacemakers/defibrillators | K59.1-K61.9, K73.1-K73.9                     |
| Percutaneous valve procedures/heart catheterisation | K35.1-K35.9                         |
| Skin and wound management        | S41.1–S42.9, S47.1–S47.9, S54.1–S57.9       |
| **Dental Procedures**           |                                              |
| Extractions & surgical removal   | F09.1–F10.9                                 |
| Other oral surgical procedures   | F01, F02, F03, F04, F05, F06, F08, F11, F18, F22, F23, F24, F26, F28, F29, F30, F32, F38, F39, F40 and 4 Character F42.1–42.3 |
| Endodontic procedures            | F12.1–F12.9                                 |
| Scaling and gingival procedures  | F16.4, F20.1–F20.9                          |
| Restorative Dental Procedures    | F13.1–F13.5, F13.8–F13.9, F17.1, F17.6     |

* Increased relative risk of developing IE within 3 months of this procedure being performed according to the data published by Janszky et al. 2018[4]
### Table S5
**Individual OPCS-4 Invasive Procedure (IPs) Code Descriptions**

| Procedure                      | Code  | OPCS-4 Code Description                                                                 |
|--------------------------------|-------|----------------------------------------------------------------------------------------|
| **Cardiac Procedures**         |       |                                                                                         |
| Coronary angiography           | K63   | Contrast radiology of heart                                                             |
|                                | K63.1 | Angiocardiography of combination of right and left side of heart                         |
|                                | K63.2 | Angiocardiography of right side of heart NEC                                           |
|                                | K63.3 | Angiocardiography of left side of heart NEC                                            |
|                                | K63.4 | Coronary arteriography using two catheters                                             |
|                                | K63.5 | Coronary arteriography using single catheter                                           |
|                                | K63.6 | Coronary arteriography NEC                                                              |
|                                | K63.8 | Other specified contrast radiology of heart                                             |
|                                | K63.9 | Unspecified contrast radiology of heart                                                |
|                                | K65   | Catheterisation of heart                                                                |
|                                | K65.1 | Catheterisation of combination of right and left side of heart NEC                      |
|                                | K65.2 | Catheterisation of right side of heart NEC                                              |

G79.3* Endoscopic insertion of tubal prosthesis into ileum
G79.8* Other specified therapeutic endoscopic operations on ileum
G79.9* Unspecified therapeutic endoscopic operations on ileum
G80* Diagnostic endoscopic examination of ileum
G80.1* Diagnostic endoscopic examination of ileum and biopsy of lesion of ileum
G80.2* Wireless capsule endoscopy
G80.3* Diagnostic endoscopic balloon examination of ileum
G80.8* Other specified diagnostic endoscopic examination of ileum
G80.9* Unspecified diagnostic examination of ileum

Lower GI endoscopic procedures (including sigmoid and rectum)

H20* Endoscopic extirpation of lesion of colon
H20.1* Fibreoptic endoscopic snare resection of lesion of colon
H20.2* Fibreoptic endoscopic cauterisation of lesion of colon
H20.3* Fibreoptic endoscopic laser destruction of lesion of colon
H20.4* Fibreoptic endoscopic destruction of lesion of colon NEC
H20.5* Fibreoptic endoscopic submucosal resection of lesion of colon
H20.6* Fibreoptic endoscopic resection of lesion of colon NEC
H20.7* Fibreoptic endoscopic mucosal resection of lesion of colon
H20.8* Other specified endoscopic extirpation of lesion of colon
H20.9* Unspecified endoscopic extirpation of lesion of colon

H21* Other therapeutic endoscopic operations on colon
H21.1* Fibreoptic endoscopic dilation of colon
H21.2* Fibreoptic endoscopic coagulation of blood vessel of colon
H21.3* Fibreoptic endoscopic removal of foreign body from colon
H21.4* Fibreoptic endoscopic insertion of expanding metal stent into colon
H21.5* Fibreoptic endoscopic decompression of colon
H21.8* Other specified other therapeutic endoscopic operations on colon
H21.9* Unspecified other therapeutic endoscopic operations on colon

H22* Diagnostic endoscopic examination of colon
H22.1* Diagnostic fibreoptic endoscopic examination of colon and biopsy of lesion of colon
H22.8* Other specified diagnostic endoscopic examination of colon
H22.9* Unspecified diagnostic endoscopic examination of colon

H23* Endoscopic extirpation of lesion of lower bowel using fibreoptic sigmoidoscope
H23.1* Endoscopic snare resection of lesion of lower bowel using fibreoptic sigmoidoscope
H23.2* Endoscopic cauterisation of lesion of lower bowel using fibreoptic sigmoidoscope
H23.3* Endoscopic laser destruction of lesion of lower bowel using fibreoptic sigmoidoscope
H23.4* Endoscopic destruction of lesion of lower bowel using fibreoptic sigmoidoscope NEC
H23.5* Endoscopic submucosal resection of lesion of lower bowel using fibreoptic sigmoidoscope
H23.6* Endoscopic resection of lesion of lower bowel using fibreoptic sigmoidoscope NEC
H23.7* Endoscopic mucosal resection of lesion of lower bowel using fibreoptic sigmoidoscope
H23.8* Other specified endoscopic extirpation of lesion of lower bowel using fibreoptic sigmoidoscope
H23.9* Unspecified endoscopic extirpation of lesion of lower bowel using fibreoptic sigmoidoscope
H24* Other therapeutic endoscopic operations on lower bowel using fibreoptic sigmoidoscope

H24.1* Endoscopic dilation of lower bowel using fibreoptic sigmoidoscope
H24.2* Endoscopic coagulation of blood vessel of lower bowel using fibreoptic sigmoidoscope
H24.3* Endoscopic insertion of tubal prosthesis into lower bowel using fibreoptic sigmoidoscope
H24.4* Endoscopic insertion of expanding metal stent into lower bowel using fibreoptic sigmoidoscope
H24.5* Endoscopic decompression of lower bowel using fibreoptic sigmoidoscope
H24.8* Other specified other therapeutic endoscopic operations on lower bowel using fibreoptic sigmoidoscope
| Code | Description |

  - F10.1 Full dental clearance
  - F10.2 Upper dental clearance
  - F10.3 Lower dental clearance
  - F10.4 Extraction of multiple teeth NEC
  - F10.8 Other specified simple extraction of tooth
  - F10.9 Unspecified simple extraction of tooth
- F01 Partial excision of lip
  - F01.1 Excision of vermilion border of lip and advancement of mucosa of lip
  - F01.8 Other specified partial excision of lip
  - F01.9 Unspecified partial excision of lip
- F02 Extirpation of lesion of lip
  - F02.1 Excision of lesion of lip
| Code  | Description                                      |
|-------|--------------------------------------------------|
| F02.2 | Destruction of lesion of lip                     |
| F02.8 | Other specified extirpation of lesion of lip     |
| F02.9 | Unspecified extirpation of lesion of lip         |
| F03   | Correction of deformity of lip                   |
| F03.1 | Primary closure of cleft lip                     |
| F03.2 | Revision of primary closure of cleft lip         |
| F03.3 | Adjustment to vermillion border of lip NEC       |
| F03.8 | Other specified correction of deformity of lip   |
| F03.9 | Unspecified correction of deformity of lip       |
| F04   | Other reconstruction of lip                     |
| F04.1 | Reconstruction of lip using tongue flap          |
| F04.2 | Reconstruction of lip using skin flap            |
| F04.8 | Other specified other reconstruction of lip      |
| F04.9 | Unspecified other reconstruction of lip          |
| F05   | Other repair of lip                             |
| F05.1 | Excision of excess mucosa from lip               |
| F05.2 | Advancement of mucosa of lip NEC                 |
| F05.3 | Suture of lip                                   |
| F05.4 | Removal of suture from lip                      |
| F05.8 | Other specified other repair of lip              |
| F05.9 | Unspecified other repair of lip                  |
| F06   | Other operations on lip                          |
| F06.1 | Division of adhesions of lip                     |
| F06.2 | Biopsy of lesion of lip                          |
| F06.3 | Shave of lip                                    |
| F06.8 | Other specified other operations on lip          |
| F06.9 | Unspecified other operations on lip              |
| F08   | Implantation of tooth                            |
| F08.1 | Allograft transplantation of tooth               |
| F08.2 | Autotransplantation of tooth                     |
| F08.3 | Replantation of tooth                            |
| F08.4 | Repositioning of tooth                           |
| F08.8 | Other specified implantation of tooth            |
| F08.9 | Unspecified implantation of tooth                |
| F11   | Preprosthetic oral surgery                       |
| F11.1 | Oral alveoplasty                                 |
| F11.2 | Augmentation of alveolar ridge using autograft   |
| F11.3 | Augmentation of alveolar ridge NEC               |
| F11.4 | Vestibuloplasty of mouth                         |
| F11.5 | Endosseous implantation into jaw                 |
| F11.6 | Subperiosteal implantation into jaw              |
| F11.8 | Other specified preprosthetic oral surgery       |
| F11.9 | Unspecified preprosthetic oral surgery           |
| F16   | Excision of dental lesion of jaw                 |
| F16.1 | Enucleation of dental cyst of jaw                |
| F18.2 | Marginalisation of dental lesion of jaw           |
| F18.8 | Other specified excision of dental lesion of jaw  |
| F18.9 | Unspecified excision of dental lesion of jaw     |
| F22   | Excision of tongue                               |
| F22.1 | Total glossectomy                                |
| F22.2 | Partial glossectomy                              |
| F22.8 | Other specified excision of tongue               |
| F22.9 | Unspecified excision of tongue                   |
| F23   | Extirpation of tongue                            |
| F23.1 | Excision of lesion of tongue                     |
| F23.2 | Destruction of lesion of tongue                  |
| F23.8 | Other specified extirpation of lesion of tongue   |
| F23.9 | Unspecified extirpation of lesion of tongue      |
| Code | Description                                      |
|------|-------------------------------------------------|
| F24  | Incision of tongue                               |
| F24.1| Biopsy of lesion of tongue                       |
| F24.2| Removal of foreign body from tongue              |
| F24.3| Glossotomy                                      |
| F24.8| Other specified incision of tongue               |
| F24.9| Unspecified incision of tongue                   |
| F26  | Other operations on tongue                       |
| F26.1| Commissurectomy of tongue                        |
| F26.2| Excision of frenulum of tongue                   |
| F26.3| Incision of frenulum of tongue                   |
| F26.4| Freeing of adhesions of tongue                   |
| F26.5| Suture of tongue                                 |
| F26.8| Other specified other operations on tongue       |
| F26.9| Unspecified other operations on tongue           |
| F28  | Extirpation of lesions of palate                 |
| F28.1| Excision of lesion of palate                     |
| F28.2| Destruction of lesion of palate                  |
| F28.3| Other specified extirpation of lesion of palate  |
| F28.4| Unspecified extinction of lesion of palate       |
| F29  | Correction of deformity of palate                |
| F29.1| Primary repair of cleft palate                   |
| F29.2| Revision of repair of cleft palate               |
| F29.3| Other specified correction of deformity of cleft palate |
| F29.4| Unspecified correction of deformity of palate    |
| F30  | Other repair of palate                           |
| F30.1| Plastic repair of palate using flap of palate    |
| F30.2| Plastic repair of palate using flap of skin      |
| F30.3| Plastic repair of palate using flap of tongue    |
| F30.4| Plastic repair of palate using graft of skin     |
| F30.5| Plastic repair of palate using flap of mucosa    |
| F30.6| Plastic repair of palate using graft of mucosa   |
| F30.7| Suture of palate                                 |
| F30.8| Other specified other repair of palate           |
| F30.9| Unspecified other repair of palate               |
| F32  | Other operations on palate                       |
| F32.1| Biopsy of lesion of palate                       |
| F32.2| Removal of foreign body from palate             |
| F32.3| Incision of palate                               |
| F32.4| Operations on uvula NEC                          |
| F32.5| Uvulopalatopharyngoplasty                        |
| F32.6| Uvulopalatoplasty                               |
| F32.8| Other specified other operations on palate       |
| F32.9| Unspecified other operations on palate           |
| F38  | Extirpation of lesion of other part of mouth     |
| F38.1| Excision of lesion of floor of mouth             |
| F38.2| Excision of lesion of mouth NEC                  |
| F38.3| Destruction of lesion of floor of mouth          |
| F38.4| Destruction of lesion of mouth NEC               |
| F38.8| Other specified extirpation of lesion of other part of mouth |
| F38.9| Unspecified extirpation of lesion of other part of mouth |
| F39  | Reconstruction of other part of mouth            |
| F39.1| Reconstruction of mouth using flap NEC           |
| F39.2| Reconstruction of mouth using graft NEC          |
| F39.8| Other specified reconstruction of other part of mouth |
| F39.9| Unspecified reconstruction of other part of mouth |
| F40  | Other repair of other part of mouth              |
| F40.1| Revision of repair of mouth NEC                  |
| F40.2| Graft of skin to mouth NEC                       |
| Code  | Description                                      |
|-------|--------------------------------------------------|
| F40.3 | Graft of mucosa to mouth NEC                    |
| F40.4 | Suture of mouth NEC                             |
| F40.5 | Removal of suture from mouth NEC                |
| F40.8 | Other specified other repair of other part of mouth |
| F40.9 | Unspecified other repair of other part of mouth |
| F42.1 | Biopsy of lesion of mouth NEC                   |
| F42.2 | Incision of mouth NEC                           |
| F42.3 | Removal of excess mucosa from mouth NEC         |
|       | **Endodontic procedures**                       |
| F12   | Surgery on apex of tooth                        |
| F12.1 | Apicectomy of tooth                             |
| F12.2 | Root canal therapy to tooth                     |
| F12.8 | Other specified surgery on apex of tooth        |
| F12.9 | Unspecified surgery on apex of tooth            |
|       | **Scaling and gingival procedures**             |
| F16.4 | Scaling of tooth                                |
| F16.4 | Scaling of tooth                                |
| F20   | Operations on gingiva                           |
| F20.1 | Excision of gingiva                             |
| F20.2 | Excision of lesion of gingiva                   |
| F20.3 | Biopsy of lesion of gingiva                     |
| F20.4 | Gingivoplasty                                   |
| F20.5 | Suture of gingiva                               |
| F20.8 | Other specified operations on gingiva           |
| F20.9 | Unspecified operations on gingiva               |
|       | **Restorative Dental Procedures**               |
| F13.1 | Full restoration of crown of tooth              |
| F13.2 | Partial restoration of crown of tooth           |
| F13.3 | Restoration of crown of tooth NEC               |
| F13.4 | Restoration of part of using inlay NEC          |
| F13.5 | Restoration of part of tooth using filling NEC  |
| F13.8 | Other specified restoration of tooth            |
| F13.9 | Unspecified restoration of tooth                |
| F17.1 | Preparation of tooth for dental crown           |
| F17.6 | Preparation of teeth for bridge                 |

**Note:** * = endoscopic GI procedures treated as interventional in sub analysis of upper and lower GI endoscopic procedures, ^ = endoscopic GI procedures treated as non-interventional
### Table S6. Case-crossover step-analysis comparing the incidence of invasive procedures (IPs) using a 4-month case period and preceding 11-month control period for 14,731 patients admitted with IE.

| Invasive Procedures (IPs) | Case Period (4m) | Control Period (11m) | Unadjusted step model<sup>a</sup> | Adjusted step-model<sup>b</sup> |
|--------------------------|------------------|----------------------|---------------------------------|---------------------------------|
|                          | Total proc<sup>a</sup> | Proc/m<sup>a</sup> | Total proc<sup>a</sup> | Proc/m<sup>a</sup> | OR      | 95% CI      | OR      | 95% CI      | p-value |
| **Cardiac Procedures**   |                  |                      |                                |                                |         |            |         |            |         |
| Coronary angiography     | 465              | 116.3                | 892                             | 81.1                           | 1.44    | 1.28 to 1.61 | 0.97    | 0.81 to 1.16 | 0.897   |
| Coronary artery bypass graft (CABG) | 15             | 3.8                  | 9                               | 0.8                            | 4.58    | 2.01 to 10.48 | 6.31    | 1.14 to 34.48 | 0.156   |
| Percutaneous coronary procedures and stents | 65            | 16.3                | 86                              | 7.8                            | 2.1     | 1.52 to 2.90  | 1.42    | 0.81 to 2.49  | 0.497   |
| Implantation of cardiac pacemakers/defibrillators | 547          | 136.8               | 588                             | 53.5                           | 2.6     | 2.32 to 2.93  | 1.29    | 1.05 to 1.58  | 0.086   |
| Percutaneous valve procedures | 9              | 2.3                 | 29                              | 2.6                            | 0.85    | 0.40 to 1.81  | 1.15    | 0.35 to 3.72  | 0.895   |
| **Dental Procedures**    |                  |                      |                                |                                |         |            |         |            |         |
| Extractions or surgical removal of teeth | 69           | 17.3                | 66                              | 6                              | 2.89    | 2.06 to 4.05  | 3.35    | 1.75 to 6.39  | 0.021   |
| Other oral surgical procedures | 14           | 3.5                 | 24                              | 2.2                            | 1.61    | 0.83 to 3.13  | 0.84    | 0.29 to 2.46  | 0.865   |
| Scaling and gingival procedures | 1             | 0.3                 | 1                              | 0.1                            | 2.75    | 0.17 to 43.90 | 1.06    | 0.01 to 126.76 | 0.981   |
| **ENT procedures**       |                  |                      |                                |                                |         |            |         |            |         |
| Tonsillectomy & Adenoidectomy | 3              | 0.8                 | 5                               | 0.5                            | 1.65    | 0.39 to 6.90  | 0.31    | 0.03 to 2.95  | 0.588   |
| Nasal packing/nasal intubation | 33             | 8.3                 | 49                              | 4.5                            | 1.93    | 1.22 to 3.04  | 1.03    | 0.48 to 2.02  | 0.979   |
| **GI Procedures**        |                  |                      |                                |                                |         |            |         |            |         |
| Upper GI endoscopic procedures (gastric, duodenum, jejunum, ileum) | 754           | 188.5                | 887                             | 80.6                           | 2.43    | 2.20 to 2.69  | 1.43    | 1.20 to 1.69  | 0.007   |
| Lower GI endoscopic procedures (including sigmoid and rectum) | 412 | 103                | 577                             | 52.5                           | 2       | 1.76 to 2.27  | 1.69    | 1.35 to 2.12  | 0.010   |

<sup>a</sup>Proc/m (procedure per million) for each IP group was calculated using the formula: 

\[ \text{Proc/m} = \frac{\text{Total proc}}{\text{Total pop at risk}} \times 1,000,000 \]

<sup>b</sup>Adjusted for duration of IP exposure in month control period, age, sex, Charlson comorbidity index, history of diabetes, hypertension, obesity, chronic kidney disease, smoking status, and Charlson co-morbidity index. 

BMJ Publishing Group Limited (BMJ) disclaims all liability and responsibility arising from any reliance on supplemental material which has been supplied by the author(s).
Notes: a, a maximum of one procedure of each type per patient was counted each month. b, period-adjusted OR of IPs in case period (6 months prior to IE admission) compared to control period (15 to 7 months prior to IE admission) calculated using a mixed effects logistic regression model with the patient as the random effect. c, OR of IPs in case period (6 months prior to IE admission) compared to control period (15 to 7 months prior to IE admission) calculated using a mixed effects logistic regression model adjusted for month and date of IE admission with the patient as the random effect. m=month, proc=procedures, OR=odds ratio, CI=confidence interval, IE=infective endocarditis, IPs=invasive procedures. P values in red = significant positive association between the IP and subsequent IE following Benjamini-Hochberg correction. P values in purple = significant negative association between IP and subsequent IE following Benjamini-Hochberg correction.

### Haematology Procedures

| Procedure                                    | Count | % | N | OR | 95% CI | P  | OR  | 95% CI | P  |
|----------------------------------------------|-------|---|---|----|--------|----|-----|--------|----|
| Blood transfusion/red cell or plasma exchange| 503   | 83.8 | 452 | 50.2 | 2.54 | 2.13 to 3.02 | 0.88 | 0.63 to 1.23 | 0.731 |
| Bone marrow puncture                         | 149   | 24.8 | 94 | 10.4 | 2.51 | 1.92 to 3.27 | 1.1 | 0.65 to 1.86 | 0.912 |

### Obstetric & gynaecological procedures

| Procedure                              | Count | % | N | OR | 95% CI | P  | OR  | 95% CI | P  |
|----------------------------------------|-------|---|---|----|--------|----|-----|--------|----|
| Abortion/dilatation & curettage        | 6     | 1 | 9 | 1  | 0.35 | 0.28 to 2.83 | 0.62 | 0.09 to 4.29 | 0.846 |
| Vaginal delivery                       | 11    | 1.8 | 25 | 2.8 | 0.66 | 0.32 to 1.34 | 0.26 | 0.08 to 0.91 | 0.805 |
| Caesarean delivery                     | 6     | 1 | 6 | 0.7 | 1.5  | 0.48 to 4.65 | 6.15 | 0.51 to 74.18 | 1.000 |

### Respiratory Procedures

| Procedure            | Count | % | N | OR | 95% CI | P  |
|----------------------|-------|---|---|----|--------|----|
| Bronchoscopic procedures | 74     | 12.3 | 49 | 5.4 | 2.29 | 1.59 to 3.29 | 0.93 | 0.46 to 1.90 | 0.932 |

### Skin Procedures

| Procedure                                      | Count | % | N | OR | 95% CI | P  |
|------------------------------------------------|-------|---|---|----|--------|----|
| Skin and wound management procedures           | 207   | 34.5 | 195 | 21.7 | 1.61 | 1.32 to 1.96 | 1.19 | 0.80 to 1.75 | 0.815 |
Figure S1. Incidence of different invasive procedures (IPs) over the 15 months before infective endocarditis (IE) hospital admission.
Figure S1. Continued.

Notes: ENT = Ear, nose and throat, GI = gastrointestinal, GU = genitourinary, IE = infective endocarditis, Obs & Gynae = Obstetrics and gynaecology, Procs = procedures. Cyan bars represent the control-period (months -4 to -15). Magenta bars represent the case-period (months -1 to -3), IE admission - day zero.
