Supplemental Figure 3:

**Figure S3:** Nuclear localization of GSK-3β and SMAD3 in WT and PAD4⁺⁻ CFs. WT and PAD4⁺⁻ CFs (P3) were cultured until reaching 90% confluence. After preparation of nuclear extracts, GSK-3β and SMAD3 were detected by Western blotting. Histon-3 was used for normalization. No differences between WT and PAD4⁺⁻ CFs were detected. Representative western blots are depicted. n = 4-6 / group.
