Supplemental Figure S2: Variability in proportion of individual lymphocyte populations between sensitive and resistant individuals

X-axis: Baseline, anti-CD3/CD28 stimulated (Stimulation), and stimulation with 1 µg/mL mycophenolate (Stimulation w/ MPA) treated lymphocytes. Y-axis: log₂ ratio between proportions of cells classified within each composite between resistant and sensitive individuals. A chi-square test was performed to determine whether the distribution of the proportion of the individual lymphocyte populations were equal between sensitive and resistant individuals. *p<0.05, **p<0.001.
