[Received on 24 July 2007]

We consider a problem of nuclear waste contamination. It takes into account the thermal effects. The temperature and the contaminant’s concentration fulfill convection-diffusion-reaction equations. The velocity and the pressure in the flow satisfy the Darcy equation, with a viscosity depending on both concentration and temperature. The equations are nonlinear and strongly coupled. Using both finite volume and nonconforming finite element methods, we introduce a scheme adapted to this problem. We prove the stability and convergence of this scheme and give some error estimates.

Keywords: porous media, miscible flow, nonconforming finite element, finite volume.

1. Introduction

A part of the high-level nuclear waste is now stored in environmentally safe locations. One has to consider the eventuality of a leakage through the engineering and geological barriers. It may cause the contamination of underground water sources far away from the original repository’s location. In the present paper, we consider such a problem of nuclear waste contamination in the basement. We take into account the thermal effects. The evolution in time of the temperature and of the contaminants concentration is then governed by convection-diffusion-reaction equations. The velocity and the pressure in the flow satisfy the Darcy equation, with a viscosity depending on both concentrations and temperature in a nonlinear way. The velocity satisfies an incompressibility constraint. We introduce a scheme adapted to this problem. We use both finite volume and nonconforming finite element methods. It ensures that a maximum principle holds and that the associated linear systems have good-conditioned matrices. We prove the stability and convergence of the scheme and give some error estimates.

Let us briefly point out some previous works. A complete model coupling concentrations and pressure equations is very seldom studied, since the system is strongly coupled. Instead, each equation is considered separately. In the general context of convection-diffusion-reaction equations, numerous schemes are available (see [15] or [19] and the references therein). Finite difference schemes are sometimes used for the convective term (in [20] for instance). But they are not adapted for the complex geometry of a reservoir. More recently, finite volume methods were developed and analysed. Let us just cite the book [2] or [13] and the references therein. Finite elements (for the diffusive term) and finite volumes (for the convective term) are coupled for instance in [3,8]. In convection dominant problems, the equations are of degenerate parabolic type. This setting is considered in [4,18]. The reaction terms are specifically studied through operator splitting methods in [14]. Now, in the specific context of porous media flow, we mention [17] who consider only the evolution of the pressure. In [11,12] a more complete set of equations is used, and a mixed finite element approximation is developed. We stress that
in all these works, as in most, the thermic effects are not taken into account.

The present paper is organized as follows. Section 2 is devoted to the derivation of the model. In section 3 we introduce the discrete tools used in this paper. It allows us to define the numerical scheme of section 4. The analysis of the scheme uses the properties of section 3. We then prove the stability and convergence of the scheme, in sections 5 and 7 respectively. We conclude with some error estimates in section 8.

2. Model of contamination

The thickness of the medium is significantly smaller than its length and width. Hence it is reasonable to average the medium properties vertically and to describe the far-field repository by a polyhedral domain $\Omega$ of $\mathbb{R}^2$ with a smooth boundary $\partial \Omega$. It is characterized by a porosity $\phi$ and a permeability tensor $K$. The time interval of interest is $[0, T]$. We denote by $p$ the pressure, by $(a_i)_{i=1}^{N_r}$ the concentrations of the $N_r$ radionuclides involved in the flow and by $\theta$ the temperature. The Darcy velocity is represented by $u$. We assume a miscible and incompressible displacement. Due to the mass and energy conservation principles, the flow is governed by the following system satisfied in $\Omega \times [0, T]$, with $i = 1, \ldots, N_r - 1$ (see [10]).

\[
\begin{align*}
\phi R_i \partial_t a_i + \text{div}(a_i u) - \text{div}(\phi D_{\theta} \nabla a_i) & = s_i - s a_i - \lambda_i R_i \phi a_i + \sum_{j=1, j \neq i}^{N_r-1} k_{ij} \lambda_j R_j \phi a_j, \\
\phi c_p \partial_t \theta + \text{div}(\theta u) - \text{div}(\phi D_{\phi} \nabla \theta) & = -s\theta - s (\theta - \theta_0), \\
\text{div} u & = s, \quad u + \frac{K}{\mu((a_j)_{j=1}^{N_r-1}, \theta)} \nabla p = f.
\end{align*}
\]

In (2.1) the retardation factors $R_i > 0$ are due to the sorption mechanism. The real $\lambda_i^{-1} > 0$ denotes the half life time of radionuclide $i$. The term $-\lambda_i R_i \phi a_i$ describes the radioactive decay of the $i$-th specy. Meanwhile, the quantity $\sum_{j \neq i} k_{ij} \lambda_j R_j \phi a_j$ is created by radioactive filiation. The molecular diffusion effects are given by the coefficient $D_{\phi} > 0$. The contamination is represented by the source term $s_i$ and $s = \sum_{i=1}^{N_r} s_i$. In (2.2) the coefficient $c_p > 0$ is the relative specific heat of the porous medium. The thermic diffusion coefficient is denoted by $D_{\phi} > 0$. The real $\theta_0 > 0$ is a reference temperature. The constitutive relation (2.3) is the Darcy law and $f$ is a density of body forces. For a large range of temperatures $\mu$ has the form

\[
\mu(a, \theta) = \mu_R(a) \exp \left( \frac{1}{\theta} - \frac{1}{\theta_0} \right)
\]

where $\mu_R$ is a nonlinear function. For instance, in the Koval model for a two-species mixture [16], we have

\[
\mu_R(a) = \mu(0) (1 + (M^{1/4} - 1)a_1)^{-4}
\]

where $M = \mu(0)/\mu(1)$ is the mobility ratio.

We notice that the equations (2.1)-(2.3) are strongly coupled. Moreover, every concentration equation (2.1) involves a different time scale. Therefore, it is difficult to build a numerical scheme that captures all the physical phenomena. We have to transform these equations. We first assume that only serial or parallel first-order reactions occur, so that $k_{ij} = y_i$ with $y_1 = 0$. Next, following [4], we assume that no two isotopes have identical decay rates and we set

\[
c_1 = a_1, \quad c_i = a_i + \sum_{j=1}^{i-1} \left( \prod_{l=j}^{i-1} \frac{y_{l+1} \lambda_j}{\lambda_i - \lambda_l} \right) a_j \quad \text{for } i = 2, \ldots, N_r.
\]
Lastly, without losing any mathematical difficulty (see remark 2.2 below), we set \( R_i = 1 \) for \( i = 1, \ldots, N_r - 1 \) and \( \phi = 1 \), \( C \neq 1 \). We also set \( s_i = s_i + \sum_{j=1}^{N_r - 1} \frac{\mu_i \lambda_j}{A_i - A_j} \) \( s_j \) and \( \kappa(c, \theta) = K/\mu \left( a_i (N_r - 1), \theta \right) \).

The contamination problem is now modelized by the following parabolic-elliptic system

\[
\begin{align*}
\partial_t c_i + \text{div}(c_i \mathbf{u}) - D_c \Delta c_i &= s_i - \lambda_i c_i, \\
\partial_t \theta + \text{div}(\theta \mathbf{u}) - D_\theta \Delta \theta &= -s_\theta - s(\theta - \theta_i), \\
\text{div} \mathbf{u} &= s, \quad \mathbf{u} \cdot \mathbf{n} = 0, \\
\end{align*}
\]

with \( i = 1, \ldots, N_r - 1 \). These equations are completed with the boundary and initial conditions

\[
\begin{align*}
\nabla c_i \cdot \mathbf{v} &= 0, \quad \nabla \theta \cdot \mathbf{v} = 0, \quad \mathbf{u} \cdot \mathbf{n} = 0, \\
c_i |_{t=0} &= c_{i0}, \quad \theta |_{t=0} = \theta_0. 
\end{align*}
\]

The pressure \( p \) is normalized by \( \int_{\Omega} p \, d\mathbf{x} = 0 \). Equations (2.5) are all similar. Thus, for the sake of simplicity, we will assume that there is only one. We set \( N_r = 2 \) and \( c = c_1, c_0 = c_{i0}, s_i = s_c, \lambda_i = \lambda_1 \).

The results of this paper readily extend to the general case.

We conclude with some notations and hypotheses. Let \( D \) be a bounded open set of \( \mathbb{R}^k \) with \( k \geq 1 \). We denote by \( \mathcal{C}^m(D) \) the set of functions that are continuous on \( D \) together with all their derivatives, and have a compact support in \( D \). For \( p \in \{ 2, \infty \} \), we use the Lebesgue spaces \( L^p(D), \| \cdot \|_{L^p(D)} \) and \( L^p(D), \| \cdot \|_{L^p(D)} \) with \( L^p = (L^p)^2 \). We also use the Sobolev spaces \( W^{m,q}(D) \) for \( p \in [1, \infty] \) and \( q \in [1, \infty] \), and \( \mathbf{L}^2(D) \). In the case \( D = \Omega \) we use the following conventions. We drop the domain dependency. We denote by \( | \cdot | \) (resp. \( \| \cdot \|_\infty \)) the norms associated to \( L^2 = L^2(\Omega) \) and \( L^2 = L^2(\Omega) \) (resp. \( L^2 = L^2(\Omega) \), \( L^\infty \)). We set \( L^2_0 = \{ v \in L^2_0; \int_{\Omega} v \, d\mathbf{x} = 0 \} \). For \( p \in [1, \infty] \) we define \( (H^p, \| \cdot \|_p) \) and \( (H^p, \| \cdot \|_p) \) with \( H^p = W^{1,p}_0 \) and \( H^p = \mathcal{C}^\infty \). Finally in all computations we use \( C > 0 \) as a generic constant. It depends only on the data of the problem.

We assume the following regularity for the data

\[
\begin{align*}
\kappa &\in W^{1,\infty}(0,1 \times (0,\infty)), \quad s_i, s_\theta, s_\theta^\pm \in L^2, \\
f &\in \mathcal{C}(0, T; L^2). 
\end{align*}
\]

We also assume that \( \kappa \geq \kappa_{inf} \) with \( \kappa_{inf} > 0 \). For the initial data, we assume that \( c_0 \in H^1, \theta_0 \in H^1 \), and that we have a.e. in \( \Omega \)

\[
0 \leq c_0(x) \leq 1, \quad \theta_- \leq \theta_0(x) \leq \theta_+. 
\]

with \( \theta_+ > 0 \). Finally we assume that we have a.e. in \( \Omega \)

\[
2 s(x) + \lambda \geq s_\theta(x) \geq 0, \quad 2 (\theta^+ - \theta^-) s(x) + s_\theta(x) \leq 0, \quad 2 (\theta^+ - \theta^-) s(x) + s_\theta(x) \geq 0. 
\]

These conditions ensure a maximum principle (proposition 6.1 below).

**Remark 2.1** We have assumed that first-order reactions occur, so that the coefficients \( k_{ij} \) in (2.4) depend only on \( i \). If \( k_{ij} \) depends on \( i \) and \( j \), one can still uncouple the equations by iterating the transformation (2.4), provided that \( k_{ij} = 0 \) for \( j = 2, \ldots, N_r - 1 \). This assumption means that the first long-lasting isotope disappears and is not created anymore. It is satisfied by many radionuclides.
For any function \( R_j \) are identical. If it is not the case, the difficulty and the approach remain the same. Indeed, let us consider the Fourier transform of \( R_j \). For a Fourier mode \( \hat{R}_j(k,t) \) we obtain
\[
\frac{d}{dt}(\phi R_j \hat{R}_j) = -\phi (\lambda_j R_j + k^2 D_c - iku) \hat{R}_j + y_i R_{j-1} \phi \hat{R}_{j-1} = -\lambda_j' R_j \phi \hat{R}_j + y_i R_{j-1} \phi \hat{R}_{j-1}
\]
with \( \lambda_j' = \lambda_j + (k^2 D_c - iku) / R_j \) for \( j = 1, \ldots, N_t - 1 \). A transform analogous to \( 2.4 \) uncouples the problem. By taking the partial differential equation counterpart, we obtain an equation similar to \( 2.5 \).

3. Discrete tools

3.1 Mesh and discrete spaces

Let \( \Omega_h \) be a triangular mesh of \( \Omega \). The circumscribed circle of a triangle \( K \in \Omega_h \) is centered at \( x_K \) and has the diameter \( h_K \). We set \( h = \max_{K \in \Omega_h} h_K \). We assume that all the interior angles of the triangles of the mesh are less than \( \pi / 2 \), so that \( x_K \in K \). The set of the edges of the triangle \( K \in \Omega_h \) is \( \partial K \). The symbol \( n_{K, \sigma} \) denotes the unit normal vector to an edge \( \sigma \in \partial K \) and pointing outward \( K \). We denote by \( \partial K \) the set of the edges of the mesh. We distinguish the subset \( \partial K_{in} \subset \partial K \) (resp. \( \partial K_{ext} \)) of the edges located inside \( \Omega \) (resp. on \( \partial \Omega \)). The middle of an edge \( \sigma \in \partial K \) is \( x_\sigma \) and its length is \( |\sigma| \). For each edge \( \sigma \in \partial K_{in} \) let \( K_\sigma \) and \( L_\sigma \) be the two triangles having \( \sigma \) in common; we set \( d_\sigma = d(x_{K_\sigma}, x_{L_\sigma}) \). For all \( \sigma \in \partial K_{ext} \) only the triangle \( K_\sigma \) located inside \( \Omega \) is defined and we set \( d_\sigma = d(x_{K_\sigma}, x_\sigma) \). Then for all \( \sigma \in \partial K \) we set \( \tau_\sigma = |\sigma| / d_\sigma \).

We assume the following on the mesh (see \[13\]): there exists \( C > 0 \) such that
\[
\forall \sigma \in \partial K, \quad d_\sigma \geq C |\sigma| \quad \text{and} \quad |\sigma| \geq Ch.
\]
It implies that there exists \( C > 0 \) such that
\[
\forall \sigma \in \partial K_{in}, \quad \tau_\sigma = |\sigma| / d_\sigma \geq C.
\]

We define on the mesh the following spaces. The usual space for finite volume schemes is
\[
P_0 = \{ q \in L^2 ; \forall K \in \Omega_h, q|_K \text{ is a constant} \}.
\]
For any function \( q_h \in P_0 \) and any \( K \in \Omega_h \) we set \( q_K = q_h|_K \). We also consider
\[
P_1^d = \{ q \in L^2 ; \forall K \in \Omega_h, q|_K \text{ is affine} \},
\]
\[
P_1^c = \{ q_h \in P_1^d ; q_h \text{ is continuous over } \Omega \},
\]
\[
P_{1nc} = \{ q_h \in P_1^d ; \forall \sigma \in \partial K_{in}, q_h \text{ is continuous at the middle of } \sigma \}.
\]
We have \( P_1^d \subset H^1 \). On the other hand \( P_{1nc} \not\subset H^1 \), but \( P_{1nc} \subset H_{d}^1 \) with
\[
H_{d}^1 = \{ q \in L^2 ; \forall K \in \Omega_h, q|_K \in H^1(K) \}.
\]
Thus we define \( \nabla_h : H_{d}^1 \rightarrow L^2 \) by setting
\[
\forall q_h \in H_{d}^1, \quad \forall K \in \Omega_h, \quad \nabla_h q_h|_K = \nabla q_h|_K
\]
and the associated norm \( ||| \cdot |||_{1,h} \) is given by
\[
\forall q_h \in H_{d}^1, \quad ||| q_h |||_{1,h} = (\| q_h \|^2 + \| \nabla_h q_h \|^2)^{1/2}.
\]
We then have the following Poincaré-like inequality for the space \( P_{1nc} \cap L_{d}^2 \) (see \[1\]).
For all 

Next, we consider the space 

for any function $q_h \in P_0$. Note that for any $p_h \in P_0$ and $q_h \in P_0$, $(p_h, q_h) \leq ||q_h||_{-1, h} ||q_h||_h$. The following Poincaré-like inequality holds for the space $P_0 \cap L^2_0$ (see \([13]\)).

**Proposition 3.2** There exists $C > 0$ such that $|q_h| \leq C ||q_h||_h$ for all $q_h \in P_0 \cap L^2_0$.

Finally we set $P_0 = (P_0)^2$, $P_1^d = (P_1^d)^2$ and use the Raviart-Thomas spaces \([7]\)

$RT_0^d = \{ v_h^d \in P_1^d ; \ \forall K \in \mathcal{T}_h, \ \forall \sigma \in \mathcal{E}_h^K, \ v_h^d|_K \cdot n_{K, \sigma} \text{ is a constant} \}$,

$RT_0 = \{ v_h \in RT_0^d ; \ \forall \sigma \in \mathcal{E}_h^{\text{int}}, \ v_h|_K \cdot n_{K, \sigma} = v_h|_{\partial K} \cdot n_{K, \sigma} \}$.

For all $v_h \in RT_0$, $K \in \mathcal{T}_h$ and $\sigma \in \mathcal{E}_h^K$, we set $(v_h|_K \cdot n_{K, \sigma}) = v_h|_K \cdot n_{K, \sigma}$.

### 3.2 Projection operators

We associate with the spaces of section 3.1 some projection operators. First, we define $\Pi_{P_1^c} : H_d^1 \to P_1^c$ by setting

\[
(\Pi_{P_1^c} p)|_K = \frac{1}{|K|} \int_K p(x) \, dx, \quad (\Pi_{P_1^c} q)|_K = q(x_K),
\]

for all $p \in L^2$, $q \in \mathcal{E}_d$ and $K \in \mathcal{T}_h$. We also set $\Pi_{P_0} = (\Pi_{P_1^c})^2$. For the space $P_1^p$, we define $\Pi_{P_1^p} : L^2 \to P_1^p$ and $\Pi_{P_1^p} : H^1 \to P_1^p$. For all $p \in L^2$ and $q \in H^1$, $\Pi_{P_1^p} p$ and $\Pi_{P_1^p} q$ satisfy

\[
\forall \psi_h \in P_1^p, \quad (\Pi_{P_1^p} p, \psi_h) = (p, \psi_h); \quad \forall \sigma \in \mathcal{E}_h, \quad \int_{\sigma} (\Pi_{P_1^p} q) \, d\sigma = \int_{\sigma} q \, d\sigma.
\]

For the space $RT_0$, we define $\Pi_{RT_0} : L^2 \to RT_0$ and $\Pi_{RT_0} : H^1 \to RT_0$. For all $v \in L^2$ and $w \in H^1$, $\Pi_{RT_0} v$ and $\Pi_{RT_0} w$ satisfy

\[
\forall w_h \in RT_0, \quad (\Pi_{RT_0} v, w_h) = (v, w_h); \quad \forall \sigma \in \mathcal{E}_h^{\text{int}}, \quad \int_{\sigma} (w - \Pi_{RT_0} w) \cdot n_{K, \sigma} \, d\sigma = 0.
\]

The operators $\Pi_{P_0}$, $\Pi_{P_1^c}$ (resp. $\Pi_{P_0}$, $\Pi_{RT_0}$) are $L^2$ (resp. $L^2$) projection operators. They are stable for the $L^2$ (resp. $L^2$) norms. The operators $\Pi_{P_0}$, $\Pi_{P_1^c}$ and $\Pi_{RT_0}$ are interpolation operators. The following estimates are classical (\([6]\) p.109 and \([7]\)).

**Proposition 3.3** There exists $C > 0$ such that for all $q \in H^1$ and $v \in H^1$,

\[
|q - \Pi_{P_0} q| \leq C h ||q||_1, \quad |v - \Pi_{RT_0} v| \leq C h ||v||_1.
\]
For all $p \in H^1$ and $q \in H^2$ we have
\[ |p - \Pi_{p} p| \leq C h \|p\|_1, \quad |\nabla_h (q - \Pi_{p} q)| \leq C h \|q\|_2. \]

For all $q \in H^2$ we have
\[ |q - \Pi_{p} q| \leq C h \|q\|_{1,h}. \]

Finally, using the Sobolev embedding theorem, one checks that
\[ |\Pi_{p} q - \Pi_{h} q| \leq C h \|q\|_{W^{1,r}} \quad \text{for all} \quad q \in W^{1,r} \quad \text{with} \quad r > 1 \quad \text{(see [22]).} \]

### 3.3 Discrete operators

Equations (2.5)–(2.7) use the differential operators gradient, divergence, and laplacian. We have to define analogous operators in the discrete setting. The discrete gradient operator $\nabla_h : P^r_{1} \rightarrow P_{0}$ is the restriction to $P^r_{1}$ of the operator $\nabla_h$ given by (3.2). The discrete divergence operator $\text{div}_h : P_{0} \rightarrow P^r_{1}$ is defined by
\[ \forall \sigma \in \mathcal{C}_h^{\text{int}}, \quad (\text{div}_h v_h)(x_\sigma) = \frac{3 |\sigma|}{|K_\sigma| + |L_\sigma|} (v_{L_\sigma} - v_{K_\sigma}) \cdot n_{K_\sigma}, \]
\[ \forall \sigma \in \mathcal{C}_h^{\text{ext}}, \quad (\text{div}_h v_h)(x_\sigma) = - \frac{3 |\sigma|}{|K_\sigma|} v_{K_\sigma} \cdot n_{K_\sigma}, \]
for all $v_h \in P_{0}$. It is adjoint to $\nabla_h$ (proposition 4.1 below). The discrete laplacian operator $\Delta_h : P_{0} \rightarrow P_{0}$ is the usual one for finite volume schemes (see [13]). For all $q_h \in P_{0}$ and $K \in \mathcal{T}_h$ we have
\[ \Delta_h q_h |_K = \frac{1}{|K|} \sum_{\sigma \in \mathcal{E}_K \cap \mathcal{E}_h^{\text{int}}} \sigma (q_{L_\sigma} - q_{K_\sigma}). \quad (3.8) \]

Let us now consider the convection terms in (2.5) and (2.6). We define $\tilde{b} : H^1 \times H^1 \rightarrow L^2$ by
\[ \tilde{b}(v, q) = \text{div}(q v) \quad (3.9) \]
for all $q \in H^2$ and $v \in H^1$. In order to define a discrete counterpart to $\tilde{b}$ we use the classical upwind scheme (see [13]). The discrete operator $b_h : RT_0 \times P_0 \rightarrow P_0$ is such that
\[ \tilde{b}_h(v_h, q_h) |_K = \frac{1}{|K|} \sum_{\sigma \in \mathcal{E}_K \cap \mathcal{E}_h^{\text{ext}}} |\sigma| (v_{h \cdot n_{K_\sigma}} q_{K}) + (v_{h \cdot n_{K_\sigma}} q_{L_\sigma} - q_{K_\sigma}) \quad (3.10) \]
for all $v_h \in RT_0$, $q_h \in P_0$ and $K \in \mathcal{T}_h$. We have set $a^+ = \max(a, 0)$ and $a^- = \min(a, 0)$ for all $a \in \mathbb{R}$. Integrating by parts the convection terms also leads to consider $b : L^2 \times L^2 \times L^\infty \rightarrow \mathbb{R}$ defined by
\[ b(v, p, q) = - \int_{\Omega} p v \cdot \nabla q \ dx \quad (3.11) \]
for all $v \in L^2$, $p \in L^2$ and $q \in L^\infty$. The discrete counterpart is $b_h : RT_0 \times P_0 \times P_0 \rightarrow \mathbb{R}$ with
\[ b_h(v_h, p_h, q_h) = \sum_{K \in \mathcal{T}_h} q_K \sum_{\sigma \in \mathcal{E}_K \cap \mathcal{E}_h^{\text{ext}}} |\sigma| (v_{h \cdot n_{K_\sigma}} q_K + (v_{h \cdot n_{K_\sigma}} q_{L_\sigma} - q_{K_\sigma}) p_{L_\sigma}) \quad (3.12) \]
for all $v_h \in RT_0$, $p_h \in P_0$ and $q_h \in P_0$. 
4. Properties of the discrete operators

The properties of the discrete operators are analogous to the ones satisfied by their continuous counterpart. The gradient and divergence operators are adjoint. For the operators \( V_h \) and \( \text{div}_h \) we state the following.

**Proposition 4.1** For all \( \mathbf{v}_h \in P_0 \) and \( q_h \in P_{1h} \) we have \( \langle \mathbf{v}_h, \nabla_h q_h \rangle = -(q_h, \text{div}_h \mathbf{v}_h) \).

Let us now consider the convection terms. Let \( q \in L^\infty(\Omega) \cap H^1, \mathbf{v} \in L^2 \) with \( \text{div} \mathbf{v} \in L^2 \) and \( \text{div} \mathbf{v}(\mathbf{x}) \geq 0 \) a.e. in \( \Omega \). We obtain \( b(\mathbf{v}, q, q) = \int_\Omega (q^2 / 2) \text{div} \mathbf{v} d\mathbf{x} \geq 0 \) by integration by parts. For \( b_h \) we state in [21] a similar result.

**Proposition 4.2** Let \( \mathbf{v}_h \in RT_0 \) with \( \text{div} \mathbf{v}_h \geq 0 \). We have \( b_h(\mathbf{v}_h, q_h, q_h) \geq 0 \) for all \( q_h \in P_0 \).

The following stability properties are used to prove the error estimates in section 8.

**Proposition 4.3** There exists \( C > 0 \) such that for all \( p_h \in P_0, q_h \in P_0 \) and \( \mathbf{v}_h \in RT_0 \) with \( \text{div} \mathbf{v}_h = 0 \)

\[
|b_h(\mathbf{v}_h, p_h, q_h)| \leq C |\mathbf{v}_h|_H \|p_h\|_H \|q_h\|_H.
\]

(4.1)

There exists \( C > 0 \) such that for all \( p_h \in P_0, q_h \in P_0 \cap L^2_0, \mathbf{v}_h \in RT_0 \)

\[
|b_h(\mathbf{v}_h, p_h, q_h)| \leq C (|\mathbf{v}_h|_H \|p_h\|_H + |\text{div} \mathbf{v}_h|_H \|p_h\|_H) \|q_h\|_H.
\]

(4.2)

**Proof.** For all \( K \in \mathcal{T}_h \) and \( \sigma \in \mathcal{E}_K \cap \mathcal{E}_h^{\text{int}} \) we write

\[
(\mathbf{v}_h \cdot \mathbf{n}_{K, \sigma}) p_K + (\mathbf{v}_h \cdot \mathbf{n}_{K, \sigma}) \tau_K = (\mathbf{v}_h \cdot \mathbf{n}_{K, \sigma}) p_K - (\mathbf{v}_h \cdot \mathbf{n}_{K, \sigma}) \sigma (p_K - q_K).
\]

Thus (3.12) reads \( b_h(\mathbf{v}_h, p_h, q_h) = S_1 + S_2 \) with

\[
S_1 = -\sum_{K \in \mathcal{T}_h} q_K \sum_{\sigma \in \mathcal{E}_h^{\text{int}}} |\sigma|(\mathbf{v}_h \cdot \mathbf{n}_{K, \sigma}) \tau_K (p_K - q_K), \\
S_2 = \sum_{K \in \mathcal{T}_h} p_K q_K \sum_{\sigma \in \mathcal{E}_h^{\text{int}}} |\sigma|(\mathbf{v}_h \cdot \mathbf{n}_{K, \sigma}) \tau_K.
\]

Using the Cauchy-Schwarz inequality we write

\[
|S_1| = \sum_{\sigma \in \mathcal{E}_h^{\text{int}}} |\sigma| |\mathbf{v}_h(\mathbf{x}_{K, \sigma}) \cdot \mathbf{n}_{K, \sigma}| (p_K - q_K) (q_K - q_K)
\]

\[
\leq h \|\mathbf{v}_h\|_\infty \left( \sum_{\sigma \in \mathcal{E}_h^{\text{int}}} (p_K - q_K)^2 \right)^{1/2} \left( \sum_{\sigma \in \mathcal{E}_h^{\text{int}}} (q_K - q_K)^2 \right)^{1/2}.
\]

Since \( \mathbf{v}_h \in RT_0 \subset (P_1)^2 \) we have \( h \|\mathbf{v}_h\|_\infty \leq C |\mathbf{v}_h|_L^2 \) (6) p. 112. Moreover (3.1) implies \( \sum_{\sigma \in \mathcal{E}_h^{\text{int}}} (p_K - q_K)^2 \leq C \sum_{\sigma \in \mathcal{E}_h^{\text{int}}} \tau_K (p_K - q_K)^2 = C \|p_h\|_H^2 \) and \( \sum_{\sigma \in \mathcal{E}_h^{\text{int}}} (q_K - q_K)^2 \leq C \|q_h\|_H^2 \). Thus

\[
|S_1| \leq C |\mathbf{v}_h|_H \|p_h\|_H \|q_h\|_H.
\]

(4.3)

We now consider \( S_2 \). We have \( (\mathbf{v}_h \cdot \mathbf{n}_{K, \sigma}) \sigma = 0 \) for all \( K \in \mathcal{T}_h \) and \( \sigma \in \mathcal{E}_K \cap \mathcal{E}_h^{\text{ext}} \). Thus we write

\[
\sum_{\sigma \in \mathcal{E}_K^{\text{ext}}} |\sigma|(\mathbf{v}_h \cdot \mathbf{n}_{K, \sigma}) \sigma = \sum_{\sigma \in \mathcal{E}_K} |\sigma|(\mathbf{v}_h \cdot \mathbf{n}_{K, \sigma}) \sigma = \int_K \text{div} \mathbf{v}_h d\mathbf{x}.
\]
It gives the following relation:

\[ S_2 = \sum_{K \subset h} p_K q_K \int_K \text{div} v_h \, dx = \int_\Omega p_h \text{div} v_h \, dx. \]

Thus if \( \text{div} v_h = 0 \) then \( S_2 = 0 \) and estimate (4.3) gives (4.1). Let us prove (4.2). Since \( q_h \in P_0 \cap L_0^2 \) we can apply proposition 3.2. Using the Cauchy-Schwarz inequality we get

\[ |S_2| \leq \|p_h\| \|\text{div} v_h\| \leq C \|p_h\| \|\text{div} v_h\|. \]

This latter estimate together with (4.3) gives (4.2).

Lastly, we claim that \( \overline{b}_h \) is a consistent approximation of \( \overline{b} \) [21].

**Proposition 4.4** Let \( r > 0 \). There exists \( C > 0 \) such that for all functions \( q \in H^2 \) and \( v \in H^{1+r} \) with \( v \cdot n|_{\partial \Omega} = 0 \)

\[ \|\Pi_h \overline{b}(v, q) - \overline{b}_h(\Pi_{R_h} v, \Pi_{R_h} q)\|_{-1, h} \leq C h \|q\| \|v\|_{1+r}. \]

Let us now consider the discrete laplacian. We have a coercivity and stability result.

**Proposition 4.5** For all \( p_h \in P_h \) and \( q_h \in P_h \), we have

\[ -\langle \Delta_h p_h, q_h \rangle = \|p_h\|^2_h, \quad |\langle \Delta_h p_h, q_h \rangle| \leq \|p_h\| \|q_h\|_h. \]

**Proof.** Definition (3.8) implies

\[ \langle \Delta_h p_h, q_h \rangle = \sum_{K \subset h} q_K \sum_{\sigma \in \partial K \cap \partial h} \tau_\sigma (p_{L\sigma} - p_{K\sigma}) = -\sum_{\sigma \in \partial h} \tau_\sigma (p_{L\sigma} - p_{K\sigma})(q_{L\sigma} - q_{K\sigma}). \] (4.4)

Setting \( q_h = p_h \) gives the first part of the result. Using the Cauchy-Schwarz inequality, we get the second one. \( \square \)

We also deduce from (4.4) the following property.

**Proposition 4.6** For all \( p_h \in P_h \) and \( q_h \in P_h \) we have \( \langle \Delta_h p_h, q_h \rangle = \langle p_h, \Delta_h q_h \rangle \).

Lastly, we state that \( \Delta_h \) is a consistent approximation of the laplacian. The proof follows the lines of the one of proposition 1.14 in [22].

**Proposition 4.7** There exists \( C > 0 \) such that for all \( q \in H^2 \) with \( \text{div} q \cdot n|_{\partial \Omega} = 0 \) we have

\[ \|\Pi_{R_h}(\Delta q) - \Delta_h(\Pi_{R_h} q)\|_{-1, h} \leq C h \|q\|_2. \]

## 5. The finite element-finite volume scheme

We now introduce the scheme for (2.5)-(2.9). The interval \([0, T]\) is split with a constant time step \( k = T / N \). We set \([0, T] = \bigcup_{m=0}^{N-1} [t_m, t_{m+1}]\) with \( t_m = m k \). The time derivatives are approximated using a first order Euler scheme. The convection terms are discretized semi-implicitly in time and the other ones in an implicit way. We set \( s_h = \Pi_{R_h} s, s_h^q = \Pi_{R_h} s_q, s_h^\theta = \Pi_{R_h} s_\theta \) and \( p_h^\theta = \Pi_{P_h} f(t_m) \) for all \( m \in \{0, \ldots, N\} \). Since \( \Pi_{R_h} \) (resp. \( \Pi_{P_h} \)) is stable for the \( L^2 \) (resp. \( L^1 \)) norm we have

\[ |s_h| \leq |s|, \quad |s_h^q| \leq |s_q|, \quad |s_h^\theta| \leq |s_\theta|, \quad |p_h^\theta| \leq |f(t_m)| \leq \|f\|_{L^1(0, T; L^1)}. \] (5.1)
The initial values are $c_h^0 = \Pi R_0 c_0$ and $\theta_h^0 = \Pi P_0 \theta_0$. Then for all $n \in \{0, \ldots, N - 1\}$, the quantities $c_h^{n+1} \in P_0$, $\theta_h^{n+1} \in P_0$, $p_h^{n+1} \in P_1^{nc} \cap L_0$, $u_h^{n+1} \in RT_0$ are the solutions of the following problem:

\[
\begin{align*}
\frac{c_h^{n+1} - c_h^n}{k} - D_e \Delta c_h^{n+1} &= s_h - (\gamma h \lambda) c_h^{n+1} - \bar{b}_h(u_h^n, c_h^n), \\
\frac{\theta_h^{n+1} - \theta_h^n}{k} - D_h \Delta \theta_h^{n+1} &= -s_h - s_h (\theta_h^{n+1} - \theta_e) - \bar{b}_h(u_h^n, \theta_h^{n+1}), \\
\text{div}_h (\kappa_h^{n+1} \nabla_h p_h^{n+1}) &= \text{div}_h p_h^{n+1} - \Pi_p s_h, \\
u_h^{n+1} &= \Pi_{RT_0} (p_h^{n+1} - \kappa_h^{n+1} \nabla_h p_h^{n+1}),
\end{align*}
\]

with $\kappa_h^{n+1} = \kappa(c_h^{n+1}, \theta_h^{n+1}) \in P_0$. This term is defined thanks to proposition 5.1 below. Note also that the boundary conditions are implicitly included in the definition of the discrete operators (section 5.3). The existence of a unique solution to (5.2) and (5.3) is classical (see [13]). Since $\kappa_h^{n+1} \geq \kappa_{\min} > 0$ and $p_h^{n+1} \in L_0$ equation (5.4) also has a unique solution (see [3]). We have a discrete equivalent for the divergence condition (5.4).

**Proposition 5.1** For all $m \in \{1, \ldots, N\}$ we have $\text{div} u_h^m = s_h$.

**Proof.** Let $m \in \{1, \ldots, N\}$ and $n = m - 1$. We compare the solution of (5.4)–(5.5) with the solution of the following mixed hybrid problem. Let $\delta_0 = \{\mu_h : \cup_{\sigma \in \delta_0} \rightarrow \mathbb{R}; \forall \sigma \in \delta_0, \mu_h|\sigma| \text{ is constant}\}$. Then $\tilde{u}_h^m \in RT_0^d$, $p_h^m \in P_0$ and $\lambda_h^m \in \delta_0$ are the solutions of (see [7])

\[
\forall v_h \in RT_0^d, \quad (\tilde{u}_h^m, v_h) + \sum_{K \in \mathcal{T}_h} \kappa^m_K \sum_{\sigma \in \delta_K} |\sigma'| \lambda^m_{\sigma'}(v_h|k \cdot n_{K, \sigma'}) - \sum_{K \in \mathcal{T}_h} |K| \kappa^m_K \sigma^m_K \text{div}_h v_h|k = (f_h^m, v_h),
\]

\[
\forall \mu_h \in \delta_0, \quad \sum_{K \in \mathcal{T}_h} \mu_h(\tilde{u}_h^m \cdot n) d\sigma = 0, \quad \forall K \in \mathcal{T}_h, \quad \int_K \text{div}_h \tilde{u}_h^m dx = \int_K s dx,
\]

and $\tilde{p}_h^m \in P_1^{nc}$ is defined by $\int_{\sigma} \tilde{p}_h^m d\sigma = \lambda_h^m$ for all $\sigma \in \delta_0$. Let $\sigma \in \delta_0$. We define $\phi_{\sigma} \in P_1^{nc}$ by setting $\phi_{\sigma}(x_{\sigma}) = 1$ and $\phi_{\sigma}(x_{\sigma'}) = 0$ for all $\sigma' \in \delta_0 \setminus \{\sigma\}$. We set $v_h = \nabla_h \phi_{\sigma} \in P_0 \subset RT_0^d$ in (5.6). We have

\[
\sum_{K \in \mathcal{T}_h} \kappa^m_K \sum_{\sigma \in \delta_K} |\sigma'| \lambda^m_{\sigma'} \nabla_h \phi_{\sigma}|k \cdot n_{K, \sigma'} = \sum_{K \in \mathcal{T}_h} \kappa^m_K \nabla_h \phi_{\sigma}|k \cdot \sum_{\sigma \in \delta_K} |\sigma'| \lambda^m_{\sigma'} n_{K, \sigma'}
\]

and according to the gradient formula

\[
\sum_{\sigma \in \delta_K} |\sigma'| \lambda^m_{\sigma'} n_{K, \sigma'} = \sum_{\sigma \in \delta_K} \int_{\sigma} \tilde{p}_h^m n_{K, \sigma'} d\sigma = \int_K \nabla_h \tilde{p}_h^m dx.
\]

Thus we get from (5.6)

\[
(\tilde{u}_h^m, \nabla_h \phi_{\sigma}) + (\kappa^m_K \nabla_h \tilde{p}_h^m, \nabla_h \phi_{\sigma}) = (f_h^m, \nabla_h \phi_{\sigma}).
\]  

The first term in (5.8) is treated as follows. Integrating by parts we get

\[
(\tilde{u}_h^m, \nabla_h \phi_{\sigma}) = -\phi_{\sigma}(\text{div} \tilde{u}_h^m) + \sum_{K \in \mathcal{T}_h} \sum_{\sigma \in \delta_K} \int_{\sigma} \phi_{\sigma}(\tilde{u}_h^m|k \cdot n_{K, \sigma'}) d\sigma'.
\]

Since (5.7) implies that $\tilde{u}_h^m \in RT_0$, we have

\[
\sum_{K \in \mathcal{T}_h} \sum_{\sigma \in \delta_K} \int_{\sigma} \phi_{\sigma}(\tilde{u}_h^m|n_{K, \sigma'}) d\sigma' = \sum_{\sigma \in \delta_K} |\sigma| \phi_{\sigma}(x_{\sigma})(\tilde{u}_h^m|L_{\sigma} \cdot n_{K, \sigma'} - \tilde{u}_h^m|K_{\sigma} \cdot n_{K, \sigma'} = 0.
\]
Thus \((\tilde{u}_h^m, \nabla_h \phi_\sigma) = - (\phi_\sigma, \text{div} \tilde{u}_h^m)\). Then, using (5.2), we get
\[(\tilde{u}_h^m, \nabla_h \phi_\sigma) = - (\phi_\sigma, s_h) = - (\phi_\sigma, \tilde{\Pi}_c s_h).\]

Furthermore, according to proposition 4.1, we have \((\kappa_h^m \nabla_h \tilde{P}_h^m, \nabla_h \phi_\sigma) = - (\phi_\sigma, \text{div} \tilde{u}_h^m)\) and \((f_h^m, \nabla_h \phi_\sigma) = - (\phi_\sigma, \text{div} f_h^m)\). Hence we deduce from (5.8) that
\[\forall \phi_\sigma \in P^nc_1, \quad (\phi_\sigma, \text{div} (\kappa_h^m \nabla_h \tilde{P}_h^m) - \text{div} f_h^m + \tilde{\Pi}_c s_h^m) = 0.\]

Since \((\phi_\sigma)_{\sigma \in \mathcal{E}_h}\) is a basis of \(P^nc_1\), we get \(\text{div}_h (\kappa_h^m \nabla_h \tilde{P}_h^m) = \text{div}_h f_h^m - \tilde{\Pi}_c s_h^m\). Thus, by (5.4), there exists a real \(C\) such that \(\tilde{P}_h^m = P_h^m + C\). We now compare \(\tilde{u}_h^m\) with \(u_h^m\). Since for all \(v_h \in \mathcal{RT}_0\) we have
\[
\sum_{K \in \mathcal{T}_h} \kappa_K^m \sum_{\sigma' \in \mathcal{E}_K} |\sigma'| \lambda^m_{\sigma'}(v_h | K \cdot n_K, \sigma) = \sum_{\sigma \in \mathcal{E}_h} |\sigma| \phi_\sigma (x_\sigma) (\tilde{u}_h^m | \kappa_{\sigma} \cdot n_K, \sigma - \tilde{u}_h^m | \kappa_{\sigma} \cdot n_K, \sigma) = 0,
\]

it follows from (5.6) that \((\tilde{u}_h^m, v) = (f_h^m - \kappa_h^m \nabla_h \tilde{P}_h^m, v)\) for any \(v \in \mathcal{RT}_0\). It means that
\[
\tilde{u}_h^m = \tilde{\Pi}_{\mathcal{RT}_0} (f_h^m - \kappa_h^m \nabla_h \tilde{P}_h^m) = \tilde{\Pi}_{\mathcal{RT}_0} (f_h^m - \kappa_h^m \nabla_h \tilde{P}_h^m) = u_h^m.
\]
Thus \(u_h^m = u_h^m\) satisfies (5.7) and \(\text{div} u_h^m = s_h\).

6. Stability analysis
We first check that a maximum principle holds. It ensures that the computed concentration and temperature are physically relevant.

**Proposition 6.1** For any \(m \in \{0, \ldots, N\}\) we have \(0 \leq c_h^m \leq 1\) and \(\theta^p_0 \leq \theta_h^m \leq \theta_\infty\).

**Proof.** We prove the result by induction. Since \(c_0^h = \Pi_{B_0} c_0\) and \(\theta_0^p = \Pi_{B_0} \theta_0\) the result holds for \(m = 0\) thanks to (2.11) and (3.4). Let us assume that it is true for \(m = n \in \{0, \ldots, N-1\}\). Let \(K \in \mathcal{T}_h\). Equation (5.2) implies
\[
(1 + k s_K + k \lambda) c_{K}^{n+1} = c_K^n + k s_K + k D_e \sum_{\sigma \in \mathcal{E}_K} \tau_{\sigma} (c_{L_{\sigma}}^{n+1} - c_{K}^{n+1}) - k b_h (u_h^n, c_K^{n+1}) |K|.
\]

We consider the last term of this relation. Since for any \(\sigma \in \mathcal{E}_K \cap \mathcal{E}_h\) we have
\[
(\mathbf{u}_h^n \cdot n_{K, \sigma}) c_{K}^{n+1} + (\mathbf{u}_h^n \cdot n_{K, \sigma}) (c_{L_{\sigma}}^{n+1}) = (\mathbf{u}_h^n \cdot n_{K, \sigma}) c_{K}^{n+1} + (- \mathbf{u}_h^n \cdot n_{K, \sigma}) (c_{K}^{n+1} - c_{L_{\sigma}}^{n+1}) + (\mathbf{u}_h^n \cdot n_{K, \sigma}) (c_{L_{\sigma}}^{n+1}).
\]

We deduce from (3.10)
\[
-b_h (u_h^n, c_{K}^{n+1}) |K| = \frac{1}{|K|} \left( c_K^n \sum_{\sigma \in \mathcal{E}_K \cap \mathcal{E}_h} |\sigma| (\mathbf{u}_h^n \cdot n_{K, \sigma}) \sigma c_{K}^{n+1} + \sum_{\sigma \in \mathcal{E}_K \cap \mathcal{E}_h} (- \mathbf{u}_h^n \cdot n_{K, \sigma}) \tau_{\sigma} (c_{L_{\sigma}}^{n+1} - c_{K}^{n+1}) \right).
\]

Since \((u_h^n, n_{K, \sigma}) = 0\) for any \(\sigma \in \mathcal{E}_K \cap \mathcal{E}_h\). It implies that \(\sum_{\sigma \in \mathcal{E}_K \cap \mathcal{E}_h} |\sigma| (\mathbf{u}_h^n \cdot n_{K, \sigma}) \sigma = \sum_{\sigma \in \mathcal{E}_K} |\sigma| (\mathbf{u}_h^n \cdot n_{K, \sigma}) \sigma\). Thus using the divergence formula and proposition 5.1 we obtain
\[
\frac{1}{|K|} \sum_{\sigma \in \mathcal{E}_K \cap \mathcal{E}_h} |\sigma| (\mathbf{u}_h^n \cdot n_{K, \sigma}) \sigma = \frac{1}{|K|} \int_K \text{div} u_h^n \, dx = s_K.
\]
Therefore we get
\[
(1 + 2ks + k\lambda) c_h^{n+1} = c_h^n + 2ks + kDc \sum_{\sigma \in \delta K \cap \partial \Omega} \tau_\sigma (c_{L_\sigma}^{n+1} - c_h^n) + \frac{1}{|K|} \sum_{\sigma \in \delta K \cap \partial \Omega} (\mathbf{n} \cdot \mathbf{n}_{K,\sigma})^+ (c_{L_\sigma}^{n+1} - c_h^n). \tag{6.1}
\]

We consider $K_i \in \mathcal{B}_h$ such that $c_{K_i}^{n+1} = \min_{K \in \mathcal{B}_h} c_{K_i}^{n+1}$. According to hypothesis (2.11) and definition (3.4) we have $2s_{K_i} + \lambda > 0$ and $s_{K_i} > 0$. Thus, using the induction hypothesis, we deduce from (6.1)
\[
\min_{K \in \mathcal{B}_h} c_{K}^{n+1} = c_{K_i}^{n+1} > \frac{c_{K_i}^n + ks_{K_i}^n}{1 + 2ks + k\lambda} \geq \frac{k s_{K_i}^n}{1 + 2ks + k\lambda} \geq 0.
\]

We now consider $K_i \in \mathcal{B}_h$ such that $c_{K_i}^{n+1} = \max_{K \in \mathcal{B}_h} c_{K_i}^{n+1}$. Using again hypothesis (2.11) we have $2s_{K_i} + \lambda > s_{K_i} > 0$. Thus, using the induction hypothesis, we deduce from (6.1)
\[
\max_{K \in \mathcal{B}_h} c_{K}^{n+1} = c_{K_i}^{n+1} \leq \frac{c_{K_i}^n + ks_{K_i}^n}{1 + 2ks + k\lambda} \leq \frac{1 + ks_{K_i}^n}{1 + 2ks + k\lambda} \leq 1.
\]

A similar work for equation (5.5) proves that $\theta_+ \leq \min_{K \in \mathcal{B}_h} \theta_K^{n+1}$ and $\max_{K \in \mathcal{B}_h} \theta_K^{n+1} \leq \theta_+$. Thus the induction hypothesis still holds for $m = n + 1$.

We now state the stability of the scheme (5.2)-(5.5).

**PROPOSITION 6.2** For any $1 \leq m \leq N$ we have
\[
k \sum_{n=1}^m \| \eta^n_h \|_h^2 + k \sum_{n=1}^m \| \rho^n_h \|_h^2 \leq C, \tag{6.2}
\]
\[
| \mathbf{u}_h^n | + \| \nabla \rho_h^n \| \leq C. \tag{6.3}
\]

**PROOF.** Let $0 \leq n \leq N - 1$. Multiplying (5.2) by $2k c_h^{n+1}$ we get
\[
(c_h^{n+1} - c_h^n, 2c_h^{n+1}) - 2kDc (\Delta_h c_h^{n+1}, c_h^{n+1}) + k (c_h^{n+1} - c_h^n) + k (s_h + \lambda) (c_h^{n+1}, c_h^{n+1}) + k b_h (\mathbf{n} \cdot \mathbf{n}_{K,\sigma})^+ (c_{L_\sigma}^{n+1} - c_h^{n+1}) = k (s_h, c_h^{n+1}).
\]

We have
\[
(c_h^{n+1} - c_h^n, 2c_h^{n+1}) = |c_h^{n+1}|^2 - |c_h^n|^2 + |c_h^{n+1} - c_h^n|^2. \text{ Thanks to propositions 4.3 and 4.5}
\]
\[
-2k (\Delta_h c_h^{n+1}, c_h^{n+1}) = 2k |c_h^{n+1}|_h^2, \quad b_h (\mathbf{n} \cdot \mathbf{n}_{K,\sigma})^+ (c_{L_\sigma}^{n+1} - c_h^{n+1}) = k (s_h, c_h^{n+1}).
\]

Using the Cauchy-Schwarz and Young inequalities we write
\[
k (s_h, c_h^{n+1}) \leq k |s_h|^n |c_h^{n+1}| \leq Ck |c_h^{n+1}| \leq k \frac{\lambda}{2} |c_h^{n+1}|^2 + Ck.
\]

Finally thanks to (2.11) and (3.4) we have $s_h > 0$. Thus we obtain
\[
|c_h^{n+1}|^2 - |c_h^n|^2 + 2kDc |c_h^{n+1}|_h^2 \leq Ck.
\]
Let \( m \in \{1, \ldots, N\} \). Summing up the latter relation from \( n = 0 \) to \( m - 1 \) we get
\[
|c_h^m|^2 + 2kDT\sum_{n=1}^{m} ||e_h^n||^2 \leq |c_h^0|^2 + C \sum_{n=1}^{m} k \leq C,
\]
thanks to proposition 6.1. With a similar work on equation (5.3), we get (6.2). We now prove (6.3). Let \( n = m - 1 \in \{0, \ldots, N - 1\} \). Multiplying equation (5.1) by \(-p_h^{n+1}\) and using proposition 4.1, we get
\[
(\kappa_h^{n+1} \nabla h p_h^{n+1}, \nabla h p_h^{n+1}) = (f_h^{n+1}, \nabla h p_h^{n+1}) + (\Pi_p^{hc} s_h, p_h^{n+1}). \tag{6.4}
\]
The left-hand side term satisfies \((\kappa_h^{n+1} \nabla h p_h^{n+1}, \nabla h p_h^{n+1}) \geq \kappa_{inf} |\nabla h p_h^{n+1}|^2\). We now consider the right-hand side. Using (5.1), the Cauchy-Schwarz and Young inequalities we write
\[
|\langle f_h^{n+1}, \nabla h p_h^{n+1} \rangle| \leq |f_h^{n+1}| |\nabla h p_h^{n+1}| \leq \frac{\kappa_{inf}}{4} |\nabla h p_h^{n+1}|^2 + C \|f\|_{L^2(0,T;L^2)}^2.
\]
Also, the stability of \(\Pi_p^{hc}\) for the \(L^2\)-norm, proposition 3.1 and the Young inequality lead to
\[
|\langle \Pi_p^{hc} s_h, p_h^{n+1} \rangle| \leq |s_h| |p_h^{n+1}| \leq C |p_h^{n+1}| \leq C |\nabla h p_h^{n+1}| \leq \frac{\kappa_{inf}}{4} |\nabla h p_h^{n+1}|^2 + C.
\]
Thus we deduce from (6.4) that \(|\nabla h p_h^{n+1}|^2 = |\nabla h p_h^{n+1}|^2 \leq C\). Then (5.3) imply
\[
|u_h^{n+1}| = |u_h^n| \leq |f_h^{n+1}| + |\nabla h p_h^{n+1}| \leq \|f\|_{L^2(0,T;L^2)} + \|\kappa\|_{W^{1-\gamma,\infty}(0,1) \times (0,\infty)} |\nabla h p_h^{n+1}| \leq C.
\]
Estimate (6.3) is proven. \(\blacksquare\)

7. Convergence analysis

Let \( \varepsilon = \max(h,k) \). In this section we study the behavior of the scheme (5.2)-(5.5) as \( \varepsilon \to 0 \). We first define the applications \( c_\varepsilon : \mathbb{R} \to P_0, \tilde{c}_\varepsilon : \mathbb{R} \to P_0, \theta_\varepsilon : \mathbb{R} \to P_0, \theta_\varepsilon : \mathbb{R} \to P_0, p_\varepsilon : \mathbb{R} \to P_0, s_\varepsilon : \mathbb{R} \to P_0, s_\varepsilon : \mathbb{R} \to P_0 \) and \( u_\varepsilon : \mathbb{R} \to RT_0, f_\varepsilon : \mathbb{R} \to P_0 \) by setting for all \( n \in \{0,\ldots,N-1\} \) and \( t \in [t_n,t_{n+1}] \)
\[
c_\varepsilon(t) = c_h^{n+1}, \quad \tilde{c}_\varepsilon(t) = c_h^{n+1} + \frac{1}{\varepsilon} (a - t_n) (c_h^{n+1} - c_\varepsilon), \quad \theta_\varepsilon(t) = \theta_h^{n+1},
\]
\[
p_\varepsilon(t) = p_h^{n+1}, \quad s_\varepsilon(t) = s_h, \quad s_\varepsilon(t) = s_h, \quad u_\varepsilon(t) = u_h^n, \quad f_\varepsilon(t) = f_h^{n+1},
\]
and for all \( t \notin (0,T) \)
\[
c_\varepsilon(t) = \tilde{c}_\varepsilon(t) = \theta_\varepsilon(t) = p_\varepsilon(t) = s_\varepsilon(t) = s_\varepsilon(t) = 0, \quad u_\varepsilon(t) = f_\varepsilon(t) = 0.
\]
We recall that the Fourier transform \( \hat{f} \) of a function \( f \in L^1(\mathbb{R}) \) is defined for any \( \tau \in \mathbb{R} \) by
\[
\hat{f}(\tau) = \int_\mathbb{R} e^{-2\pi i \tau f(t)} dt. \tag{7.1}
\]
We begin with the following estimate.

**Proposition 7.1.** Let \( 0 < \gamma < \frac{1}{4} \). There exists \( C > 0 \) such that for all \( \varepsilon > 0 \)
\[
\int_\mathbb{R} |\tau|^{2\gamma} (|\hat{c}_\varepsilon(\tau)|^2 + |\hat{\theta}_\varepsilon(\tau)|^2) d\tau \leq C.
\]
Proposition 4.5 allows us to write
\[ \Delta_h g_e = D_e \Delta_h c_e + s'_e - (s_e + \lambda) c_e - \tilde{b}_h(u_e, c_e). \]
Multiplying this equation by \(-g_e\) we obtain
\[ - (\Delta_h g_e, g_e) = - D_e (\Delta_h c_e, g_e) - (s'_e - (s_e + \lambda) c_e, g_e) + b_h(u_e, c_e, g_e). \tag{7.2} \]
Proposition 4.5 allows us to write
\[ - (\Delta_h g_e, g_e) = \|g_e\|_h^2, \]
so
\[ - (\Delta_h c_e, g_e) \leq \|c_e\|_h \|g_e\|_h. \]
Thanks to the Cauchy-Schwarz inequality, proposition 5.1 and proposition 3.2 we have
\[ \big| (s'_e - (s_e + \lambda) c_e, g_e) \big| \leq C (|s_e| + |s| + \lambda) \|g_e\|_h \leq C \|g_e\|_h. \]
According to proposition 5.3 then proposition 6.1 and 6.3, we have
\[ |b_h(u_e, c_e, g_e)| \leq C \|c_e\|_\infty \|g_e\|_h |\text{div } u_e| + C \|c_e\|_h \|g_e\|_h |u_e| \leq C \|g_e\|_h |\text{div } u_e| + C \|c_e\|_h \|g_e\|_h. \]
Let us plug these estimates into (7.2) and integrate from 0 to T. We get
\[ \int_0^T \|g_e\|_h dt \leq C \int_0^T |\text{div } u_e| dt + C \int_0^T |c_e|_h dt \leq C, \]
because of proposition 5.1 and 6.2. Definition 7.1 then leads to
\[ \forall \tau \in \mathbb{R}, \quad \|\tilde{g}_e(\tau)\|_h \leq C. \tag{7.3} \]
We now use this estimate to prove (7.1). Equation 5.2 reads
\[ \frac{d}{dt} \tilde{c}_e = \Delta_h g_e + (c^0_h \delta_0 - c^N_h \delta_T) \]
where \(\delta_0\) and \(\delta_T\) are Dirac distributions respectively localized in 0 and T. Let \(\tau \in \mathbb{R}\). Applying the Fourier transform to the latter equation we obtain
\[ -2i \pi \tau \tilde{c}_e(\tau) = \Delta_h \tilde{g}_e(\tau) + (c^0_h - c^N_h e^{-2i \pi T}). \]
Let us take the scalar product of this relation with \(i \text{sign}(\tau) \tilde{c}_e(\tau)\). Applying propositions 3.2 and 4.5 leads to
\[ 2\pi |\tau| |\tilde{c}_e(\tau)|^2 \leq C (|\tilde{g}_e(\tau)|_h + |c^0_h| + |c^N_h|) \|\tilde{c}_e(\tau)\|_h. \]
We assume that \(\tau \neq 0\) and multiply this estimate by \(|\tau|^{2\gamma-1}\). Using proposition 6.1 and 7.3 we get
\[ |\tau|^{2\gamma} \|\tilde{c}_e(\tau)\|^2 \leq C |\tau|^{2\gamma-1} \|\tilde{c}_e(\tau)\|_h. \]
Using the Young inequality and integrating over \(\{\tau \in \mathbb{R}; |\tau| > 1\}\), we obtain
\[ \int_{|\tau|>1} |\tau|^{2\gamma} \|\tilde{c}_e(\tau)\|^2 d\tau \leq \int_{|\tau|>1} |\tau|^{4\gamma-2} d\tau + C \int_{|\tau|>1} \|\tilde{c}_e(\tau)\|^2 d\tau. \]
Using the Fourier transform, we prove that this convergence is strong. Let

\[ \int_{|\tau| \leq 1} |\tau|^{2g} |\hat{e}_e(\tau)|^2 d\tau \leq C \int_{|\tau| \leq 1} |\hat{e}_e(\tau)|^2 d\tau. \]

By combining the bounds for $|\tau| > 1$ and $|\tau| \leq 1$ we get

\[ \int_{|\tau| > 1} |\tau|^{2g} |\hat{e}_e(\tau)|^2 d\tau \leq \int_{|\tau| > 1} |\tau|^{4g-2} d\tau + C \int \|\hat{e}_e(\tau)\|_{L^2_h}^2 d\tau. \]

Since $4g - 2 < -1$, we have $\int_{|\tau| > 1} |\tau|^{4g-2} d\tau \leq C$. Thanks to the Parseval theorem and (6.2)

\[ \int_{|\tau| > 1} |\tau|^{4g-2} d\tau \leq C. \]

because $\|\epsilon_n\|_{L^2_h} = \|\Pi_{t_0} \epsilon_0\|_{L^2_h} \leq C \|\epsilon_0\|_{L^1}$. We have

\[ \int_{|\tau| > 1} |\tau|^{4g-2} d\tau \leq C. \]

We can now prove the following convergence result.

**Proposition 7.2** There exists a subsequence of $(c_e, \theta_e, p_e, u_e)_{\epsilon > 0}$, not relabeled for convenience, such that the following convergences hold for $\epsilon \to 0$

\[ c_e \to c \quad \text{in } L^2(0, T; L^2), \quad \theta_e \to \theta \quad \text{in } L^2(0, T; L^2), \quad p_e \to p \quad \text{weakly in } L^2(0, T; H^1), \quad u_e \to u \quad \text{weakly in } L^2(0, T; L^2). \]

The limits $(c, \theta, p, u)$ satisfy the following properties. We have $c \in L^2(0, T; H^1)$, $\theta \in L^2(0, T; H^1)$, $p \in L^\infty(0, T; H^1)$ and $u \in L^\infty(0, T; L^2)$. We also have $0 \leq c(x, t) \leq 1$ and $\theta^- \leq \theta(x, t) \leq \theta^+ \quad \text{a.e. in } \Omega \times (0, T)$. For all $\phi \in \mathcal{C}_0^\infty(\Omega \times (-1, T))$, and $c, \theta$ satisfy

\[ \int_0^T \left( c(\theta, \phi) + D_c(\nabla c, \nabla \phi) - c(u \cdot \nabla \phi) - (s_e - (s + \lambda) c) \phi \right) dt = (c_0, \phi(\cdot, 0)), \]

\[ \int_0^T \left( (\theta, \partial_t \phi) + D_\theta(\nabla \theta, \nabla \phi) - \theta(u \cdot \nabla \phi) + (s_\theta + s(\theta - \theta_e)) \phi \right) dt = (\theta_0, \phi(\cdot, 0)). \]

Lastly we have

\[ u = f - \kappa(c, \theta) \nabla p \quad \text{in } L^\infty(0, T; L^2), \quad \text{div } u = s \quad \text{in } L^2. \]

**Proof.** In what follows, the convergence results hold for extracted subsequences. They are not relabeled for convenience. We begin by proving (7.4). According to Proposition 6.1, the sequence $(c_e)_{\epsilon > 0}$ is uniformly bounded in $L^\infty(0, T; L^2)$. Thus there exists $c \in L^\infty(0, T; L^2)$ such that

\[ c_e \to c \quad \text{weakly in } L^2(0, T; L^2). \]

Using the Fourier transform, we prove that this convergence is strong. Let $d_e = c_e - c$ and $M > 0$. We use the following splitting

\[ \int_R |\hat{d}_e(\tau)|^2 d\tau = \int_{|\tau| > M} |\hat{d}_e(\tau)|^2 d\tau + \int_{|\tau| \leq M} |\hat{d}_e(\tau)|^2 d\tau = I_e^M + J_e^M. \]
Since $|\hat{d}_e(\tau)|^2 \leq 2|\hat{c}_e(\tau)|^2 + 2|\hat{c}(\tau)|^2$ we have

$$P^M_e \leq 2 \int_{|\tau|>M} |\hat{c}_e(\tau)|^2 d\tau + 2 \int_{|\tau|>M} |\hat{c}(\tau)|^2 d\tau.$$  

Using proposition 7.1 we write

$$\int_{|\tau|>M} |\hat{c}_e(\tau)|^2 d\tau \leq \frac{1}{M^{2\gamma}} \int_{|\tau|>M} |\tau|^2 |\hat{c}_e(\tau)|^2 d\tau \leq \frac{C}{M^{2\gamma}}.$$  

Hence

$$P^M_e \leq \frac{2C}{M^{2\gamma}} + 2 \int_{|\tau|>M} |\hat{c}(\tau)|^2 d\tau.$$  

This implies that for all $e > 0$, $P^M_e \to 0$ when $M \to \infty$. We now consider $J^M_i$. Let $\tau \in [-M,M]$. Since $c_e(t) \in \mathbb{P}_0$ for all $t \in \mathbb{R}$, and $c_e \to c$ weakly in $L^2(0,T;L^2)$, we deduce from (7.1) that $\hat{c}_e(\tau) \in \mathbb{P}_0$ and $\hat{c}_e(\tau) \to \hat{c}(\tau)$ weakly in $L^2$. Extending $\hat{c}_e(\tau)$ by 0 outside $\Omega$, one checks (13) p.811) that

$$\forall \eta \in \mathbb{R}^2, \quad |\hat{c}_e(\tau) \cdot \eta - \hat{c}(\tau)| \leq C|\hat{c}_e(\tau)||\eta|(|\eta| + \epsilon).$$  

Then, using estimate (6.2), we deduce from (13) (p.834) that $\hat{c}_e(\tau) \to \hat{c}(\tau)$ strongly in $L^2$. Thus $d_e(\tau) = \hat{c}_e(\tau) - \hat{c}(\tau) \to 0$ in $L^2$, so that $J^M_i \to 0$ when $e \to 0$. Now, let us report the limits for $P^M_i$ and $J^M_i$ into (7.9). Using the Parseval identity we get

$$\int_{\mathbb{R}} |\hat{d}_e(\tau)|^2 d\tau = \int_{\mathbb{R}} |d_e|^2 dt = \int_{\mathbb{R}} |c_e - c|^2 dt \to 0.$$  

Thus we have proven that $c_e \to c$ in $L^2(0,T;L^2)$. A similar work proves that $\theta_e \to \theta$ in $L^2(0,T;L^2)$ with $\theta \in L^\infty(0,T;L^2)$. Hence (7.4) is proven. Moreover using proposition 6.1 we obtain $0 \leq c(x,t) \leq 1$ and $\theta^- \leq \theta(x,t) \leq \theta^+$ a.e. in $\Omega \times [0,T]$. Lastly, using (6.2) and (7.9), we get as in (13) (p.811) that $c \in L^2(0,T;H^1)$ and $\theta \in L^2(0,T;H^1)$.

Let us now consider the sequences $(p_e)_{e \geq 0}$ and $(u_e)_{e \geq 0}$. According to (5.3) and (6.3) the sequence $(\Pi_T p_e)_{e \geq 0}$ is bounded in $L^\infty(0,T;H^1)$. It implies that there exists $p \in L^\infty(0,T;H^1)$ such that $\Pi_T p_e \to p$ weakly in $L^2(0,T;H^1)$. Using proposition 5.3 we get $p \to p$ weakly in $L^2(0,T;H^1)$. Moreover, according to (6.2), the sequence $(u_e)_{e \geq 0}$ is bounded in $L^\infty(0,T;L^2)$. Thus we have $u_e \to u$ weakly in $L^2(0,T;L^2)$ with $u \in L^\infty(0,T;L^2)$. We check the properties of $u$. Using a Taylor expansion, the Cauchy-Schwarz inequality, and a density argument, we have

$$\|\kappa(c,\theta) - \kappa(c_e,\theta_e)\|_{L^2(0,T;L^2)} \leq \|\kappa\|_{W^{1,\infty}(0,1)\times(0,\infty)} \left(\|c - c_e\|_{L^2(0,T;L^2)} + \|\theta - \theta_e\|_{L^2(0,T;L^2)}\right).$$  

Thus, using the strong convergence of the sequences $(c_e)_{e \geq 0}$ and $(\theta_e)_{e \geq 0}$, we have $\kappa(c_e,\theta_e) \to \kappa(c,\theta)$ in $L^2(0,T;L^2)$. Since $\nabla h p_e \to \nabla p$ weakly in $L^2(0,T;L^2)$, we deduce from this

$$\kappa(c_e,\theta_e) \nabla h p_e \to \kappa(c,\theta) \nabla p \quad \text{weakly in} \quad L^2(0,T;L^2).$$  

Now let $v \in L^2(0,T;(|\kappa|_0^\infty)^2)$. According to (5.5) we have

$$(u_e, \Pi_{RTV} v) = (f_e - \kappa(c_e,\theta_e) \nabla h p_e, v).$$  

Using proposition 5.3 one checks easily that $(f_e, \Pi_{RTV} v) \to (f, v)$ and $(u_e, \Pi_{RTV} v) \to (u, v)$ in $L^1(0,T)$. Using moreover convergence (7.10) and a density argument, we deduce from this that $u = f - \kappa(c,\theta) \nabla p$. And since $\text{div} u_e = s_e$ by proposition 5.1 we also have $\text{div} u = s$. 

Study of a finite volume-finite element scheme for a nuclear transport model
We finally prove that $c$ satisfies (7.6). For all $t \in (0, T)$ equation (5.2) reads
\[
\frac{d}{dt} \varepsilon - D_c \Delta_h \varepsilon + b_h(u_e, \varepsilon) = s'_{\varepsilon} - (s_{\varepsilon} + \lambda) \varepsilon.
\]

Let $\psi \in \mathcal{V}_h^0(\Omega \times (-1, T))$ and $\psi_h = \tilde{\Pi}_h \psi$. Multiplying the latter equation by $\psi_h$ and integrating over $[0, T]$, we obtain
\[
\int_0^T \left( \frac{d}{dt} \varepsilon, \psi_h \right) dt - D_c \int_0^T (\Delta_h \varepsilon, \psi_h) dt + \int_0^T b_h(u_e, \varepsilon, \psi_h) dt = \int_0^T (s'_{\varepsilon} - (s_{\varepsilon} + \lambda) \varepsilon, \psi_h) dt. \tag{7.11}
\]

We now pass to the limit $\varepsilon \to 0$ in this equation. We begin with the term $\int_0^T b_h(u_e, \varepsilon, \psi_h) dt$. We use the splitting $b(u, c, \psi) - b_h(u_e, \varepsilon, \psi_h) = A_1^\varepsilon + A_2^\varepsilon + A_3^\varepsilon$ with
\[
A_1^\varepsilon = b(u, c, \psi) - b(u_e, c, \psi), \quad A_2^\varepsilon = b(u_e, c, \psi) - \int_\Omega \text{div}(c u_e) \psi_h \, dx,
\]
A_3^\varepsilon = \int_\Omega \text{div}(c u_e) \psi_h \, dx - b_h(u_e, c, \psi_h).

According to definition (3.11)
\[
A_1^\varepsilon = b(u, c, \psi) - b(u_e, c, \psi) = -\int_\Omega c(u - u_e) \cdot \nabla \psi \, dx.
\]

We know that $c \nabla \psi \in L^2(0, T; \mathbb{L}^2)$. Since $u_e \to u$ in $L^2(0, T; \mathbb{L}^2)$ we get $\int_0^T A_1^\varepsilon \, dt \to 0$. We now consider $A_2^\varepsilon$. We have
\[
A_2^\varepsilon = \int_\Omega (\psi - \psi_h) \text{div}(c u_e) \, dx = \int_\Omega (\psi - \psi_h)(u_e \cdot \nabla c + c \text{div} u_e) \, dx.
\]

Using the Cauchy-Schwarz inequality we get
\[
\int_0^T \left| A_2^\varepsilon \right| \, dt \leq \left\| \psi - \psi_h \right\|_{L^2(\Omega \times (0, T))} \left\| u_e \right\|_{L^2(0, T; \mathbb{L}^2)} + \left\| \text{div} u_e \right\|_{L^2(0, T; \mathbb{L}^2)} \left\| c \right\|_{L^2(0, T; H^1)}.
\]

Using a Taylor expansion, one checks that $\left\| \psi - \psi_h \right\|_{L^2(\Omega \times (0, T))} \leq h \left\| \nabla \psi \right\|_{L^2(\Omega \times (0, T))}$. Thus $\int_0^T A_2^\varepsilon \, dt \to 0$. Finally we estimate $A_3^\varepsilon$. For all triangles $K \in \mathcal{T}_h$ and $L \in \mathcal{R}_h$ sharing an edge $\sigma$, we set $c_{k,L} = c_K$ if $u_e \cdot n_{K,\sigma} \geq 0$ and $c_{K,L} = c_L$ otherwise. Using the divergence formula, we deduce from definition (3.12)
\[
A_3^\varepsilon = \sum_{K \in \mathcal{T}_h} \sum_{\sigma \subset \partial K \cap \partial L} \psi_K \int_{\sigma} (c - c_{K,L})(u_e \cdot n_{K,\sigma}) \, d\sigma
\]
\[
= \sum_{\sigma \subset \partial L} \left( \psi_{K,\sigma} - \psi_{L,\sigma} \right) \int_{\sigma} (c - c_{K,L})(u_e \cdot n_{K,\sigma}) \, d\sigma.
\]

Using definition (3.5) this reads
\[
A_3^\varepsilon = \sum_{\sigma \subset \partial L} \left( \psi_{K,\sigma} - \psi_{L,\sigma} \right) \left( \int_{\sigma} (c_{K,L})(x_{\sigma}) - c_{K,L,\sigma} \right)(u_e \cdot n_{K,\sigma,\sigma}) \, d\sigma.
\]
Using a Taylor expansion, one checks that \( |\psi_{K\sigma} - \psi_{c\sigma}| \leq h \| \nabla \psi \|_{L^\infty(\Omega \times (0,T))} \). Moreover \( |\sigma| \leq h \). Thus, using the Cauchy-Schwarz inequality, we have

\[
|A^\varepsilon_3| \leq C h^2 \sum_{\sigma \in \mathcal{G}_h^{\text{int}}} |\mathbf{u}_c(x_\sigma)| \left| (\Pi_{P^c_1} c)(x_\sigma) - c_{K\sigma,L\sigma} \right|
\]

\[
\leq C h^2 \left( \sum_{\sigma \in \mathcal{G}_h^{\text{int}}} |\mathbf{u}_c(x_\sigma)|^2 \right)^{1/2} \left( \sum_{\sigma \in \mathcal{G}_h^{\text{int}}} \left| (\Pi_{P^c_1} c)(x_\sigma) - c_{K\sigma,L\sigma} \right|^2 \right)^{1/2}.
\]

Using the assumption on the mesh, one checks that \( |K| \geq C h^2 \) for all \( K \in \mathcal{G}_h \). Thus, thanks to a quadrature formula, we have

\[
|A^\varepsilon_3| \leq C \left( \sum_{K \in \mathcal{G}_h} \sum_{\sigma \in \partial K \cap \mathcal{G}_h^{\text{int}}} |\mathbf{u}_c(x_\sigma)|^2 \right)^{1/2} \left( \sum_{K \in \mathcal{G}_h} \sum_{\sigma \in \partial K \cap \mathcal{G}_h^{\text{int}}} \left| (\Pi_{P^c_1} c)(x_\sigma) - c_{K\sigma,L\sigma} \right|^2 \right)^{1/2}.
\]

We write \( \Pi_{P^c_1} c - c = (\Pi_{P^c_1} c - c) + (c - c) \) and we use proposition 5.3. We obtain with (5.3)

\[
\int_0^T |A^\varepsilon_3| dt \leq C \| \mathbf{u}_c \|_{L^2(0,T;L^2)} \left( \| c - c \|_{L^2(0,T;H^1)} + \| c - c \|_{L^2(0,T;L^2)} \right).
\]

Since \( c_e \to c \) in \( L^2(0,T;L^2) \) when \( \varepsilon = \max(h,k) \to 0 \), we conclude that \( \int_0^T A^\varepsilon_3 dt \to 0 \). Gathering the limits for \( A^\varepsilon_1, A^\varepsilon_2, A^\varepsilon_3 \), we obtain

\[
\int_0^T b_h(u, c, \Pi_{P_h} \psi) dt \to \int_0^T b(u, c, \psi) dt.
\]

We now consider the other terms in (7.11). Proposition 4.6 leads to

\[
(\Delta_h c_e, \Pi_{P_h} \psi) = (\mathbf{c}_e - \Delta_h(\Pi_{P_h} \psi)) = (c_e, \Delta_h(\Pi_{P_h} \psi) - \Delta \psi) + (c_e, \Delta \psi).
\]

According to proposition 4.7

\[
\left( c_e, \Delta_h(\Pi_{P_h} \psi) - \Delta \psi \right) \leq \| c_e \|_h \| \Delta_h(\Pi_{P_h} \psi) - \Delta \psi \|_{-1,h} \leq C h \| c_e \|_h \| \psi \|_2.
\]

We then apply the Cauchy-Schwarz inequality and use (5.2). We obtain

\[
\int_0^T \left( c_e, \Delta_h(\Pi_{P_h} \psi) - \Delta \psi \right) dt \leq C h \left( \int_0^T \| c_e \|_h^2 dt \right)^{1/2} \leq C h \left( \int_0^T \| c_e \|_h^2 dt \right)^{1/2} \leq C h.
\]

Moreover, since \( c_e \to c \) in \( L^2(0,T;L^2) \), we have \( \int_0^T (c_e, \Delta \psi) dt \to \int_0^T (c, \Delta \psi) dt \). Thus we deduce from (7.12)

\[
\int_0^T (\Delta_h c_e, \Pi_{P_h} \psi) dt \to \int_0^T (c, \Delta \psi) dt.
\]

We are left with two terms. First, using Taylor expansions, one checks that

\[
\psi_h \to \psi, \quad \partial_t \psi_h \to \partial_t \psi \quad \text{in} \quad L^2(\Omega \times (-1,T)), \quad \psi_h(\cdot,0) \to \psi(\cdot,0) \quad \text{in} \quad L^2.
\]

(7.13)
We know that $c_\varepsilon \to c$ in $L^2(0,T;L^2)$. Thus
\[ \int_0^T (s_\varepsilon - (s + \lambda) c_\varepsilon, \psi_h) \, dt \to \int_0^T (s_c - (s + \lambda) c, \psi) \, dt. \]

Finally, integrating by parts the first term of (7.11), we get
\[ \int_0^T \left( \frac{d}{dt} \tilde{c}_\varepsilon, \psi_h \right) \, dt = (\tilde{c}_\varepsilon, \psi_h)_{t=T} - (\tilde{c}_\varepsilon, \psi_h)_{t=0} - \int_0^T (\tilde{c}_\varepsilon, \partial_t \psi_h) \, dt. \]

Since $\psi \in C_0^\infty(\Omega \times (-1, T))$, we have $(\tilde{c}_\varepsilon, \psi_h)_{t=T} = 0$. Using proposition 3.3 one checks that $c_h^0 = \Pi_0 c_0 \to c_0$ in $L^2$; using moreover (7.13) we get
\[ (\tilde{c}_\varepsilon, \psi_h)_{t=0} = (c_h^0, \psi_h(\cdot, 0)) = (\Pi_0 c_0, \psi_h(\cdot, 0)) \to (c_0, \psi(\cdot, 0)). \]

For the last term, one easily checks that $\|\tilde{c}_\varepsilon - c_\varepsilon\|_{L^2(0,T;L^2)} \to 0$. Thus, since $c_\varepsilon \to c$ in $L^2(0,T;L^2)$, we also have $\tilde{c}_\varepsilon \to c$ in $L^2(0,T;L^2)$. Using moreover (7.13) we get
\[ \int_0^T (\tilde{c}_\varepsilon, \partial_t \psi_h) \, dt \to \int_0^T (c, \partial_t \psi) \, dt. \]

Therefore
\[ \int_0^T \left( \frac{d}{dt} \tilde{c}_\varepsilon, \psi_h \right) \, dt \to - (c_0, \psi(\cdot, 0)) - \int_0^T (c, \partial_t \psi) \, dt. \]

By gathering the limits we have obtained in (7.11) we get (7.6). The relation (7.7) for $\theta$ is proven in a similar way. \hfill \blacksquare

8. Error estimates
We have proven in section 7 that the problem (2.5)–(2.9) has a weak solution $(c, \theta, p, u)$. From now on, we assume the following regularity for this solution:
\[ c, \theta \in C(0,T;H^2), \quad c_t, \theta_t \in L^2(0,T;H^{1+r}) \cap C(0,T;L^2), \]
\[ c_{tt}, \theta_{tt} \in L^2(0,T;L^2), \quad p \in C(0,T;H^2), \quad u \in C(0,T;H^{1+r}), \]
with $r > 0$ and $s > 0$. We also assume that $f \in C(0,T;H^1)$.

8.1 Definitions
For all $m \in \{0, \ldots, N\}$, we define the following errors
\[ e^m_{h,c} = c(t_m) - c_h^m, \quad e^m_{h,\theta} = \theta(t_m) - \theta_h^m, \]
\[ e^m_{h,p} = p(t_m) - p_h^m, \quad e^m_{h,u} = u(t_m) - u_h^m. \]

We have the following splittings
\[ e^m_{h,c} = e^m_{h,c} + e^m_{h,c}, \quad e^m_{h,\theta} = e^m_{h,\theta} + e^m_{h,\theta}, \]
\[ e^m_{h,p} = e^m_{h,p} + e^m_{h,p}, \quad e^m_{h,u} = e^m_{h,u} + e^m_{h,u} \]
with the discrete errors
\[ e^m_{h,c} = \Pi_h c(t_m) - c_h^m, \quad e^m_{h,\theta} = \Pi_h \theta(t_m) - \theta_h^m, \]
\[ e^m_{h,p} = \Pi_h p(t_m) - p_h^m, \quad e^m_{h,u} = \Pi_h u(t_m) - u_h^m. \]
and the interpolation errors
\[
\eta_{h,\mathbf{c}} = c(t_m) - \Pi_h c(t_m), \quad \eta_{h,\theta} = \theta(t_m) - \Pi_h \theta(t_m), \\
\eta_{h,p} = p(t_m) - \Pi_h^{P_r} p(t_m), \quad \eta_{h,u} = u(t_m) - \Pi_h^{RT} u(t_m).
\]

The interpolation errors are estimated as follows. We write \( \eta_{h,c} \leq |c(t_m) - \Pi_h c(t_m)| + |\Pi_h c(t_m) - \Pi_h c(t_m)| \) and the same for \( \eta_{h,\theta} \). Using proposition \((5.3)\) and \((5.7)\) we obtain
\[
|\eta_{h,c}| \leq C h \|c(t_m)\|_1 \leq C h \|c\|_{L^\infty(0,T;H^1)}, \quad |\eta_{h,\theta}| \leq C h \|\theta\|_{L^\infty(0,T;H^1)}.
\] (8.1)

According to proposition \((5.3)\) we also have
\[
|\eta_{h,p}| + |\nabla_h \eta_{h,p}| \leq C h \|p(t_m)\|_2 \leq C h \|p\|_{L^2(0,T;H^2)}, \\
|\eta_{h,u}| \leq C h \|u(t_m)\|_1 \leq C h \|u\|_{L^2(0,T;H^1)}.
\] (8.2) (8.3)

We now have to estimate the discrete errors.

**PROPOSITION 8.1** For all \( n \in \{0, \ldots, N - 1\} \) and \( \psi_h \in P_1^{mc} \) we have
\[
\frac{c_{h,c}^{n+1} - c_{h,c}^n}{k} - D_h \Delta c_{h,c}^{n+1} + \tilde{b}_h c_{h,c}^{n+1} \geq \tilde{b}_h \left( c_{h,c}^{n+1} + \lambda \right) c_{h,c}^{n+1} - C_{h,1}^{n+1} + C_{h,2}^{n+1},
\] (8.4)
\[
\frac{c_{h,\theta}^{n+1} - c_{h,\theta}^n}{k} - D_h \Delta c_{h,\theta}^{n+1} + \tilde{b}_h c_{h,\theta}^{n+1} + \tilde{b}_h \left( \frac{c_{h,\theta}^{n+1}}{k} \right) + s_h \frac{c_{h,\theta}^{n+1}}{k} = \Theta_{h,1}^{n+1} + \Theta_{h,2}^{n+1},
\] (8.5)
\[
(\kappa c_{h,c}^{n+1} + \Theta_{h,1}^{n+1}) \nabla c_{h,c}^{n+1} \cdot \nabla \psi_h = -((\kappa_{h,1} c_{h,c}^{n+1} + \kappa_{h,2} c_{h,\theta}^{n+1}) \nabla p(t_m), \nabla \psi_h) - (P_{h,c}^{n+1}, \nabla \psi_h),
\] (8.6)
\[
e_{h,c}^{n+1} - \Pi_h^{RT} \left( (\kappa_{h,1} c_{h,c}^{n+1} + \kappa_{h,2} c_{h,\theta}^{n+1}) \nabla p(t_m) + \kappa (c_{h,c}^{n+1} + \Theta_{h,1}^{n+1}) \nabla e_{h,c}^{n+1} \right) - U_{h,c}^{n+1}.
\] (8.7)

For all \( m \in \{0, \ldots, N\} \), the consistency errors \( c_{h,c}^m, c_{h,\theta}^m, \Theta_{h,1}^m, \Theta_{h,2}^m, P_{h}^m \) and \( U_{h}^m \) are defined in \((8.9), (8.10), (8.14), (8.15)\) and the terms \( \kappa_{h,1}^m \) and \( \kappa_{h,2}^m \) are given by \((8.13)\) below.

**PROOF.** Let \( n \in \{0, \ldots, N - 1\} \). Equation \((2.5)\) for \( t = t_{n+1} \) reads
\[
\partial_t c(t_{n+1}) - D_h \Delta c(t_{n+1}) + \tilde{b}(u(t_{n+1}), c(t_{n+1})) = s_c - (s + \lambda) c(t_{n+1}).
\]

We introduce the time discretization by setting
\[
R_{n+1} = \left( \frac{c(t_{n+1}) - c(t_n)}{k} - c(t_{n+1}) + \tilde{b}(u(t_n), c(t_{n+1})) \right) = s_c - (s + \lambda) c(t_{n+1}).
\]

We get
\[
\frac{c(t_{n+1}) - c(t_n)}{k} - D_h \Delta c(t_{n+1}) + \tilde{b}(u(t_n), c(t_{n+1})) = s_c - (s + \lambda) c(t_{n+1}) + R_{n+1}.
\]

We apply \( \Pi_h \) to this equation. By subtracting the result from \((5.2)\) we get
\[
\Pi_h \left( \frac{c(t_{n+1}) - c(t_n)}{k} - \frac{c_{h,c}^{n+1} - c_{h,c}^n}{k} - D_h (\Pi_h \Delta c(t_{n+1}) - \Delta h c_{h,c}^{n+1}) \right)
+ \Pi_h \tilde{b}(u(t_n), c(t_{n+1})) - \tilde{b}_h (u_{h,c}^{n+1} + \Pi_h ((s + \lambda) c(t_{n+1}) - (s + \lambda) c_{h,c}^{n+1} - \Pi_h R_{n+1}^{n+1}).
\] (8.8)
We now introduce the discrete errors as follows. Since \( c(t_{n+1}) - c(t_n) = \int_{t_n}^{t_{n+1}} c(t) \, ds \) one checks that
\[
\Pi_0 \left( \frac{c(t_{n+1}) - c(t_n)}{k} \right) - \frac{c_{n+1}^m - c_n^m}{k} = \frac{1}{k} \int_{t_n}^{t_{n+1}} (\Pi_0 c(t) - \Pi_0 c(t)) \, ds + \frac{1}{k} (e_{n+1}^m - e_n^m).
\]
We also have
\[
\Pi_0 \Delta c(t_{n+1}) - \Delta t c_{n+1} = \Pi_0 \Delta c(t_{n+1}) - \Delta t (\Pi_0 c(t_{n+1})) + \Delta t e_{n+1}^m.
\]
Using the linearity of \( \Pi_0 \), one easily checks that
\[
\Pi_0 b(t_n, c(t_{n+1})) - \Pi_0 b(t_n, c_{n+1}) = \Pi_0 b(t_n, e_{n+1}^m) + \Pi_0 (\Pi_0 c(t_{n+1}))
\]
Lastly
\[
\Pi_0 ((s + \lambda) c(t_{n+1})) - (s + \lambda) c_{n+1} = \Pi_0 ((s + \lambda) e_{n+1}^m) + (s + \lambda) e_{n+1}^m.
\]
Using these relations in (8.8) we get (8.4). For any \( m \in \{1, \ldots, N\} \), the consistency errors \( C_{h,1}^m \in P_0 \) and \( C_{h,2}^m \in P_0 \) are given by
\[
\begin{align*}
C_{h,1}^m &= \Pi_0 \left( \frac{c(t_m) - c(t_{m-1})}{k} - c(t_m) + b(t_{m-1}) - u(t_m), c(t_m) \right)
+ \Pi_0 ((s + \lambda) e_{h,c}^m) - \frac{1}{k} \int_{t_{m-1}}^{t_m} (\Pi_0 c(t) - \Pi_0 c(t)) \, ds,
\end{align*}
\]
\[
\begin{align*}
C_{h,2}^m &= \Delta c(t_m) - \Delta \left( \Pi_0 \Delta c(t_m) \right) - \left( \Pi_0 b(t_{m-1}) - b_h (\Pi_0 u(t_{m-1}), \Pi_0 c(t_m)) \right). \\
\end{align*}
\]
A similar proof leads to (8.5) where the consistency errors \( \Theta_{h,1}^m \in P_0 \) and \( \Theta_{h,2}^m \in P_0 \) are defined for any \( m \in \{1, \ldots, N\} \) by
\[
\begin{align*}
\Theta_{h,1}^m &= \Pi_0 \left( \frac{\theta(t_m) - \theta(t_{m-1})}{k} - \theta(t_m) + b(t_{m-1}) - u(t_m), \theta(t_m) \right)
+ \Pi_0 (s \eta_{h,\theta}) - \frac{1}{k} \int_{t_{m-1}}^{t_m} (\Pi_0 \theta(s) - \Pi_0 \theta(s)) \, ds,
\end{align*}
\]
\[
\begin{align*}
\Theta_{h,2}^m &= \Delta \theta(t_m) - \Delta \left( \Pi_0 \Delta \theta(t_m) \right) - \left( \Pi_0 b(t_{m-1}) - b_h (\Pi_0 u(t_{m-1}), \Pi_0 \theta(t_m)) \right). \\
\end{align*}
\]
We now consider the problem associated with the pressure. Let \( n \in \{0, \ldots, N-1\} \) and \( \psi_h \in P_1^{nc} \). Multiplying equation (7.7) written for \( t = t_{n+1} \) by \( \psi_h \) and integrating by parts, we get
\[
(\kappa(c(t_{n+1}), \theta(t_{n+1})) \nabla p(t_{n+1}), \nabla \psi_h) = (f(t_{n+1}), \nabla \psi_h) + (s, \psi_h).
\]
On the other hand, using (5.2) and proposition 4.1, we have
\[
(\kappa(c_{h}^{n+1}, \theta_{h}^{n+1}) \nabla_h p_{h}^{n+1}, \nabla_h \psi_h) = (f_{h}^{n+1}, \nabla_h \psi_h) + (\Pi_{1}^{nc} s_h, \psi_h).
\]
Since \( \nabla_h \psi_h \in P_0 \), one checks that \( (f_{h}^{n+1}, \nabla_h \psi_h) = (\Pi_{0} f(t_{n+1}), \nabla_h \psi_h) = (f(t_{n+1}), \nabla_h \psi_h) \). According to (3.5) we also have \( (\Pi_{1}^{nc} s_h, \psi_h) = (s_h, \psi_h) \). Thus
\[
(\kappa(c_{h}^{n+1}, \theta_{h}^{n+1}) \nabla_h p_{h}^{n+1}, \nabla_h \psi_h) = (f(t_{n+1}), \nabla_h \psi_h) - (s_h, \psi_h).
\]
Substracting (8.11) from the latter relation, we obtain
\[
\kappa(c(t_{n+1}), \theta(t_{n+1})) \nabla p(t_{n+1}) - \kappa(c_{h,n+1}^n, \theta_{h,n+1}^n) \nabla_h p_{h,n+1}^n, \nabla_h \psi_h) = -(s - s_b, \psi_h). \tag{8.12}
\]

We split the left-hand side as
\[
\kappa(c_{h,n+1}^n, \theta_{h,n+1}^n)(\nabla p(t_{n+1}) - \nabla_h p_{h,n+1}^n) + (\kappa(c(t_{n+1}), \theta(t_{n+1})) - \kappa(c_{h,n+1}^n, \theta_{h,n+1}^n)) \nabla p(t_{n+1}).
\]

Using a Taylor expansion, one can check that
\[
\kappa(c(t_{n+1}), \theta(t_{n+1})) - \kappa(c_{h,n+1}^n, \theta_{h,n+1}^n) = (c_{h,n+1}^n + \eta_{h,c}^{n+1}) \kappa_{h,1}^{n+1} + (\theta_{h,t}^{n+1} + \eta_{h,t}^{n+1}) \kappa_{h,2}^{n+1}.
\]

We have set for any \(m \in \{0, \ldots, N\}\) and \(s \in [0,1]\)
\[
c_h^m(s) = c_h^m + (c(t_m) - c_h^m)s, \quad \theta_h^m(s) = \theta_h^m + (\theta(t_m) - \theta_h^m)s,
\]
\[
\kappa_{h,1}^m = \int_0^1 \kappa_c(c_h^m(s), \theta_h^m(s)) ds, \quad \kappa_{h,2}^m = \int_0^1 \kappa_h(\theta_h^m(s), \theta_h^m(s)) ds. \tag{8.13}
\]

We also have
\[
\nabla p(t_{n+1}) - \nabla_h p_{h,n+1}^n = \nabla_h \epsilon_{h,n+1}^n + \nabla_h \eta_{h,n+1}^n.
\]

Plugging these relations into (8.12) we get (8.6). For all \(m \in \{0, \ldots, N\}\) we have
\[
P_h^m = (\kappa_{h,1}^m, \eta_{h,c}^m, \eta_{h,2}^m) \nabla p(t_m) + \kappa(c_{h,n+1}^n, \theta_{h,n+1}^n) \nabla_h \eta_{h,n+1}^m. \tag{8.14}
\]

We end with the equation associated with \(u\). Let \(n \in \{0, \ldots, N - 1\}\). Applying the operator \(\Pi_{RT_0}\) to (8.7) for \(t = t_{n+1}\) we obtain
\[
\Pi_{RT_0} u(t_{n+1}) = \Pi_{RT_0} f(t_{n+1}) - \Pi_{RT_0} (\kappa(c(t_{n+1}), \theta(t_{n+1})) \nabla p(t_{n+1})).
\]

Let us substract this equation from (5.5). Since \(P_{h,n+1} = \Pi_{P_0} f(t_{n+1})\) we get
\[
\Pi_{RT_0} u(t_{n+1}) - u_{h,n+1} = \Pi_{RT_0} (f(t_{n+1}) - \Pi_{P_0} f(t_{n+1}))) - \Pi_{RT_0} (\kappa(c(t_{n+1}), \theta(t_{n+1})) \nabla p(t_{n+1}) - \kappa_{h,n+1} \nabla_h p_{h,n+1}^n).
\]

One easily checks that
\[
\Pi_{RT_0} u(t_{n+1}) - u_{h,n+1} = \Pi_{RT_0} (u(t_{n+1}) - \Pi_{RT_0} u(t_{n+1})) + \epsilon_{h,u}^n.
\]

Thus we get (8.7). For all \(m \in \{0, \ldots, N\}\), we have
\[
U_h^m = \Pi_{RT_0} (f(t_m) - \Pi_{P_0} f(t_m)) - \eta_{h,u}^m - P_h^m. \tag{8.15}
\]

This ends the proof of proposition 8.1.
8.2 Error estimates

We first estimate the consistency errors.

**Proposition 8.2** For all \( m \in \{1, \ldots, N \} \) the consistency errors satisfy

\[
\begin{align*}
&k \sum_{n=1}^{m} |C_{h,1}^n|^2 + k \sum_{n=1}^{m} |\Theta_{h,1}^n|^2 \leq C (h^2 + k^2), \\
&k \sum_{n=1}^{m} ||C_{h,2}^n||^2_{-1,h} + k \sum_{n=1}^{m} ||\Theta_{h,2}^n||^2_{-1,h} \leq C h^2, \\
|P_{h,m}^n| + |U_{h,m}^n| \leq C h.
\end{align*}
\]

**Proof.** Let \( n \in \{1, \ldots, N \} \). Since the operator \( \Pi_{P_0} \) is stable for the \( L^2 \)-norm we have

\[
|\Pi_{P_0}\mathcal{R}^n| \leq |\mathcal{R}^n| \leq \left| \frac{c(t_n) - c(t_{n-1})}{k} - c(t_n) \right| + \left| \tilde{b}(u(t_{n-1}) - u(t_n), c(t_n)) \right|. 
\]

Using a Taylor expansion and the Cauchy-Schwarz inequality, we get

\[
\left| \frac{c(t_n) - c(t_{n-1})}{k} - c(t_n) \right| \leq \frac{1}{k} \int_{t_{n-1}}^{t_n} |c_r(s)| ds \leq \sqrt{k} \left( \int_{t_{n-1}}^{t_n} |c_r(s)|^2 ds \right)^{1/2}. 
\]

On the other hand, since \( \nabla c(t_n) \cdot \partial \Omega = 0 \), we deduce from (3.10) by integrating by parts

\[
\tilde{b}(u(t_{n-1}) - u(t_n), c(t_n)) = (u(t_{n-1}) - u(t_n)) \cdot \nabla c(t_n).
\]

Using a Taylor expansion and the Cauchy-Schwarz inequality, we get

\[
|(u(t_{n-1}) - u(t_n)) \cdot \nabla c(t_n)| \leq \sqrt{k} \|c\|_{L^\infty(0,T;H^1)} \left( \int_{t_{n-1}}^{t_n} |u(s)|^2 ds \right)^{1/2}. 
\]

Thus

\[
|\Pi_{P_0}\mathcal{R}^n| \leq \sqrt{k} \left( \int_{t_{n-1}}^{t_n} |c_r(s)|^2 ds \right)^{1/2} + \sqrt{k} \|c\|_{L^\infty(0,T;H^1)} \left( \int_{t_{n-1}}^{t_n} |u(s)|^2 ds \right)^{1/2}. 
\]

Thanks to the stability of \( \Pi_{P_0} \) for the \( L^2 \)-norm and to (8.1) we have

\[
|\Pi_{P_0}((s+\lambda) \eta_{h,0}^n)| \leq C h \|s\|_{L^\infty(0,T;L^2)} + \lambda \|c\|_{L^\infty(0,T;H^1)}. 
\]

The Cauchy-Schwarz inequality and (5.7) allow us to write

\[
\int_{t_{n-1}}^{t_n} |\Pi_{P_0}c_r(s) - \Pi_{P_0}c_t(s)| ds \leq C h \sqrt{k} \left( \int_{t_{n-1}}^{t_n} |c_r(s)|_{1+}^2 ds \right)^{1/2}. 
\]

By plugging these estimates into definition (8.9) we get

\[
\begin{align*}
&k |C_{h,1}^n|^2 \leq k^2 \|c\|_{L^\infty(0,T;H^1)}^2 \int_{t_{n-1}}^{t_n} |u(s)|^2 ds + k^2 \int_{t_{n-1}}^{t_n} |c_r(s)|^2 ds \\
&\quad + C h^2 \int_{t_{n-1}}^{t_n} |c_t(s)|^2_{1+} ds + C k h^2 \|c\|_{L^\infty(0,T;H^1)}^2. 
\end{align*}
\]
Summing up the latter relation for \( n = 1 \) to \( m \in \{1, \ldots, N\} \) and using a similar work on \( \Theta_{h,1}^m \) we get (8.16). Now let \( n \in \{1, \ldots, N\} \). Using propositions [4.7] and [4.4] we have

\[
\| \Pi_{h,n} \Delta c(t_n) - \Delta_h (\Pi_{h,n} c(t_n)) \|_{-1,n} \leq C h \| c \|_{L^2(0,T;H^2)}
\]

and

\[
\| \Pi_{h,n} b(u(t_{n-1}), c(t_n)) - b_h (\Pi_{RT,n} u(t_{n-1}), \Pi_{h,n} c(t_n)) \|_{-1,n} \leq C h \| c \|_{L^2(0,T;H^1)} \| u \|_{L^2(0,T;H^1)}.
\]

Plugging these estimates into definition (8.9) and summing up from \( n = 1 \) to \( m \), we obtain

\[
k \sum_{n=1}^m \| C_{h,2}^n \|_{-1} \leq C h^2 \left( \| c \|^2_{L^2(0,T;H^1)} + \| u \|^2_{L^2(0,T;H^1)} \right).
\]

A similar work on \( \Theta_{h,2}^m \) then leads to (8.17). We finally prove (8.18). Let \( m \in \{1, \ldots, N\} \). On the one hand, we have by (8.14)

\[
\| P_{h,n} \| \leq \left( \| \kappa_{h,1}^m \|_{\infty} | \eta_{h,1}^m | + \| \kappa_{h,2}^m \|_{\infty} | \eta_{h,2}^m | \right) | \nabla p(t_m) | + \| \kappa(c_h^m, \Theta_h^m) \|_{\infty} | \nabla \eta_{h,p}^m |.
\]

Using estimates (8.1)–(8.3) we get

\[
\| P_{h,n} \| \leq C h \| \kappa \|_{W^{1,(0,1)\times(0,\infty)}} \| c \|_{L^2(0,T;H^1)} + \| \theta \|_{L^2(0,T;H^1)} + \| p \|_{L^2(0,T;H^2)}.
\]

On the other hand definition (8.15) leads to

\[
\| U_{h,n} \| \leq | \Pi_{RT,n} (f(t_m) - \Pi_{h,0} f(t_m)) | + | \eta_{h,1}^m | + | P_{h,n} |.
\]

Using the stability of \( \Pi_{RT,n} \) for the \( L^2 \)-norm and proposition [3.3] we have

\[
| \Pi_{RT,n} (f(t_m) - \Pi_{h,0} f(t_m)) | \leq C h \| f \|_{L^2(0,T;H^1)}.
\]

Using moreover (8.3) we obtain

\[
\| U_{h,n} \| \leq C h \| \kappa \|_{W^{1,(0,1)\times(0,\infty)}} \| c \|_{L^2(0,T;H^1)} + \| \theta \|_{L^2(0,T;H^1)}
\]

\[
+ C ( \| p \|_{L^2(0,T;H^2)} + \| f \|_{L^2(0,T;H^1)} + \| u \|_{L^2(0,T;H^1)} ).
\]

We have proven (8.18).

Using the former proposition we are now able to estimate the discrete errors.

**PROPOSITION 8.3** There exists some real \( k_0 > 0 \) such that for any \( k < k_0 \) and \( m \in \{1, \ldots, N\} \)

\[
| e_{h,c}^m |^2 + | e_{h,\theta}^m |^2 + k \sum_{n=1}^m \left( | e_{h,c}^m |^2 + | e_{h,\theta}^m |^2 \right) \leq C (h^2 + k^2),
\]

(8.19)

\[
| \nabla_h e_{h,\theta}^m | + | e_{h,\theta}^m | \leq C (h + k).
\]

(8.20)

**PROOF.** Multiplying (8.4) by \( 2k e_{h,c}^{m+1} \), we obtain

\[
\left( \frac{e_{h,c}^{m+1} - e_{h,c}^m}{k}, 2k e_{h,c}^{m+1} \right) - 2 D_c k (\Delta_h e_{h,c}^{m+1}, e_{h,c}^m) + 2 k b_h (u_h, e_{h,c}^{m+1}, e_{h,c}^m) + 2 k \lambda | e_{h,c}^{m+1} |^2
\]

\[
= 2k (e_{h+1,c}^{m+1} + C_{h,2} e_{h,c}^{m+1}) - 2 k (s_h, | e_{h,c}^{m+1} |^2) - 2 k b_h (e_{h,c}^{m+1}, \Pi_{h,c} (t_{n+1}), e_{h,c}^{m+1}).
\]

(8.21)
Using an algebraic identity we have
\[
\left( \frac{\varepsilon_{h,c}^{n+1} - \varepsilon_{h,c}^{n}}{k}, 2k \varepsilon_{h,c}^{n+1} \right) = |\varepsilon_{h,c}^{n+1}|^2 - |\varepsilon_{h,c}^{n}|^2 + |\varepsilon_{h,c}^{n+1} - \varepsilon_{h,c}^{n}|^2.
\]
We know by propositions 4.2 and 4.5 that
\[-2k(\Delta_h \varepsilon_{h,c}^{n+1}, \varepsilon_{h,c}^{n+1}) = 2k \|\varepsilon_{h,c}^{n+1}\|_h^2, \quad b_h(u_h^n, \varepsilon_{h,c}^{n+1}, \varepsilon_{h,c}^{n+1}) \geq 0.\]
We have
\[2k(s_h, |\varepsilon_{h,c}^{n+1}|^2) \leq 2k \|s_h\|_\infty \|\varepsilon_{h,c}^{n+1}\|_h^2 \leq Ck |\varepsilon_{h,c}^{n+1}|^2.\]
Using the Young inequality, we also write
\[\text{equality in (8.7) we get}
\]
We are left with the term \(b_h(u_h^n, \varepsilon_{h,c}^{n+1}, \varepsilon_{h,c}^{n+1})\). We have \(\varepsilon_{h,u}^n \in \mathcal{R}T_0\). Using the divergence formula, proposition 3.1 and (3.5), one easily checks that \(\text{div} \varepsilon_{h,u}^n = 0\). Thus we can apply proposition 4.3 to get
\[|b_h(u_h^n, \Pi_{h,c}(t_{n+1}), \varepsilon_{h,c}^{n+1})| \leq C |\varepsilon_{h,u}^n|||\Pi_{h,c}(t_{n+1})||_h |\varepsilon_{h,c}^{n+1}|_h.\] (8.22)
Let us first bound \(||\Pi_{h,c}(t_{n+1})||_h\). We have
\[||\Pi_{h,c}(t_{n+1})||_h \leq ||\Pi_{h,c}(t_{n+1}) - \Pi_{h,c}(t_{n+1})||_h + ||\Pi_{h,c}(t_{n+1})||_h.\]
Using an inverse inequality (see proposition 1.2 in (8.22)) and (3.7), we get
\[||\Pi_{h,c}(t_{n+1}) - \Pi_{h,c}(t_{n+1})||_h \leq C \frac{1}{h} ||\Pi_{h,c}(t_{n+1}) - \Pi_{h,c}(t_{n+1})||_h \leq C.\]
Moreover, according to (13) (p. 776), we have \(||\Pi_{h,c}(t_{n+1})||_h \leq C \|c\|_L_\infty(0,T;H^1).\) Thus \(||\Pi_{h,c}(t_{n+1})||_h \leq C.\) We now estimate \(\varepsilon_{h,u}^n.\) Using the stability of \(\Pi_{RT_0}\) for the \(L^2\)-norm and the Cauchy-Schwarz inequality in (8.7), we get
\[|\varepsilon_{h,u}^n| \leq \|k\|_{W^{1,\infty}(0,1)} \left( |\nabla p|_{L^2((0,T;L^2)} (|\varepsilon_{h,c}^{n+1}| + |\varepsilon_{h,c}^{n+1}) + |\nabla_h \varepsilon_{h,p}^n|) + |u_h^{n+1}|.\] (8.23)
We bound \(\varepsilon_{h,p}^{n+1}\) as follows. Setting \(\psi_h = e_{h,p}^{n+1}\) in (8.6) and using the Cauchy-Schwarz inequality, we get
\[(\kappa(e_{h,p}^{n+1}, \theta_{h,p}^{n+1}) \nabla_h \varepsilon_{h,p}^{n+1}, \nabla_h \varepsilon_{h,p}^{n+1}) \leq \|k\|_{W^{1,\infty}(0,1)} \|\nabla p\|_{L^2((0,T;L^2)} (|\varepsilon_{h,c}^{n+1}| + |\varepsilon_{h,c}^{n+1}) |\nabla_h \varepsilon_{h,p}^{n+1}| + |p_h^{n+1}| |\nabla_h \varepsilon_{h,p}^{n+1}| + |s - s_h||\varepsilon_{h,p}^{n+1}|.\]
The left-hand side is such that \((\kappa(e_{h,p}^{n+1}, \theta_{h,p}^{n+1}) \nabla_h \varepsilon_{h,p}^{n+1}, \nabla_h e_{h,p}^{n+1}) \geq \kappa_{m_f} |\nabla_h e_{h,p}^{n+1}|^2\). As for the right-hand side, we have \(s_h = \Pi_{h,s}\) and \(\varepsilon_{h,p}^{n+1} \in P_h^{mc} \cap L^2_0\). Thus, according to propositions 3.1 and 3.3
\[|s - s_h||\varepsilon_{h,p}^{n+1}| \leq C h \|s\|_{L^\infty(0,T;H^1)} \|\nabla_h e_{h,p}^{n+1}|.\]
Using a discrete Gronwall lemma (see lemma 5.2 in [22]) we get (8.19). Then (8.24) and (8.25) imply

\[ \sum \text{relation with the one obtained by a similar work on (8.5)} \]

we obtain

\[ |e_h^n| \leq C (h + |e_h^{n+1}| + |e_{h,\theta}^{n+1}|). \]  

Let us plug this bound into (8.23). Since \(|U_h^{n+1}| \leq C h \) thanks to (8.18), we get

\[ |e_h^n| \leq C (h + |e_h^{n+1}| + |e_{h,\theta}^{n+1}|). \]  

Now, plugging this estimate into (8.23) and using the Young inequality, we obtain

Now we have treated all the terms in (8.21). This equation implies

\[ |e_{h,c}^{n+1}|^2 - |e_{h,c}^n|^2 + D_k \|e_h^{n+1}\| \leq C k (h^2 + |e_{h,c}^{n+1}|^2 + |e_{h,\theta}^{n+1}|^2 + |e_{h,\theta}^{n+1}|^2). \]

Let \(m \in \{1, \ldots, N\}\). Let us sum up the latter estimate from \(n = 0\) to \(m - 1\). Thanks to (3.3)

\[ |e_{h,c}^0| = |\Pi_{h,c} c_0 - e_h^0| = |\Pi_{h,c} - E(\Pi_{h,c})| \leq C h \|c\|_{L^2(0,T;H^2)}. \]

Using moreover estimates (8.16) and (8.17) we get

\[ |e_{h,c}^{m}|^2 + D_k \sum_{n=1}^m \|e_{h,c}^n\|^2 \leq C k \sum_{n=1}^m (|e_{h,c}^n|^2 + |e_{h,\theta}^n|^2) + C (h^2 + k^2). \]

Summing this relation with the one obtained by a similar work on (8.5) we obtain

\[ |e_{h,c}^{m}|^2 + |e_{h,\theta}^{m}|^2 + k \sum_{n=1}^m (D_k \|e_{h,c}^n\|^2 + D_0 \|e_{h,\theta}^n\|^2) \leq C k \sum_{n=1}^m (|e_{h,c}^n|^2 + |e_{h,\theta}^n|^2) + C (h^2 + k^2). \]

Using a discrete Gronwall lemma (see lemma 5.2 in [22]) we get (8.19). Then (8.24) and (8.25) imply (8.20).

By combining proposition 8.3 with estimates (8.1)–(8.3), we obtain finally the following result.

**Theorem 8.1** There exists a real \(k_0 > 0\) such that for all \(k < k_0\) and \(m \in \{1, \ldots, N\}\)

\[ |e_{h,c}^{m}|^2 + |e_{h,\theta}^{m}|^2 + k \sum_{n=1}^m (\|e_{h,c}^n\| + \|e_{h,\theta}^n\|) \leq C (h^2 + k^2), \]

\[ |\nabla e_{h,p}^m| + |e_{h,u}^m| \leq C (h + k). \]
