HANKEL DETERMINANTS OF CERTAIN SEQUENCES OF BERNOULLI POLYNOMIALS: A DIRECT PROOF OF AN INVERSE MATRIX ENTRY FROM STATISTICS

LIN JIU AND YE LI*

Abstract. We calculate the Hankel determinants of sequences of Bernoulli polynomials. This corresponding Hankel matrix comes from statistically estimating the variance in nonparametric regression. Besides its entries’ natural and deep connection with Bernoulli polynomials, a special case of the matrix can be constructed from a corresponding Vandermonde matrix. As a result, instead of asymptotic analysis, we give a direct proof of calculating an entry of its inverse. Further extensions also include an identity of Stirling numbers of the both kinds.

1. Introduction

The Hankel determinant of a sequence \( c = (c_0, c_1, \ldots) \), denoted by \( H_n(c) \) or \( H_n(c_k) \), is defined as the determinant of the Hankel matrix, or persymmetric matrix, given by

\[
(c_{i+j})_{0 \leq i,j \leq n} = \begin{pmatrix}
c_0 & c_1 & c_2 & \cdots & c_n \\
c_1 & c_2 & c_3 & \cdots & c_{n+1} \\
c_2 & c_3 & c_4 & \cdots & c_{n+2} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
c_n & c_{n+1} & c_{n+2} & \cdots & c_{2n}
\end{pmatrix}.
\]

Hankel determinants of various classes of sequences have been extensively studied, partly due to their close relationship with classical orthogonal polynomials; see, e.g., [14, Ch. 2]; And for numerous results see, e.g., the very extensive treatments in [16, 17, 18], and the numerous references provided there.

Applications and appearance of Hankel matrices and determinants also involve statistics. Dai et al. [5] studied the following Hankel determinant from nonparametric regression. Define

\[
I_k := \sum_{c=1}^{r} c^k
\]

and the Hankel matrix

\[
V_n := \begin{pmatrix}
I_0 & I_2 & \cdots & I_{2n} \\
I_2 & I_4 & \cdots & I_{2n+2} \\
\vdots & \vdots & \ddots & \vdots \\
I_{2n} & I_{2n+2} & \cdots & I_{4n}
\end{pmatrix}.
\]

Key words and phrases. Hankel determinant, Bernoulli polynomial, Vandermonde matrix.

*corresponding author.
We shall show when $V_k$ is invertible as follows.

**Proposition 1.1.** $V_n$ is invertible iff $n < r$.

In fact, a more specific result gives the left-upper entry of the inverse is given, for $n = r - 1$. One can find a proof in [6], by asymptotic analysis, for the following result.

**Proposition 1.2.** $(V_{r-1})_{1,1} = 2 \left( \frac{(2n)^r}{2r} \right)^2 - 1$, where the left-hand sides is the $(1,1)$ entry of the inverse matrix of $V_{r-1}$.

It is the original purpose of this paper to give a direct computational proof of Prop. 1.2. Thanks to Dr. Christian Krattenthaler for his email, it turns out both Props. 1.1 and 1.2 are direct corollaries of the following expressions.

**Theorem 1.3.** Let $(a)_n = a(a + 1) \cdots (a + n - 1)$ be the Pochhammer symbol and $B_n(x)$ be the $n$th Bernoulli polynomial.

\begin{equation}
H_n \left( \frac{B_{2k+5} \left( \frac{x+1}{2} \right)}{2k+5} \right) = \frac{1}{5 \cdot 2^{n+2}} \prod_{i=1}^{n} \frac{(2i + 3)!^2(2i + 2)!^2}{(4i + 5)!(4i + 4)!} \prod_{\ell=0}^{n}(x - 2n - 1 + 2\ell)_{4n-4\ell+3} \\
\times \sum_{i=1}^{n+2} \frac{(2i - 1) \left( n + \frac{3}{2} \right)_{i-1} \left( \frac{3}{2} + \frac{3}{2} \right)_{n+2} \left( \frac{3}{2} - n - \frac{3}{2} \right)_{n+2}}{(n - i + \frac{3}{2})_{i} (n + 2 - i)!(n + 1 + i)!(x^2 - (2i - 1)^2)},
\end{equation}

and

\begin{equation}
\det V_n = 2^{2n^2 - 2n - 1} \prod_{i=1}^{n} \frac{(2i)!^4}{(4i)!^2(4i + 1)!} \prod_{\ell=0}^{n}(r - \ell)_{2\ell+1} \prod_{\ell=0}^{n-1} \left( r + \frac{1}{2} - \ell \right)_{2\ell+1} \\
\times \sum_{i=1}^{n+1} \frac{(2n + 2i)!(2n + 2 - 2i)!(r + 1)_{n+1}}{(n + i)!^2(n + 1 - i)!^2(r + i)}.
\end{equation}

We shall provide a different proof of (1.2), which directly leads to (1.3), aside from the techniques in [11] and [12]. More precisely, besides (1.2), we shall also prove the following Hankel determinants.

**Proposition 1.4.**

\begin{equation}
H_n \left( \frac{B_{2k+1} \left( \frac{x+1}{2} \right)}{2k+1} \right) = \left( \frac{x}{2} \right)^{n+1} \prod_{\ell=1}^{n} \left( \frac{(2\ell)!^2(2\ell - 1)!^2(x^2 - (2\ell - 1)^2)(x^2 - (2\ell)^2)}{16(4\ell - 3)(4\ell - 1)^2(4\ell + 1)} \right)^{n+1-\ell}.
\end{equation}

\begin{equation}
H_n \left( \frac{B_{2k+1} \left( \frac{x+1}{2} \right)}{2k+1} \right) = \left( \frac{x^3 - x}{24} \right)^{n+1} \\
\times \prod_{\ell=1}^{n} \left( \frac{(2\ell)!^2(2\ell + 1)!^2(x^2 - (2\ell + 1)^2)(x^2 - (2\ell)^2)}{16(4\ell - 1)(4\ell + 1)^2(4\ell + 3)} \right)^{n+1-\ell}.
\end{equation}
Note that these three sequences are different from the recent work [7, 8, 9], by Dilcher and the first author, on the Hankel determinants of sequences related to Bernoulli and Euler polynomial. Although the Hankel determinant of $H_n \left( B_{2k+1}(\frac{r+1}{2}) \right)$ is obtained in [7, Thm. 1.1], the expression of $H_n \left( \frac{B_{2k+1}(r+1)}{2k+1} \right)$ is quite different, which, in general, is true for $H_n(a_k), H_n(a_k/k)$, and $H_n(ko_k-1)$. Take the Euler numbers $E_k$ as an example: we have [1, Eq. (4.2)]

$$H_n(E_k) = (-1)^{\left(\frac{n+1}{2}\right)} \prod_{\ell=1}^{n} \ell^2,$$

and [8, Cor. 3.4],

$$H_n(kE_{k-1}) = \begin{cases} 0, & k = 2m; \\ (-1)^{m+1} \cdot 2^{m(m+1)} \prod_{\ell=1}^{m} \ell^8, & k = 2m + 1. \end{cases}$$

Namely, the latter also depends on the parity of the dimension.

This paper is structured as follows. In Section 2 we first quote important results in Bernoulli polynomials, orthogonal polynomials, continued fractions, and polygamma functions, required in later sections. In Section 3 we give the proofs of three Hankel determinants (1.4), (1.5), and (1.2). In Section 4 besides the proof of (1.3) some further results on $V_k$ are given, including alternative proofs of Props. (1.1) and (1.2) rather than direct corollaries from (1.3). This approach leads an identity involving Stirling numbers, stated and proven finally in Section 5 together with some further remarks.

2. Preliminaries

All the necessary background stated here in this section can be found in [7, 8, 9], in concise form. We repeat this material here for easy reference, and to make this paper self-contained.

2.1. Bernoulli numbers, Bernoulli polynomials and connection with $V_n$. The Bernoulli numbers $B_n$ and Bernoulli polynomials $B_n(x)$ are usually defined by their exponential generating functions

$$te^{tx} e^t - 1 = \sum_{n=0}^{\infty} B_n(x) \frac{t^n}{n!} \quad \text{and} \quad te^{tx} e^t - 1 = \sum_{n=0}^{\infty} B_n(x) \frac{t^n}{n!}.$$

Their application and connections include number theory, combinatorics, numerical analysis, and other areas. The direct connection between $B_n(x)$ and $I_k$ can be derived from

$$B_{n+1}(x+1) - B_{n+1}(x) = (n+1)x^n;$$

(see e.g., [15, Entry (24.4.1)]), so that

$$I_k = \frac{B_{k+1}(r+1) - B_{k+1}(1)}{k+1}.$$

Note that $B_{2k+1}(1) = 0$ (see e.g., [15] Entries (24.2.4), (24.4.3)) for all positive integers $k$. Hence,

$$I_{2k} = \begin{cases} \frac{B_{2k+1}(r+1)}{2k+1}, & k > 0; \\ B_1(r+1) - B_1(1) = r, & k = 0. \end{cases}$$

(2.1)
Corollary 2.2. \( y^r P_n(y) \) is well-known facts and state them as a lemma with two corollaries; see, e.g., [14, Ch. 2] and [3, pp. 7–10].

**Lemma 2.1.** Let \( L \) be the linear functional in (2.4). If (and only if) \( H_n(c_k) \neq 0 \) for all \( n = 0, 1, 2, \ldots \), there exists a unique sequence of monic polynomials \( P_n(y) \) of degree \( n \), \( n = 0, 1, \ldots \), and a sequence of positive numbers \( (\zeta_n)_{n \geq 1} \), with \( \zeta_0 = 1 \), such that

\[
L(P_m(y)P_n(y)) = \zeta_n \delta_{m,n},
\]

where \( \delta_{m,n} \) is the Kronecker delta function. Furthermore, for all \( n \geq 1 \) we have \( \zeta_n = H_n(c) / H_{n-1}(c) \), and for \( n \geq 1 \),

\[
P_n(y) = \frac{1}{H_{n-1}(c)} \det \begin{pmatrix} c_0 & c_1 & \cdots & c_n \\ c_1 & c_2 & \cdots & c_{n+1} \\ \vdots & \vdots & \ddots & \vdots \\ c_{n-1} & c_n & \cdots & c_{2n-1} \\ 1 & y & \cdots & y^n \end{pmatrix},
\]

where the polynomials \( P_n(y) \) satisfy the 3-term recurrence relation \( P_0(y) = 1, P_1(y) = y + s_0 \), and

\[
P_{n+1}(y) = (y + s_n)P_n(y) - t_n P_{n-1}(y) \quad (n \geq 1),
\]

for some sequences \( (s_n)_{n \geq 0} \) and \( (t_n)_{n \geq 1} \).

We now multiply both sides of (2.4) by \( y^r \) and replace \( y^j \) by \( c_j \), which includes replacing the constant term 1 by \( c_0 \) for \( r = 0 \). Then for \( 0 \leq r \leq n - 1 \) the last row of the matrix in (2.4) is identical with one of the previous rows, and thus the determinant is 0. When \( r = n \), the determinant is \( H_n(c) \). We therefore have the following result.

**Corollary 2.2.** With the sequence \( (c_k) \) and the polynomials \( P_n(y) \) as above, we have

\[
y^r P_n(y) \bigg|_{y^k=c_k} = \begin{cases} 
0, & 0 \leq r \leq n - 1; \\
H_n(c)/H_{n-1}(c), & r = n.
\end{cases}
\]

The polynomials \( P_n(y) \) are known as “the monic orthogonal polynomials belonging to the sequence \( c = (c_0, c_1, \ldots) \), or “the polynomials orthogonal with respect to \( c \”.

The next result which we require establishes a connection with certain continued fractions (in this case called J-fractions). It can be found in various relevant publications, for instance in [16, p. 20].
Lemma 2.3. Let $c = (c_k)_{k \geq 0}$ be a sequence of numbers with $c_0 \neq 0$, and suppose that its generating function is written in the form
\[
\sum_{k=0}^{\infty} c_k z^k = \frac{c_0}{1 + s_0 z - \frac{t_1 z^2}{1 + s_1 z - \frac{t_2 z^3}{1 + \cdots}}},
\]
where both sides are considered as formal power series. Then the sequences $(s_n)$ and $(t_n)$ are the same as in (2.5); and we have
\[
H_n(c) = c_{n+1} t_{n+1} \cdots t_n (n \geq 0).
\]

Following [20], we consider the infinite band matrix
\[
J := \begin{pmatrix}
-s_0 & 1 & 0 & 0 & \cdots \\
t_1 & -s_1 & 1 & 0 & \cdots \\
0 & t_2 & -s_2 & 1 & \cdots \\
\vdots & \vdots & \ddots & \ddots & \ddots
\end{pmatrix}
\]
Furthermore, for each $n \geq 0$ let $J_n$ be the $(n+1)$th leading principal submatrix of $J$ and let
\[
D_n := \det J_n,
\]
so that $D_0 = -s_0$. We also set $D_{-1} = 1$ by convention, and furthermore, using elementary determinant operations, we get from (2.8) the recurrence relation
\[
D_{n+1} = -s_{n+1} D_n - t_{n+1} D_{n-1}.
\]
We can now quote the following results.

Lemma 2.4. [20] Prop. 1.2 With notation as above, for a given sequence $c$ we have
\[
H_n(c_{k+1}) = H_n(c_k) \cdot D_n,
\]
and
\[
H_n(c_{k+2}) = H_n(c_k) \cdot \left( \prod_{\ell=1}^{n+1} t_{\ell} \right) \cdot \sum_{\ell=-1}^{n} \frac{D_{\ell}^2}{\prod_{j=1}^{\ell+1} t_j}.
\]

Lemma 2.5. [13] Eq. (2.4) For a given sequence $c$ and $(s_n)$ as defined above, we have
\[
s_n = -\frac{1}{H_{n-1}(c_{k+1})} \left( \frac{H_{n-1}(c_k) H_n(c_{k+1})}{H_n(c_k)} + \frac{H_n(c_k) H_{n-2}(c_{k+1})}{H_{n-1}(c_k)} \right).
\]

2.3. Continued fractions. Following the usage in books such as [4] or [19], we write
\[
b_0 + \frac{\infty}{m=1} \left( \frac{a_m}{b_m} \right) = b_0 + K(a_m/b_m) = b_0 + \frac{a_1}{b_1 + \frac{a_2}{b_2 + \cdots}},
\]
for an infinite continued fraction. The $n$th approximant is expressed by
\[
b_0 + \frac{n}{m=1} \left( \frac{a_m}{b_m} \right) = b_0 + \frac{a_1}{b_1 + \frac{a_2}{b_2 + \cdots + \frac{a_n}{b_n}}} = \frac{A_n}{B_n}.
\]
and \( A_n, B_n \) are called the \( n \)th numerator and denominator, respectively. The continued fraction (2.14) is said to converge if the sequence of approximants in (2.15) converges. In this case, the limit is called the value of the continued fraction (2.14).

Two continued fractions are said to be equivalent if and only if they have the same sequences of approximants. In other words, we have
\[
b_0 + \sum_{m=1}^{n} \left( a_m/b_m \right) = d_0 + \sum_{m=1}^{n} \left( c_m/d_m \right)
\]
if and only if there exists a sequence of nonzero complex numbers \( r_m \) with \( r_0 = 1 \), such that for \( m \geq 0 \),
\[
d_m = r_m b_m \quad \text{and} \quad c_{m+1} = r_{m+1} r_m a_{m+1};
\]
(see [4, Eq. (1.4.2)]). We also require the following special case of the more general concept of a contraction; see, e.g., [4, p. 16].

**Definition 2.6.** Let \( A_n, B_n \) be the \( n \)th numerator and denominator, respectively, of a continued fraction \( \text{cf}_1 := b_0 + K(a_m/b_m) \), and let \( C_n, D_n \) be the corresponding quantities of \( \text{cf}_2 := d_0 + K(c_m/d_m) \). Then \( \text{cf}_2 \) is called an **even canonical contraction** of \( \text{cf}_1 \) if
\[
C_n = A_{2n} \quad D_n = B_{2n} \quad (n \geq 0);
\]
and is called an **odd canonical contraction** of \( \text{cf}_1 \) if
\[
C_0 = A_1/B_1, \quad D_0 = 1, \quad C_n = A_{2n+1}, \quad D_n = B_{2n+1} \quad (n \geq 0).
\]

We will now state three identities that will be used in later sections; see [4, pp. 16–18], [19, pp. 83–85], or [21, pp. 21–21] for proofs and further details.

**Lemma 2.7.** An even canonical contraction of \( b_0 + K(a_m/b_m) \) exists if and only if \( b_{2k} \neq 0 \) for \( k \geq 1 \), and we have
\[
b_0 + \sum_{m=1}^{\infty} \left( a_m/b_m \right) = b_0 + \frac{a_1 b_2}{a_2 + b_1 b_2 - \frac{a_4 a_5 b_6}{a_4 + b_3 b_4 + a_5 b_6 - \frac{a_8 a_9 b_{10}}{a_8 + b_7 b_9 + a_9 b_{10} - \cdots}}}
\]
In particular, with \( b_0 = 0, b_k = 1 \) for \( k \geq 1, a_1 = 1, \) and \( a_k = \alpha_{k-1} t \ (k \geq 1) \), for some variable \( t \), we have
\[
1 - \frac{\alpha_1 t}{1 - \alpha_1 t} = \frac{1}{1 - (\alpha_2 + \alpha_3) t - \frac{\alpha_5 \alpha_4 t^2}{1 - (\alpha_4 + \alpha_5) t - \frac{\alpha_9 \alpha_8 t^2}{1 - (\alpha_8 + \alpha_9) t - \cdots}}}
\]
Similarly, an odd canonical contraction gives
\[
1 + \frac{\alpha_1 t}{1 - (\alpha_1 + \alpha_2) t - \frac{\alpha_5 \alpha_4 t^2}{1 - (\alpha_3 + \alpha_4) t - \frac{\alpha_9 \alpha_8 t^2}{1 - (\alpha_7 + \alpha_8) t - \cdots}}}
\]
for the continued fraction on the left-hand side of (2.17).
2.4. Polygamma functions. We shall use the polygamma function of order $m$:

$$\psi^{(m)}(z) := \frac{d^{m+1}}{dz^{m+1}} \log \Gamma(z),$$

with

$$\psi(z) = \psi^{(0)}(z) = \frac{d}{dz} (\log \Gamma(z)) = \frac{\Gamma'(z)}{\Gamma(z)}.$$

Among all the properties, we first recall the following well-known complete asymptotic expansion, valid for $|\arg z| < \pi$: (see e.g., [10, p. 48, Eq. (12)])

\begin{equation}
\log \Gamma(z + x) = \left(z + x - \frac{1}{2}\right) \log z - z + \frac{\log(2\pi)}{2} + \sum_{n=1}^{\infty} \frac{(-1)^{n+1} B_{n+1}(x)}{n(n+1)z^n},
\end{equation}

which, by differentiating both sides with respect to $z$, yields the asymptotic expansion of $\psi(z)$:

\begin{equation}
\psi(z + x) = \log z + \frac{x - \frac{1}{2}}{z} - \sum_{n=1}^{\infty} \frac{(-1)^{n+1} B_{n+1}(x)}{(n+1)z^{n+1}}.
\end{equation}

Meanwhile, the series expansion formula (see e.g., [15, Entry 5. 7. 6])

\begin{equation}
\psi(z) = -\gamma - \frac{1}{z} + \sum_{k=1}^{\infty} \frac{z}{k(k+z)} = -\gamma + \sum_{k=0}^{\infty} \left( \frac{1}{k+1} - \frac{1}{k+z} \right),
\end{equation}

later shall lead us to the continued fraction expressions that are crucial to our proofs.

3. Hankel Determinants

We begin with our three main Hankel determinants.

3.1. $B_{2k+1} \left( \frac{z+1}{2} \right) / (2k+1)$.

Proof of (1.4). From (2.20), we have

$$\psi \left( z + \frac{1+x}{2} \right) - \psi \left( z + \frac{1-x}{2} \right)$$

$$= \frac{x}{z} + \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{(n+1)z^{n+1}} \left( B_{n+1} \left( \frac{1-x}{2} \right) - B_{n+1} \left( \frac{1+x}{2} \right) \right) = 2 \sum_{n=0}^{\infty} \frac{B_{2n+1} \left( \frac{1+x}{2} \right) - B_{2n+1} \left( \frac{1-x}{2} \right)}{2n+1},$$

where we used the reflection formula (see e.g., [15, Entry 24. 4. 23]) so that

$$B_{n+1} \left( \frac{1-x}{2} \right) = B_{n+1} \left( 1 - \frac{1+x}{2} \right) = (-1)^n B_{n+1} \left( \frac{1+x}{2} \right)$$

and $B_1(x) = x - 1/2$. This, finally by the change of variables $z \mapsto 1/z$, implies

$$\sum_{n=0}^{\infty} \frac{B_{2n+1} \left( \frac{1+x}{2} \right) - B_{2n+1} \left( \frac{1-x}{2} \right)}{2n+1} \psi \left( \frac{1}{z} + \frac{1+x}{2z} \right) - \psi \left( \frac{1}{z} + \frac{1-x}{2z} \right) = \frac{1}{2z},$$

We denote the left-hand side of the above equation by $F(z)$, where the independence on $x$ is implied. By the series expansion (2.21), we see

$$z F(z) = \sum_{k=0}^{\infty} \left( \frac{1}{\frac{z}{2} - x + 2k + 1} - \frac{1}{\frac{z}{2} + x + 2k + 1} \right),$$
Now we use the following continued fraction due to Ramanujan (see e.g., [2, p. 149, Entry 30]) for either $n$ is an integer or $Re(t) > 0$:
\[
\sum_{k=0}^{\infty} \left( \frac{1}{t - n + 2k + 1} - \frac{1}{t + n + 2k + 1} \right) = \frac{n}{t^{\frac{1}{2}} \sqrt{1 - x^2}} \cdot \frac{1}{\tau + \ldots},
\]
by letting $t = 2/z$ and $n = x$, to get
\[
zF(z) = \frac{z}{2} + \frac{\frac{1}{2}(1 - x^2)}{z + \frac{\frac{1}{2}(1 - x^2)}{\frac{1}{2} z + \ldots}}.
\]
Using equivalence of continued fractions (2.16), with
\[
r_m = \begin{cases} 
1, & m = 0; \\
\frac{z}{2(2m-1)}, & m \geq 1,
\end{cases} \quad a_m = \begin{cases} 
x, & m = 1; \\
(m-1)^2((m-1)^2 - x^2), & m \geq 2,
\end{cases} \quad b_m = \frac{2(2m-1)}{z},
\]
we could get
\[
d_m = b_m r_m = \frac{2(2m-1)}{z} \frac{z}{2(2m-1)} = 1,
\]
\[
e_{m+1} = r_{m+1} r_m a_{m+1} = \frac{m^2(m^2 - r^2)z^2}{4(2m+1)(2m-1)}.
\]
Hence, after dividing both sides by $xz/2$, we have
\[
(3.1) \quad F(z) = \frac{z}{2} + \frac{\frac{1}{2}(1 - x^2)}{z + \frac{\frac{1}{2}(1 - x^2)}{\frac{1}{2} z + \ldots}}.
\]
For simplification, we define
\[
(3.2) \quad \alpha_m = \frac{m^2(x^2 - m^2)}{4(2m+1)(2m-1)},
\]
and apply the even canonical contraction (2.17) on (3.1), to obtain
\[
\tau^{(0)}_m = \alpha_{2m-1} \alpha_{2m} = \frac{(2m-1)^2(2m)^2(x^2 - (2m-1)^2)(x^2 - (2m)^2)}{16(4m+3)(4m-1)^2(4m+1)},
\]
\[
\sigma^{(0)}_m = \alpha_{2m+1} = \frac{(8m^2 + 4m - 1)r^2 - (32m^4 + 32m^3 + 8m^2 - 1)}{4(4m+1)(4m+1)(4m-1)}
\]
such that
\[
F(z) = \frac{x}{2} + \frac{\frac{1}{2} z^2}{1 + \frac{\frac{1}{2} z^2}{1 + \frac{\frac{1}{2} z^2}{1 + \ldots}}}.\]
Then use Lem. 2.3 with $c_0 = \frac{x}{2}$, $s_j = -\sigma_j^{(0)}$, and $t_j = \tau_j^{(0)}$, we have the desired result \( \Box \).

### 3.2. $B_{2k+3} \left( \frac{z+1}{2} \right) / (2k+3)$.

**Proof of (1.5).** Similarly, let

$$G(z) = \sum_{n=0}^{\infty} \frac{B_{2n+3}(1+z)}{2n+3} z^{2n+2} = F(z) - B_1 \left( \frac{1+x}{2} \right) = F(z) - \frac{x}{2}.$$  

Then, by (3.1),

$$\frac{G(z)}{z^2} = \frac{F(z)}{z^2} - 1 = \frac{1}{1 + \frac{(1-x^2)(1-x^2)}{1+x^2}} - 1.$$  

Focus on the first continued fractions above. Using odd canonical contraction (2.18) with $\alpha_m$ defined in (3.2), we would have

$$G(z) = \frac{x^3 - x}{z^2 - \sigma_1^{(1)} z^2 - \sigma_2^{(1)} z^2 - \cdots},$$  

where

$$\tau_1^{(1)} = \alpha_{2m} \alpha_{2m+1} = \frac{(2m)^2(2m+1)^2(x^2 - (2m))(x^2 - (2m+1)^2)}{16(4m-1)(4m+1)^2(4m+3)},$$

$$\sigma_1^{(1)} = \alpha_{2m+1} + \alpha_{2m+2} = \frac{(2m+1)^2(x^2 - (2m+1)^2)}{4(4m+3)(4m+1)} + \frac{(2m+2)^2(x^2 - (2m+2)^2)}{4(4m+5)(4m+3)}.$$  

Then use Lem. 2.3 with $c_0 = \frac{x^3-x}{24} = \frac{x}{2} \alpha_1$, $s_j = -\sigma_j^{(1)}$, and $t_j = \tau_j^{(1)}$, we have the desired result \( \Box \).

**Remark.** Noting that $c_k = b_{k+1}$, so the “left-shifted” sequence formula applies here and leads to the same result \( \Box \). In fact, we can easily derive that

$$D_n^{(0)} := \det \begin{pmatrix} \sigma_0^{(0)} & 1 & 0 & 0 & \cdots & 0 \\ \tau_0^{(0)} & \sigma_1^{(0)} & 1 & 0 & \cdots & 0 \\ 0 & \tau_2^{(0)} & \sigma_2^{(0)} & 1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \ddots & \ddots & \vdots \\ 0 & \cdots & 0 & \tau_n^{(0)} & \sigma_n^{(0)} \end{pmatrix} = \frac{1}{4^{n+1}} \prod_{\ell=1}^{n+1} \frac{(x^2 - (2\ell+1)^2)(4\ell-1)^2}{(4\ell-1)(4\ell-3)},$$
so that

\begin{equation}
H_n \left( \frac{B_{2k+3} \left( \frac{x+1}{2} \right)}{2k+3} \right) = H_n \left( \frac{B_{2k+1} \left( \frac{x+1}{2} \right)}{2k+1} \right) D_n^{(1)}. \tag{3.7}
\end{equation}

3.3. \( B_{2k+5} \left( \frac{x+1}{2} \right) / (2k+5) \). The following proof contains some tedious calculation and simplification, the details of which are omitted.

**Proof of (1.2).** Similarly as the remark above, it suffices to show

\[
H_n \left( \frac{B_{2k+3} \left( \frac{x+1}{2} \right)}{2k+3} \right) =: D_n^{(1)} = \det \begin{pmatrix}
\sigma_0^{(1)} & 1 & 0 & \cdots & 0 \\
\tau_1^{(1)} & \sigma_1^{(1)} & 1 & \cdots & 0 \\
0 & \tau_2^{(1)} & \sigma_2^{(1)} & 1 & \cdots & 0 \\
\vdots & \vdots & \ddots & \ddots & \ddots & \vdots \\
0 & \cdots & 0 & \sigma_n^{(1)}
\end{pmatrix},
\]

or equivalently, by (2.10), to show

\begin{equation}
D_{n+1}^{(1)} = \sigma_n^{(1)} D_n^{(1)} - \tau_n^{(1)} D_{n-1}^{(1)}, \tag{3.8}
\end{equation}

where \( H_n \left( B_{2k+5} \left( \frac{x+1}{2} \right) / (2k+5) \right) \) is given by (1.2), and \( \tau_n^{(1)} \) and \( \sigma_n^{(1)} \) are given by (3.4) and (3.5), respectively.

(1) First of all, by simplification, we see

\[
\left( \frac{x}{2} + \frac{1}{2} \right)_{n+2} \left( \frac{x}{2} - n - \frac{3}{2} \right)_{n+2} = \frac{1}{2^{2n+4}} \prod_{i=1}^{n+2} \left( i - (2i-1)^2 \right).
\]

(2) In addition, let

\[
f(n, x) := \frac{1}{5} \cdot 2^{n+2} \prod_{i=1}^{n} \frac{(2i+3)(2i+2)x}{(4i+5)(4i+4)} \prod_{i=0}^{n} \left( 4n - 1 + 2l \right)_{4n-4l+3},
\]

and the recurrence, upon simplification,

\[
\frac{f(n+1, x)}{f(n, x)} = \frac{x(x^2-1)}{2} \cdot \frac{(2n+5)x\left(2n+4\right)x^2\left(4n+9\right)(4n+8)!}{(4n+9)(4n+8)!} \prod_{i=1}^{n+4} \left[ x^2 - (2i+1)^2 \right] \left[ x^2 - (2l)^2 \right]
\]

indicates

\[
H_{n+1} \left( \frac{B_{2k+3} \left( \frac{x+1}{2} \right)}{2k+3} \right) = \frac{f(n+1, x)}{f(n, x)} \cdot \frac{4(4n+9)(4n+7)}{(2n+5)(2n+4)^2}.
\]

(3) Due to \( (a)_n = \Gamma(a+n)/\Gamma(a) \) and \( \Gamma \left( \frac{1}{2} + n \right) = (2n-1)!! \sqrt{\pi}/2^n \), we see

\[
\frac{(n+\frac{5}{2})_{-1}}{(n-i+\frac{5}{2})_1 (n+2-i)! (n+1+i)!} = \frac{\Gamma \left( n+i+\frac{5}{2} \right) \Gamma \left( n-i+\frac{5}{2} \right)}{4^{n+2} \Gamma \left( n+\frac{5}{2} \right) \Gamma \left( n+3-i \right) \Gamma \left( n+2+i \right)}
\]

\[
\frac{\Gamma \left( n+i+\frac{5}{2} \right) \Gamma \left( n-i+\frac{5}{2} \right)}{(2n+3)!!^{2}\pi} \Gamma \left( n+3-i \right) \Gamma \left( n+2+i \right)
\]
Therefore, it suffices to show that
\[ D_n^{(1)} = \frac{2(n+1)!^2}{(4n+5)!!} \prod_{i=1}^{n+2} (x^2 - (2i-1)^2) \sum_{i=1}^{n+2} \frac{(2i-1)\Gamma(n+i+\frac{3}{2})\Gamma(n-i+\frac{5}{2})}{\Gamma(n+3-i)\Gamma(n+2+i)(x^2 - (2i-1)^2)}, \]
satisfies (3.8). Although the product term \( \prod_{i=1}^{n+2} (x^2 - (2i-1)^2) \) has degree \( 2n+4 \), the sum with \( x^2 - (2i-1)^2 \) in the denominator will always cancel one factor. Therefore, \( D_n^{(1)} \) is a polynomials in \( x \) of degree at most \( 2n+2 \). Also noting that \( \tau_n^{(1)} \) is of degree \( 4 \); while \( \tau_n^{(1)} \) of degree \( 2 \), in \( x \), we see (3.8) is basically showing two polynomials of degree at most \( 2(n+2) \) are identical. Therefore, as long as the left-hand side matches the right-hand side at \( 2n+5 \) different values of \( x \), (3.8) holds for any \( x \), and the proof is complete.

(1) Consider \( x = \pm(2j-1) \), where \( j = 1, 2, \ldots, n+1 \) (i.e., \( 2n+2 \) different points). In the case, all the terms in the summation of \( D_n^{(1)} \) will vanish, except for exactly the one with \( i = 2j-1 \), since the factor \( x^2 - (2i-1)^2 \) is canceled with the previous product, making it
\[
\left( \prod_{i=1}^{j-1} (2j-1)^2 - (2i-1)^2 \right) \left( \prod_{i=j+1}^{n+2} (2j-1)^2 - (2i-1)^2 \right)
\]
Then, by canceling the common product term and after simplification, we see the left-hand side of (3.8) is given by,
\[
\left( \prod_{i=n+2}^{n+3} (2j-1)^2 - (2i-1)^2 \right) \frac{2(n+2)!^2(2j-1)}{4^{2n+5}(4n+9)!!} \left( \frac{2n+4+2j}{n+2+j} \right) \left( \frac{2n+6-2j}{n+3-j} \right),
\]
while the right-hand side is
\[
\frac{(2n+4)^2((2j-1)^2 - (2n+4)^2) + (2n+3)^2((2j-1)^2 - (2n+3)^2)}{4(4n+7)(4n+9)} + \frac{2(n+1)^2(2j-1)}{4^{2n+3}(4n+5)!!} \left( \frac{2n+2+2j}{n+1+j} \right) \left( \frac{2n+4-2j}{n+2-j} \right) - \frac{2(n+3)^2((2j-1)^2 - (2n+3)^2)((2j-1)^2 - (2n+2)^2)}{16(4n+7)(4n+3)(4n+5)^2} \times \frac{2(n+2)!^2(2j-1)}{4^{2n+1}(4n+1)!!} \left( \frac{2n+2}{n+j} \right) \left( \frac{2n+2-2j}{n+1-j} \right).
\]
Further simplification shows that (3.8) with \( x = \pm(2j-1) \), for \( j = 1, 2, \ldots, n+1 \) is equivalent to
\[
((2j-1)^2 - (2n+5)^2) \frac{(n+2)^2(2n+3+2j)(2n+5-2j)}{4(4n+9)} - (n+2+j)(n+3-j)\]
\[= \left( \frac{(2n+4)^2((2j-1)^2 - (2n+4)^2)}{4(4n+9)} + \frac{(2n+3)^2((2j-1)^2 - (2n+3)^2)}{4(4n+5)} \right) \]
\[+ \frac{(2n+3)^2(n+1+j)(n+2-j)}{(4n+5)},\]
which is trivial to verify.
(2) Let $x = \pm (2n+3)$, i.e., $x = \pm (2j - 1)$ for $j = n+2$. Note that in this case, the summation in $D_{n-1}^{(1)}$ will not reduce to a single term; but $\tau_{n+1}^{(1)} = 0$, which simplifies (3.8) into

\[
\left(2n+3\right)^2 - (2n+5)^2 \frac{2(n+2)^2(2n+3)}{4^{2n+5}(4n+9)!!} \left(\frac{4n+8}{2n+4}\right) \left(\frac{2}{1}\right)
\]

which is equivalent to the trivial identity

\[
(n + 2)\left(\frac{4n+8}{2n+4}\right) = (4n + 7)\left(\frac{4n+6}{2n+3}\right).
\]

(3) Now, we have already checked $2n+4$ different points, so one more is adequate. Note that $x = 2n+5$ does not work, since in this case, the summation in both $D_n^{(1)}$ and $D_{n-1}^{(1)}$ remain. Instead, we take $x = 2n+2$, so that

\[
\sigma_{n+1}^{(1)} \bigg|_{x=2n+2} = -\frac{(2n+3)(6n+13)}{4(4n+9)} \quad \text{and} \quad \tau_{n+1}^{(1)} \bigg|_{x=2n+2} = 0.
\]

Therefore, it suffices to show

\[
-3(n+2)^2 \sum_{i=1}^{n+3} \frac{(2i-1)\Gamma(n+i+\frac{5}{2})\Gamma(n-i+\frac{5}{2})}{\Gamma(n+4-i)\Gamma(n+3+i)(((2n+2)^2-(2i-1)^2)}
\]

which is equivalent to the trivial identity

\[
(n + 2)\left(\frac{4n+8}{2n+4}\right) = (4n + 7)\left(\frac{4n+6}{2n+3}\right).
\]

We use the WZ-method, i.e., the fastZeil.m package to show that the sum on the right-hand side is

\[
-\frac{(n+2)^2(2n+5)(4n+9)\sqrt{\pi}\Gamma\left(2n+\frac{5}{2}\right)}{4(2n+5)!}
\]

which is exactly the left-hand side. Therefore, we have proven (5.8), which is equivalent to (1.2). \[\square\]
4. Results on $V_k$.

Due to (2.1), in this section, we always let $x = 2r + 1$, which makes $(x + 1)/2 = r + 1$.

We first begin with the following simple lemma.

**Lemma 4.1.**

(4.1) \[ \det V_n = H_n \left( \frac{B_{2k+1}(r+1)}{2k+1} \right) - \frac{1}{2} H_{n-1} \left( \frac{B_{2k+5}(r+1)}{2k+5} \right). \]

*Proof.* By the cofactor expansion, we can see that

\[ \det V_n - I_0 H_{n-1} \left( \frac{B_{2k+5}(r+1)}{2k+5} \right) = H_n \left( \frac{B_{2k+1}(r+1)}{2k+1} \right) - \left( r + \frac{1}{2} \right) H_{n-1} \left( \frac{B_{2k+5}(r+1)}{2k+5} \right), \]

which gives the desired result. \( \square \)

*Proof of (1.3).* Now, it is apparent to combine (1.2) and (4.1), in order to prove (1.3). The calculation and simplification are straightforward, but tedious, so are omitted here. \( \square \)

For the rest of this section, we shall provide alternative proofs for Props. (1.1) and (1.2), without directly using (1.3). This approach eventually leads an identity involving Stirling numbers, as Cor. (5.1) in the next section.

**Lemma 4.2.** We have

(4.2) \[ V_{r-1} = VS(r)^T VS(r), \]

where $VS(n)$ is the $n \times n$ Vandermonde matrix of the first $n$ squares, namely,

\[
VS(r) = \begin{pmatrix}
1 & 1 & 1 & \cdots & 1 \\
1 & 2^2 & 2^4 & \cdots & 2^{2(r-1)} \\
1 & 3^2 & 3^4 & \cdots & 3^{2(r-1)} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
1 & n^2 & n^4 & \cdots & n^{2(r-1)}
\end{pmatrix}.
\]

*Proof.* This directly follows from

\[
\sum_{\ell=1}^{r} (\ell^2)^{k-1} \cdot (\ell^2)^{j-1} = \sum_{\ell=1}^{r} \ell^{2(k-1)+2(j-1)} = I_{2(k+j)-4},
\]

which is the $(k,j)$ (and also $(j,k)$) entry of $V_{r-1}$. Here, please note that the $(1,1)$ entry is $I_0$, i.e., with both horizontal and vertical indices shifted. \( \square \)

**Corollary 4.3.** For $n < r$, $\det V_n \neq 0$.

*Proof.* Note that (4.2) indicates that

\[ \det V_{r-1} = \prod_{1 \leq \ell < j \leq r} (j^2 - \ell^2)^2 \neq 0. \]

We see for all $n < r - 1$, $V_n$ is one of the principal submatrices of $V_{r-1}$, which is real, symmetric, and positive-definite, due to again (4.2). Hence $V_n$ is invertible. \( \square \)

**Corollary 4.4.** For $n > r$, $\det V_k = 0$. 

Proof. First of all For $n > r$ in (1.4), the term $(2r + 1)^2 - (2r + 1)^2$ will appear in the product, so that
\[ H_n \left( \frac{B_{2k+1}(r+1)}{2k+1} \right) = 0. \]
Similarly, for $n > r - 1$, in (1.5), the product becomes 0, which also, by (2.11), leads to
\[ H_n \left( \frac{B_{2k+5}(r+1)}{2k+5} \right) = 0. \]
Therefore, for $n > r$, i.e., $n - 1 > r - 1$, $\det V_k = 0$, by (4.1). □

Now, we can give an alternative proof of Prop. 1.2.

Proof of Prop. 1.2. Let $n = r - 1$ in (4.1) to see
\[ H_{r-1} \left( \frac{B_{2k+5}(r+1)}{2k+5} \right) = 2 \left( H_{r-1} \left( \frac{B_{2k+1}(r+1)}{2k+1} \right) - \det V_{r-1} \right). \]
Meanwhile, by the formula of cofactors to compute the inverse of a matrix,
\[ \left( V_{r-1}^{-1}\right)_{1,1} = \frac{H_{r-2} \left( \frac{B_{2k+5}(r+1)}{2k+5} \right)}{\det V_{r-1}} = 2 \left( \frac{H_{r-1} \left( \frac{B_{2k+1}(r+1)}{2k+1} \right)}{\det V_{r-1}} - 1 \right). \]
Therefore, it is equivalent to show
\[ \frac{H_{r-1} \left( \frac{B_{2k+1}(r+1)}{2k+1} \right)}{\det V_{r-1}} = \frac{(4r)}{(2r)^2}, \]
which can be done by simplifying the left-hand side. Details are omitted here. □

Finally, we shall complete the proof of Prop. 1.1. By Cor. 4.3 and 4.4. we only need to show $\det V_r = 0$. The following sequence plays the essential rule.

Definition 4.5. The sequence $T(n, k)$ (A204579^2) can be defined by the recurrence:

\[ T(n, k) = \begin{cases} 1, & n = k = 1; \\ T(n-1, k-1) - (n-1)^2 T(n-1, k), & n > 1, 1 \leq k \leq n; \\ 0, & \text{otherwise}. \end{cases} \]

Lemma 4.6. Let $\mathbf{0}$ be the zero vector. We have
\[ V_r \cdot \left( \begin{array}{cccc} T(r+1, 1) & T(r+1, 2) & \cdots & T(r+1, r+1) \end{array} \right)^T = \mathbf{0}. \]
Proof. First of all, (4.4) is equivalent to the following $r + 1$ identities: for any $j = 0, 1, \ldots, r$,
\[ \sum_{k=0}^{r} I_{2j+2k} T(r+1, k+1) = 0. \]
By definition and simplification, we have
\[ \sum_{k=0}^{r} I_{2j+2k} T(r+1, k+1) = \sum_{c=1}^{r} c^{2j} \sum_{k=0}^{r} c^{2k} T(r+1, k+1). \]

^2https://oeis.org/A204579
Now, we claim, for \( c = 1, 2, \ldots, r \),

\[
(4.6) \quad \sum_{k=0}^{r} c^{2k} T(r+1, k+1) = 0,
\]

which implies (4.5), for any \( j \).

When \( r = 1 \), the only case is \( c = 1 \). Since \( T(2, 1) = -1 \), and \( T(2, 2) = 1 \), we have (4.6) for \( r = 1 \). Assume (4.6) holds for \( r = m - 1 \). For \( r = m \), by the recurrence (4.3), we have

\[
\sum_{k=0}^{m} c^{2k} T(m+1, k+1) = \sum_{k=0}^{m} c^{2k} \left( T(m, k) - m^{2} T(m, k+1) \right)
\]

\[
= \sum_{k=0}^{m} c^{2k} T(m, k) - m^{2} \sum_{k=0}^{m} c^{2k} T(m, k+1)
\]

\[
= \sum_{k=1}^{m} c^{2k} T(m, k) - m^{2} \sum_{k=0}^{m-1} c^{2k} T(m, k+1),
\]

where in the last step, we used \( T(m, 0) = T(m, m+1) = 0 \). Finally, by shifting the summation index of the first sum, we have

\[
\sum_{k=0}^{m} c^{2k} T(m+1, k+1) = c^{2} \sum_{k=0}^{m-1} c^{2k} T(m, k+1) - m^{2} \sum_{k=0}^{m-1} c^{2k} T(m, k+1)
\]

\[
= (c^{2} - m^{2}) \sum_{k=0}^{m-1} c^{2k} T(m, k+1) = 0,
\]

for \( c = 0, 1, \ldots, m - 1 \), (by the inductive assumption) and \( c = m \) (due to the first factor).

\[\square\]

Lemma 4.7. \( \det V_{r} = 0 \), for all \( r \in \mathbb{N} \).

Proof. Note that \( T(m, m) = T(m-1, m-1) = \cdots = T(1, 1) = 0 \), so the vector in (4.4) is not a zero vector. Therefore \( V_{r} \) is not invertible. \[\square\]

5. Final remarks

5.1. An identity on Stirling numbers. Let \( s(n, k) \) be the Stirling numbers of the first kind and \( S(n, k) \) be the Stirling numbers of the second kind. \( T(n, k) \) also has an alternative expression:

\[
T(r+1, k+1) = \sum_{i=0}^{2k+2} (-1)^{r+1+i} s(r+1, i) s(r+1, 2k+2-i).
\]

Meanwhile, recall the well-known connection between Bernoulli numbers and \( S(n, k) \):

\[
B_{m} = \sum_{\ell=0}^{m} \frac{(-1)^{\ell} \ell!}{\ell+1} S(m, \ell).
\]

(See [15] Entry (24.15.6).) Then, (2.1) indicates

\[
I_{2j+2k} = \frac{1}{2j+2k+1} \sum_{m=0}^{2j+2k} \binom{2j+2k+1}{m} r^{2j+2k+1-m} \sum_{\ell=0}^{m} \frac{(-1)^{\ell} \ell!}{\ell+1} S(m, \ell),
\]

where in the last step, we used \( T(r, 0) = T(r, r+1) = 0 \). Finally, by shifting the summation index of the first sum, we have

\[
\sum_{k=0}^{m} c^{2k} T(m+1, k+1) = c^{2} \sum_{k=0}^{m-1} c^{2k} T(m, k+1) - m^{2} \sum_{k=0}^{m-1} c^{2k} T(m, k+1)
\]

\[
= (c^{2} - m^{2}) \sum_{k=0}^{m-1} c^{2k} T(m, k+1) = 0,
\]

for \( c = 0, 1, \ldots, m - 1 \), (by the inductive assumption) and \( c = m \) (due to the first factor). \[\square\]
This not only allows us to recursively solve (5.2). In the proof of (1.5), we actually have shown that

\[ G(x) = \sum_{m=0}^{n} \binom{n}{m} x^{n-m} B_m \]

(see [15] Entry (24.2.5)) is also applied. Therefore, (1.5) yields the following identity of Stirling numbers.

**Corollary 5.1.** For any \( r \in \mathbb{N} \) and \( j = 0, 1, \ldots, r \), we have

\[
\sum_{k=0}^{r} \frac{1}{2j+2k+1} \left( \sum_{m=0}^{2j+2k} \binom{2j+2k+1}{m} \right) (r+1)^{2j+2k+1} - 1 \sum_{\ell=0}^{m} \frac{(-1)^\ell}{\ell+1} S(m, \ell) \quad \times \sum_{i=0}^{2k+2} (-1)^{r+1+i} s(r+1, i) s(r+1, 2k+2) = 0.
\]

5.2. **Continued fraction approach in general.** It is natural to consider the continued fraction to the generating function of \( B_{2k+5}(\frac{1}{24})/(2k+5) \):

\[
H(z) = \sum_{n=0}^{\infty} \frac{B_{2n+5}(\frac{1}{24})}{2n+5} z^{2n} = \frac{G(z) - B_3(\frac{1}{24})}{z^2} = \frac{G(z) - \frac{z^3-x}{24}}{z^2}
\]

Then,

\[
\frac{z^2 H(z)}{z^2 - \frac{x^3-x}{24}} = \frac{G(z)}{z^2 - \frac{x^3-x}{24}} - 1.
\]

In the proof of (1.5), we actually have shown that

\[
\frac{G(z)}{z^2 - \frac{x^3-x}{24}} = \frac{1}{1 - (\alpha_1 + \alpha_2) z^2 - \frac{\alpha_2 \alpha_1 z^4}{1-\alpha_3 \alpha_4 z^2 - \frac{\alpha_4 \alpha_5 \alpha_6 \alpha_7 z^4}{1-\alpha_3 \alpha_4 \alpha_5 \alpha_6 z^2 - \frac{\alpha_5 \alpha_6 \alpha_7 \alpha_8 z^4}{1-\alpha_3 \alpha_4 \alpha_5 \alpha_6 \alpha_7 \alpha_8 z^2 - \cdots}}}}.
\]

We then define another sequence \((\beta_n)_{n \geq 1}\) by \(\beta_1 = \alpha_1 + \alpha_2\), and for \(m \geq 1\),

\[
(5.1) \quad \beta_{2m-1} \beta_{2m} = \alpha_{2m} \alpha_{2m+1},
\]

\[
(5.2) \quad \beta_{2m} + \beta_{2m+1} = \alpha_{2m+1} + \alpha_{2m+2}.
\]

This not only allows us to recursively solve \(\beta_n\); but also indicate, by the inverse even contraction (2.17) and the odd contraction (2.18), that

\[
\frac{G(z)}{z^2 - \frac{x^3-x}{24}} = \frac{1}{1 - (\beta_1 + \beta_2) z^2 - \frac{\beta_2 \beta_3 z^4}{1-\beta_4 \beta_5 z^2 - \frac{\beta_5 \beta_6 z^4}{1-\beta_4 \beta_5 \beta_6 \beta_7 z^2 - \cdots}}}}.
\]

which eventually leads to

\[
H(z) = \frac{\frac{x^3-x}{24} \beta_1}{1 - (\beta_1 + \beta_2) z^2 - \frac{\beta_2 \beta_3 z^4}{1-\beta_4 \beta_5 \beta_6 \beta_7 z^2 - \cdots}}.
\]

Note that

\[
\frac{x^3-x}{24} \beta_1 = \frac{x^3-x}{24} \left( \frac{x^2-1}{12} + \frac{x^2-4}{15} \right) = \frac{(3x^2-7)x(x^2-1)}{480} = \frac{B_5 \left( \frac{x+1}{2} \right)}{5}.
\]
Hence,
\[
H_n\left(\frac{B_{2k+5}(x+1)}{2k+1}\right) = \left(\frac{(3x^2 - 7)x(x^2 - 1)}{480}\right)^{n+1} \prod_{\ell=1}^{n} (\beta_{2\ell}\beta_{2\ell+1})^{n+1-\ell}.
\]

In fact, it is not hard to see \(D_n^{(1)} = \prod_{\ell=0}^{n} \beta_{2\ell+1}\).

### 5.3. Further results.

We list some nice partial results with \(x = 2r + 1\) that can be easily calculated from the results above.

- \(\alpha_{2r+1} = 0\), which implies \(\tau_{r}^{(1)} = 0\).
- \(D_{r-1}^{(1)} = (r)!^2\) and \(D_{r}^{(1)} = -\frac{(r+1)!^2}{4r+5}\).
- \(\beta_{2r} = 0\) and \(\beta_{2r+1} = -\frac{(r+1)!^2}{4r+5}\).
- \(\frac{H_r \left(\frac{B_{2k+5}(r+1)}{2k+1}\right)}{H_{r-1} \left(\frac{B_{2k+5}(r+1)}{2k+3}\right)} = 2\) and \(\frac{H_{r-1} \left(\frac{B_{2k+5}(r+1)}{2k+5}\right)}{H_{r-1} \left(\frac{B_{2k+5}(r+1)}{2k+3}\right)} = (r)!^2\).

## Acknowledgment

We would like to thank Dr. Christian Krattenthaler for providing the expressions of (1.2) and (1.3), right after we uploaded the first version of this paper on arXiv. Also, we thank Dr. Dongmian Zou for his general idea on considering the eigenvector with respect to 0, as the key in the proof of Lem. 4.6 which eventually leads to Corol. [5,1].
