Abstract: The connecting rod is the intermediate member between the piston and the Crankshaft. Its primary function is to transmit the push and pull from the piston pin to the crank pin, thus converting the reciprocating motion of the piston into rotary motion of the crank. Connecting rod design is very important because of its role in the crank mechanism, so that the research that can be applied in optimal design of connecting rod can lead to increased engine performance. The connecting rod is very hard and strong but sometimes deforms and breaks due to vibration. The determination the natural frequency of components is essential to prevent the resonance phenomenon. Identify the critical velocity of connecting rod for the resonance frequency range is essential. This study incorporates FEA modal analysis and experimental modal analysis of connecting rod. A parametric model of Connecting rod is modelled using Pro-E and finite element analysis is carried out by using ANSYS Software. Finite element method is used to determine natural frequencies of a connecting rod.

Keywords: Connecting Rod, crank Mechanism, Natural Frequency, Noise and Vibration, ANSYS Software.

I. INTRODUCTION

The connecting rod is the intermediate member between the piston and the Crankshaft. In a reciprocating engine, the connecting rod connects the piston to the crank or crankshaft. Together with they form a simple mechanism that converts reciprocating motion into rotating motion. As a connecting rod is rigid, it may transmit either a push or a pull and so the rod may rotate the crank through both halves of a revolution. Generally connecting rods are manufactured using carbon steel and in recent days aluminium alloys are finding its application in manufacturing of connecting rod. The connecting rod primarily undergoes tensile and compressive loading under engine cyclic process. The forces acting on connecting rod are forces due to maximum combustion pressure and force due to inertia of connecting rod and reciprocating mass. The connecting rod is very hard and strong but sometimes deforms and breaks due to vibration. The determination the natural frequency of components is essential to prevent the resonance phenomenon. Identify the critical velocity of connecting rod for the resonance frequency range is essential.

Vibration is a mechanical phenomenon whereby oscillations occur about an equilibrium point. The oscillations may be periodic, such as the motion of a pendulum—or random, such as the movement of a tire on a gravel road. There are generally two categories for the oscillations that occur under controversial foreign forces are called forced vibrations, when the controversial operating system is oscillating with frequency, oscillation can be controversial if the impulse frequency of the system natural frequency is resonance mode occurs and may be dangerous, there are large fluctuations. Natural frequency is the frequency at which a system tends to oscillate in the absence of any driving or damping force. Free vibrations of an elastic body are called natural vibrations and occur at a frequency called the natural frequency. Natural vibrations are different from forced vibrations which happen at frequency of applied force (forced frequency). If forced frequency is equal to the natural frequency, the amplitude of vibration increases manifolds. This phenomenon is known as resonance.

Numbers of methods are available for the design optimization of structural system and these methods are based on mathematical programming technique and optimally designed using ANSYS software. The finite element method is capable of providing this information but it is time taken, the time need to create such a model is large. In order to reduce the modelling software can be used. One such model is provided by ANSYS work bench.

II. PROBLEM DEFINITION

The connecting rod is under tremendous stress from the reciprocating load represented by the piston, actually stretching and being compressed with every rotation, and the load increases as the square of the engine speed increase. Combination of axial and bending stresses act on the rod in operation. The axial stresses are product due to
cylinder gas pressure and inertia force arising on account of reciprocating motion. Whereas bending stresses caused due to centrifugal effects hence it causes failure of connecting rod. In some cases there are geometrical errors, deflections and friction present, and accordingly, connecting rod some- times creating noise and vibration to such an extent that it becomes a problem. Hence in the machine element like connecting rod according to their geometry errors, unsuitable material selection, deflection and friction present, and sometime applied force and boundary condition create noise and vibration a of element and also reduce life of element.

III.THEORETICAL DESIGN

1) Design of cross-section of connecting rod:
The cross-section selected is I-section, as shown in fig.

![Figure 1. I-Section of connecting Rod](image)

Dimensions of cross-section of connecting rod:
- Flange thickness = t= 4.6mm
- Web thickness = t= 4.6mm
- Width of Flange (B) = 4t= 18.4mm
- Depth of Section (H) = 5t= 23mm
This cross-section is taken at the middle of the connecting rod.

2) Design Of Other Parts Of Connecting Rod:
The other parts of the connecting rod are:
- Small End of Connecting Rod
- Big End of Connecting Rod
- Bolts for Big End Bearing Cap

![Figure 2. Schematic Diagram of Connecting Rod](image)

(A) Small End of Connecting Rod:
Let,
- \( d_{ci} = \) inner diameter of small end, mm
- \( d_{co} = \) outer diameter of small end, mm
- \( d_{p} = \) diameter of piston pin, mm
- \( l_{i} = \) width of small end, mm

\[
F_{\text{imax}} = m_{e}w^{2}r \cos \theta + \frac{\cos 2\theta}{n_{0}}
\]
\[
= m_{e}w^{2}r \cos(360) + \frac{\cos(720)}{n_{0}} \quad (\text{at } \theta = 360^0)
\]
\[
F_{\text{imax}} = m_{e}w^{2}r \left[1 + \frac{1}{n_{0}}\right] \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ ld
then structure or machine or any system is excited its response exhibits a sharp peak at resonance when the forcing frequency is equal to its natural frequency.

1) Steps to follow:
   a) The geometry of the connecting rod to be analysed is imported from solid modeller Pro-Engineer in IGES format this is compatible with the ANSYS[11].
   b) The element type and materials properties such as Young's modulus and Poisson's ratio are specified.
   c) Meshing the three-dimensional model.
   d) The boundary conditions and external loads are applied.
   e) The solution is generated based on the previous input parameters.
   f) Finally, the solution is viewed in a variety of displays.

2) Analysis of Model:
   behaviour by dividing the geometry into a number of elements of standard shapes, applying constraints. Uses of proper boundary conditions are very important since they strongly affect the results of the finite element analysis. Connecting rod is modelled in Pro-E. The step file of model is imported in ANSYS workbench. The main objective of this work is to perform the Finite Element Analysis of intermediate connecting rod using CAE Tools, so as to determine the natural frequency in the connecting rod. The material properties are demanded in CAE to perform analysis.

2.1 Pre-processing: The constructs a model of the connecting rod in which the geometry is divided into a number of discrete sub regions, or “elements,” connected at discrete points called “nodes.” Certain of these nodes will have fixed displacements, and others will have prescribed loads.

Discretization is the method of converting continuous models to discrete parts.
2.3 Post Processing: The post processing stage involves viewing of data files generated by the software during the solution phase.

2.3.1 Result obtain from ANSYS:
Case: Pressure 13 MPa At Small End of Connecting Rod

Equivalent (von-Mises) Stress

V. RESULTS AND DISCUSSION
Connecting rod undergoes noise and vibration frequently. The maximum von-misses stress generated is 37.618 MPa and the maximum deformation generated is 0.0047524 m. The results obtained are within limits and will have minimum effect on the working condition of the shaft and gear. The material used and the design developed for the required force is valid for the automobile connecting rod.

VI. CONCLUSION
The finite element method (FEM) is most widely for Natural frequency analysis of machine elements using the ANSYS software. The development of finite element analysis model of the shaft with gear mounting to simulate the von-misses stress calculation and total deformation calculation plays more significant role in the design. FEM methods for calculation of natural frequencies of shaft with gear are described. The connecting rod in PRO-E and analyzed in ANSYS for its natural frequency.

Hence with the help of ANSYS software we find out the total deformation, equivalent stress which is response for noise and vibration of machine element such as connecting rod.

ACKNOWLEDGMENT
The authors would like to express sincere gratitude to Department of Mechanical Engineering, Dr. Daulatrao Aher College Engineering, Karad, Satara, India for their help and support.
