Abstract: We address the problem of adaptive minimax estimation in white gaussian noise model under $L_p$-loss, $1 \leq p \leq \infty$, on the anisotropic Nikolskii classes. We present the estimation procedure based on a new data-driven selection scheme from the family of kernel estimators with varying bandwidths. For proposed estimator we establish so-called $L_p$-norm oracle inequality and use it for deriving minimax adaptive results. We prove the existence of rate-adaptive estimators and fully characterize behavior of the minimax risk for different relationships between regularity parameters and norm indexes in definitions of the functional class and of the risk. In particular some new asymptotics of the minimax risk are discovered including necessary and sufficient conditions for existence a uniformly consistent estimator. We provide also with detailed overview of existing methods and results and formulate open problems in adaptive minimax estimation.

AMS 2000 subject classifications: 62G05, 62G20.

Keywords and phrases: white gaussian noise model, oracle inequality, adaptive estimation, kernel estimators with varying bandwidths, $L_p$-risk.

1. Introduction

Let $\mathbb{R}^d$, $d \geq 1$, be equipped with Borel $\sigma$-algebra $\mathcal{B}(\mathbb{R}^d)$ and Lebesgue measure $\nu_d$. Put $\tilde{\mathcal{B}}(\mathbb{R}^d) = \{ B \in \mathcal{B}(\mathbb{R}^d) : \nu_d(B) < \infty \}$ and let $(W(B), B \in \tilde{\mathcal{B}}(\mathbb{R}^d))$ be the white noise with intensity $\nu_d$. Set also for any $A \in \mathcal{B}(\mathbb{R}^d)$ and any $1 \leq p < \infty$

$$L_p(A, \nu_d) = \left\{ g : A \to \mathbb{R} : \| g \|_{p, A}^p := \int_A |g(t)|^p \nu_d(dt) < \infty \right\};$$

$$L_\infty(A) = \left\{ g : A \to \mathbb{R} : \| g \|_{\infty, A} := \sup_{t \in A} |g(t)| < \infty \right\}.$$

1.1. Statistical model and $L_p$-risk

Consider the sequence of statistical experiments (called gaussian white noise model) generated by the observation $X_\varepsilon = \{ X_\varepsilon(g), g \in L_2(\mathbb{R}^d, \nu_d) \}_\varepsilon$ where

$$X_\varepsilon(g) = \int f(t)g(t)\nu_d(dt) + \varepsilon \int g(t)W(dt). \quad (1.1)$$

Here $\varepsilon \in (0, 1)$ is understood as the noise level which is usually supposed sufficiently small.

The goal is to recover unknown signal $f$ from observation $X_\varepsilon$ on a given cube $(-b, b)^d$, $b > 0$. The quality of an estimation procedure will be described by $L_p$-risk, $1 \leq p \leq \infty$, defined in (1.2) below and as an estimator we understand any $X_\varepsilon$-measurable Borel function belonging to...
for formal definition. Here we such estimator exists we will call it optimally or rate-adaptive.

Let \( \epsilon \), \( \ell, \ell : \mathbb{R}^d \rightarrow \mathbb{R} \) be random functions which may have very complicated structure.

Thus, for any estimator \( \tilde{f}_\epsilon \) and any \( f \in \mathbb{L}_p(\mathbb{R}^d, \nu_d) \cap \mathbb{L}_2(\mathbb{R}^d, \nu_d) \) we define its \( \mathbb{L}_p \)-risk as

\[
\mathcal{R}_\epsilon^{(p)}[\tilde{f}_\epsilon; f] = \left\{ \mathbb{E}_f^{(\epsilon)} \left( \|\tilde{f}_\epsilon - f\|_p^q \right) \right\}^{1/q}, \quad q \geq 1.
\]  

Here and later \( \|\cdot\|_p, 1 \leq p \leq \infty \), stands for \( \|\cdot\|_{p,(-b,b)^d} \) and \( \mathbb{E}_f^{(\epsilon)} \) denote the mathematical expectation with respect to the probability law of \( X^\epsilon \).

Let \( \mathbb{F} \) be a given subset of \( \mathbb{L}_p(\mathbb{R}^d, \nu_d) \cap \mathbb{L}_2(\mathbb{R}^d, \nu_d) \). For any estimator \( \tilde{f}_\epsilon \) define its maximal risk by \( \mathcal{R}_\epsilon^{(p)}[\tilde{f}_\epsilon; \mathbb{F}] = \sup_{f \in \mathbb{F}} \mathcal{R}_\epsilon^{(p)}[\tilde{f}_\epsilon; f] \) and its minimax risk on \( \mathbb{F} \) is given by

\[
\phi_\epsilon(\mathbb{F}) := \inf_{\tilde{f}_\epsilon} \mathcal{R}_\epsilon^{(p)}[\tilde{f}_\epsilon; \mathbb{F}].
\]

Here infimum is taken over all possible estimators. An estimator whose maximal risk is proportional to \( \phi_\epsilon(\mathbb{F}) \) is called minimax on \( \mathbb{F} \).

### 1.2. Adaptive estimation

Let \( \{ \mathbb{F}_\vartheta, \vartheta \in \Theta \} \) be the collection of subsets of \( \mathbb{L}_p(\mathbb{R}^d, \nu_d) \cap \mathbb{L}_2(\mathbb{R}^d, \nu_d) \), where \( \vartheta \) is a nuisance parameter which may have very complicated structure.

The problem of adaptive estimation can be formulated as follows: is it possible to construct a single estimator \( \tilde{f}_\epsilon \) which would be simultaneously minimax on each class \( \mathbb{F}_\vartheta, \vartheta \in \Theta \), i.e.

\[
\mathcal{R}_\epsilon^{(p)}[\tilde{f}_\epsilon; \mathbb{F}_\vartheta] \sim \phi_\epsilon(\mathbb{F}_\vartheta), \quad \epsilon \to 0, \quad \forall \vartheta \in \Theta?
\]

We refer to this question as the problem of adaptive estimation over the scale of \( \{ \mathbb{F}_\vartheta, \vartheta \in \Theta \} \). If such estimator exists we will call it optimally or rate-adaptive.

In the present paper we will be interested in adaptive estimation over the scale

\[
\mathbb{F}_\vartheta = \mathbb{N}_{\tilde{r},d}(\tilde{\beta}, \tilde{L}), \quad \vartheta = (\tilde{\beta}, \tilde{r}, \tilde{L}),
\]

where \( \mathbb{N}_{\tilde{r},d}(\tilde{\beta}, \tilde{L}) \) is an anisotropic Nikolskii class, see Section 3.1 for formal definition. Here we only mention that for any \( f \in \mathbb{N}_{\tilde{r},d}(\tilde{\beta}, \tilde{L}) \) the coordinate \( \beta_i \) of the vector \( \tilde{\beta} = (\beta_1, \ldots, \beta_d) \in (0, \infty)^d \) represents the smoothness of \( f \) in the direction \( i \) and the coordinate \( r_i \) of the vector \( \tilde{r} = (r_1, \ldots, r_d) \in [1, \infty)^d \) represents the index of the norm in which \( \beta_i \) is measured. Moreover, \( \mathbb{N}_{\tilde{r},d}(\tilde{\beta}, \tilde{L}) \) is the intersection of the balls in some semi-metric space and the vector \( \tilde{L} \in (0, \infty)^d \) represents the radii of these balls.

The aforementioned dependence on the direction is usually referred to anisotropy of the underlying function and the corresponding functional class. The use of the integral norm in the definition of the smoothness is referred to inhomogeneity of the underlying function. The latter means that the function \( f \) can be sufficiently smooth on some part of the observation domain and rather irregular on the other part. Thus, the adaptive estimation over the scale \( \{ \mathbb{N}_{\tilde{r},d}(\tilde{\beta}, \tilde{L}), (\tilde{\beta}, \tilde{r}, \tilde{L}) \in (0, \infty)^d \times [1, \infty)^d \times (0, \infty)^d \} \) can be viewed as the adaptation to anisotropy and inhomogeneity of the function to be estimated.
1.3. Historical notes

The history of the adaptive estimation over scales of sets of smooth functions counts nowadays 30 years. During this time the variety of functional classes was introduced in the nonparametric statistics in particular Sobolev, Nikol’skii and Besov ones. The relations between different scales as well as between classes belonging to the same scale can be found, for instance, in Nikol’skii (1977). It is worth mentioning that although considered classes are different, the same estimation procedure may be minimax on them. In such situations we will say that the class $F_1$ \textit{statistically equivalent} to the class $F_2$ and write $F_1 \asymp F_2$. Also for two sequences $a_\varepsilon \to 0$ and $b_\varepsilon \to 0$ we will write $a_\varepsilon \sim b_\varepsilon$ and $a_\varepsilon \gtrsim b_\varepsilon$ if $0 < \lim_{\varepsilon \to 0} a_\varepsilon b_\varepsilon^{-1} < \infty$ and $\lim_{\varepsilon \to 0} a_\varepsilon b_\varepsilon^{-1} \geq 1$ respectively.

**Estimation of univariate functions** The first adaptive results were obtained in Efroimovich and Pinsker (1984). The authors studied the problem of adaptive estimation over the scale of periodic Sobolev classes (Sobolev ellipsoids), $W(\beta, L)$, in the univariate model (1.1) under $L_2$-loss ($p = 2$). The exact asymptotics of minimax risk on $W(\beta, L)$ is given by $P(L)\varepsilon^{\frac{2\beta}{2\beta+1}}$, where $P(L)$ is the Pinsker constant. The authors proposed the estimation procedure based on blockwise bayesian construction and showed that it is adaptive efficient over the scale of considered classes. Noting that $W(\beta, L) \gg N_{2,1}(\beta, L)$ one can assert that Efroimovich-Pinsker estimator is rate-adaptive on $N_{2,1}(\beta, L)$ as well.

Starting from this pioneering paper a variety of adaptive methods under $L_2$-loss were proposed in different statistical models such as density and spectral density estimation, nonparametric regression, deconvolution model, inverse problems and many others. Let us mention some of them.

- Extension of Efroimovich-Pinsker method, Efroimovich (1986, 2008);
- Unbiased risk minimization, Golubev (1992), Golubev and Nussbaum (1992);
- Model selection, Barron et al. (1999), Birgé and Massart (2001), Birgé (2008);
- Aggregation of estimators, Nemirovski (2000), Juditsky and Nemirovski (2000), Wegkamp (2003), Tsybakov (2003), Rigollet and Tsybakov (2007), Bunea et al. (2007), Goldenshluger (2009);
- Exponential weights, Leung and Barron (2006), Dalalyan and Tsybakov (2008), Rigollet and Tsybakov (2011);
- Risk hull method, Cavalier and Golubev (2006);
- Blockwise Stein method, Cai (1999), Cavalier and Tsybakov (2001), Rigollet (2006).

Some of aforementioned papers deal with not only adaptation over the scale of functional classes but contain sharp oracle inequalities (about oracle approach and its relation to adaptive estimation see for instance Goldenshluger and Lepski (2012) and the references therein). Without any doubts the adaptation under $L_2$-loss is the best developed area of the adaptive estimation. Rather detailed overview and some new ideas related to this topic can be found in the recent paper Baraud et al. (2014a).

The adaptive estimation under $L_p$-loss, $1 \leq p \leq \infty$ was initiated in Lepskii (1991) over the collection of Hölder classes, i.e. $N_{\infty,1}(\beta, L)$. The asymptotics of minimax risk is given by

$$
\phi(N_{\infty,1}(\beta, L)) \sim \begin{cases} 
\varepsilon^{\frac{2\beta}{2\beta+1}}, & p \in [1, \infty); \\
(\varepsilon^2 |\ln(\varepsilon)|)^{\frac{\beta}{2\beta+1}}, & p = \infty.
\end{cases}
$$

The author constructed the optimally-adaptive estimator which is obtained by the selection from the family of piecewise polynomial estimators. Selection rule is based on pairwise comparison of
estimators (bias-majorant tradeoff). Some sharp results were obtain in Lepskii (1992b), where efficient adaptive estimator was proposed in the case of $L_\infty$-loss, see also Tsybakov (1998).

Recent development in adaptive univariate density estimation under $L_\infty$-loss can be found in Giné and Nickl (2009), Gach et al. (2013). Another "extreme" case, the estimation under $L_1$-loss, was scrutinized in Devroye and Lugosi (1996), Devroye and Lugosi (1997).

The consideration of the classes of inhomogeneous functions in nonparametric statistics has been started in Nemirovski (1985), where the minimax rates of convergence were established and minimax estimators were constructed in the case of generalized Sobolev classes. The adaptive estimation problem over the scale of Besov classes $B_{r,q}^\beta(L)$ was studied for the first time in Donoho et al. (1996) in the framework of the density model. We note that $B_{r,\infty}^\beta = N_{r,1}(\beta, L)$ and although $B_{r,q}^\beta \supset N_{r,1}(\beta, L)$ for any $q \geq 1$, see Nikol’skii (1977), one has $B_{r,q}^\beta \supset N_{r,1}(\beta, L)$.

The same problem in the univariate model (1.1) was studied in Lepski et al. (1997). The asymptotics of minimax risk is given by

$$
\phi(B_{r,q}^\beta(L)) \sim \begin{cases} 
\varepsilon^{2\beta}, & (2\beta + 1)r > p; \\
(\varepsilon^2 \ln(\varepsilon))^{\beta - 1/r + 1/p}, & (2\beta + 1)r \leq p.
\end{cases}
$$

The set of parameters satisfying $r(2\beta + 1) > p$ is called in the literature the dense zone and the case $r(2\beta + 1) \leq p$ is referred to the sparse zone. As it was shown in Donoho et al. (1996) hard threshold wavelet estimator is nearly adaptive over the scale of Besov classes. The latter means that the maximal risk of the proposed estimator differs from $\phi(B_{r,q}^\beta(L))$ by logarithmic factor on the dense zone and on the boundary $(2\beta + 1)r = p$. The similar result was proved in Lepski et al. (1997) but for completely different estimation procedure: for the first time local bandwidth selection scheme was used for the estimation of entire function. Moreover, the computations of the maximal risk of the proposed estimator on $B_{r,q}^\beta(L)$ was made by integration of the local oracle inequality.

It is important to emphasize that both aforementioned results were proved under additional assumption

$$
1 - (\beta r)^{-1} + (\beta p)^{-1} > 0. 
$$

Independently, the approach similar to Lepski et al. (1997) was proposed in Goldenshluger and Nemirovski (1997). The authors constructed nearly adaptive estimation over the scale of generalized Sobolev classes.

The optimally adaptive estimator over the scale of Besov classes was built in Juditsky (1997). The estimation procedure is the hard threshold wavelet construction with random thresholds those choice are based on some modification of the comparison scheme proposed in Lepskii (1991). Several years later similar result was obtained in Johnstone and Silverman (2005). The estimation method is again hard threshold wavelet estimator but with empirical bayes selection of thresholds. Both results were obtained under additional condition $\beta > 1/r$ which is slightly stronger than (1.4). Efficient adaptive estimator over the scale of Besov classes under $L_2$-loss was constructed in Zhang (2005) by use of empirical bayes thresholding.

We finish this part with mentioning the papers Juditsky and Lambert–Lacroix (2004), Reynaud–Bouret et al. (2011), where very interesting phenomena related to the adaptive density estimation under $L_p$-loss with unbounded support were observed, and the paper Goldenshluger (2009), where $L_p$-aggregation of estimators was proposed.

**Multivariate function estimation** Much less is known when adaptive estimation of multivariate function is considered. The principal difficulty is related to the fact that the methods developed
in the univariate case cannot be directly generalized to the multivariate setting.

In the series of papers starting in the end of 70’s Ibragimov and Hasminskii studied the problem of minimax estimation over $N_{r,d}((\beta, L))$ under $\mathbb{L}_p$-losses in different statistical models, see Hasminskii and Ibragimov (1990) and references therein. Note, however, that these authors treated only the case $r_i = p, i = 1, \ldots, d$, that allowed to prove that standard linear estimators (kernel, local polynomial, etc) are minimax. The optimally adaptive estimator corresponding to the latter case was constructed in Goldenshluger and Lepski (2011) in the density model on $\mathbb{R}^d$.

The estimation over isotropic Besov class $\mathbb{B}^\beta_{r,q}( \bar{L} )$ was studied in Delyon and Juditsky (1996), where the authors established the asymptotic of minimax risk under $\mathbb{L}_p$-loss and constructed minimax estimators. Here the isotropy means that $\beta = (b, \ldots, b)$, $\bar{r} = (r, \ldots, r)$ and $\bar{L} = (L, \ldots, L)$. The asymptotics of minimax risk is given by
\[
\phi\left( \mathbb{B}^\beta_{r,q}( \bar{L} ) \right) \sim \begin{cases} 
\frac{e^{3b}}{p}, & (2b + d) r > dp; \\
\left( \frac{\epsilon^2}{\ln(\epsilon)} \right)^{b-d/r + \frac{1}{p} - \frac{d}{dp}}, & (2b + d) r \leq dp.
\end{cases}
\]

Nearly adaptive with respect to $\mathbb{L}_p$-risk, $1 \leq p < \infty$, estimator over collection of isotropic Nikolskii classes $N_{r,d}(\beta, L) \supseteq \mathbb{B}^\beta_{r,q}( \bar{L} )$ was built in Goldenshluger and Lepski (2008). The proposed procedure is based on the special algorithm of local bandwidth selection from the family of kernel estimators. The corresponding upper bound for maximal risks is proved under additional assumption $b > d/r$.

Bertin (2005) considered the problem of adaptive estimation over the scale of anisotropic H"older classes, i.e. $N_{r,d}(\beta, L)$ with $r_i = \infty$ for any $i = 1, \ldots, d$ under $\mathbb{L}_\infty$-loss. The asymptotics of minimax risk is given here by
\[
\phi\left( N_{r,d}(\beta, L) \right) \sim \left( \frac{\epsilon^2}{\ln(\epsilon)} \right)^{\frac{1}{2b+1}},
\]
where $1/\beta = 1/\beta_1 + \cdots + 1/\beta_d$. The construction of the optimally adaptive estimator is based on the selection rule from the family of kernel estimators developed in Lepski and Levit (1998).

Akakpo (2012) studied the problem of adaptive estimation over the scale of anisotropic Besov classes $\mathbb{B}^\beta_{r,q}( \bar{L} )$ under $\mathbb{L}_2$-loss in multivariate density model on the unit cube. The construction of the optimally-adaptive estimator is based on model selection approach and it uses sophisticated approximation bounds. Note however that all results are proved in the situation where coordinates of the vector $\bar{r}$ are the same ($r_i = r, i = 1, \ldots d$).

For the first time the minimax and minimax adaptive estimation over the scale of anisotropic classes $N_{r,d}(\beta, L)$ under $\mathbb{L}_p$-loss in the multivariate model (1.1) was studied in full generality in Kerkyacharian et al. (2001, 2008).

To describe the results obtained in this paper we will need the following notations used in the sequel as well. Set $\omega^{-1} = (\beta_1 r_1)^{-1} + \cdots + (\beta_d r_d)^{-1}$ and define for any $1 \leq s \leq \infty$
\[
\tau(s) = 1 - 1/\omega + 1/(s\beta), \quad \varkappa(s) = \omega(2 + 1/\beta) - s.
\]

In Kerkyacharian et al. (2001) under assumption
\[
\tau(\infty) > 0, \quad \sum_{i=1}^d \left[ 1/(r_i \beta_i) - 1/(p \beta_i) \right] < 2/p \tag{1.5}
\]
(called by the authors the dense zone) the following asymptotics of minimax risk was found
\[
\phi_{\epsilon}(N_{r,d}(\beta, L)) \sim \epsilon^{\frac{d}{2b+1}}.
\]
In Kerkyacharian et al. (2008) under assumption
\[ \tau(\infty) > 0, \quad \varkappa(p) \leq 0, \quad \bar{r} \in [1, p]^d, \] (1.6)
called by the authors the sparse zone) the following asymptotics of minimax risk was found
\[ \phi_\varepsilon(N_{\bar{r},d}(\bar{\beta}, \bar{L})) \sim (\varepsilon^2 |\ln(\varepsilon)|)^{\frac{\varkappa(p)}{2\tau(p)}} \].

The authors built nearly adaptive with respect to $\mathbb{L}_p$-risk, $1 \leq p < \infty$, estimator. Its construction is based on the pointwise bandwidths selection rule which differs from whose presented in Lepski and Levit (1998) as well as from the construction developed several years later in Goldenshluger and Lepski (2008, 2013). It is important to emphasize that the method developed in the present paper is in some sense a "global" version of the aforementioned procedure.

The existence of an optimally-adaptive estimator as well as the asymptotics of minimax risk in the case, where assumptions (1.5) and (1.6) are not fulfilled, remained an open problem. Note also that the assumption (1.4) appeared in the univariate case can be rewritten as $\tau(p) > 0$. The minimax as well as adaptive estimation in the case $\tau(p) \leq 0$ was not investigated. One can suppose that a uniformly consistent estimator on $\mathbb{N}_{-1}(\beta, L)$ does not exist if $\tau(p) \leq 0$ since $\tau(p) > 0$ is the sufficient condition for the compact embedding of the univariate Nikol’skii space into $\mathbb{L}_p$, see Nikol’skii (1977).

The attempt to shed light on aforementioned problems was recently undertaken in Goldenshluger and Lepski (2013) in the framework of the density estimation on $\mathbb{R}^d$. The authors are interested in adaptive estimation under $\mathbb{L}_p$-loss, $p \in [1, \infty)$ over the collection of functional classes
\[ \mathbb{F}_\vartheta = N_{\bar{r},d}(\bar{\beta}, \bar{L}, M) := N_{\bar{r},d}(\bar{\beta}, \bar{L}) \cap \{ f : \|f\|_{\infty} \leq M \}, \quad \vartheta = (\bar{\beta}, \bar{r}, \bar{L}, M). \]
Adapting the results obtained in the latter paper to the observation model (1.1) we first state that the asymptotics of the minimax risk satisfies
\[ \phi_\varepsilon(N_{\bar{r},d}(\bar{\beta}, \bar{L}, M)) \gtrsim \mu_\varepsilon^\nu \]
where
\[ \nu = \begin{cases} \frac{\beta}{2\beta+1}, & \varkappa(p) > 0; \\ \frac{\tau(p)}{2\tau(2)}, & \varkappa(p) \leq 0, \tau(\infty) > 0; \\ \frac{\omega}{p}, & \varkappa(p) \leq 0, \tau(\infty) \leq 0; \end{cases} \]
\[ \mu_\varepsilon = \begin{cases} \varepsilon^2, & \varkappa(p) > 0 \text{ or } \varkappa(p) \leq 0, \tau(\infty) \leq 0; \\ \varepsilon^2 |\ln(\varepsilon)|, & \varkappa(p) \leq 0, \tau(\infty) > 0. \end{cases} \]

It is important to note that the obtained lower bound remains true if $p = \infty$ that implies in particular that under $\mathbb{L}_\infty$-loss there is no a uniformly consistent on $N_{\bar{r},d}(\bar{\beta}, \bar{L}, M)$ estimator if $\tau(\infty) \leq 0$ (note that $\varkappa(\infty) = -\infty$).

The authors proposed nearly adaptive estimator, i.e. the estimator whose maximal risk is proportional to $(\varepsilon^2 |\ln(\varepsilon)|)^\nu$, whatever the value of the nuisance parameter $\vartheta = (\bar{\beta}, \bar{r}, \bar{L}, M)$ and $p \in [1, \infty)$.

Thus, the existence of optimally-adaptive estimators remains an open problem. Moreover, all discussed results are obtained under additional assumption that the underlying function is uniformly bounded. We will see that the situation change completely if this condition does not hold. The optimally-adaptive estimator over the scale of anisotropic Nikol’skii classes under $\mathbb{L}_\infty$-loss was constructed in Lepski (2013a) under assumption $\tau(\infty) > 0$. Since $\tau(\infty) > 0$ implies automatically
that $N_{\vec{r},d}(\vec{r},\vec{L},M) = N_{\vec{r},d}(\vec{r},\vec{L})$ for some $M$ completely determined by $\vec{L}$ the investigation under $L_\infty$-loss is finalized.

We would like to finish our short overview with mentioning works where the adaptation is studied not only with respect to the smoothness properties of the underlying function but also with respect to some structural assumptions imposed on the statistical model.

- Composite function structure, Horowitz and Mamen (2007), Iouditski et al. (2009), Baraud and Birgé (2014);
- Multi-index structure (single-index, projection pursuit etc), Hristache et al. (2001), Goldenshluger and Lepski (2009), Lepski and Serdyukova (2014);
- Multiple index model in density estimation, Samarov and Tsybakov (2007).
- Independence structure in density estimation, Lepski (2013a).

The problems of adaptive estimation over the scale of functional classes defined on some manifolds were studied Kerkyacharian et al. (2011), Kerkyacharian et al. (2012).

1.4. Objectives

Considering the collection of functional classes

$$F_\vartheta = N_{\vec{r},d}(\vec{r},\vec{L})$$

we want to answer on the following questions

1. **What is the optimal decay of the minimax risk for any fixed value of the nuisance parameter $\vartheta$ and norm index $p \in [1, \infty]$?**
2. **Do optimally-adaptive estimators always exist?**

To realize this program we propose first a new data-driven selection rule from the family of kernel estimators with varying bandwidths and establish for it so-called $L_p$-norm oracle inequality. Then, we use this inequality in order to prove the adaptivity properties of the proposed estimation procedure.

Let us discuss our approach more in detail. Throughout of the paper we will use the following notations. For any $u, v \in \mathbb{R}^d$ the operations and relations $u/v, uv, u \lor v, u \land v, u < v, au, a \in \mathbb{R}$, are understood in coordinate-wise sense and $|u|$ stands for euclidian norm of $u$. All integrals are taken over $\mathbb{R}^d$ unless the domain of integration is specified explicitly. For any real $a$ its positive part is denoted by $(a)_+$ and $[a]$ is used for its integer part.

**Kernel estimator with varying bandwidth** Put $\mathcal{H} = \{h_s = e^{-s^2}, s \in \mathbb{N}\}$ and denote by $\mathcal{S}_1$ the set of all measurable functions defined on $(-b,b)^d$ and taking values in $\mathcal{H}$. Introduce

$$\mathcal{S}_d = \{\vec{h} : (-b,b)^d \to \mathcal{H} : \vec{h}(x) = (h_1(x), \ldots, h_d(x)), x \in (-b,b)^d, h_i \in \mathcal{S}_1, i = 1, \ldots, d\}. $$

Let $K : \mathbb{R}^d \to \mathbb{R}$ be a function satisfying $\int K = 1$. With any $\vec{h} \in \mathcal{S}_d$ we associate the function

$$K_{\vec{h}}(t,x) = V_{\vec{h}}^{-1}(x)K\left(\frac{t - x}{h(x)}\right), \quad t \in \mathbb{R}^d, x \in (-b,b)^d, $$

where $V_{\vec{h}}(x) = \prod_{i=1}^d h_i(x)$. Let $\mathcal{S}^*$ be a given subset of $\mathcal{S}_d$. Consider the family of estimators

$$\mathcal{F}(\mathcal{S}^*) = \left\{\hat{F}_{\vec{h}}(x) = X_t \left(K_{\vec{h}}(\cdot, x)\right), \quad \vec{h} \in \mathcal{S}^*, x \in (-b,b)^d\right\}. $$

(1.7)
We will call these estimators kernel estimators with varying bandwidth. This type of estimators was introduced in Müller and Stadtmüller (1987) in the context of cross-validation technique.

We will be particularly interested in the set $\mathcal{S}^* = \mathcal{S}^*_{d,\text{const}} \subset \mathcal{S}_d$ which consists of constant functions. Note that if $\tilde{h} \in \mathcal{S}^*_{d,\text{const}}$ we come to the standard definition of kernel estimator in white gaussian noise model.

In view of (1.1) we have the following decomposition which will be useful in the sequel
\[
\tilde{f}_h(x) - f(x) = \int K_h(t, x)[f(t) - f(x)]\nu_d(dt) + \varepsilon \xi_h(x), \quad \xi_h(x) = \int K_h(t, x)W(dt).
\]

We note that $\xi_h$ is centered gaussian random field on $(-b, b)^d$ with the covariance function
\[
V_\xi^{-1}(x)V_\xi^{-1}(y) = K\left(\frac{t-x}{h(x)}\right)K\left(\frac{t-y}{h(y)}\right)\nu_d(dt), \quad x, y \in (-b, b)^d.
\]

**Oracle approach** Our goal is to propose data-driven (based on $X^\varepsilon$) selection procedure from the collection $\mathcal{F}(\mathcal{S}^*)$ and establish for it $L_p$-norm oracle inequality. More precisely we construct the random field $(\tilde{h}(x), \ x \in (-b, b)^d)$ completely determined by the observation $X^\varepsilon$, such that $x \mapsto \tilde{h}(x)$ belongs to $\mathcal{S}^*$, and prove that for any $p \in [1, \infty]$, $q \geq 1$ and $\varepsilon > 0$ small enough
\[
\mathcal{R}_{\varepsilon}^{(p)}[\tilde{f}_h; f] \leq \Upsilon_1 \inf_{\tilde{h} \in \mathcal{S}^*} A^{(\varepsilon)}(\tilde{f}, \tilde{h}) + \Upsilon_2 \varepsilon.
\]

Here $\Upsilon_1$ and $\Upsilon_2$ are numerical constants depending on $d, p, q, b$ and $K$ only and the inequality (1.9) is established for any function $f \in L_p(\mathbb{R}^d, \nu_d) \cap L_2(\mathbb{R}^d, \nu_d)$. We call (1.9) $L_p$-norm oracle inequality.

We provide with explicit expression of the functional $A^{(\varepsilon)}(\cdot, \cdot)$ that allows us to derive different minimax adaptive results from the unique $L_p$-norm oracle inequality. In this context it is interesting to note that in the "extreme cases" $p = 1$ and $p = \infty$ it suffices to select the estimator from the family $\mathcal{F}(\mathcal{S}^*)$. When $p \in (1, \infty)$, the oracle inequality (1.9) as well as the selection from the family $\mathcal{F}(\mathcal{S}^*)$ will be done for some special choice of bandwidth’s set $\mathcal{S}^*$. We will see that the restrictions imposed on $\mathcal{S}^*$ are rather weak that will allow us to prove very strong adaptive results presented in Section 3.

**1.5. Organization of the paper**

In Section 2 we present our selection rule and formulate for it $L_p$-norm oracle inequality, Theorem 1. Its consequence related to the selection from the family $\mathcal{S}^*_{d,\text{const}}$ is established in Corollary 1. Section 3 is devoted to adaptive estimation over the collection of anisotropic Nikolskii classes. Lower bound result is formulated in Theorem 2 and the adaptive upper bound is presented in Theorem 3. In Section 4 we discuss open problems in adaptive minimax estimation in different statistical models. Proofs of main results are given in Sections 5–7 and all technical lemmas are proven in Appendix.

**2. Selection rule and $L_p$-norm oracle inequality**

**2.1. Functional classes of bandwidths**

Put for any $\tilde{h} \in \mathcal{S}_d$ and any $s = (s_1, \ldots, s_d) \in \mathbb{N}^d$
\[
\Lambda_s[\tilde{h}] = \cap_{j=1}^d \Lambda_{s_j}(h_j), \quad \Lambda_{s_j}(h_j) = \{x \in (-b, b)^d : h_j(x) = h_{s_j}\}.
\]
Let \( \varepsilon \in (0, 1) \) and \( L > 0 \) be given constants. Define

\[
\mathbb{H}_d(\varepsilon, L) = \left\{ \tilde{h} \in \mathcal{G}_d : \sum_{s \in \mathbb{N}^d} \nu^\varepsilon_d\left( \Lambda_s[\tilde{h}] \right) \leq L \right\}.
\]

We remark that obviously \( \mathcal{G}^\text{const}_d \subset \mathbb{H}_d(\varepsilon, L) \) for any \( \varepsilon \in (0, 1) \) and \( L = (2b)^\varepsilon \).

Put \( \mathbb{N}^*_p = \{ |p| + 1, |p| + 2, \ldots \} \) and define for any \( A \geq e^d \)

\[
\mathbb{B}(A) = \bigcup_{r \in \mathbb{N}^*_p} \mathbb{B}_r(A), \quad \mathbb{B}_r(A) = \left\{ \tilde{h} \in \mathcal{G}_d : \left\| V_\tilde{h}^{-\frac{1}{2}} \right\|_{r^{-p}} \leq A \right\}.
\]

Later on in the case \( p \in (1, \infty) \) we will be interested in selection from the family \( \mathcal{F}(\mathbb{H}) \), where \( \mathbb{H} \) is an arbitrary subset of \( \mathbb{H}_d(\varepsilon, L, A) := \mathbb{H}_d(\varepsilon, L) \cap \mathbb{B}(A), \varepsilon \in (0, 1/d), \) with some special choice \( A = A_\varepsilon \rightarrow \infty, \varepsilon \rightarrow 0 \).

The following notations related to the functional class \( \mathbb{B}(A) \) will be exploited in the sequel. For any \( \tilde{h} \in \mathbb{B}(A) \) define

\[
\mathbb{N}^*_p(\tilde{h}, A) = \mathbb{N}^*_p \cap [r_\mathbb{A}(\tilde{h}), \infty), \quad r_\mathbb{A}(\tilde{h}) = \inf \{ r \in \mathbb{N}^*_p : \tilde{h} \in \mathbb{B}_r(\mathbb{A}) \}.
\]

Obviously \( r_\mathbb{A}(\tilde{h}) < \infty \) for any \( \tilde{h} \in \mathbb{B}(A) \).

**Assumptions imposed on the kernel \( K \)**

Let \( a \geq 1 \) and \( A > 0 \) be fixed.

**Assumption 1.** There exists \( K : \mathbb{R} \rightarrow \mathbb{R} \) such that \( \int K = 1, \text{ supp}(K) \subset [-a, a] \) and

(i) \( |K(s) - K(t)| \leq A|s - t|, \forall s, t \in \mathbb{R}; \)

(ii) \( K(x) = \prod_{i=1}^d K(x_i), \forall x = (x_1, \ldots, x_d) \in \mathbb{R}^d \)

Throughout the paper we will consider only kernel estimators with \( K \) satisfying Assumption 1.

### 2.2. Upper functions and the choice of parameters

Put

\[
h_\varepsilon := e^{-\sqrt{\ln(e)}}, \quad A_\varepsilon := e^{\ln^2(e)},
\]

and let \( \mathcal{G}_d(h_\varepsilon) \subset \mathcal{G}_d \) consists of the functions \( \tilde{h} \) taking values in \( \mathcal{F}^d(h_\varepsilon) := \mathcal{F}^d \cap (0, h_\varepsilon]^d \).

Set \( C_2(r) = C_2(r, d\varepsilon, (2\mathbb{E})^d) \) and define for any \( \tilde{h} \in \mathbb{B}(A_\varepsilon) \)

\[
\tilde{\Psi}_{\varepsilon,p}(\tilde{h}) = C_1 \left\| \sqrt{\ln (eV_\tilde{h})} |V_\tilde{h}|^{-\frac{1}{2}} \right\|_{r^{-p}}, \quad p \in [1, \infty]
\]

\[
\tilde{\Psi}_{\varepsilon,p}(\tilde{h}) = \inf_{r \in \mathbb{N}^*_p(\tilde{h}, A_\varepsilon)} \left\| \int_{r^{-p}} \right\|_{r^{-p}}, \quad p \in [1, \infty).
\]

Introduce finally

\[
\Psi_{\varepsilon,p}(\tilde{h}) = \begin{cases}
\tilde{\Psi}_{\varepsilon,p}(\tilde{h}) \land \tilde{\Psi}_{\varepsilon,p}(\tilde{h}), & \tilde{h} \in \mathbb{B}(A_\varepsilon) \cap \mathcal{G}_d(h_\varepsilon), \ p \in [1, \infty); \\
\tilde{\Psi}_{\varepsilon,p}(\tilde{h}), & \tilde{h} \in \mathbb{B}(A_\varepsilon) \setminus \mathcal{G}_d(h_\varepsilon), \ p \in [1, \infty].
\end{cases}
\]
Some remarks are in order.

1) The constant $C_1$ depends on $K, d, p$ and $b$ and its explicit expression is given in Section 5.1. The explicit expression of the quantity $C_2(r, \tau, L), r > p, \tau \in (0,1), L > 0$, can be found in Lepski (2013b), Section 3.2.2. Its definition is rather involved and since it will not be exploited in the sequel we omit the definition of the latter quantity in the present paper. Here we only mention that $C_2(r, \tau, L) : (p, \infty) \to \mathbb{R}_+$ is bounded on each bounded interval. However $C_2(r, \tau, L) \to \infty, r \to \infty$.

2) The selection rule presented below exploits heavily the fact that $\{\Psi_{\epsilon,p}(\hat{h}), \hat{h} \in \mathbb{H}\}, p \in [1,\infty]$, is the upper function for the collection $\{\|\xi_{\eta}\|_p, \eta \in \mathbb{H}\}$. Here the random field $\xi_{\eta}$ appeared in the decomposition (1.8) of kernel estimator and $\mathbb{H}$ is an arbitrary countable subset of $\mathbb{H}_d(\tau, \kappa, \mathcal{A})$. The latter result is recently proved in Lepski (2013b), and it is presented in Proposition 1, Section 5.2.

3) The choice of $h_\epsilon$ and $A_\epsilon$ is mostly dictated by the following simple observation which will be used for proving adaptive results presented in Section 3.

$$\lim_{\epsilon \to 0} \epsilon^{-a} h_\epsilon = \infty, \quad \lim_{\epsilon \to 0} \epsilon^a A_\epsilon = \infty, \ \forall a > 0. \quad (2.3)$$

The general relation between parameters $h_\epsilon$ and $A_\epsilon$ can be found in Lepski (2013b).

### 2.3. Selection rule

Let $\mathbb{H}$ be a countable subset of $\mathbb{H}_d(\tau, \kappa, \mathcal{A})$. Define

$$\widehat{R}_\mathbb{H}(\hat{h}) = \sup_{\eta \in \mathbb{H}} \left[ \left\| \hat{f}_{\hat{h} \vee \eta} - \hat{f}_{\eta} \right\|_p - \epsilon \Psi_{\epsilon,p}(\hat{h} \vee \eta) - \epsilon \Psi_{\epsilon,p}(\eta) \right]_+, \ \hat{h} \in \mathbb{H}. \quad (2.4)$$

Our selection rule is given now by $\hat{h}_0 = \arg \inf_{\hat{h} \in \mathbb{H}} \left\{ \widehat{R}_\mathbb{H}(\hat{h}) + \epsilon \Psi_{\epsilon,p}(\hat{h}) \right\}$. Since $\hat{h}_0$ does not necessarily belong to $\mathbb{H}$ we define finally $\hat{h} \in \mathbb{H}$ from the relation

$$\widehat{R}_\mathbb{H}(\hat{h}) + \epsilon \Psi_{\epsilon,p}(\hat{h}) \leq \widehat{R}_\mathbb{H}(\hat{h}_0) + \epsilon \Psi_{\epsilon,p}(\hat{h}_0) + \epsilon, \quad (2.5)$$

that leads to the estimator $\hat{f}_{\hat{h}}$.

**Remark 1.** We restrict ourselves by consideration of countable subsets of $\mathbb{H}_d(\tau, \kappa, \mathcal{A})$ in order not to discuss the measurability of $\hat{f}_{\hat{h}}^\epsilon$. Formally, the proposed selection rule can be applied for any $\mathbb{H} \subseteq \mathbb{H}_d(\tau, \kappa, \mathcal{A})$ for which final estimator can be correctly defined.

### 2.4. $L_p$-norm oracle inequality

For any $\bar{h} \in \mathbb{E}_d$ define

$$S_{\bar{h}}(x, f) = \int_{\mathbb{R}^d} K_{\bar{h}}(t - x) f(t) \nu_d(dt), \ x \in \mathbb{R}^d,$$

which is understood as kernel approximation (smoother) of the function $f$ at a point $x$.

For any $\hat{h}, \bar{h} \in \mathbb{E}_d$ introduce also

$$B_{\hat{h}, \bar{h}}(x, f) := |S_{\hat{h} \vee \bar{h}}(x, f) - S_{\bar{h}}(x, f)|, \quad B_{\hat{h}}(x, f) = |S_{\hat{h}}(x, f) - f(x)|, \quad (2.6)$$

and define finally for any $p \in [1, \infty]$

$$B_{\hat{h}}^p(f) = \sup_{\bar{h} \in \mathbb{H}} \left\| B_{\hat{h}, \bar{h}}(\cdot, f) \right\|_p + \left\| B_{\hat{h}}(\cdot, f) \right\|_p. \quad (2.7)$$
**Theorem 1.** Let Assumption 1 be fulfilled and let \( p \in [1, \infty], q \geq 1, \varpi \in (0, 1/d) \) and \( \mathcal{L} \geq 1 \) be fixed. Then, there exists \( \varepsilon(q) > 0 \) such that for any any \( \varepsilon \leq \varepsilon(q) \) and \( H \subseteq \mathbb{H}_d(\varpi, \mathcal{L}, \mathcal{A}_\varepsilon) \)

\[
\mathcal{R}_{\varepsilon}^{(p)}[\hat{f}_H; f] \leq 5 \inf_{\hat{h} \in \mathbb{H}} \left\{ B_{\hat{h}}^{(p)}(f) + \varepsilon \Psi_{\varepsilon, p}(\hat{h}) \right\} + 9(C_3 + C_4 + 2)\varepsilon, \quad \forall f \in L_p(\mathbb{R}^d, \nu_d) \cap L_2(\mathbb{R}^d, \nu_d).
\]

The quantities \( C_3 \) and \( C_4 \) depend on \( \mathcal{K}, p, q, b \) and \( d \) only and their explicit expressions are presented in the Section 5.1.

**Some consequences** The selection rule (2.5) deals with the family of kernel estimators with varying bandwidths. This allows, in particular, to apply \( L_p \)-norm oracle inequality established in Theorem 1 to adaptive estimation over the collection of inhomogeneous and anisotropic functional classes. However in some cases it suffices to select from much less "massive" set of bandwidths namely from \( \mathcal{G}^\text{const}_d \). In this case one can speak about standard multi-bandwidth selection. In particular, in the next section we will show that the selection from \( \mathcal{G}^\text{const}_d \) leads to optimally adaptive estimator over anisotropic Nikol’skii classes if \( p = \{1, \infty\} \). Moreover, considering \( \mathcal{G}^\text{const}_d \) we simplify considerably the "approximation error" \( B_{\hat{h}}^{(p)}(f) \) as well as the upper function \( \Psi_{\varepsilon, p}(\cdot) \). The following corollary of Theorem 1 will be proved in Section 5.2.

Set \( C_{2,p} = (2b)^d \inf_{r \in \mathbb{R}^d} C_2(r) \) and define for any \( \bar{h} \in \mathcal{G}^\text{const}_d(\bar{h}) := \mathcal{G}^\text{const}_d \cap \mathcal{G}_d(\bar{h}) \)

\[
\Psi_{\varepsilon, p}^{(\text{const})}(\bar{h}) = C_{2,P} V_{\bar{h}}^{-\frac{1}{2}}, \quad p \in [1, \infty), \quad \Psi_{\varepsilon, \infty}^{(\text{const})}(\bar{h}) = C_1 1 \ln(\varepsilon V_{\bar{h}}) V_{\bar{h}}^{-\frac{1}{2}}.
\]

Let \( \{e_1, \ldots, e_d\} \) be the canonical basis in \( \mathbb{R}^d \). For any \( \bar{h} \in \mathcal{G}^\text{const}_d \) introduce

\[
b_{\bar{h}, j}(x) = \sup_{s: h_s \leq h_j} \left| \int_{\mathbb{R}} K(u) f(x + uh_s e_j) \nu(du) - f(x) \right|, \quad j = 1, \ldots, d.
\]

Define finally \( \mathbb{H}^\text{const}_\varepsilon = \mathcal{G}^\text{const}_d(\varepsilon) \cap \{ \bar{h} : V_{\bar{h}} \geq (2b)^d \mathcal{A}_\varepsilon^{-2} \} \) and let \( \hat{f}_{\mathcal{H}}^{(\text{const})} \) be the estimator obtained by the selection rule (2.5) with \( \mathcal{H} = \mathbb{H}^\text{const}_\varepsilon \) and \( \Psi_{\varepsilon, p}(\hat{h}) \) replaced by \( \Psi_{\varepsilon, p}^{(\text{const})}(\bar{h}) \) given in (2.8).

**Corollary 1.** Let Assumption 1 be fulfilled and let \( p \in [1, \infty] \) and \( q \geq 1 \) be fixed. Then, there exists \( \varepsilon(q) > 0 \) such that for any \( \varepsilon \leq \varepsilon(q) \), \( \mathbb{H} \subseteq \mathbb{H}^\text{const}_\varepsilon \) and \( f \in L_p(\mathbb{R}^d, \nu_d) \cap L_2(\mathbb{R}^d, \nu_d) \)

\[
\mathcal{R}_{\varepsilon}^{(p)}[\hat{f}_{\mathcal{H}}^{(\text{const})}; f] \leq 5 \inf_{\bar{h} \in \mathcal{H}} \left\{ 3 \|K\|_{1, \infty} \|b_{\bar{h}, j}\|_p + \varepsilon \Psi_{\varepsilon, p}^{(\text{const})}(\bar{h}) \right\} + 9(C_3 + C_4 + 2)\varepsilon.
\]

We remark that since \( \mathbb{H}^\text{const}_\varepsilon \) is finite a selected multi-bandwidth \( \bar{h} \in \mathcal{H} \) is given by

\[
\bar{h} = \arg \inf_{\bar{h} \in \mathcal{H}} \left\{ \mathcal{R}_{\varepsilon}^{(p)}(\bar{h}) + \varepsilon \Psi_{\varepsilon, p}^{(\text{const})}(\bar{h}) \right\}.
\]

3. Adaptive estimation

In this section we study properties of the estimator defined in Section 2.3. The \( L_p \)-norm oracle inequalities obtained Theorem 1 and Corollary 1 can be viewed as initial step in bounding \( L_p \)-risk of this estimator on the anisotropic Nikol’skii classes.
3.1. Anisotropic Nikolskii classes

Recall that \((e_1, \ldots, e_d)\) denotes the canonical basis of \(\mathbb{R}^d\). For function \(g : \mathbb{R}^d \to \mathbb{R}^1\) and real number \(u \in \mathbb{R}\) define the first order difference operator with step size \(u\) in direction of the variable \(x_j\) by

\[
\Delta_{u,j}g(x) = g(x + u e_j) - g(x), \quad j = 1, \ldots, d.
\]

By induction, the \(k\)-th order difference operator with step size \(u\) in direction of the variable \(x_j\) is defined as

\[
\Delta^k_{u,j}g(x) = \Delta_{u,j} \Delta^{k-1}_{u,j} g(x) = \sum_{l=1}^{k} (-1)^{l+k} \binom{k}{l} \Delta_{u,j}^{l} g(x).
\] (3.1)

Definition 1. For given vectors \(\vec{r} = (r_1, \ldots, r_d)\), \(r_j \in [1, \infty]\), \(\vec{\beta} = (\beta_1, \ldots, \beta_d)\), \(\beta_j > 0\), and \(\vec{L} = (L_1, \ldots, L_d)\), \(L_j > 0, \ j = 1, \ldots, d\), we say that function \(g : \mathbb{R}^d \to \mathbb{R}^1\) belongs to the anisotropic Nikolskii class \(\bar{N}_{\vec{r}, d}(\vec{\beta}, \vec{L})\) if

(i) \(\|g\|_{r_j, \mathbb{R}^d} \leq L_j\) for all \(j = 1, \ldots, d\);
(ii) for every \(j = 1, \ldots, d\) there exists natural number \(k_j > \beta_j\) such that

\[
\left\| \Delta^{k_j}_{u,j}g \right\|_{r_j, \mathbb{R}^d} \leq L_j |u|^\beta_j, \quad \forall u \in \mathbb{R}, \ \forall j = 1, \ldots, d.
\] (3.2)

Recall that the consideration of white gaussian noise model requires \(f \in L_2(\mathbb{R}^d)\) that is not always guaranteed by \(f \in \bar{N}_{\vec{r}, d}(\vec{\beta}, \vec{L})\). So, later on we will study the functional classes \(N_{\vec{r}, d}(\vec{\beta}, \vec{L}) = \bar{N}_{\vec{r}, d}(\vec{\beta}, \vec{L}) \cap L_2(\mathbb{R}^d)\) which we will also call anisotropic Nikolskii classes. Some conditions guaranteed \(N_{\vec{r}, d}(\vec{\beta}, \vec{L}) = \bar{N}_{\vec{r}, d}(\vec{\beta}, \vec{L})\) can be found in Section 7.1.

3.2. Main results

Let \(N_{\vec{r}, d}(\vec{\beta}, \vec{L})\) be the anisotropic Nikolskii functional class. Put

\[
\frac{1}{\beta} := \sum_{j=1}^{d} \frac{1}{\beta_j}, \quad \frac{1}{\omega} := \sum_{j=1}^{d} \frac{1}{\beta_j r_j}, \quad L_\beta := \prod_{j=1}^{d} L_j^{1/\beta_j},
\]

and define for any \(1 \leq s \leq \infty\)

\[
\tau(s) = 1 - 1/\omega + 1/(s\beta), \quad \varphi(s) = \omega(2 + 1/\beta) - s.
\]

The following obvious relation will be useful in the sequel.

\[
\frac{\varphi(s)}{\omega s} = \frac{2 - s}{s} + \tau(s).
\] (3.3)
Set finally \( p^* = \lceil \max_{j=1,\ldots,d} r_j \rceil \vee p \) and introduce

\[
a = \begin{cases} 
\beta \frac{1}{2\beta + 1}, & \kappa(p) > 0; \\
\frac{\tau(p)}{2\tau(p)}, & \kappa(p) \leq 0, \ \tau(p^*) > 0; \\
\frac{\omega(p^*-p)}{p(p^*-\omega(2+1/\beta))}, & \kappa(p) \leq 0, \ \tau(p^*) \leq 0, \ p^* > p; \\
0, & \kappa(p) \leq 0, \ \tau(p^*) \leq 0; \ p^* = p.
\end{cases}
\]

\[
\delta_{\varepsilon} = \begin{cases} 
L\beta\varepsilon^2, & \kappa(p) > 0; \\
L\beta\varepsilon^2|\ln(\varepsilon)|, & \kappa(p) \leq 0, \ \tau(p^*) \leq 0; \\
\frac{L^{1-2/p}}{\beta\tau(p)}\varepsilon^2|\ln(\varepsilon)|, & \kappa(p) \leq 0, \ \tau(p^*) > 0.
\end{cases}
\]

### 3.2.1. Lower bound of minimax risk

**Theorem 2.** Let \( q \geq 1, L_0 > 0 \) and \( 1 \leq p \leq \infty \) be fixed. Then for any \( \bar{\beta} \in (0,\infty)^d, \bar{r} \in [1,\infty]^d \) and \( \bar{L} \in [L_0,\infty)^d \) there exists \( c > 0 \) independent of \( \bar{L} \) such that

\[
\liminf_{\varepsilon \to 0} \inf \sup_{\beta \in \mathbb{N}_{r,d}(\bar{\beta}, \bar{L})} \delta_{\varepsilon}^{-\alpha} R_{\varepsilon}^{(p)}[\hat{f}; f] \geq c,
\]

where infimum is taken over all possible estimators.

Let us make several remarks.

1. **Case** \( p^* = p \). Taking into account (3.3) we note that there is no a uniformly consistent estimator over \( \mathbb{N}_{r,d}(\bar{\beta}, \bar{L}) \) if

\[
\tau(p)|_{[2,\infty)}(p) + \kappa(p)|_{[1,2)}(p) \leq 0,
\]

and this result seems to be new. As it will follow from the next theorem the latter condition is necessary and sufficient for nonexistence of uniformly consistent estimators over \( \mathbb{N}_{r,d}(\bar{\beta}, \bar{L}) \) under \( L^p \)-loss, \( 1 \leq p \leq \infty \). In the case of \( L^\infty \)-loss, (3.4) is reduced to \( \omega \leq 1 \) and the similar result was recently proved in Goldenshluger and Lepski (2013) for the density model.

2. **Case** \( \kappa(p) \leq 0, \ \tau(p^*) \leq 0, \ p^* > p \). The lower bound for minimax risk given in this case by

\[
(L\beta\varepsilon^2|\ln(\varepsilon)|)^{\frac{\omega(p^*-p)}{p(p^*\omega(2+1/\beta))}}
\]

is new. It is interesting that the latter case does not appear in the dimension 1 or, more generally, when isotropic Nikolskii classes are considered. Indeed, if \( r_l = r \) for all \( l = 1,\ldots,d \), then \( p^* > p \) means \( r > p \) that, in its turn, implies \( \tau(p^*) = \tau(r) = 1 > 0 \). It is worth mentioning that we improve in order the lower bound recently found in Goldenshluger and Lepski (2013), which corresponds formally to our case \( p^* = \infty \).

3. **Case** \( \kappa(p) \leq 0, \ \tau(p^*) > 0 \). For the first time the same result was proved in Kerkyacharian et al. (2008) but under more restrictive assumption \( \kappa(p) \leq 0, \ \tau(\infty) > 0 \). Moreover, the dependence of the asymptotics of the minimax risk on \( \bar{L} \) was not optimal.

4. **Case** \( \kappa(p) > 0 \). Presented lower bound of minimax risk became the statistical folklore since it is the minimax rate of convergence over anisotropic Hölder class \( (r_l = \infty, \ l = 1,\ldots,d) \). If so, the required result can be easily deduced from the embedding of a Hölder class to \( \mathbb{N}_{r,d}(\bar{\beta}, \bar{L}) \) whatever the value of \( \bar{r} \). However the author was enable to find exact references and derived the announced
result from the general construction used in the proof of Theorem 2. Moreover we are interested in finding not only the optimal decay of the minimax risk with respect to $\varepsilon \to 0$ but also its correct dependence of the radii $\tilde{L}$.

3.2.2. Upper bound for minimax risk. Optimally-adaptive estimator

The results of this section will be derived from $L_p$-norm oracle inequalities proved in Theorem 1 and Corollary 1.

Construction of kernel $K$ We will use the following specific kernel $K$ [see, e.g., Kerkyacharian et al. (2001) or Goldenshluger and Lepski (2011)] in the definition of the estimator’s family (1.7).

Let $\ell$ be an integer number, and let $w : [-1/(2\ell), 1/(2\ell)] \to \mathbb{R}$ be a function satisfying $\int w(y)dy = 1$, and $w \in C^1(\mathbb{R})$. Put

$$w_\ell(y) = \sum_{i=1}^\ell \left(\frac{\ell}{i}\right) (-1)^{i+1} \frac{1}{i} w\left(\frac{y}{i}\right), \quad K(t) = \prod_{j=1}^d w_\ell(t_j), \quad t = (t_1, \ldots, t_d).$$ (3.5)

Set of bandwidths Set $t_{k,n} = -(b+1) + (b+1)k2^{1-n}$, $k = 0, \ldots, 2^n$, $n \in \mathbb{N}^*$ and let $\Delta_{k,n} = [t_{k,n}, t_{k+1,n}], \Delta_k = (\Delta_{k,n}, k = 0, \ldots, 2^{n-1}, \Delta_{k,n} = (t_{k,n}, t_{k+1,n}], k = 2^{n-1} + 1, \ldots, 2^n - 1$. Thus, $\{\Delta_{k,n}, k = 0, \ldots, 2^n\}$ forms the partition of $(-b-1, b+1)$ whatever $n \in \mathbb{N}^*$.

For any $n \in \mathbb{N}^*$ set also $\mathfrak{S}_n = \{0, \ldots, 2^n\}^d$ and define

$$\Gamma_d(n) = \left\{ \Delta_{k,n}^{(d)} = \Delta_{k,1,n} \times \cdots \times \Delta_{k,d,n}, \ k = (k_1, \ldots, k_d) \in \mathfrak{S}_n \right\}.$$ (3.6)

For any $n \in \mathbb{N}^*$ the collection of cubes $\Gamma_d(n)$ determines the partition of $(-b-1, b+1)^d$.

Denote by $\mathfrak{S}_d^{(n)}, n \in \mathbb{N}^*$, the set of all step functions defined on $(-b,b)^d$ with the steps belonging to $\Gamma_d(n) \cap (-b,b)^d$ and taking values in $\mathfrak{S}^d$.

Introduce finally for any $R > 0$

$$\mathbb{H}_\varepsilon(R) = \mathbb{H}_d(1/(2d), R, \mathcal{A}_\varepsilon) \cap \left\{ \cup_{n \in \mathbb{N}^*} \mathfrak{S}_d^{(n)} \right\},$$

where $\mathcal{A}_\varepsilon$ is given in (2.2).

Let $\hat{f}_R^{\text{(const)}}$, $R > 0$, denote the estimator obtained by the selection rule (2.4)–(2.5) from the family of kernel estimators $\mathcal{F}(\mathbb{H}_\varepsilon(R))$ and $\hat{f}_R^{\text{(const)}}$ denote the estimator constructed in Corollary 1. Both constructions are made with the kernel $K$ satisfying (3.5).

Adaptive upper bound For any $\ell \in \mathbb{N}^* and L_0 > 0$ set $\Theta = (0, \ell]^d \times [1, \infty]^d \times [L_0, \infty)^d$ and later on we will use the notation $\vartheta \in \Theta$ for the triplet $(\beta, r, L)$. Denote $\mathcal{P} = \Theta \times [1, \infty]$ and introduce

$$\mathcal{P}_{\text{consist}} = \left\{ (\vartheta, p) \in \mathcal{P} : \tau(p)1_{[2, \infty]}(p) + \varkappa(p)1_{[1, 2]}(p) > 0 \right\} \cup \left\{ (\vartheta, p) \in \mathcal{P} : p^* > p \right\}.$$ 

The latter set consists of the class parameters and norm indexes for which a uniform consistent estimation is possible.
Let $V_p(\tilde{L})$ be the quantity whose presentation is postponed to Section 7.4 since its expression is rather cumbersome. Put $L^* = \min_{j: r_j = p} L_j$ and introduce

$$\delta_\epsilon = \begin{cases} L_\beta \epsilon^2, & \kappa(p) \geq 0; \\ L_\beta (L^*)^{\frac{1}{2}} \epsilon^2 |\ln(\epsilon)|, & \kappa(p) \leq 0, \tau(p^*) \leq 0; \\ V_p(\tilde{L}) \epsilon^2 |\ln(\epsilon)|, & \kappa(p) \leq 0, \tau(p^*) > 0. \end{cases}$$

**Theorem 3.** Let $q \geq 1$, $L_0 > 0$ and $\ell > 0$ be fixed and let $R = 3 + \sqrt{2b}$.

1) For any $(\vartheta, p) \in \mathcal{P}^{\text{consist}}$ such that $p \in (1, \infty)$, $\varrho \in (1, \infty)^d$ and $\kappa(p) \neq 0$ there exists $C > 0$ independent of $\tilde{L}$ for which

$$\limsup_{\epsilon \to 0} \sup_{f \in \mathbb{N}_{r,d}(\tilde{L})} \delta_\epsilon^{-\vartheta} \mathcal{R}_p^{(\varrho)}(\hat{f}_h^{(\tilde{L})}; f) \leq C.$$ 

2) For any $(\vartheta, p) \in \mathcal{P}^{\text{consist}}$, $p \in \{1, \infty\}$ there exists $C > 0$ independent of $\tilde{L}$ for which

$$\limsup_{\epsilon \to 0} \sup_{f \in \mathbb{N}_{r,d}(\tilde{L})} \delta_\epsilon^{-\vartheta} \mathcal{R}_p^{(\text{const})}(\hat{f}_h^{(\tilde{L})}; f) \leq C.$$ 

3) For any $(\vartheta, p) \in \mathcal{P}^{\text{consist}}$ such that $p \in (1, \infty)$, $\varrho \in (1, \infty)^d$ and $\kappa(p) = 0$ there exists $C > 0$ independent of $\tilde{L}$ for which

$$\limsup_{\epsilon \to 0} \sup_{f \in \mathbb{N}_{r,d}(\tilde{L})} \delta_\epsilon^{-\vartheta} (|\ln(\epsilon)|)^{\frac{1}{p}} \mathcal{R}_p^{(\varrho)}(\hat{f}_h^{(\tilde{L})}; f) \leq C.$$ 

Some remarks are in order.

1$^0$. Combining the results of Theorems 2 and 3 we conclude that optimally-adaptive estimators under $L_p$-loss exist over all parameter set $\mathcal{P}^{\text{consist}}$ if $p \in \{1, \infty\}$. If $p \in (1, \infty)$ such estimators exist as well except the boundary cases $\kappa(p) = 0$ and $\min_{j=1,\ldots,d} r_j = 1$.

2$^0$. We remark that the upper and lower bound for minimax risk differ each other on the boundary $\kappa(p) = 0$ only by $(|\ln(\epsilon)|)^{\frac{1}{p}}$-factor. Using (1,1)-weak type inequality for strong maximal operator, Guzman (1975), one can prove adaptive upper bound on the boundary $\min_{j=1,\ldots,d} r_j = 1$ containing additional $\sqrt{|\ln(\epsilon)|}$-factor. Note, nevertheless, that exact asymptotics of minimax risk on both boundaries remains an open problem.

3$^0$. We obtain full classification of minimax rates over anisotropic Nikolskii classes if $p \in \{1, \infty\}$ and "almost" full one (except the boundaries mentioned above) if $p \in (1, \infty)$. We can assert that $\delta_\epsilon^0$ is minimax rate of convergence on $\mathbb{N}_{r,d}(\tilde{L})$ for any $\tilde{L} \in (0, \infty)^d$, $\varrho \in (1, \infty)^d$ and $\tilde{L} \in (0, \infty)^d$. Indeed, for given $\tilde{L}$ and $\tilde{L}$ one can choose $L_0 = \min_{j=1,\ldots,d} L_j$ and the number $\ell$, used in the kernel construction (3.5), as an any integer strictly larger than $\max_{j=1,\ldots,d} \beta_j$.

4$^0$. We remark that the dependence of minimax rate on $\tilde{L}$ is correct ( $\delta_\epsilon = \delta_\epsilon$) if $\kappa(p) \geq 0$. In spite of the cumbersome expression of the quantity $V_p(\tilde{L})$ one can easily check that

$$V_p(\tilde{L}) = L_\beta \frac{1-2/p}{\tau_p(p)}$$

if $L_j = L$ for any $j = 1, \ldots, d$. Hence, under this restriction $\delta_\epsilon = \delta_\epsilon$ if $\kappa(p) \leq 0, \tau(p^*) > 0$ as well.
4. Open problems in adaptive estimation

The goal of this section is to discuss the directions in adaptive multivariate function estimation to be developed. We do not pretend here to cover whole specter of existing problems and mostly restrict ourselves by consideration of the adaptation over the scale of anisotropic classes. Moreover we will be concentrated on principal difficulties and the mathematical aspect of the problem and we will not pay much attention to the technical details and practical applications. Although we will speak about adaptive estimation it is important to realize that for the majority of problems discussed below very little is known about the minimax approach.

4.1. Abstract statistical model

Let \((Y^{(n)}, \mathcal{A}^{(n)}, \mathbb{P}^{(n)}, f \in \mathcal{F})\) be the sequence of statistical experiments generated by observation \(Y^{(n)}, n \in \mathbb{N}^*\). Let \(\Lambda\) be a set and \(\rho : \Lambda \times \Lambda \to \mathbb{R}_+\) be a loss functional. The goal is to estimate the mapping \(G : \mathcal{F} \to \Lambda\) and as an estimator we understand a \(Y^{(n)}\)-measurable \(\Lambda\)-valued map.

The quality of an estimation procedure \(\hat{G}_n\) on \(\mathcal{F}\) is measured by the maximal risk

\[
\mathcal{R}_n[\hat{G}_n; \mathcal{F}] = \left\{ \sup_{f \in \mathcal{F}} \mathbb{E}^{(n)}_f \rho(\hat{G}_n, G(f)) \right\}^{\frac{1}{q}}, \quad q \geq 1.
\]

and as previously \(\phi_n(\mathcal{F}) = \inf_{\hat{G}_n} \mathcal{R}_n[\hat{G}_n; \mathcal{F}]\) denotes the minimax risk.

Assume that \(\mathcal{F} \supset \bigcup_{\theta \in \Theta} \mathcal{F}_{\theta}\), where \(\{\mathcal{F}_{\theta}, \theta \in \Theta\}\) is a given collection of sets.

PROBLEM I (fundamental): Find necessary and sufficient conditions of existence of optimally-adaptive estimators, i.e. the existence of an estimator \(\hat{G}_n\) satisfying

\[
\mathcal{R}_n[\hat{G}_n; \mathcal{F}_\theta] \sim \phi_n(\mathcal{F}_\theta), \quad \forall \theta \in \Theta.
\]

It is well-known that optimally-adaptive estimators do not always exist, see Lepskii (1990), Lepskii (1992a), Efroimovich and Low (1994), Cai and Low (2005). Hence, the goal is to understand how the answer on aforementioned question depends on the statistical model, underlying estimation problem (mapping \(G\)) and the collection of considered classes. The attempt to provide with such classification was undertaken in Lepskii (1992a), but found there sufficient conditions of existence as well as of nonexistence of optimally-adaptive estimators are too restrictive.

It is important to realize that the answers on formulated problem may be different even if the statistical model and the collection of functional classes are the same and estimation problems have "similar nature". Indeed, consider univariate model (1.1) and let \(\mathcal{F}_{\theta} = \mathbb{N}_{1,1}(\beta, L), \quad \theta = (\beta, L)\), be the collection of Hölder classes. Set

\[
G_{\infty}(f) = \|f\|_{\infty}, \quad G_2(f) = \|f\|_2.
\]

As we know the optimally-adaptive estimator of \(f\), say \(\hat{f}_n\), under \(L_\infty\)-loss was constructed in Lepskii (1991). Moreover the asymptotics of minimax risk under \(L_\infty\)-loss on \(\mathbb{N}_{1,1}(\beta, L)\) coincides with asymptotics corresponding to the estimation of \(G_{\infty}(\cdot)\). Therefore, \(\hat{G}_n := G_{\infty}(\hat{f}_n)\) is an optimally-adaptive estimator for \(G_{\infty}(\cdot)\). On the other hand, there is no optimally-adaptive estimator for \(G_2(\cdot)\), Cai and Low (2006).
4.2. **White gaussian noise model**

Let us return to the problems studied in the present paper. Looking at the optimally-adaptive estimator proposed in Theorem 3 we conclude that its construction is not feasible. Indeed, it is based on the selection from very huge set of parameters, sometimes even infinite.

**PROBLEM II (feasible estimator):** Find optimally-adaptive estimator whose construction would be computationally reasonable.

At our glance the interest to this problem is not related to the "practical applications" since the pointwise bandwidths selection rule from Goldenshluger and Lepski (2013) will do this job although it is not theoretically optimal. We think that "feasible solution" could bring new ideas and approaches to the construction of estimation procedures.

Another source of problems is structural adaptation. Let us consider one of the possible directions. Denote by $E$ the set of all $d \times s$ real matrices, $1 \leq s < d$. Introduce the following collection of functional classes

$$F_\vartheta = S_{r,d}((\beta, L), E) := \{ f : \mathbb{R}^d \to \mathbb{R} : f(x) = g(Ex), \ g \in N_{r,p}((\beta, L), E \in E) \}, \ \vartheta = (\beta, r, L, E).$$

**PROBLEM III (structural adaptation):** Prove or disprove the existence of optimally-adaptive estimators over the collection $S_{r,d}((\beta, L), E)$ under $L^p$-loss.

Note that if $r = (\infty, \ldots, \infty)$ (Hölder case) the optimally adaptive estimator was constructed in Goldenshluger and Lepski (2009). Nearly adaptive estimator in the case $s = 1$ (single index constraint) and $d = 2$ was proposed in Lepski and Serdyukova (2014). Many other structural models like additive, projection pursuit or their generalization, see Goldenshluger and Lepski (2009), can be studied as well.

4.3. **Density model**

Let $X_i, i = 1, \ldots, n$, be i.i.d. $d$-dimensional random vectors with common probability density $f$. The goal is to estimate $f$ under $L^p$-loss on $\mathbb{R}^d$.

**PROBLEM IV:** Prove or disprove the existence of optimally-adaptive estimators over the collection of anisotropic Nikolskii classes $N_{r,d}((\beta, L), E)$ under $L^p$-loss.

The last advances in this task were made in Goldenshluger and Lepski (2013). However, as it was conjectured in this paper, the developed there local approach cannot lead to the construction of optimally-adaptive estimators. On the other hand it is not clear how to adapt the approach developed in the present paper to the density estimation on $\mathbb{R}^d$. Indeed, the key element of our procedure is upper functions for $L^p$-norm of random fields found in Lepski (2013b). These results are heavily based on the fact that corresponding norm is defined on a bounded interval of $\mathbb{R}^d$.

The same problem can be formulated for more complicated deconvolution model. Recent advances in the estimation under $L^2$-loss in this model can be found in Comte and Lacour (2013).

4.4. **Regression model**

Let $\xi_i, i \in \mathbb{N}^*$, be i.i.d. symmetric random variables with common probability density $\varrho$ and let $X_i, i \in \mathbb{N}^*$, be i.i.d. $d$-dimensional random vectors with common probability density $g$. Suppose that we observe the pairs $(X_1, Y_1), \ldots, (X_n, Y_n)$ satisfying

$$Y_i = f(X_i) + \xi_i, \ \ i = 1, \ldots, n.$$
The goal is to estimate function $f$ under $L^p$-loss on $(-b,b)^d$, where $b > 0$ is a given number.

We will suppose that the sequences $\xi_i, i \in \mathbb{N}^*$, and $X_i, i \in \mathbb{N}^*$, are mutually independent and that the design density $g$ (known or unknown) is separated away from zero on $(-b,b)^d$.

**Regular noise** Suppose that there exists $a > 0$ and $A > 0$ such that for any $u, v \in [-a,a]$ 
\[
\int_{\mathbb{R}} \frac{\varphi(y+u)\varphi(y+v)}{\varphi(y)} \, dy \leq 1 + A|uv|.
\]
(4.1)

Assume also that $E|\xi_1|^{\alpha} < \infty$ for some $\alpha \geq 2$.

**Problem V:** Prove or disprove the existence of optimally-adaptive estimators over the collection of anisotropic Nikolskii classes $\mathbb{N}_{\vec{r},d}(\vec{\beta},\vec{L})$ under $L^p$-loss.

The interesting question arising in this context is what is the minimal value of $\alpha$ under which the formulated problem can be solved. In particular, is it related to the norm index $p$ or not?

**Cauchy noise** Let $\varphi(x) = \left\{ \pi(1 + x^2) \right\}^{-1}$. In this case the noise is of course regular, i.e. (4.1) holds, but the moment assumption fails. At our knowledge there is no minimax and minimax adaptive results in the multivariate regression model with noise "without moments" when anisotropic functional classes are considered.

**Problem VI:** Propose the construction of optimally-adaptive estimators over the scale of anisotropic Hölder classes $\mathbb{N}_{\vec{\infty},d}(\vec{\beta},\vec{L})$ under $L^p$-loss.

The same problem can be of course formulated over the scale of anisotropic Nikolskii classes but it seems that nowadays neither probabilistic nor the tools from functional analysis are sufficiently developed in order to proceed to this task.

**Irregular noise** Consider two particular examples:
\[
\varphi(x) = 2^{-1}1_{[-1,1]}(x), \quad \varphi_\gamma(x) = C_\gamma e^{-|x|^\gamma}, \quad \gamma \in (0, 1/2).
\]

In both cases the condition (4.1) is not fulfilled. In parametric case $f(\cdot) \equiv f \in \mathbb{R}$ the minimax rate of convergence is faster than $n^{-\frac{1}{2}}$, Ibragimov and Hasminski (1981).

**Problem VII:** Find minimax rate of convergence on anisotropic Hölder class $\mathbb{N}_{\vec{\infty},d}(\vec{\beta},\vec{L})$ under $L^p$-loss. Propose an aggregation scheme for these estimators led to the construction of optimally-adaptive estimators.

One of the possible approaches to solving Problems VI and VII could be an $L^p$-aggregation of locally-bayesian or $M$-estimators. Some recent advances in this direction can be found in Chichignoud (2012), Chichignoud and Lederer (2014).

**Unknown distribution of the noise** Suppose now that the density $\varphi$ is unknown or even does not exist. The goal is to consider simultaneously the noises with and without moments, regular or irregular etc. Even if the regression function belong to known functional class the different noises may lead to different minimax rates of convergence.

**Problem VIII:** Build an estimator which would simultaneously adapt to a a given scale of functional classes and to the noise distribution.
We do not precise here the collection of classes since the formulated problem seems extremely complicated. Any solution even in the dimension 1 can be considered as the great progress. In this context let us mention very promising results recently obtained in Baraud et al. (2014b).

We finish this section with following remarks. The regression model is very rich and many other problems can be formulated in the framework of it. For instance, the discussed problems can be mixed with imposing structural assumptions in the model. On the other hand aforementioned problems are not directly related to the concrete statistical model. In particular, almost all of them can be postulated in the inverse problem estimation context or in nonparametric auto-regression.

5. Proof of Theorem 1 and Corollary 1

We start this section with presenting the constants appearing in the assertion of Theorem 1.

5.1. Important quantities

Put

\[ C_1 = 2(q \vee [p1\{p < \infty\} + 1\{p = \infty\}]) + 2\sqrt{2d} \left[ \sqrt{\pi + \|K\|_2} \left( \sqrt{\ln (4bA\|K\|_2)} + 1 \right) \right]; \]

\[ C_3 = C_3(\bar{q}, p)1\{p < \infty\} + C_3(q, 1)1\{p = \infty\}, \quad \bar{q} = (q/p) \vee 1; \]

\[ C_4 = \left( \gamma_{q+1} \sqrt{\frac{\pi}{2}} \right) \left( 1 \vee (2b)^{qd} \right) \sum_{r \in \mathbb{N}_p} e^{-r} \left[ \left( r \sqrt{\frac{e}{\pi}} \right)^d \|K\|_2^{d \frac{d}{r+2}} \right] \frac{2}{q}, \]

where \( \gamma_{q+1} \) is the \((q+1)\)-th absolute moment of the standard normal distribution and

\[ C_3(u, v) = 2 \frac{d}{u} \left[ 2u \int_0^\infty z^{u-1} \exp \left( - \frac{z^2}{8\|K\|_2^2} \right) dz \right]^{\frac{1}{uv}}, \quad u, v \geq 1. \]

5.2. Auxiliary results

As it was already mentioned the main ingredient of the proof of Theorem 1 is the fact that \( \{\tilde{\Psi}_\varepsilon(h), h \in \mathbb{H}\} \) is the upper function for the collection \( \{\|\xi_h\|_p, h \in \mathbb{H}\} \). The corresponding result formulated below for citation convenience as Proposition 1 is proved in Theorem 1 and in Corollary 1 of Theorem 2, Lepski (2013b).

Set for any \( p \in [1, \infty), \tau \in (0, 1) \) and \( \mathcal{L} > 0 \)

\[ \psi_\varepsilon(h) = \tilde{\Psi}_{\varepsilon, \mathcal{L}}(h) \wedge \left( \inf_{r \in \mathbb{N}_p^*} C_2(r, \tau, \mathcal{L}) \left\| V_{\tilde{h}}^{-\frac{1}{2}} \left\| \frac{\tilde{h}}{r} \right\|_p \right\| \right), \quad \tilde{h} \in \mathbb{B}(A_\varepsilon) \]

**Proposition 1.** Let \( \mathcal{L} > 0 \) be fixed and let \( h_\varepsilon \) and \( A_\varepsilon \) are defined in (2.2). Suppose also that \( K \) satisfies Assumption 1.

Then for any \( q \geq 1 \) and \( \tau \in (0, 1) \) one can find \( \varepsilon(\tau, q) \) such that

1) for any \( p \in [1, \infty), \varepsilon \leq \varepsilon(\tau, q) \) and any countable \( H \subset \mathcal{G}_d(h_\varepsilon) \cap \mathbb{H}_d(\tau, \mathcal{L}, A_\varepsilon) \) one has

\[ \mathbb{E} \left\{ \sup_{h \in H} \left[ \|\xi_h\|_p - \psi_\varepsilon(h) \right]^q \right\} \leq \{(C_3 + C_4)\varepsilon\}^q; \]
2) for any \( p \in [1, \infty], \varepsilon \leq \varepsilon(\tau, q) \) and any countable \( H \subset \mathcal{G}_d \)

\[
\mathbb{E}\left\{ \sup_{\hat{h} \in H} \left[ \|\xi_\varepsilon\|_p - \tilde{\Psi}_{\varepsilon,p}(\hat{h}) \right]_+^q \right\} \leq \{ C_3 \varepsilon \}^q.
\]

We will need also the following technical result.

Lemma 1. For any \( d \geq 1, \kappa \in (0, 1/d), \mathcal{L} > 0 \) and \( A \geq e^d \)

(i) \( \mathbb{H}_d(\kappa, \mathcal{L}, A) \subseteq \mathbb{H}_d(d\kappa, 4\mathcal{L}, A) \).

(ii) \( \tilde{h} \vee \tilde{\eta} \in \mathbb{H}_d(d\kappa, (2\mathcal{L})^d, A), \forall \tilde{h}, \tilde{\eta} \in \mathbb{H}_d(\kappa, \mathcal{L}, A) \).

The first statement of the lemma is obvious and the second one will be proved in Appendix.

5.3. Proof of Theorem 1

Let \( \tilde{h} \in \mathbb{H} \) be fixed. We have in view of the triangle inequality

\[
\left\| \hat{f}_{\tilde{h} \vee \tilde{\eta}} - f \right\|_p \leq \left\| \hat{f}_{\tilde{h} \vee \tilde{h}} - \hat{f}_{\tilde{h}} \right\|_p + \left\| \hat{f}_{\tilde{h} \vee \tilde{\eta}} - \hat{f}_{\tilde{h}} \right\|_p + \left\| \hat{f}_{\tilde{h}} - f \right\|_p.
\]

(5.1)

First, note that \( \hat{f}_{\tilde{h} \vee \tilde{h}} \equiv \hat{f}_{\tilde{h} \vee \tilde{\eta}} \) and, therefore,

\[
\left\| \hat{f}_{\tilde{h} \vee \tilde{\eta}} - \hat{f}_{\tilde{h}} \right\|_p \leq \left\| \hat{f}_{\tilde{h} \vee \tilde{h}} - \hat{f}_{\tilde{h}} \right\|_p \leq \tilde{\mathcal{R}}_{\mathbb{H}}(\tilde{h}) + \varepsilon \Psi_{\varepsilon,p}(\tilde{h} \vee \tilde{\eta}) + \varepsilon \Psi_{\varepsilon,p}(\tilde{h}) \leq \tilde{\mathcal{R}}_{\mathbb{H}}(\tilde{h}) + 2\varepsilon \Psi_{\varepsilon,p}(\tilde{h}).
\]

(5.2)

Here we used first, \( \tilde{h} \in \mathbb{H} \), and then that \( V_{\tilde{h} \vee \tilde{\eta}} \geq V_{\tilde{h}} \vee V_{\tilde{\eta}} \) implies \( \Psi_{\varepsilon,p}(\tilde{h} \vee \tilde{\eta}) \leq \Psi_{\varepsilon,p}(\tilde{h}) \wedge \Psi_{\varepsilon,p}(\tilde{\eta}) \) for any \( \tilde{h} \) and \( \tilde{\eta} \). Similarly we have

\[
\left\| \hat{f}_{\tilde{h} \vee \tilde{\eta}} - \hat{f}_{\tilde{h}} \right\|_p \leq \tilde{\mathcal{R}}_{\mathbb{H}}(\tilde{h}) + \varepsilon \Psi_{\varepsilon,p}(\tilde{h} \vee \tilde{\eta}) + \varepsilon \Psi_{\varepsilon,p}(\tilde{h}) \leq \tilde{\mathcal{R}}_{\mathbb{H}}(\tilde{h}) + 2\varepsilon \Psi_{\varepsilon,p}(\tilde{h}).
\]

(5.3)

The definition of \( \tilde{h} \) implies

\[
\tilde{\mathcal{R}}_{\mathbb{H}}(\tilde{h}) + 2\varepsilon \Psi_{\varepsilon,p}(\tilde{h}) + \tilde{\mathcal{R}}_{\mathbb{H}}(\tilde{h}) + 2\varepsilon \Psi_{\varepsilon,p}(\tilde{h}) \leq 4\tilde{\mathcal{R}}_{\mathbb{H}}(\tilde{h}) + 4\varepsilon \Psi_{\varepsilon,p}(\tilde{h}) + 2\varepsilon,
\]

and we get from (5.1), (5.2) and (5.3)

\[
\left\| \hat{f}_{\tilde{h}} - f \right\|_p \leq 4\tilde{\mathcal{R}}_{\mathbb{H}}(\tilde{h}) + 4\varepsilon \Psi_{\varepsilon,p}(\tilde{h}) + \left\| \hat{f}_{\tilde{h}} - f \right\|_p + 2\varepsilon.
\]

(5.4)

We obviously have for any \( \tilde{h}, \tilde{\eta} \in \mathbb{H} \)

\[
\left\| \hat{f}_{\tilde{h} \vee \tilde{\eta}} - \hat{f}_{\tilde{\eta}} \right\|_p \leq \left\| B_{\tilde{h}, \tilde{\eta}} \right\|_p + \varepsilon \left\| \xi_{\tilde{h}, \tilde{\eta}} \right\|_p + \varepsilon \left\| \xi_{\tilde{\eta}} \right\|_p.
\]

Denote \( \mathbb{H}^* = \{ \tilde{\upsilon} : \tilde{\upsilon} = \tilde{h} \vee \tilde{\eta}, \tilde{h}, \tilde{\eta} \in \mathbb{H} \} \) and remark that \( \mathbb{H} \subseteq \mathbb{H}^* \subseteq \mathbb{H}(d\kappa, (2\mathcal{L})^d, A_\varepsilon) \). The latter inclusion follows from assertions of Lemma 1. Moreover since \( \mathbb{H} \) is countable \( \mathbb{H}^* \) is countable as well. Putting \( \zeta = \sup_{\tilde{\eta} \in \mathbb{H}^*} \left[ \left\| \xi_{\tilde{\upsilon}} \right\|_p - \Psi_{\varepsilon,p}(\tilde{\upsilon}) \right] \right\}_+ \), we obtain

\[
\tilde{\mathcal{R}}_{\mathbb{H}}(\tilde{h}) \leq \sup_{\tilde{\eta} \in \mathbb{H}^*} \left\| B_{\tilde{h}, \tilde{\eta}}(\cdot, f) \right\|_p + 2\varepsilon \zeta
\]

20
and, therefore, in view of (5.4)
\[ \|\tilde{f}_h - f\|_p \leq 4\sup_{\eta \in \mathbb{H}} \|B_{\tilde{h},\eta}(\cdot, f)\|_p + 4\varepsilon \Psi_{\varepsilon,p}(\tilde{h}) + 8\varepsilon\zeta + \|\tilde{f}_h - f\|_p + 2\varepsilon. \]

Taking into account that \( \|\tilde{f}_h - f\|_p \leq \|B_{\tilde{h}}\|_p + \varepsilon\|\xi_\tilde{h}\|_p \), we obtain
\[ \|\tilde{f}_h - f\|_p \leq 5B_{\varepsilon,h}^{(p)}(f) + 5\varepsilon \Psi_{\varepsilon,p}(\tilde{h}) + 9\varepsilon\zeta + 2\varepsilon. \]

It remains to note that if \( p \in [1, \infty) \) in view of the definition of \( \Psi_{\varepsilon,p}(\cdot) \)
\[ \zeta = \left( \sup_{\tilde{\eta} \in \mathcal{H}^* \cap \mathcal{S}_d(h)} \left[ \|\xi_{\tilde{\eta}}\|_p - \Psi_{\varepsilon,p}(\tilde{\eta}) \right] \right) \vee \left( \sup_{\tilde{\eta} \in \mathcal{H}^* \setminus \mathcal{S}_d(h)} \left[ \|\xi_{\tilde{\eta}}\|_p - \Psi_{\varepsilon,p}(\tilde{\eta}) \right] \right). \]

Applying the first and the second assertions of Proposition 1 with \( \tau = d\varepsilon, \mathcal{L} = (2\mathcal{E})^d \), \( \mathcal{H} = \mathbb{H}^* \cap \mathcal{S}_d(h) \) and \( \mathcal{H} = \mathbb{H}^* \setminus \mathcal{S}_d(h) \) respectively, we obtain
\[ \mathcal{R}_{\varepsilon,h}^{(p)}[\tilde{f}_h; f] \leq 5B_{\varepsilon,h}^{(p)}(f) + 5\varepsilon \Psi_{\varepsilon,p}(\tilde{h}) + 18(C_3 + C_4 + 2)\varepsilon. \]

It remains to note that the left hand side of the obtained inequality is independent of \( \tilde{h} \) and we come to the assertion of the theorem with \( \Upsilon = 18(C_3 + C_4 + 2) \) where, recall, \( C_3 \) and \( C_4 \) are given in Section 5.1.

If \( p = \infty \) the second assertion of Proposition 1 with \( \mathcal{H} = \mathbb{H}^* \) is directly applied to the random variable \( \zeta \) and the statement of the theorem follows.

### 5.4. Proof of Corollary 1

The proof of the corollary consists mostly in bounding from above the quantity \( B_{\varepsilon,h}^{(p)}(f) \). This, in its turn, is based on the technical result presented in Lemma 2 below which will be used in the proof of Proposition 2, Section 7.3.1, as well.

#### 5.4.1. Auxiliary lemma

The following notations will be exploited in the sequel.

For any \( J \subseteq \{1, \ldots, d\} \) and \( y \in \mathbb{R}^d \) set \( y_J = \{y_j, j \in J\} \in \mathbb{R}^{|J|} \) and we will write \( y = (y_J, y \setminus J) \), where as usual \( J = \{1, \ldots, d\} \setminus J \).

For any \( j = 1, \ldots, d \) introduce \( E_j = (0, \ldots, e_j, \ldots, 0) \) and set \( E[J] = \sum_{j \in J} E_j \). Later on \( E_0 = E[\emptyset] \) denotes the matrix with zero entries.

To any \( J \subseteq \{1, \ldots, d\} \) and any \( \lambda : \mathbb{R}^d \to \mathbb{R}_+ \) such that \( \lambda \in L_p(\mathbb{R}^d) \), associate the function
\[ \lambda(y_J, z_J) = \lambda(z + E[J](y - z)), \quad y, z \in \mathbb{R}^d, \]
with the obvious agreement \( \lambda_J \equiv \lambda \) if \( J = \{1, \ldots, d\} \) that is always the case if \( d = 1 \).

At last for any \( h = (h_1, \ldots, h_d) \in \mathbb{S}_d^{\text{const}} \) and \( J \subseteq \{1, \ldots, d\} \) set \( K_{\tilde{h},J}(u_J) = \prod_{j \in J} h_j^{-1} K(u_j/h_j) \) and define for any \( y \in \mathbb{R}^d \)
\[ [K_{\tilde{h}} \ast \lambda]_J(y) = \int_{\mathbb{R}^{|J|}} K_{\tilde{h},J}(u_J - y_J) \lambda(y_J, u_J) \nu_{\mathbb{R}^{|J|}}(du_J). \]
The following result is a trivial consequence of the Young inequality and Fubini theorem. For any \( J \subseteq \{1, \ldots, d\} \) and \( p \in [1, \infty] \),

\[
\left\| \left[ K_\cdot * \lambda \right]_J \right\|_p \leq \| \mathcal{K} \|_{1, \mathbb{R}}^{d - |J|} \| \lambda \|_{p, \mathcal{A}_J}, \quad \forall \lambda \in \mathcal{S}_d^{\text{const}},
\]

where we have denoted \( \mathcal{A}_J = (-b, b)^{|J|} \times \mathbb{R}^{|J|} \).

**Lemma 2.** For any \( \vec{h}, \vec{\eta} \in \mathcal{S}_d^{\text{const}} \) one can find \( k = 1, \ldots, d \) and the collection of indexes \( \{j_1 < j_2 < \cdots < j_k\} \subseteq \{1, \ldots, d\} \) such that for any \( x \in \mathbb{R}^d \) and any \( f : \mathbb{R}^d \to \mathbb{R} \)

\[
B_{\vec{h}, \vec{\eta}}(x, f) \leq \sum_{l=1}^k \left( \left| \mathcal{K}_{\vec{h} \setminus \cdot} \ast b_{\vec{\eta}, j_l} \right|_{j_l} (x) + \left| \mathcal{K}_{\vec{\eta}} \ast b_{\vec{h}, j_l} \right|_{j_l} (x) \right);
\]

\[
B_{\vec{h}}(x, f) \leq \sum_{l=1}^d \left| K_{\vec{h}} \ast b_{\vec{h}, j_l} \right|_{j_l} (x), \quad \mathcal{J}_l = \{j_1, \ldots, j_l\}.
\]

The proof of the lemma is postponed to Appendix.

**5.4.2. Proof of the corollary**

We obtain in view of the first assertion of Lemma 2 and (5.5)

\[
\left\| B_{\vec{h}, \vec{\eta}}(\cdot, f) \right\|_p \leq \sum_{l=1}^k \left\| \mathcal{K} \right\|_{1, \mathbb{R}}^{d - l} \left\| b_{\vec{h}, j_l} \right\|_{p, \mathcal{A}_J} = \sum_{l=1}^k \left\| \mathcal{K} \right\|_{1, \mathbb{R}}^{d - l} \left\| b_{\vec{h}, j_l} \right\|_p.
\]

The latter equality follows from the fact that \( f \) is compactly supported on \((-b, b)^d\) that implies that \( b_{\vec{h}, j_l}(x, \cdot) \) is compactly supported on \((-b, b)^{d-l}\). Taking into account that \( \| \mathcal{K} \|_{1, \mathbb{R}} \geq 1 \) we get

\[
\left\| B_{\vec{h}, \vec{\eta}}(\cdot, f) \right\|_p \leq 2 \left\| \mathcal{K} \right\|_{1, \mathbb{R}}^{d - l} \sum_{l=1}^k \left\| b_{\vec{h}, j_l} \right\|_p \leq 2 \left\| \mathcal{K} \right\|_{1, \mathbb{R}}^{d - l} \sum_{j=1}^d \left\| b_{\vec{h}, j} \right\|_p, \quad \forall \vec{h}, \vec{\eta} \in \mathcal{S}_d^{\text{const}}.
\]

Since the right hand side of the latter inequality is independent of \( \vec{\eta} \) we obtain

\[
\sup_{\vec{\eta} \in \mathcal{S}_d^{\text{const}}} \left\| B_{\vec{h}, \vec{\eta}}(\cdot, f) \right\|_p \leq 2 \left\| \mathcal{K} \right\|_{1, \mathbb{R}}^{d - l} \sum_{j=1}^d \left\| b_{\vec{h}, j} \right\|_p.
\]

Repeating previous computations and using the second assertion of Lemma 2 we have

\[
\left\| B_{\vec{h}}(\cdot, f) \right\|_p \leq \left\| \mathcal{K} \right\|_{1, \mathbb{R}}^{d} \sum_{j=1}^d \left\| b_{\vec{h}, j} \right\|_p
\]

(5.6)

for any \( \vec{h} \in \mathcal{S}_d^{\text{const}} \) and any \( p \geq 1 \). We obtain finally

\[
\mathcal{B}_{\vec{h}}^{(p)}(f) \leq 3 \left\| \mathcal{K} \right\|_{1, \mathbb{R}}^{d} \sum_{j=1}^d \left\| b_{\vec{h}, j} \right\|_p.
\]

(5.7)
We obviously have 
$$r_A(\vec{h}) = [p] + 1$$ for any \( \vec{h} \in \mathbb{H}_\varepsilon \) and, therefore, for any \( p \in [1, \infty) \)
$$\Psi_{\varepsilon,p}(\vec{h}) \leq (2b)^d \frac{1}{\vec{h}} \inf_{r \in \mathbb{N}_p} C_2(r) = \Psi_{\varepsilon,p}^{(const)}(\vec{h}).$$

It is also obvious that
$$\Psi_{\varepsilon,\infty}(\vec{h}) = \Psi_{\varepsilon,\infty}^{(const)}(\vec{h}), \quad \forall \vec{h} \in \mathbb{H}_\varepsilon.$$

As it was already mentioned \( \mathcal{G}_d^{\text{const}} \subset \mathbb{H}_d(\varkappa, \mathcal{L}) \) for any \( \varkappa \in (0, 1) \) and \( \mathcal{L} = (2b)^\varkappa \). Thus, choosing for example \( \varkappa = (2d)^{-1} \) we constat that \( \mathbb{H}_\varepsilon^{\text{const}} \subset \mathbb{H}_d((2d)^{-1}, (2b)^{\frac{1}{2d}}, \mathcal{A}_\varepsilon) \) and, moreover, \( \mathbb{H}_\varepsilon^{\text{const}} \) is obviously finite set.

The assertion of the corollary follows now from (5.7) and Theorem 1.

6. Proof of Theorem 2

The proof is organized as follows. First, we formulate two auxiliary statements, Lemmas 3 and 4. Second, we present a general construction of a finite set of functions employed in the proof of lower bounds. Then we specialize the constructed set of functions in different regimes and derive the announced lower bounds.

6.1. Proof of Theorems 2. Auxiliary lemmas

The first statement given in Lemma 3 is a simple consequence of Theorem 2.4 from Tsybakov (2009). Let \( \mathbb{F} \) be a given set of real functions defined on \((-b, b)^d\).

**Lemma 3.** Assume that for any sufficiently small \( \varepsilon > 0 \) one can find a positive real number \( \rho_\varepsilon \) and a finite subset of functions \( \{f^{(0)}, f^{(j)}, j \in \mathcal{J}_\varepsilon\} \subset \mathbb{F} \) such that

$$\|f^{(i)} - f^{(j)}\|_p \geq 2\rho_\varepsilon, \quad \forall i, j \in \mathcal{J}_\varepsilon \cup \{0\} : i \neq j; \quad (6.1)$$

and

$$\limsup_{\varepsilon \to 0} \frac{1}{|\mathcal{J}_\varepsilon|^2} \sum_{j \in \mathcal{J}_\varepsilon} \mathbb{E}_{f^{(0)}} \left\{ \frac{\mathrm{dP}_{f^{(j)}}}{\mathrm{dP}_{f^{(0)}}}(X(\varepsilon)) \right\}^2 =: C < \infty. \quad (6.2)$$

Then for any \( q \geq 1 \)

$$\liminf_{\varepsilon \to 0} \inf_{f} \sup_{f \in \mathbb{F}} \rho_{\varepsilon}^{-1} \left( \mathbb{E}_f \|\tilde{f} - f\|_p^q \right)^{1/q} \geq \left( \sqrt{C} + \sqrt{C + 1} \right)^{-2/q},$$

where infimum on the left hand side is taken over all possible estimators.

We will apply Lemma 3 with \( \mathbb{F} = \mathbb{N}_{\vec{r},d}(\vec{J}, \vec{L}, M) \).

Next, we will need the result being a generalization of the Varshamov–Gilbert lemma. It can be found in Rigollet and Tsybakov (2011), Lemma A3. In the version established in Lemma 4 below we only provide with particular choice of the constants appeared in the latter result.

Let \( \varrho_n \) be the Hamming distance on \( \{0, 1\}^n, n \in \mathbb{N}^* \), i.e.

$$\varrho_n(a, b) = \sum_{j=1}^{n} \mathbf{1}_{\{a_j \neq b_j\}} = \sum_{j=1}^{n} \left| a_j - b_j \right|, \quad a, b \in \{0, 1\}^n.$$
Lemma 4. For any \( m \geq 4 \) there exist a subset \( P_{m,n} \) of \( \{0,1\}^n \) such that

\[
|P_{m,n}| \geq 2^{-m(n/m - 1)^2}, \quad \sum_{k=1}^{n} a_k = m, \quad \varrho_m(a,a') \geq m/2, \quad \forall a,a' \in P_{m,n}.
\]

6.2. Proof of Theorem 2. General construction of a finite set of functions

This part of the proof is mostly based on the constructions and computations made in Goldenshluger and Lepski (2013), proof of Theorem 3. For any \( t \in \mathbb{R} \) set

\[
g(t) = e^{-1/(1-t^2)} 1_{[-1,1]}(t).
\]

For any \( l = 1, \ldots, d \) let \( b/2 > \sigma_l = \sigma_l(\varepsilon) \to 0, \varepsilon \to 0, \) be the sequences to be specified later. Let \( M_l = \sigma_l^{-1} \), and without loss of generality assume that \( M_l, l = 1, \ldots, d \) are integer numbers.

Define also

\[
x_{j,l} = -b + 2j\sigma_l, \quad j = 1, \ldots, M_l, \quad l = 1, \ldots, d,
\]

and let \( M = \{1, \ldots, M_1\} \times \cdots \times \{1, \ldots, M_d\} \). For any \( m = (m_1, \ldots, m_d) \in M \) define

\[
\pi(m) = \sum_{j=1}^{d-1} (m_j - 1) \left( \prod_{l=j+1}^{d} M_l \right) + m_d, \quad G_m(x) = \prod_{l=1}^{d} g \left( \frac{x_l - x_m,l}{\sigma_l} \right), \quad x \in \mathbb{R}^d.
\]

Let \( W \) be a subset of \( \{0,1\}^{|M|} \). Define a family of functions \( \{f_w, w \in W\} \) by

\[
f_w(x) = A \sum_{m \in M} w_{\pi(m)} G_m(x), \quad x \in \mathbb{R}^d,
\]

where \( w_j, j = 1, \ldots, |M| \) are the coordinates of \( w \), and \( A \) is a parameter to be specified.

Suppose that the set \( W \) is chosen so that

\[
\varrho_{|M|}(w,w') \geq B, \quad \forall w,w' \in W, \tag{6.3}
\]

where, we remind, \( \varrho_{|M|} \) is the Hamming distance on \( \{0,1\}^{|M|} \). Here \( B = B(\varepsilon) \geq 1 \) is a parameter to be specified. Let also \( S_W := \sup_{w \in W} \{|j : w_j \neq 0\}| \). Note finally that \( f_w, w \in W \), are compactly supported on \((-b,b)^d\).

Repeating the computations made in Goldenshluger and Lepski (2013), proof of Theorem 3, we assert first that if

\[
A\sigma_l^{-\beta_l} \left( S_W \prod_{j=1}^{d} \sigma_j \right)^{1/r_l} \leq C_1^{-1} L_l, \quad \forall l = 1, \ldots, d \tag{6.4}
\]

then \( f_w \in N_{r,d}(\bar{\beta}, \bar{L}) \) for any \( w \in W \). Here \( C_1 \) as well as \( C_2 \) and \( C_3 \) defined below are the numerical constants completely determined by the function \( g \).

Next, the condition (6.1) of Lemma 3 is fulfilled with

\[
\rho_\varepsilon = C_2 A \left( B \prod_{j=1}^{d} \sigma_j \right)^{1/p}, \tag{6.5}
\]
which remains true if \( p = \infty \) as well. At last, we have \( \|f_w\|_2^2 \leq C_3 A^2 S_W \prod_{j=1}^{d} \sigma_j \).

Set \( f^{(0)} = 0 \) and let us verify condition (6.2) of Lemma 3. First observe that in view of Girsanov formulae

\[
\frac{dP}{dP^{(0)}}(X^{(\varepsilon)}) = \exp \left\{ \varepsilon^{-1} \int f_w b(dt) - (2\varepsilon^2)^{-1} \|f_w\|_2^2 \right\}.
\]

It yields for any \( w \in W \)

\[
E_{f^{(0)}} \left\{ \frac{dP}{dP^{(0)}}(X^{(\varepsilon)}) \right\}^2 = \exp \left\{ \varepsilon^{-2} \|f_w\|_2^2 \right\} \leq \exp \left\{ \varepsilon^{-2} C_3 A^2 S_W \prod_{j=1}^{d} \sigma_j \right\}.
\]

The right hand side of the latter inequality does not depend on \( w \); hence we have

\[
\frac{1}{|W|^2} \sum_{w \in W} E_{f^{(0)}} \left\{ \frac{dP}{dP^{(0)}}(X^{(\varepsilon)}) \right\}^2 \leq \exp \left\{ C_3 \varepsilon^{-2} A^2 S_W \left( \prod_{j=1}^{d} \sigma_j \right) - \ln(|W|) \right\}.
\]

Therefore, the condition (6.2) of Lemma 3 is fulfilled with \( C = 1 \) if

\[
C_3 \varepsilon^{-2} A^2 S_W \prod_{j=1}^{d} \sigma_j \leq \ln(|W|).
\] (6.6)

In order to apply Lemma 3 it remains to specify the parameters \( A, \sigma_l, l = 1, \ldots, d \), and the set \( W \) so that the relationships (6.3), (6.4) and (6.6) are simultaneously fulfilled. According to Lemma 3, under these conditions the lower bound is given by \( \rho_{\varepsilon} \) in (6.5).

### 6.3. Proof of Theorems 2. Choice of the parameters

We begin with the construction of the set \( W \). Let \( m \geq 4 \) be an integer number whose choice will be made later, and, without loss of generality, assume that \( |M|/m \geq 9 \) is integer. Let \( \mathcal{P}_{m,|M|} \) be a subset of \( \{0, 1\}^{|M|} \) defined in Lemma 4, where we put \( n = |M| \).

Set \( W = \mathcal{P}_{m,|M|} \cup \mathbf{0} \), where \( \mathbf{0} \) is the zero sequence of the size \( |M| \). With such a set \( W \)

\[
S_W \leq m, \quad \ln(|W|) \geq (m/2) \left\lfloor \ln_2 \left( |M|/m - 1 \right) - 2 \right\rfloor
\]

and, therefore, condition (6.6) holds true if

\[
A^2 \varepsilon^{-2} \prod_{j=1}^{d} \sigma_j \leq (2C_3)^{-1} \left[ \ln_2 \left( |M|/m - 1 \right) - 2 \right].
\] (6.7)

We also note that condition (6.4) is fulfilled if we require

\[
A \sigma_l^{-\beta_l} \left( m \prod_{j=1}^{d} \sigma_j \right)^{1/r_l} \leq C_1^{-1} L_l, \quad \forall l = 1, \ldots, d.
\] (6.8)

In addition, (6.3) holds with \( B = m/2 \) and, therefore

\[
\rho_{\varepsilon} = 2^{-1/p} C_2 A \left( m \prod_{j=1}^{d} \sigma_j \right)^{1/p}.
\] (6.9)
6.4. Proof of Theorem 2. Derivation of lower bounds in different zones

Let \(c_i, i = 1, \ldots, 6\), be constants those choice will be made later.

Case: \(\varkappa(p) \leq 0, \tau(p) \leq 0\) Set

\[
\overline{w}_\varepsilon = \begin{cases} 
\left( L_\beta^{\varepsilon^2} |\ln(\varepsilon)| \right)^{\varkappa(p)}, & \varkappa(p) < 0; \\
L_\beta e^{-\varepsilon^2}, & \varkappa(p) = 0;
\end{cases}
\]

and note that \(\overline{w}_\varepsilon \to \infty, \varepsilon \to 0\). In view of the latter remark we will assume that \(\varepsilon\) is small enough provided \(\overline{w}_\varepsilon > 1\). We start our considerations with the following remark. The case \(\varkappa(p) = 0\) is possible only if \(p^* = p\) since \(\varkappa(\cdot)\) is strictly decreasing. Moreover, in view of the relation (3.3) \(\varkappa(p) = 0\) is possible only if \(p \leq 2\) since \(\tau(p) \leq 0\). Choose

\[
A = c_1 \overline{w}_\varepsilon, \quad m = c_2 L_\beta \overline{w}_\varepsilon^{-p^* \tau(p^*)}, \quad \sigma_l = c_3 L_l^{-\frac{1}{p_l}} L_\beta^{-p^* \tau(p^*)}. \]

With this choice, we have \(\frac{|M|}{m} = m^{-1} \prod_{j=1}^d \sigma_j^{-1} = c_2^{-1} c_3^{-d} \overline{w}_\varepsilon^{-p^*} \to \infty, \varepsilon \to 0\). Hence, for any \(\varepsilon\) small enough one has

\[
\left[ \ln_2 \left( |M| / m - 1 \right) - 2 \right] \geq Q_1 \left\{ \begin{array}{ll}
|\ln(\varepsilon)|, & \varkappa(p^*) < 0; \\
\varepsilon^{-2}, & \varkappa(p^*) = 0,
\end{array} \right.
\]

where \(Q_1\) is independent of of \(\varepsilon\) and \(\bar{L}\). This yields that (6.7) and (6.8) will be fulfilled if

\[
c_1^2 c_3^d \leq (2C_3)^{-1} Q_1, \quad c_1 c_2^{\frac{1}{p^*}} c_3^{\frac{d}{\beta l} - \beta l} \leq C_1. \tag{6.10}
\]

Some remarks are in order. First, since \(r_l \leq p^*\) for any \(l = 1, \ldots, d\) and \(\varkappa(p) < 0\) we have

\[
\sigma_l \leq c_3 L_l^{-\frac{1}{p_l}} \leq c_3 \left[ \min_{l=1,\ldots,d} L_0^{-\frac{1}{p_l}} \right].
\]

Here we also used \(\overline{w}_\varepsilon > 1\). Thus, choosing \(c_3\) small enough we can guarantee that \(\sigma_l \leq b/2\) for any \(l = 1, \ldots, d\) that was the unique restriction imposed on the choice of the latter sequence.

Next \(\tau(p^*) \leq 0, \overline{w}_\varepsilon > 1\) and \(p^* \tau(p^*) = 2 - p^*\), when \(\varkappa(p^*) = 0\), imply that \(m \geq c_2 L_0^{\frac{1}{p^*}}\) and, therefore, choosing \(c_2\) large enough we guarantee that \(m \geq 4\). At last, choosing \(c_1\) small enough we can assert that (6.10) is satisfied.

Thus, it remains to compute \(\rho_\varepsilon\). We get from (6.9)

\[
\rho_\varepsilon = C_2 2^{-1/p} c_1 \left( c_2 c_3^d \right)^{1/p} \overline{w}_\varepsilon^{1-p^*} : = 1_{(p, \infty)}(p^*) Q_2 \left( L_\beta^{\varepsilon^2} |\ln(\varepsilon)| \right)^{\varkappa(p^*-p)} \overline{w}_\varepsilon^{\varkappa(p^*-p)}. \tag{6.11}
\]

We remark that there is no uniformly consistent estimators if \(p^* = p\).

Case: \(\varkappa(p) \leq 0, \tau(p^*) > 0\) First note, that the case \(\varkappa(p) \leq 0, \tau(p^*) > 0\), is possible only if \(p > 2\). It follows from (3.3) and \(\tau(p^*) \leq \tau(p)\) since \(\tau(\cdot)\) is decreasing. It implies \(\tau(2) > 0\) and \(\tau(r_l) > 0\) for any \(l = 1, \ldots, d\), since \(r_l \leq p^*\).

Set \(\overline{w}_\varepsilon = \varepsilon^2 |\ln(\varepsilon)|\) and choose

\[
A = c_4 L_\beta^{\frac{1}{p^* (2)}} \overline{w}_\varepsilon^{1-\frac{1}{\varkappa(2)}}, \quad m = 4, \quad \sigma_l = L_l^{-\frac{1}{p_l}} L_\beta^{\frac{r_l-2}{2\beta r_l (2)}} \overline{w}_\varepsilon^{\frac{1}{\beta r_l (2)}}. \tag{6.12}
\]
We remark, first that
\[ \sigma_l \to 0, \quad \varepsilon \to 0, \quad \forall l = 1, \ldots, d, \]
and, therefore, \( \sigma_l \leq b/2 \) for all \( \varepsilon > 0 \) small enough.

Next, \( |M|/m = 4^{-1} L_\beta^{1/(2\beta)} \sigma_l^{-2/(\beta+1)} \geq 4^{-1} L_0^{1/(2\beta)} \sigma_l^{-2/(\beta+1)} \) and, hence, for any \( \varepsilon \) small enough
\[
\left[ \ln \left( \frac{|M|}{m} - 1 \right) - 2 \right] \geq Q_3 |\ln(\varepsilon)|,
\]
where \( Q_3 \) is independent of \( \varepsilon \) and \( \tilde{L} \). This yields that (6.7) and (6.8) will be fulfilled if
\[
\mathbf{c}_4 \leq (2C_3)^{-1} Q_3, \quad \mathbf{c}_4^{1/\beta} \leq C_1^{-1}.
\]
Choosing \( \mathbf{c}_4 \) small enough we satisfy the latter restrictions. Thus, it remains to compute \( \rho_\varepsilon \). We get from (6.9)
\[
\rho_\varepsilon = C_2 2^{1/p} \mathbf{c}_4 L_\beta^{1-2/p} \sigma_l^{1-2/p} \sigma_l^{1/(2\beta+1)} =: Q_4 \left( \frac{1-2/p}{p} \right) \left( \frac{\varepsilon^2}{\ln(\varepsilon)} \right) \left( \frac{1-1/(\omega+1/\beta)}{2-2/(\omega+1/\beta)} \right) .
\]

**Case: \( \varepsilon(p) > 0 \)** Choose
\[
A = \mathbf{c}_6 (L_\beta \varepsilon^2)^{\frac{\beta}{2\beta+1}}, \quad m = 9^{-1} L_\beta (L_\beta \varepsilon^2)^{-\frac{\beta}{2\beta+1}}, \quad \sigma_l = L_\beta^{-\frac{1}{\beta+1}} (L_\beta \varepsilon^2)^{\frac{\beta}{\beta(2\beta+1)}}.
\]

We remark that \( |M|/m = 9 \) and \( m \to \infty, \varepsilon \to 0 \); hence \( m > 4 \). Moreover
\[ \sigma_l \to 0, \quad \varepsilon \to 0, \quad \forall l = 1, \ldots, d, \]
and, therefore, \( \sigma_l \leq b/2 \) for all \( \varepsilon > 0 \) small enough.

We obviously get that (6.7) and (6.8) will be fulfilled if
\[
\mathbf{c}_6 \leq (2C_3)^{-1}, \quad \mathbf{c}_6 \leq (9C_1)^{-1}.
\]
Choosing \( \mathbf{c}_6 \) small enough we satisfy the latter restrictions. Finally, we get from (6.9)
\[
\rho_\varepsilon = C_2 \mathbf{c}_4 18^{-1/p} (L_\beta \varepsilon^2)^{\frac{\beta}{2\beta+1}}.
\]

7. Proof of Theorem 3

Later on \( \mathbf{c}_i, \ i = 1, 2, \ldots, \) denote numerical constants independent of \( \tilde{L} \). Moreover without further mentioning we will assume that all quantities those definitions involve the kernel \( \mathcal{K} \) are defined with \( \mathcal{K} = \mathcal{K}_q \).
\subsection{Preliminary facts. Embedding of Nikolskii classes}

For any $\vec{\beta} \in (0, \infty)^d$, $\vec{r} \in [1, \infty]^d$ and $s \geq 1$ define

$$
\gamma_j(s) = \frac{\beta_j \tau(s)}{\tau(r_j)}, \quad j = 1, \ldots, d, \quad \vec{\gamma}(s) = (\gamma_1(s) \wedge \beta_1, \ldots, \gamma_d(s) \wedge \beta_d); \quad (7.1)
$$

$$
r^*(s) = \left[ \max_{j=1, \ldots, d} r_j \right] \vee s, \quad \vec{r}(s) = (r_1 \vee s, \ldots, r_d \vee s). \quad (7.2)
$$

\textbf{Lemma 5.} For any $s \geq 1$ provided $\tau(r^*(s)) > 0$

$$
\mathbb{N}_{\vec{r},d}(\vec{\beta}, \vec{L}) \subseteq \mathbb{N}_{\vec{\gamma},d}(\vec{\gamma}(s), c\vec{L}),
$$

where constant $c > 0$ is independent of $\vec{L}, \vec{r}$ and $\vec{\beta}$.

The statement of the lemma is a generalization of the embedding theorem for anisotropic Nikol’skii classes $\mathbb{N}_{\vec{r},d}(\vec{\beta}, \vec{L})$. Indeed, if $r^*(s) = s$ the assertion of the lemma can be found in Nikol’skii (1977), Section 6.9. The proof of this lemma as well as whose of Lemma 6 below is postponed to Appendix.

Define $\mathcal{J}_\pm = \{j = 1, \ldots, d : r_j \neq 0\}$, $p_\pm = [\sup_{j \in \mathcal{J}_\pm} r_j] \vee p$ and introduce

$$q_j = \begin{cases} p_\pm, & j \in \mathcal{J}_\pm, \\ \infty, & j \notin \mathcal{J}_\pm, \end{cases}, \quad \gamma_j = \begin{cases} \gamma_j(p_\pm), & j \in \mathcal{J}_+, \\ \beta_j, & j \notin \mathcal{J}_+. \end{cases}
$$

(7.3)

Note that $p^* \geq p_\pm$ and, therefore, if $\tau(p^*) > 0$ we have in view of Lemma 5 with $s = p_\pm$

$$
\mathbb{N}_{\vec{r},d}(\vec{\beta}, \vec{L}) \subseteq \mathbb{N}_{\vec{\gamma},d}(\vec{\gamma}, c\vec{L}), \quad (7.4)
$$

\textbf{Lemma 6.} Let $f \in \mathbb{N}_{\vec{r},d}(\vec{\beta}, \vec{M})$ and let $\ell > \max_{j=1, \ldots, d} \beta_j$. Then for any $\vec{h} \in \mathfrak{S}_d^{\text{const}}$

$$
\|b_{\vec{h},j}(:, f)\|_{r, \mathbb{R}^d} \leq (2b + 1)^d \|w_\ell\|_{1, \mathbb{R}^d} (1 - e^{-\beta_j})^{-1} M_j h_j^{\beta_j}, \quad \forall r \in [1, r_j], j = 1, \ldots, d. \quad (7.5)
$$

Moreover, if $\tau(p^*) > 0$ then for any $p \geq 1$

$$
\|b_{\vec{h},j}(:, f)\|_{q_j, \mathbb{R}^d} \leq (2b + 1)^d \|w_\ell\|_{1, \mathbb{R}^d} (1 - e^{-\gamma_j})^{-1} M_j h_j^{\gamma_j}, \quad \forall j = 1, \ldots, d, \quad (7.6)
$$

where $\vec{\gamma}$ and $\vec{\tilde{q}}$ are defined in (7.3).

\subsection{Preliminary facts. Maximal operator}

Let $\lambda : \mathbb{R}^m \to \mathbb{R}$, $m \geq 1$, be a locally integrable function. We define the strong maximal function $M[\lambda]$ of $\lambda$ by formula

$$
M[\lambda](x) := \sup_{\mathcal{K}_m} \frac{1}{\nu_m(\mathcal{K}_m)} \int_{\mathcal{K}_m} \lambda(t) \nu_m(dt), \quad x \in \mathbb{R}^m, \quad (7.7)
$$

where the supremum is taken over all possible hyper-rectangles $\mathcal{K}_m$ in $\mathbb{R}^m$ with sides parallel to the coordinate axes, containing point $x$. It is worth noting that the \textit{Hardy–Littlewood maximal function} is defined by (7.7) with the supremum taken over all cubes with sides parallel to the coordinate axes, centered at $x$. 

It is well known that the strong maximal operator \( \lambda \mapsto M[\lambda] \) is of the strong \((r,r)\)-type for all \( 1 < r \leq \infty \), i.e., if \( \lambda \in L_r(\mathbb{R}^m) \) then \( M[\lambda] \in L_r(\mathbb{R}^m) \) and for any \( r > 1 \) there exists a constant \( \bar{C}(r) \) depending on \( r \) only such that
\[
\|M[\lambda]\|_{r,\mathbb{R}^d} \leq \bar{C}(r)\|\lambda\|_{r,\mathbb{R}^d}.
\] (7.8)

Using the notations from Section 5.4, to any \( J \subseteq \{1, \ldots, d\} \cup \emptyset \) and locally integrable function \( \lambda: \mathbb{R}^d \to \mathbb{R}_+ \) we associate the operator
\[
M_J[\lambda](x) = \sup_{\mathcal{K}[J]} \frac{1}{\nu_{\mathcal{K}[J]}} \int_{\mathcal{K}[J]} (\lambda + E[J] + t) \nu_{\mathcal{K}[J]}(dt)
\]
where the supremum is taken over all hyper-rectangles in \( \mathbb{R}^{|J|} \) with center \( x_j = (x_j, j \in J) \) and with sides parallel to the axis.

As we see \( M[\lambda] \) is the strong maximal operator applied to the function obtained from \( \lambda \) by fixing of coordinates those indices belong to \( J \). It is obvious that \( M_{\emptyset}[\lambda] \equiv M[\lambda] \) and \( M_{\{1, \ldots, d\}}[\lambda] \equiv \lambda \).

The following result is the direct consequence of (7.8) and Fubini theorem. For any \( r > 1 \) there exists \( C_r \) such that for any \( d \geq 1, \lambda, J \subseteq \{1, \ldots, d\} \cup \emptyset \) and \( y \in (0, \infty) \)
\[
\|M_J[\lambda]\|_{r,(-y,y)^d} \leq C_r\|\lambda\|_{r,T_J(y)},
\] (7.9)
where we have denoted \( T_J(y) = (-y, y)^{|J|} \times \mathbb{R}^{|J|} \). Note also that \( C_\infty = 1 \).

### 7.3. Preliminary facts. Key proposition

The result presented in Proposition 2 below is the milestone for the proof of Theorem 3. For any \((\vartheta, p) \in \mathcal{P}^{\text{consist}}\) define
\[
\varphi := \varphi_e(\vartheta, p) = \begin{cases} (L_\beta \epsilon^2)^{\beta/(2\beta+1)}, & \vartheta(p) > 0; \\ (L_\beta \epsilon^2 |\ln(\epsilon)|)^{\beta/(2\beta+1)}, & \vartheta(p) \leq 0. \end{cases}
\]

**Special set of bandwidths** For any \((\vartheta, p) \in \mathcal{P}^{\text{consist}}, m \in \mathbb{N}\) and any \( j = 1, \ldots, d\) set
\[
\bar{\eta}_j(m) = e^{-2(L_j^{-1}\varphi)^{1/\gamma_j}} e^{2d m \left( \frac{1}{L_j^{1/\gamma_j}} \frac{u^{(2\gamma_j+1)/\gamma_j}}{\bar{\gamma}_j} \right)},
\] (7.10)
\[
\tilde{\eta}_j(m) = e^{-2(L_j^{-1}\varphi)^{1/\gamma_j}} e^{2d m \left( \frac{1}{L_j^{1/\gamma_j}} \frac{u^{(2\gamma_j+1)/\gamma_j}}{\bar{\gamma}_j} \right)} \left( \frac{L_\gamma \varphi^{1/\beta}}{L_\beta \varphi^{1/\gamma}} \right)^{\frac{\bar{\gamma}_j}{\bar{\gamma}_j}}.
\] (7.11)

where \( \gamma_j, q_j \) are defined in (7.3) and \( \gamma, v \) and \( L_\gamma \) are given by
\[
\frac{1}{\gamma} := \sum_{j=1}^d \frac{1}{\gamma_j}, \quad \frac{1}{v} := \sum_{j=1}^d \frac{1}{\gamma_j q_j}, \quad L_\gamma := \prod_{j=1}^d L_j^{1/\gamma_j}.
\] (7.12)

Introduce the integer \( \hat{m} = \hat{m}(\vartheta, p), (\vartheta, p) \in \mathcal{P}^{\text{consist}}, \) satisfying
\[
e^{-2d \left[ (L_\gamma/L_\beta)^{1/\gamma} \varphi^{-1} \right]^{1/2} \frac{\bar{\gamma}_j \tau(2)}{2}} \leq e^{2d \hat{m}} \leq \left[ (L_\gamma/L_\beta)^{1/\gamma} \varphi^{-1} \frac{1}{\bar{\gamma}_j \tau(2)} \right].
\]

Later on \( \hat{m} \) will be used only if \( \vartheta(p) < 0 \) and \( \tau(p^*) > 0 \). Note that in this case \( \hat{m} \geq 1 \) for all \( \epsilon > 0 \) small enough since \( \tau(2) > 0 \) (see, e.g., the proof of Theorem 2).
Introduce also the integer \( \tilde{m} = \tilde{m}(\partial, p) \), \( (\partial, p) \in \mathcal{P}^{\text{const}} \) as follows.

**Case** \( \varkappa(p) > 0 \), \( \varkappa(p^*) \geq 0 \): \( \tilde{m} = +\infty \).

**Case** \( \varkappa(p) > 0 \), \( \varkappa(p^*) < 0 \): \( e^{-2d} (h_0^{-1} \varphi) \leq e^{2d\tilde{m}} < (h_0^{-1} \varphi) \).

**Case** \( \varkappa(p) \leq 0 \), \( \tau(p^*) \leq 0 \): \( e^{-2d} (L_0^{-1} \varphi) \leq e^{2d\tilde{m}} < (L_0^{-1} \varphi) \).

**Case** \( \varkappa(p) \leq 0 \), \( \tau(p^*) > 0 \): \( \tilde{m} = \tilde{m} + 1 \) if \( p^* = p \); \( \tilde{m} = \tilde{m} + \overline{m} \) if \( p^* > p \), where

\[
e^{-2d} \leq \frac{1 \pm (1/\gamma - 1/\delta) \nu(1/p - 1/p^*)}{(1 + (1/\gamma - 1/\delta) \nu(1/p - 1/p^*)} \leq e^{2d\tilde{m}} \leq \varphi^{p^*}, \quad p^* > p.
\]

Some remarks are in order. First we note that \( \tilde{m} \geq 1 \) for all \( \varepsilon > 0 \) small enough. Indeed, \( \varphi \to 0, \varepsilon \to 0 \), and \( \varkappa(p) \leq 0 \) implies \( \varkappa(p^*) < 0 \) if \( p^* > p \). Moreover, since \( (\partial, p) \in \mathcal{P}^{\text{const}} \) the case \( \varkappa(p) \leq 0 \), \( \tau(p^*) \leq 0 \) is possible only if \( p^* > p \) that, in its turn, implies \( \varkappa(p^*) < 0 \).

For any \( (\partial, p) \in \mathcal{P}^{\text{const}} \) and any \( 0 \leq m \leq \tilde{m} \) introduce

\[
\hat{\eta}(m) = \begin{cases} 
\hat{\eta}(m)_{1 \leq m \leq \tilde{m}}, & \varkappa(p) \leq 0, \tau(p^*) > 0; \\
\hat{\eta}(m), & \text{otherwise}, 
\end{cases}
\]

and define \( \eta(m) = (\eta_1(m), \ldots, \eta_d(m)) \) as follows.

For any \( m \in \mathbb{N} \) set \( \eta_j(m) = h_{s_j(m)} \in \mathfrak{H} \), where \( s(m) = (s_1(m), \ldots, s_d(m)) \in \mathbb{N}^d \) is given by

\[
s_j(m) = \min\{s \in \mathbb{N} : h_s \leq \eta_j(m)\}. \quad (7.13)
\]

Introduce finally the set of bandwidths \( \mathfrak{H}_\varepsilon(\partial, p) = \{ \hat{\eta}(m), \quad m = 0, \ldots, \tilde{m} \} \).

**Lemma.** For any \( (\partial, p) \in \mathcal{P}^{\text{const}} \) and any \( \varepsilon > 0 \) small enough one has

\[
\mathfrak{H}_\varepsilon(\partial, p) \subset \begin{cases} 
\mathfrak{H}(\varepsilon), & \varkappa(p) > 0; \\
\mathfrak{H}, & \text{otherwise}.
\end{cases}
\]

Moreover, \( s(m) \neq s(n), \quad \forall m \neq n, \quad m, n = 0, \ldots, \tilde{m} \).

**Result formulation** For any \( \tilde{h} \in \mathfrak{S}_d \) and any \( x \in \mathbb{R}^d \) put

\[
\Phi_\varepsilon(\tilde{V}_{\tilde{h}}(x)) = \begin{cases} 
V_{\tilde{h}}^{-\frac{1}{2}}(x), & \varkappa(p) > 0; \\
\left[ V_{\tilde{h}}^{-1}(x) \ln (\varepsilon V_{\tilde{h}}(x)) \right]^{\frac{1}{2}}, & \varkappa(p) \leq 0.
\end{cases}
\]

For any \( g : \mathbb{R}^d \to \mathbb{R} \) and any \( \tilde{h} \in \mathfrak{S}_d^{\text{const}} \) introduce

\[
B^*_h(x, g) = \sup_{\eta \in \mathfrak{S}^{\text{const}}_d} B_{\tilde{h}, \eta}(x, g) + B^*_h(x, g);
\]

\[
b^*_h(x, g) = \sup_{J \in \mathfrak{J}} \sup_{j = 1, \ldots, d} M_j[b^*_h \eta_j(x).
\]

Here \( B_{\tilde{h}, \eta} \) and \( B^*_h \) are defined in (2.6) and \( b^*_h \eta_j \) is defined in (2.9), where \( f \) is replaced by \( g \).
Let $\mathbb{C}_K(\mathbb{R}^d)$ denote the set of continuous functions on $\mathbb{R}^d$ compactly supported on $K = (-b - 1, b + 1)^d$ and let $\mathbb{N}_{\gamma,d}(\vec{\beta}, \vec{\Lambda}) = \mathbb{N}_{\gamma,d}(\vec{\beta}, \vec{\Lambda}) \cap \mathbb{C}(\mathbb{R}^d)$. Remark that $\mathbb{N}_{\gamma,d}(\vec{\beta}, \vec{\Lambda}) \subset \mathbb{C}(\mathbb{R}^d)$ if $\omega > 1$ in view of (7.4).

For any $\vec{\beta} \in (0, \infty)^d$ and $\vec{\tau} \in (1, \infty)^d$ set $\beta_\tau = \min_{j=1,\ldots,d} \beta_j$, $C(\vec{\tau}) = \max_{j=1,\ldots,d} C_{\tau_j}$ and define

$$Y_1 = 3d(1 \vee \|w_\ell\|_{\infty, \mathbb{R}^d})^d, \quad Y_2 = 4Y_1C(\vec{\tau})(2b + 1)^d\|w_\ell\|_{1, \mathbb{R}^d}(1 - e^{-\beta_\tau})^{-1}.$$

**Proposition 2.** For any $\alpha \geq 1$, $\ell \in \mathbb{N}^*$, $L_0 > 0$, any $(\vartheta, p) \in \mathcal{P}_{\text{consist}}$ and $\varepsilon > 0$ one can find $\mathcal{G}_\varepsilon^*(\vartheta, p) = \{\vec{h} : (-b, b)^d \to \mathcal{S}_\varepsilon(\vartheta, p)\}$ such that for any $\varepsilon > 0$ small enough

1) $\mathcal{G}_\varepsilon^*(\vartheta, p) \subset \mathbb{H}_{\varepsilon}(3 + \sqrt{2b})$;

2) for any $g \in \mathbb{N}_{\tau,d}(\vec{\beta}, a\vec{\Lambda})$ there exists $\tilde{h}_g \in \mathcal{G}_\varepsilon^*(\vartheta, p)$ such that

(i) $B^{*}_{\tilde{h}_g}(x, g) + aY_2\varepsilon\Phi_k(V_{\tilde{h}_g}(x)) \leq \inf_{\hat{h} \in \mathcal{G}_\varepsilon^*(\vartheta, p)} \left[Y_1 b^{\varepsilon}_k(x, g) + aY_2\varepsilon\Phi_k(V_{\hat{h}})\right] + \varepsilon, \forall x \in (-b, b)^d$;

(ii) if, $\varkappa(p) > 0$ there exists $r \in \mathbb{N}_p^*$ such that $\varkappa\left(\frac{r}{r-p}\right) > 0$ and $r \in \mathbb{N}_p^*(\tilde{h}_g, A_k)$.

### 7.3.1. Proof of Proposition 2

We break up the proof on several steps.

10. The condition $g \in \mathbb{C}_K(\mathbb{R}^d)$ implies that $g$ is uniformly continuous on $\mathbb{R}^d$ and, therefore, for any $\varepsilon > 0$ there exists $\delta(\varepsilon)$ such that

$$|g(y) - g(y')| \leq \varepsilon^2, \quad \forall y, y' \in \mathbb{R}^d : |y - y'| \leq \delta(\varepsilon). \quad (7.15)$$

Let $x_{k,n}, k \in \mathbb{R}_n, n \in \mathbb{N}^*$ denote the center of the cube $\Delta_{k,n}^{(d)}$ defined in (3.6). Introduce for any $\tilde{h} \in \mathcal{G}_d^{\text{const}}$

$$\tilde{B}_{\tilde{h}}^*(x, g) = \sum_{k \in \mathbb{R}_n} B_{\tilde{h}}^*(x_{k,n}, g) 1_{\Delta_{k,n}^{(d)}}(x),$$

where $\vec{n}$ is chosen from the relation $2^{-\vec{n}} < \delta(\varepsilon) \leq 2^{-\vec{n}+1}$.

Our first goal is to prove that

$$\sup_{\tilde{h} \in \mathcal{G}_d^{\text{const}}} \|B_{\tilde{h}}^*(\cdot, g) - \tilde{B}_{\tilde{h}}^*(\cdot, g)\|_{\infty, \mathbb{R}^d} \leq c_1 \varepsilon^2. \quad (7.16)$$

Indeed, for any $\tilde{h} \in \mathcal{G}_d^{\text{const}}$ since $g$ is compactly supported on $K$ one has

$$\|B_{\tilde{h}}^*(\cdot, g) - \tilde{B}_{\tilde{h}}^*(\cdot, g)\|_{\infty, \mathbb{R}^d} = \sup_{k \in \mathbb{R}_n} \sup_{x \in \Delta_{k,n}^{(d)}} |B_{\tilde{h}}^*(x, g) - B_{\tilde{h}}^*(x_{k,n}, g)|. \quad (7.17)$$

In view of the definition of $B_{\tilde{h}}^*(\cdot, g)$ we have for any $x \in \Delta_{k,n}^{(d)}$

$$|B_{\tilde{h}}^*(x, g) - B_{\tilde{h}}^*(x_{k,n}, g)| \leq 3 \sup_{\tilde{h} \in \mathcal{G}_d^{\text{const}}} \left|S(\tilde{h}^*(x, g) - S(\tilde{h}^*(x_{k,n}, g))\left| + |g(x) - g(x_{k,n})| \right. \right.$$

$$\leq 3 \sup_{\tilde{h} \in \mathcal{G}_d^{\text{const}}} \left|S(\tilde{h}^*(x, g) - S(\tilde{h}^*(x_{k,n}, g))\left| + \varepsilon^2. \right.$$
Hence, for any \( \vec{\epsilon} \in \mathcal{E} \) and any \( x \in \Delta_{k,n}^{(d)} \)
\[
|S_{\vec{\epsilon}}^*(x, g) - S_{\vec{\epsilon}}^*(x_{\vec{\epsilon}, \vec{\nu}}) - g(x_{\vec{\epsilon}, \vec{\nu}} + u\vec{\nu})| u\nu(du) \leq \|K\|_{1, \mathbb{R}^d} \epsilon^2
\]
in view of (7.15) and the definition of \( \vec{\nu} \).

Since the latter bound is independent of \( \vec{\nu} \) we obtain for any \( \vec{\nu} \in \mathcal{E}_n^\square \) and any \( x \in \Delta_{k,n}^{(d)} \)
\[
|B_{\vec{\nu}}^*(x, g) - B_{\vec{\nu}}^*(x_{\vec{\nu}, \vec{\nu}}) - g(x_{\vec{\nu}, \vec{\nu}} + u\vec{\nu})| u\nu(du) \leq (1 + 3\|K\|_{1, \mathbb{R}^d}) \epsilon^2.
\]

Taking into account that the right hand side of the latter inequality is independent of \( \vec{\nu}, k \) and \( x \) we deduce (7.16) from (7.17).

One of the immediate consequences of (7.16) is that for any \( x \in \mathbb{R}^d \)
\[
\inf_{\vec{\nu} \in \mathcal{E}_n^\square} \left[ B_{\vec{\nu}}^*(x, g) + a\mathcal{Y}_2 \epsilon \Phi_\epsilon(V_{\vec{\nu}}^*(x)) \right] - \inf_{\vec{\nu} \in \mathcal{E}_n^\square} \left[ B_{\vec{\nu}}^*(x, g) + a\mathcal{Y}_2 \epsilon \Phi_\epsilon(V_{\vec{\nu}}^*(x)) \right] \leq c_1 \epsilon^2. \quad (7.18)
\]

For any \( x \in (-b, b)^d \) introduce
\[
\vec{\nu}_g(x) = \arg \inf_{\vec{\nu} \in \mathcal{E}_n^\square} \left[ B_{\vec{\nu}}^*(x, g) + a\mathcal{Y}_2 \epsilon \Phi_\epsilon(V_{\vec{\nu}}^*(x)) \right], \quad (7.19)
\]
and define \( \mathcal{E}_n^\square = \{ \vec{\nu}_g, g \in \mathbb{N}_{\nu, \epsilon}^\square(\bar{\alpha}, \Lambda) \} \).

First, we deduce from (7.16) and (7.18) that for any \( x \in (-b, b)^d \)
\[
B_{\vec{\nu}}^*(x, g) + a\mathcal{Y}_2 \epsilon \Phi_\epsilon(V_{\vec{\nu}}^*(x)) \leq \inf_{\vec{\nu} \in \mathcal{E}_n^\square} \left[ B_{\vec{\nu}}^*(x, g) + a\mathcal{Y}_2 \epsilon \Phi_\epsilon(V_{\vec{\nu}}^*(x)) \right] + 2c_1 \epsilon^2. \quad (7.20)
\]

Next, since \( B_{\vec{\nu}}^*(\cdot, g) \) is a piecewise constant on \( \{ \Delta_{k,n}^{(d)} \cap (-b, b)^d, k \in \mathcal{E}_n^\square \} \) one has \( \vec{\nu}_g \in \mathcal{E}_n^\square \) and, hence, we can assert that
\[
\vec{\nu}_g \in \bigcup_{n \in \mathbb{N}} \mathcal{E}_n^\square, \quad \forall g \in \mathbb{C}(\mathbb{R}^d). \quad (7.21)
\]

Our goal now is to prove that for any \( (\vartheta, p) \in \mathcal{P}_\epsilon^\square \) one can find \( \epsilon(\vartheta, p) > 0 \) such that for any \( \epsilon < \epsilon(\vartheta, p) \)
\[
\vec{\nu}_g \in \mathbb{H}_d(1/(2d), 3 + \sqrt{2b}, A_\epsilon), \quad \forall g \in \mathbb{N}_{\nu, \epsilon}^\square(\bar{\alpha}, \Lambda). \quad (7.22)
\]

Note that the definition of the function \( w_\epsilon \) together with the assumption \( g \in \mathbb{C}_K(\mathbb{R}^d) \) implies that \( \sup_{x \in \mathbb{R}^d} |B_{\vec{\nu}}^*(x, g)| < \infty \) that implies in view of (7.16) \( \sup_{x \in \mathbb{R}^d} |B_{\vec{\nu}}^*(x, g)| < \infty \).

Hence, \( h_{j,g}(x) < \infty \) for any \( x \in (-b, b)^d \) and any \( j = 1, \ldots, d_n \), where \( h_{j,g}(\cdot) \) is \( j \)-th coordinate of the vector-function \( \vec{\nu}_g \). It implies, in particular, that the infimum in (7.19) is achievable and, therefore, for any \( x \in (-b, b)^d \)
\[
\vec{\nu}_g(x) \in \mathcal{E}(\vartheta, p), \quad \forall g \in \mathbb{N}_{\nu, \epsilon}^\square(\bar{\alpha}, \Lambda). \quad (7.23)
\]
By the same reason $B_{\tilde{h}(\cdot, g)}^s$ as well as $\tilde{T}_{\tilde{h}(\cdot, g)}^s$ are Borel functions and since $S_\varepsilon(\partial, p)$ is countable we assert in view of (7.23) that for any $s \in \mathbb{N}^d$ such that $\tilde{h}_s := (h_{s_1}, \ldots, h_{s_d}) \in S_\varepsilon(\partial, p)$

$$\Lambda_s[\tilde{h}_g] \in \mathfrak{B}(\mathbb{R}^d), \quad \forall g \in C_K(\mathbb{R}^d).$$  \hspace{1cm} (7.24)

It implies, in particular, that $\tilde{h}_g$ is Borel function.

30b. Taking into account that $w_\ell$ is compactly supported on $[-1/2, 1/2]^d$ we easily deduce from the assertions of Lemma 2 that for any $\tilde{h}, \tilde{\eta} \in S_\varepsilon^{\text{consist}}$

$$B_{\tilde{h}, \tilde{\eta}}^s(x, g) \leq 2d(1 + \|w_\ell\|_{\infty, \mathbb{R}^d})^d \sup_{J \in \mathcal{J}} \sup_{j=1, \ldots, d} M_J[b_{\tilde{h}, j}](x);$$

$$B_{\tilde{h}}^s(x, g) \leq d(1 + \|w_\ell\|_{\infty, \mathbb{R}^d})^d \sup_{J \in \mathcal{J}} \sup_{j=1, \ldots, d} M_J[b_{\tilde{h}, j}](x).$$

Since the right hand side of the first inequality is independent of $\tilde{\eta}$ we obtain for any $\tilde{h} \in S_\varepsilon^{\text{consist}}$

$$B_{\tilde{h}}^s(x, g) \leq \Upsilon_1 \sup_{J \in \mathcal{J}} \sup_{j=1, \ldots, d} M_J[b_{\tilde{h}, j}](x), \quad \forall x \in \mathbb{R}^d. \quad (7.25)$$

In particular, it yields together with (7.20) for any $x \in \mathbb{R}^d$

$$B_{\tilde{h}, \tilde{\eta}}^s(x, g) + a\Upsilon_2\varepsilon\Phi_\varepsilon(V_{\tilde{h}}(x)) \leq \inf_{\tilde{h} \in S_\varepsilon(\partial, p)} \left[ \Upsilon_1 b_{\tilde{h}}^s(x, g) + a\Upsilon_2\varepsilon\Phi_\varepsilon(V_{\tilde{h}}(x)) \right] + 2c_1\varepsilon^2. \quad (7.26)$$

40. To get (7.22) let us first prove that for any $(\partial, p) \in \mathcal{P}_\varepsilon^{\text{consist}}$ one can find $\varepsilon(\partial, p) > 0$ such that for any $\varepsilon > \varepsilon(\partial, p)$

$$\tilde{h}_g \in \mathbb{Y}_d(1/(2d), 3 + \sqrt{2}\delta), \quad \forall g \in \mathbb{N}^d_\varepsilon(\beta, a\overline{\Lambda}). \quad (7.27)$$

For any $s \in \mathbb{N}^*$ recall that $\tilde{h}_s = (h_{s_1}, \ldots, h_{s_d})$ and $V_s = \prod_{j=1}^d h_{s_j}$. Denote $S^d = \{s(m), \ m = 0, \ldots, \tilde{m}\}$ and remark that $\Lambda_s[\tilde{h}_g] := \left\{ x \in (-b, b)^d : \tilde{h}_g(x) = \tilde{h}_s \right\} = \emptyset$ for any $s \in \mathbb{N}^d, \ s \neq S^d$, in view of the definition of $\tilde{h}_g$.

Taking into account (7.24) we have for any $1 \leq m \leq \tilde{m}$ in view of the definition $\tilde{h}_g$ and the second assertion of Lemma 7

$$\Lambda_s(m)[\tilde{h}_g] \subseteq \left\{ x \in (-b, b)^d : B_{\tilde{h}(m-1)}^s(x, g) + a\Upsilon_2\varepsilon\Phi_\varepsilon(V_{s(m-1)}) \geq B_{\tilde{h}(m)}^s(x, g) + a\Upsilon_2\varepsilon\Phi_\varepsilon(V_{s(m)}) \right\} \quad \subseteq \left\{ x \in (-b, b)^d : c_2\varepsilon^2 + B_{\tilde{h}(m-1)}^s(x, g) \geq a\Upsilon_2\varepsilon\Phi_\varepsilon(V_{s(m)}) - \varepsilon\Phi_\varepsilon(V_{s(m-1)}) \right\}.$$ 

To get the last inclusion we have taken into account (7.16). The definition of $s(m)$ implies that

$$e^{-d} \prod_{j=1}^d h_{s_j(m)} \leq \prod_{j=1}^d \eta_j(m) = e^{-2d} L_{\tilde{h}}^{-1} \varphi \leq \prod_{j=1}^d h_{s_j(m)}, \quad \forall m = 0, \ldots, \tilde{m} \quad (7.28)$$

and, therefore, $V_{s(m-1)}^{-1} V_{s(m)} \leq e^{-3d}$. It yields

$$\Phi_\varepsilon(V_{s(m)}) - \Phi_\varepsilon(V_{s(m-1)}) \geq 2^{-1} \Phi_\varepsilon(V_s)$$
for any $\varepsilon > 0$ small enough.

Putting $c_2 = a(2b + 1)C(\bar{r})\|w\|_{1,R^d}(1 - e^{-\beta_r})^{-1}$ and using (7.25) we have for any $\varepsilon > 0$ provided $\varepsilon < c_1^{-1}c_2$

$$\Lambda_{s(m)}[\tilde{h}_g] \subseteq \left\{ x \in (-b, b)^d : c_1\varepsilon^2 + B^*_{b_0(m-1)}(x, g) \geq 2^{-1}a_{(2e)}\Phi_\varepsilon(V_\varepsilon) \right\}$$

$$\subseteq \bigcup J \bigcup \bigcup_{j=1}^{d} \left\{ x \in (-b, b)^d : \varepsilon^{-1}\Phi_\varepsilon^{-1}(V_\varepsilon)M_J[b_{b_0(m-1),j}] (x) > c_2 \right\}. \quad (7.29)$$

Here we have also used that $\Upsilon_1 \geq 1$ as well as $\Phi_\varepsilon(V_\varepsilon) > 1$ for any $s \in S^d$.

Introduce $J_\infty = \{ j = 1, \ldots, d : r_j = \infty \}$ and recall that $J_\pm = \{ 1, \ldots, d \} \setminus J_\infty$. In view of (7.9) and the bound (7.5) of Lemma 6 with $r = \infty$ and $M = a\bar{L}$ we obtain for any $j \in J_\infty$ and any $J \in J_\infty$,

$$\left\| M_J[b_{b_0(m-1),j}] \right\|_{\infty,R^d} \leq c_2L_j\eta_j^\beta(m-1) \leq c_2\varepsilon e^{2d(m-1)}. \quad (7.30)$$

Here we have used that $\eta_j^\beta(m-1) = e^{-2(L_j^{-1}\varphi)^{1/\beta_j}e^{2d(m-1)}}$ if $r_j = \infty$.

Set $\mu_\varepsilon = 1$ if $\varepsilon(p) > 0$ and $\mu_\varepsilon = \sqrt{\ln(\varepsilon)}$ if $\varepsilon(p) \leq 0$. We obtain for any $m = 0, \ldots, \bar{m}$ in view of (7.28) and the definition of $\varphi$

$$(\varepsilon\mu_\varepsilon)^{-1}\sqrt{V_{s(m)}}\varphi e^{2d(m-1)} \leq e^{-\frac{d\varphi}{2}}.$$}

Moreover, we obviously have that $\Phi(V_\varepsilon) \geq V_\varepsilon^{-\frac{1}{2}}\mu_\varepsilon$ for any $s \in \mathbb{N}^d$. Thus, we have

$$\varepsilon^{-1}\Phi_\varepsilon^{-1}(V_\varepsilon)\varphi e^{2d(m-1)} \leq e^{-\frac{d\varphi}{2}} \quad (7.31)$$

and, therefore, for any $j \in J_\infty$ and any $J \in J_\infty$,

$$\left\| M_J[b_{b_0(m-1),j}] \right\|_{\infty,R^d} \leq c_2e^{-\frac{d\varphi}{2}} < c_2. \quad (7.32)$$

It yields together with (7.29)

$$\Lambda_{s(m)}[\tilde{h}_g] \subseteq \bigcup J \bigcup \bigcup_{j \in J_\pm} \left\{ x \in (-b, b)^d : \varepsilon^{-1}\Phi_\varepsilon^{-1}(V_\varepsilon)M_J[b_{b_0(m-1),j}] (x) > c_2 \right\}. \quad (7.32)$$

We remark also that if $J_\pm = 0$ then only $\Lambda_{s(0)}[\tilde{h}_g] \neq 0$. Let us consider now separately two cases.

40a. Suppose that either $\varepsilon(p) > 0$ or $\varepsilon(p) \leq 0, \gamma(p^*) \leq 0$ and remind that $\eta_j^\beta(m) = \eta_j(m), j = 1, \ldots, d$, for all values of $m$. Applying the Markov inequality we get for any $m = 1, \ldots, \bar{m}$ in view of (7.9) and the bound (7.5) of Lemma 6 with $r = r_j$ and $M = a\bar{L}$,

$$2^{-d}\nu_d\left(\Lambda_{s(m)}[\tilde{h}_g] \right) \leq \sum_{j \in J_\pm} \left[ c_2\varepsilon \Phi_\varepsilon(V_\varepsilon) \right]^{-r_j} \left[ b_{b_0(m-1),j} \right]^{r_j} \left[ \right]_{r_j,R^d}$$

$$\leq \sum_{j \in J_\pm} \left[ c_2\varepsilon \Phi_\varepsilon(V_\varepsilon) \right]^{-r_j} \left[ c_2L_j\eta_j^\beta(j) \right]^{r_j}$$

$$\leq \sum_{j \in J_\pm} \left[ \varepsilon^{-1}\Phi_\varepsilon^{-1}(V_\varepsilon) \right]^{r_j} \left[ \right]_{r_j} e^{-2d\omega(2+1/\beta_j)(m-1)}. \quad (7.33)$$
Taking into account that $\omega \geq \beta$, we obtain in view of (7.31) for any $\varepsilon < c_1^{-1}c_2$
\[
\nu_d\left(\Lambda_{s(m)}[\mathbf{h}_g]\right) \leq d e^{-\frac{c_2 \varepsilon}{2} e^{-2d(2+1/\beta)(m-1)}}, \quad \forall m = 1, \ldots, \tilde{m}. \quad (7.34)
\]

Remembering that $\Lambda_s[\mathbf{h}_g] = \emptyset$ for any $s \notin S_d$ and that $\nu_d(\Lambda_{s(0)}[\mathbf{h}_g]) \leq (2b)^d$, taking into account the second assertion of Lemma 7, we obtain putting $\tau = (2d)^{-1}$ for any $\varepsilon < c_1^{-1}c_2$
\[
\sum_{s \in \mathbb{N}^d} \nu_d\left(\Lambda_{s(m)}[\mathbf{h}_g]\right) = \sum_{m=1}^{\tilde{m}} \nu_d\left(\Lambda_{s(m)}[\mathbf{h}_g]\right) + (2b)^d \leq d \sum_{m=1}^{\tilde{m}} (1 - e^{-1})^{-1} + \sqrt{2b} \leq 2 + \sqrt{2b}.
\]

Here we have used that $\sup_{d \geq 1} d \frac{\varepsilon}{2} (1 - e^{-1})^{-1} < 2$.

Thus, we assert that (7.27) is established if either $\V(p) > 0$ or $\V(p) \leq 0, \tau(p^*) \leq 0$.

4b. Let now $\V(p) \leq 0, \tau(p^*) > 0$. Since $\bar{\eta}_j(m) = \eta_j(m), j = 1, \ldots, d$, if $m = 0, \ldots, \tilde{m}$, (7.34) remains true for any $m = 0, \ldots, \tilde{m}$. Similarly to (7.33) we obtain for any $m \geq \tilde{m}$ in view of (7.9) and the bound (7.6) of Lemma 6 with $M = aL$
\[
2^{-d} \nu_d\left(\Lambda_{s(m)}[\mathbf{h}_g]\right) \leq \sum_{j \in \mathcal{J}_\pm}^{d} \left[ c_2 \varepsilon \Phi_\varepsilon(V_s) \right]^{-q_j} \left[ b_\varepsilon s(m-1,j) \right]^{q_j}_{\mathbb{R}^d} \leq \sum_{j \in \mathcal{J}_\pm}^{d} \left[ c_2 \varepsilon \Phi_\varepsilon(V_s) \right]^{-q_j} \left[ c_3 (1 - e^{-\gamma})^{-1} L_j h_\varepsilon^\gamma j \right]^{q_j} \leq \sum_{j \in \mathcal{J}_\pm}^{d} \left[ c_4 (1 - e^{-\gamma})^{-1} e^{-1} \Phi_\varepsilon^{-1}(V_s) L_j \bar{\eta}_j^\gamma j(m-1) \right]^{q_j}, \quad (7.35)
\]

where we have put $c_3 = (1 - \varepsilon^{3\beta^*})c_2$ and $c_4 = (1 - \varepsilon^{3\beta^*})$.

Using (7.31) we get
\[
\left[ \varepsilon^{-1} \Phi_\varepsilon^{-1}(V_s) L_j \bar{\eta}_j^\gamma j(m-1) \right]^{q_j} \leq e^{-3d\varepsilon^{3\beta^*} - 2e^{-2d(2+1/\gamma)(m-1)} \left[ L_\varepsilon \phi_\varepsilon^{1/\beta} \right]^v} \left[ L_\beta \phi^{1/\beta} \right].
\]

Moreover, the definition of $\tilde{m}$ implies that
\[
e^{-2d\varepsilon^{2+1/\gamma}} \varepsilon^{1/(\beta - 1/\gamma)} v \leq e^{d} \left( L_\beta / L_\gamma \right)^{-\frac{v(2+1/\gamma)}{2\beta \varepsilon^{(1+1/\beta)}(1/\gamma - 1/\beta)}} \varepsilon^{\frac{v(2+1/\gamma)}{2\beta \varepsilon^{(1+1/\beta)}(1/\gamma - 1/\beta)}} \varphi^{\frac{2+1/\beta}{2\beta \varepsilon^{(1+1/\beta)}(1/\gamma - 1/\beta)}} v(1/\gamma - 1/\beta).
\]

Below we prove (see, formulae (8.20)), that $v(2 + 1/\gamma) - \omega(2 + 1/\beta) = 2\beta(2)\omega v(1/\gamma - 1/\beta)$, and we obtain (recall that $\tau(2) > 0$ in the considered case, see, e.g. proof of Theorem 2)
\[
e^{-2d\varepsilon^{2+1/\gamma}} \varepsilon^{1/(\beta - 1/\gamma)} v \leq e^{d} \left( L_\beta / L_\gamma \right)^{-\frac{v(2+1/\gamma)}{2\beta \varepsilon^{2+1/\gamma}(1/\gamma - 1/\beta)}} \varphi^{\frac{2+1/\beta}{2\beta \varepsilon^{2+1/\gamma}(1/\gamma - 1/\beta)}} v(1/\gamma - 1/\beta) \to 0, \varepsilon \to 0.
\]

The latter bound together with (7.35) yields for any $m \geq \tilde{m} + 1$
\[
\nu_d\left(\Lambda_{s(m)}[\mathbf{h}_g]\right) \leq e^{-\frac{3d\varepsilon^{3\beta^*}}{2} \left( \frac{2+1/\beta}{2\beta \varepsilon^{2+1/\gamma}(1/\gamma - 1/\beta)} \varphi^{\frac{2+1/\beta}{2\beta \varepsilon^{2+1/\gamma}(1/\gamma - 1/\beta)}} v(1/\gamma - 1/\beta) \right)} e^{-2d\varepsilon^{2+1/\gamma}(m-\tilde{m})} \quad (7.36)
\]

and, therefore, putting $\tau = (2d)^{-1}$, we can assert that one can find $\varepsilon(\vartheta, p) > 0$ such that for any $\varepsilon < \varepsilon(\vartheta, p)$
\[
\sum_{m=\tilde{m}+1}^{\tilde{m}} \nu_d\left(\Lambda_{s(m)}[\mathbf{h}_g]\right) \leq 1.
\]
It yields together with (7.34) for all \( \varepsilon < \min\{c_1^{-1}c_2, \varepsilon(\theta, p)\} \)
\[
\sum_{s \in \mathbb{N}^d} \nu_d^\ast \left( \Lambda_s [\vec{h}_g] \right) \leq \sum_{m=1}^{\bar{m}} \nu_d^\ast \left( \Lambda_{s(m)} [\vec{h}_g] \right) + (2b)^{dr} + 1 \leq 3 + \sqrt{2b}.
\]
Thus, we assert that (7.27) is established in the case \( \varkappa(p) \leq 0, \tau(p^*) > 0 \) as well.

5\(^0\). To get (7.22) it remains to prove that for any \((\vartheta, p) \in \mathcal{P}^\text{consist}\) one can find \(\varepsilon(\vartheta, p) > 0\) such that for any \(\varepsilon < \varepsilon(\vartheta, p)\)
\[
\vec{h}_g \in \mathbb{H}(\mathcal{A}_c), \quad \forall g \in \mathbb{N}_{r,d}^{\ast} (\vec{\beta}, a\vec{L}).
\] (7.37)
The proof of (7.37) is mostly based on the choice of \(\mathcal{A}_c\) given in (2.2) which, in its turn, guarantees (2.3). We will consider separately 2 cases.

5\(^0\)a. Let \(\varkappa(p) > 0\). Obviously we can find \(r \in \mathbb{N}_p^*\) such that \(p := \frac{\varpi}{r-p}\) satisfies \(\varkappa(p) > 0\) and we have in view of (7.28)
\[
\left\| V^{-\frac{1}{2}}_{\vec{h}_g} \right\|^p \leq e^{dp} L_{\beta}^{p/2} \varphi^{-\frac{dp}{2}} \left(2b\right)^d + \sum_{m=1}^{m} e^{2pdm} \nu_d \left( \Lambda_{s(m)} [\vec{h}_g] \right). \tag{7.38}
\]
Using the first bound established in (7.34) we obtain
\[
\left\| V^{-\frac{1}{2}}_{\vec{h}_g} \right\|^p \leq e^{dp} L_{\beta}^{p/2} \varphi^{-\frac{dp}{2}} \left(2b\right)^d + d2^{-\frac{d}{2}} e^{-2d\omega(2+1/\beta)} \sum_{m=1}^{m} e^{2(p-\omega(2+1/\beta))dm}. \tag{7.39}
\]
Remembering that \(p - \omega(2 + 1/\beta) = -\varkappa(p) < 0\) and that \(\varphi^{\frac{p}{2}} \mathcal{A}_c \rightarrow \infty\), we assert that there exists \(\varepsilon(\theta, p) > 0\) such that \(\left\| V^{-\frac{1}{2}}_{\vec{h}_g} \right\|^p \leq \mathcal{A}_c\) for any \(\varepsilon < \varepsilon(\theta, p)\).

Thus, (7.37) is proved if \(\varkappa(p) > 0\). Moreover, since the right hand side of the inequality (7.39) as well as the choice of \(r\) is independent of \(g\) we can assert that for all \(\varepsilon < \varepsilon(\theta, p)\)
\[
r \in \mathbb{N}_p^* (\vec{h}_g, \mathcal{A}_c), \quad \forall g \in \mathbb{N}_{r,d}^{\ast} (\vec{\beta}, a\vec{L}),
\]
and the assertion 2(ii) of the proposition follows.

5\(^0\)b. In all other cases the set \(\mathcal{S}_c(\vartheta, p)\) is finite and we obviously have in view of (7.28)
\[
\left\| V^{-\frac{1}{2}}_{\vec{h}_g} \right\|^p \leq \left(2b\right)^d e^{d} e^{1/2} \varphi^{-\frac{d}{2}} e^{2dm}, \quad \forall t \geq 1. \tag{7.40}
\]
This, together with the definition of \(\bar{m}\) and \(\varphi\) implies that the right hand side of the latter inequality increases to infinity polynomially in \(\varepsilon^{-1}\). Thus, there exists \(\varepsilon(\theta, p) > 0\) such that \(\left\| V^{-\frac{1}{2}}_{\vec{h}_g} \right\|^p \leq \mathcal{A}_c\) for any \(\varepsilon < \varepsilon(\theta, p)\) and (7.37) follows.

6\(^0\). Thus, (7.22) follows from (7.27) and (7.37) and it yields together with (7.21) that \(\mathcal{S}_c^\ast(\vartheta, p) \subset \mathbb{H}_c(R)\) for all \(\varepsilon > 0\) small enough and, therefore, the first assertion of the proposition is proved. We note that the assertion 2(i) of the proposition follows from (7.26) for any \(\varepsilon > 0\) such that \(2c_1\varepsilon \leq 1\). Recall, at last, that in view of (7.23) any \(\vec{h} \in \mathcal{S}_c^\ast(\vartheta, p)\) takes values in \(\mathcal{S}_c(\vartheta, p)\). \(\blacksquare\)
7.4. Proof of the theorem. Case \( p \in (1, \infty) \)

We will need some technical results presented in Lemmas 8 and 9. Whose proofs are postponed to Appendix.

Recall that the quantity \( B^p_h(\cdot) \) is defined in (2.7) with \( K \) given in (3.5). Also, furthermore \( a = \| K \|_{1, R^d} = \| w \|_{1, R^d} \).

**Lemma 8.** For any \( (\theta, p) \in \mathcal{P} \) and any \( \mathbb{H} \subseteq \mathcal{S}_d \)

\[
\sup_{f \in \mathcal{N}_{\theta, d}(\tilde{\beta}, \tilde{L})} \inf_{\tilde{h} \in \mathbb{H}} \left[ B^p_h(f) + \varepsilon \Psi_{\varepsilon, p}(\tilde{h}) \right] \leq \sup_{g \in \mathcal{N}^\ast_{\theta, d}(\tilde{\beta}, a\tilde{L})} \inf_{\tilde{h} \in \mathcal{H}_\varepsilon(\theta, p)} \left[ B^p_h(g) + \varepsilon \Psi_{\varepsilon, p}(\tilde{h}) \right].
\]

For any \( x \in (-b, b)^d \) and any \( g \in \mathcal{N}^\ast_{\theta, d}(\tilde{\beta}, a\tilde{L}) \) define

\[
U_{\theta, p}(x, g) = \inf_{\tilde{h} \in \mathcal{H}_\varepsilon(\theta, p)} \left[ b^p_h(x, g) + \omega_x V^{-\frac{1}{p}}_h \right],
\]

where \( \omega_x = \omega \) if \( \omega(p) > 0 \) and \( \omega_x = \omega \sqrt{\ln(\varepsilon)} \) if \( \omega(p) \leq 0 \).

**Lemma 9.** For any \( (\theta, p) \in \mathcal{P} \) provided \( p^\ast > p \) and any \( \varepsilon > 0 \) small enough

\[
\sup_{g \in \mathcal{N}^\ast_{\theta, d}(\tilde{\beta}, a\tilde{L})} \| U_{\theta, p}(\cdot, g) \|_{p^\ast} \leq \mathcal{Y}_3 L^\ast,
\]

where, recall, \( L^\ast = \min \{ j; r_j = p^\ast \} \) \( L^\ast_j \) and \( \mathcal{Y}_3 = ad^{2d} C_{p^\ast} (C_{p^\ast} \| w \|_{\infty, R^d} + 1) + 1 \).

Let \( (\theta, p) \in \mathcal{P} \) be fixed. Later on \( R = 3 + \sqrt{2b} \) and without further mentioning we will assume that \( \varepsilon > 0 \) is sufficiently small in order to provide the results of Proposition 2, Lemmas 7 and 9. Set also

\[
V_{p}(\tilde{L}) = (L_{\gamma}/L_{\tilde{\beta}})(\varepsilon^{\frac{p^{\ast} - \omega(p)(2 + \frac{1}{p^\ast})}{2k^{(2)}}} L_{\tilde{\beta}}^\gamma, p < \infty; \quad V_{\infty}(\tilde{L}) = L_{\gamma}.
\]

7.4.1. Proof of the theorem. Preliminaries

We deduce from Theorem 1 and Lemma 8

\[
\mathcal{R} := c_5^{-1} \sup_{f \in \mathcal{N}_{\theta, d}(\tilde{\beta}, \tilde{L})} \mathcal{R}^p_c \left[ f^R_h ; f \right] \leq \sup_{g \in \mathcal{N}^\ast_{\theta, d}(\tilde{\beta}, a\tilde{L})} \inf_{\tilde{h} \in \mathcal{H}_\varepsilon(\theta, p)} \left[ B^p_h(g) + \varepsilon \Psi_{\varepsilon, p}(\tilde{h}) \right] + \varepsilon.
\]

In view of the first assertion of Proposition 2 \( \mathcal{S}^\ast_{\varepsilon}(\theta, p) \subset \mathbb{H}(R) \).

\[
\mathcal{R} \leq \sup_{g \in \mathcal{N}^\ast_{\theta, d}(\tilde{\beta}, a\tilde{L})} \inf_{\tilde{h} \in \mathcal{S}^\ast_{\varepsilon}(\theta, p)} \left[ B^p_h(g) + \varepsilon \Psi_{\varepsilon, p}(\tilde{h}) \right] + \varepsilon, \quad (7.41)
\]

Note also the following obvious inequality: for any \( p \geq 1 \) and any \( g : \mathbb{R}^d \rightarrow \mathbb{R} \)

\[
\sup_{\eta \in \mathcal{S}_d} \| B_{\tilde{h}, \eta}(\cdot, g) \|_p \leq \sup_{\eta \in \mathcal{S}^\ast_{\varepsilon}(\tilde{h}, \eta, \cdot, g)} \left\| B_{\tilde{h}, \eta}(\cdot, g) \right\|_p, \quad \forall \tilde{h} \in \mathcal{S}_d.
\]
This yields, in particular, for any $\tilde{h} \in \mathcal{G}_d$ and any $g : \mathbb{R}^d \rightarrow \mathbb{R}$
\begin{equation}
B^{(p)}_{\tilde{h}}(g) \leq 2 \| B^*_{\tilde{h}}(\cdot, g) \|_p.
\end{equation}
(7.42)

Combining (7.41) and (7.42) we get
\begin{equation}
\mathcal{R} \leq \sup_{g \in \mathbb{N}_{r,d}^+(\beta, aL)} \left\{ 2 \| B^*_{\tilde{h}_g}(\cdot, g) \|_p + \varepsilon \Psi_{\varepsilon, p}(\tilde{h}_g) \right\} + \varepsilon,
\end{equation}
(7.43)

where $\tilde{h}_g$ satisfies the second assertion of Proposition 2. Consider separately two cases.

**Case $\varkappa(p) > 0$**  Recall that $\tilde{h}_g(x)$ takes values in $\mathcal{F}_\varepsilon(\partial, p)$ for any $g \in \mathbb{N}_{r,d}^+(\beta, aL)$ and $x \in (-b, b)^d$. Additionally, $\mathcal{F}_\varepsilon(\partial, p) \subset \mathcal{F}^d(\mathcal{H}_\varepsilon)$ in view of the first assertion of Lemma 7 since $\varkappa(p) > 0$.

It implies $\tilde{h}_g \in \mathcal{G}_d(\mathcal{H}_\varepsilon)$ and we can assert that
\begin{equation}
\Psi_{\varepsilon, p}(\tilde{h}_g) \leq \inf_{r \in \mathbb{N}_{r,d}^+(\tilde{h}_g, A_c)} C_2(r) \sup_{\varepsilon, p} \left\{ V_{\tilde{h}_g}^{-\frac{1}{2}} \right\}, \quad \forall g \in \mathbb{N}_{r,d}^+(\tilde{h}_g, aL).
\end{equation}

Applying the assertion 2(ii) of Proposition 2 we can state that for some $r$ provided $\varkappa(\frac{r}{\varepsilon - r}) > 0$
\begin{equation}
\Psi_{\varepsilon, p}(\tilde{h}_g) \leq C_2(r) \sup_{\varepsilon, p} \left\{ V_{\tilde{h}_g}^{-\frac{1}{2}} \right\}, \quad \forall g \in \mathbb{N}_{r,d}^+(\tilde{h}_g, aL).
\end{equation}

Denoted $p = \frac{r}{\varepsilon - r}$. Since $p > p$ in view of Hölder inequality $\| B^*_{\tilde{h}_g}(\cdot, g) \|_p \leq (2b)^d \| B^*_{\tilde{h}_g}(\cdot, g) \|_p$ and we deduce from (7.43) (remembering that we consider here the norms of positive functions) that
\begin{equation}
\mathcal{R} \leq c_6 \sup_{g \in \mathbb{N}_{r,d}^+(\tilde{h}_g, aL)} \left\{ \| B^*_{\tilde{h}_g}(\cdot, g) \|_p + \varepsilon \sup_{\varepsilon, p} \left\{ V_{\tilde{h}_g}^{-\frac{1}{2}} \right\} \right\} + \varepsilon.
\end{equation}
(7.44)

Applying the assertion 2(i) of Proposition 2 we obtain
\begin{equation}
\mathcal{R} \leq c_8 \sup_{g \in \mathbb{N}_{r,d}^+(\tilde{h}_g, aL)} \left\{ \inf_{\tilde{h} \in \mathcal{H}_\varepsilon(\partial, p)} \left[ b^*_{\tilde{h}}(\cdot, g) + \varepsilon \Phi_{\varepsilon}(V_{\tilde{h}}) \right] \right\} + \varepsilon.
\end{equation}
(7.45)

**Case $\varkappa(p) \leq 0$**  Since $\Psi_{\varepsilon, p}(\tilde{h}) \leq \left( C_1 \sqrt{\ln \left( \varepsilon V_{\tilde{h}} \right) V_{\tilde{h}}^{-\frac{1}{2}} \left\| V_{\tilde{h}}^{-\frac{1}{2}} \right\|_p } \right)$ for any $\tilde{h} \in \mathcal{B}(A_c)$, we deduce from (7.43) similarly to (7.44)
\begin{equation}
\mathcal{R} \leq c_9 \sup_{g \in \mathbb{N}_{r,d}^+(\tilde{h}_g, aL)} \left\{ B^*_{\tilde{h}_g}(\cdot, g) + \varepsilon \sup_{\varepsilon, p} \left\{ \ln \left( \varepsilon V_{\tilde{h}_g} \right) \right\} \right\} + \varepsilon.
\end{equation}
(7.46)

Applying the first assertion 2(ii) of Proposition 2 we have
\begin{equation}
\mathcal{R} \leq c_{10} \sup_{g \in \mathbb{N}_{r,d}^+(\tilde{h}_g, aL)} \left\{ \inf_{\tilde{h} \in \mathcal{H}_\varepsilon(\partial, p)} \left[ b^*_{\tilde{h}}(\cdot, g) + \varepsilon \Phi_{\varepsilon}(V_{\tilde{h}}) \right] \right\} + \varepsilon.
\end{equation}
This together with (7.45) allows us to assert that

$$\mathcal{R} \leq c_{11} \sup_{g \in \mathbb{N}_{p,d}(\beta, \bar{a} \bar{L})} \left\| \inf_{\tilde{h} \in \mathcal{H}_{\epsilon}(\vartheta, p)} \left[ b_{\tilde{h}}^\ast(\cdot, g) + \varepsilon \Phi_\varepsilon(V_{\tilde{h}}) \right] \right\|_p + \varepsilon, \quad (7.46)$$

where we have denoted $p = p$ if $\kappa(p) > 0$ and $p = p$ if $\kappa(p) \leq 0$.

The definition of $\bar{m}$ allows us to assert that if $\kappa(p) \leq 0$

$$\Phi_\varepsilon(V_{\tilde{h}}) \leq c_{12} \sqrt{|\ln(\varepsilon)|} |V_{\tilde{h}}|^{-\frac{1}{d}}, \quad \forall \tilde{h} \in \mathcal{H}_{\epsilon}(\vartheta, p).$$

Hence we get from (7.46)

$$\mathcal{R} \leq c_{13} \sup_{g \in \mathbb{N}_{p,d}(\beta, \bar{a} \bar{L})} \left\| \inf_{\tilde{h} \in \mathcal{H}_{\epsilon}(\vartheta, p)} \left[ b_{\tilde{h}}^\ast(\cdot, g) + \bar{w}_\varepsilon V_{\tilde{h}}^{-\frac{1}{d}} \right] \right\|_p + \varepsilon =: c_{13} \sup_{g \in \mathbb{N}_{p,d}(\beta, \bar{a} \bar{L})} \mathcal{R}_p(g) + \varepsilon, \quad (7.47)$$

where, recall, \( \bar{w}_\varepsilon = \varepsilon \) if $\kappa(p) > 0$ and \( \bar{w}_\varepsilon = \varepsilon \sqrt{|\ln(\varepsilon)|} \) if $\kappa(p) \leq 0$.

### 7.4.2. Proof of the theorem. Slicing

For any $g \in \mathbb{N}_{p,d}(\beta, \bar{a} \bar{L})$ we have

$$\mathcal{R}_p(g) \leq (2b)^d (Q \varphi)^p + \sum_{m=0}^{\bar{m}} (Q e^{2d(m+1)} \varphi)^p \nu_d(\Gamma_m) + \int_{\Gamma_m} |U_{\vartheta,p}(x, g)|^p \nu_d(dx)$$

$$= (2b)^d (Q \varphi)^p + (Q e^{2d} \varphi)^p \sum_{m=1}^{\bar{m}} e^{2dm} \nu_d(\Gamma_m) + T_{\bar{m}}. \quad (7.48)$$

Here we have put $\Gamma_m = \{ x \in (b, b)^d : U_{\vartheta,p}(x, g) \geq Q e^{2dm} \}$ and $Q = 2c_2 + d^d$, where, recall, $c_2 = a(2b+1)C(\bar{r}) \| w \|_{1, R^d}(1 - e^{-\bar{r}})^{-1}$. Moreover, if $\bar{m} = \infty$ we set $T_{\infty} = 0$.

We have in view of the definition of $U_{\vartheta,p}$

$$\Gamma_m \subset \{ x \in (b, b)^d : b_{\ast}^\ast \varphi_{\ast}(\cdot, g) + \sqrt{\varepsilon} V_{s(m)}^{-\frac{1}{d}} \geq Q e^{2dm} \}$$

Recall that in view of (7.28) $e^{-d} V_{s(m)} \leq e^{-2d} L^{-1}_{\beta} \bar{r}^2 e^{-4dm} \leq V_{s(m)}$ for any $m = 0, \ldots, \bar{m}$.

Hence, $\bar{w}_\varepsilon V_{s(m)}^{-\frac{1}{d}} \leq e^d \varphi e^{2dm}$ and we get

$$\Gamma_m \subset \{ x \in (b, b)^d : b_{\ast}^\ast \varphi_{\ast}(\cdot, g) \geq 2c_2 e^{2dm} \} =: \Gamma^*_m \quad (7.49)$$

Note also that $\bar{w}_\varepsilon V_{s(m)}^{-\frac{1}{d}} \leq e^d \varphi e^{2dm} < e^d c_2 e^{2dm} \varphi < e^d b_{\ast}^\ast \varphi_{\ast}(x, g)$ for any $x \in \Gamma^*_m$ that yields,

$$|U_{\vartheta,p}(x, g)| \leq (e^d + 1) b_{\ast}^\ast \varphi_{\ast}(x, g), \quad \forall x \in \Gamma^*_m. \quad (7.50)$$
The latter inequality allows us to bound from above $T_{\tilde{m}}$ if $\tilde{m} < \infty$. Indeed, in view of (7.50)

$$T_{\tilde{m}} \leq (e^d + 1)^p \|b^*_h(\cdot, g)\|_p^p.$$  \hspace{1cm} (7.51)

Another bound can be obtained in the case $p^* > p$. Applying Hölder inequality, the assertion of Lemma 9 and (7.49)

$$T_{\tilde{m}} \leq (L^*\bar{\gamma}_3)^p \nu_d(\Gamma^*_m)^{1-p/p^*}.$$  \hspace{1cm} (7.52)

The definition of $b^*_h(\cdot, g)$ implies that for any $m = 1, \ldots, \tilde{m}$

$$\Gamma^*_m \subseteq \bigcup_{j \in J} \bigcup_{J \in J} \left\{ x \in (b, b)^d : M_J[b^*_h(\cdot, g)](x) \geq 2e^{2dm} \Phi \right\}.$$  \hspace{1cm} (7.53)

Since in view of (7.30) $\|M_J[b^*_h(\cdot, g)]\|_{\infty, \mathbb{R}^d} \leq e^{2dm}$ for any $j \in J_\infty$ and any $J \in \mathcal{J}$ we obtain

$$\nu_d(\Gamma^*_m) \leq c_{14} e^{-2dm\omega(2+1/\beta)}, \quad \forall m = 1, \ldots, \tilde{m}. \hspace{1cm} (7.54)$$

If either $\kappa(p) > 0$ or $\kappa(p) \leq 0$, $\tau(p^*) \leq 0$ the following bound is true.

Indeed, applying the Markov inequality we get for any $m = 1, \ldots, \tilde{m}$ in view of (7.9) and the bound (7.5) of Lemma 6 with $r = r_j$ and $\tilde{M} = aL$

$$2^{-d} \nu_d(\Gamma^*_m) \leq \sum_{j \in J_\pm} [c_2 e^{2dm} \Phi]^{-r_j} \|b^*_h(\cdot, g)\|_{r_j, \mathbb{R}^d} r_j \leq \sum_{j \in J_\pm} \left[ e^{2dm} \Phi \right]^{-r_j} \left( L_j h_{s_j(m)} \right)^{r_j} \leq de^{-2dm\omega(2+1/\beta)}.$$  \hspace{1cm} (7.55)

If $\kappa(p) \leq 0$, $\tau(p^*) > 0$ we have for any $\tilde{m} < m \leq \tilde{m}$

$$\nu_d(\Gamma^*_m) \leq c_{16} (L_\gamma/L_\beta)^{\nu(1/\beta - 1/\gamma)\nu} e^{-2dm\nu(2+1/\gamma)}. \hspace{1cm} (7.56)$$

Indeed, we obtain for any $m > \tilde{m}$ in view of (7.9) and the bound (7.6) of Lemma 6 with $\tilde{M} = aL$

$$2^{-d} \nu_d(\Gamma^*_m) \leq \sum_{j \in J_\pm} [c_2 e^{2dm} \Phi]^{-q_j} \|b^*_h(\cdot, g)\|_{q_j, \mathbb{R}^d} q_j \leq c_{15} \sum_{j \in J_\pm} \left[ e^{2dm} \Phi \right]^{-q_j} \left( L_j h_{s_j(m)} \right)^{q_j} \leq c_{15} \sum_{j \in J_\pm} e^{-2dm\omega(2+1/\beta)}.$$  \hspace{1cm} (7.57)

### 7.4.3. Proof of the theorem. Derivation of rates

We will proceed differently in depending on a zone to which the pair $(\vartheta, p) \in \mathcal{P}_{\text{consist}}$ belongs.
Dense zone: $\kappa(p) > 0$. Case $\kappa(p^*) \geq 0$  Recall that $\bar{m} = \infty$ in this case and, therefore $T_{\bar{m}} = 0$. Moreover $p = p$. We get from (7.48) and (7.54)

$$R_p^\beta(g) \leq c_{17}\varphi^p \sum_{m=0}^{\infty} e^{2dm(p-\omega(2+1/\beta))} \leq c_{18}\varphi^p = c_{18}\delta^\varphi, \quad (7.56)$$

since $p - \omega(2 + 1/\beta) = -\kappa(p) < 0$ in view of the definition of $p$. Taking into account that the right hand side of the latter inequality is independent of $g$ we obtain in view of (7.47)

$$\mathcal{R} \leq c_{19}(\delta)^\alpha. \quad (7.57)$$

Dense zone: $\kappa(p) > 0$. Case $\kappa(p^*) < 0$  Note first that $\kappa(p^*) < 0$ and $\kappa(p) > 0$ implies $p < p^*$ since $\kappa(\cdot)$ is decreasing. We get in view of (7.52) and (7.54)

$$T_{\bar{m}} \leq c_{20}(L^*)^p e^{-2d\bar{m}\omega(2+1/\beta)(1-p/p^*)} \leq c_{21}(L^*)^p (\varphi(\delta_e) + \varphi(\omega^2(1-p/p^*)/\kappa(p^*)p^*)) \quad (7.58)$$

Noting that $p + \omega(2+1/\beta)(1-p/p^*) = p^*\kappa(p)/\kappa(p^*) < 0$ and taking into account (2.3), we obtain that

$$\varphi^{-p}(\varphi(\delta_e) + \varphi(\omega^2(1-p/p^*)/\kappa(p^*)p^*)) T_{\bar{m}} \to 0, \quad \varepsilon \to 0.$$ 

Since (7.56) holds we assert finally that (7.57) remains true if $\kappa(p^*) < 0$ as well. Thus, the theorem is proved in the case $\kappa(p) > 0$.

New zone: $\kappa(p) \leq 0$, $\tau(p^*) \leq 0$  Recall that $p = p$ and necessarily $p^* > p$ since we consider $(\vartheta, p) \in \mathcal{P}\text{consist}$.

Noting that the first inequality in (7.58) remains true we deduce from (7.48) and (7.54)

$$R_p^\beta(g) \leq c_{22}\varphi^p \sum_{m=0}^{\bar{m}} e^{2dm(p-\omega(2+1/\beta))} + c_{20}(L^*)^p e^{-2d\bar{m}\omega(2+1/\beta)(1-p/p^*)}. \quad (7.59)$$

If $\kappa(p) < 0$ we have

$$R_p^\beta(g) \leq c_{23}\varphi^p e^{-2d\bar{m}(p-\omega(2+1/\beta))} + c_{20}(L^*)^p e^{-2d\bar{m}\omega(2+1/\beta)(1-p/p^*)} \leq c_{24}(1 + L^*)^p \varphi \omega^2(1-p-1/p^*)/\omega^2(2+1/\beta) = c_{24}(1 + L^*)^p \delta^\varphi \omega^2(2+1/\beta) \quad (7.60)$$

in view of the definition of $\bar{m}$. Taking into account that the right hand side of the latter inequality is independent of $g$ we obtain in view of (7.47)

$$\mathcal{R} \leq c_{19}(1 + L^*)(\delta)^\alpha. \quad (7.61)$$

If $\kappa(p) = 0$ we deduce from (7.59) and the definition of $\bar{m}$

$$R_p^\beta(g) \leq c_{23}\varphi^p \bar{m} + (L^*)^p \varphi \omega^2(2+1/\beta)(1-p-1/p^*)/\omega^2(2+1/\beta) \leq c_{24}\varphi^p |\ln(\varepsilon)| + (L^*)^p \varphi^p.$$ 

Here we have used that $\omega^2(2+1/\beta)(1-p-1/p^*)/\omega^2(2+1/\beta) = \frac{\beta}{23+1}$ if $\kappa(p) = 0$. Thus, we conclude

$$\mathcal{R} \leq c_{25}(\delta)^\alpha |\ln(\varepsilon)|^{\frac{1}{p}}. \quad (7.62)$$

Thus, the theorem is proved in the case $\kappa(p) \leq 0$. 41
Sparse zone: \( \kappa(p) \leq 0, \tau(p^*) > 0 \) If \( p^* = p \) taking into account that \( \hat{m} = \hat{m} + 1 \) we deduce from (7.48), (7.51), (7.54) and (7.55)

\[
\mathcal{R}^p_p(g) \leq c_{18} \varphi^p \sum_{m=0}^{\hat{m}} e^{2dm(p-\omega(2+1/\beta))} + (e^d + 1)^p \|b^*_a(\hat{m}+1)g\|_p^p.
\]

Using (7.51), (7.9) and the triangle inequality we have

\[
\|b^*_a(\hat{m}+1)g\|_p \leq \sum_{j\in J} \sum_{j=1}^d \|M_j[b^*_a(\hat{m}+1)g]\|_p \leq c_{26} \sum_{j=1}^d \|b^*_a(\hat{m}+1)g\|_{p,R^d}.
\]

Note that \( p^* = p \) implies \( p_\pm = p \) and, therefore, \( q_j = p \) for any \( j = 1, \ldots, d \), where, recall, \( q_j \) are given in (7.3). Hence we obtain using the bound (7.6) of Lemma 6 with \( \tilde{M} = a\tilde{L} \)

\[
\|b^*_a(\hat{m}+1)g\|_p \leq c_{27} \sum_{j=1}^d L_j \hat{h}^\gamma(y_j(\hat{m}+1)) \leq c_{27} \sum_{j=1}^d L_j \hat{h}^\gamma_j(\hat{m}+1)
\]

\[
\leq c_{28} (L_\gamma/L_\beta)^{\gamma/p} \varphi^{1/(\beta-1/\gamma)}(v/p) e^{2\hat{m}(1-(v/p)(2+1/\gamma))}
\]

\[
\leq c_{28} (L_\gamma/L_\beta)^{2\gamma/p} \varphi^{2\gamma(1-1/\gamma)(2+1/\beta)/(2\gamma(2))} = c_{28} \delta_\epsilon^a.
\]

We get in view of the definition of \( \hat{m} \)

\[
\varphi^p \sum_{m=0}^{\hat{m}} e^{2dm(p-\omega(2+1/\beta))} \leq c_{29} \varphi^p e^{2\hat{m}(p-\omega(2+1/\beta))} \leq c_{30} \delta_\epsilon^p, \quad \kappa(p) < 0; \quad (7.64)
\]

\[
\varphi^p \sum_{m=0}^{\hat{m}} e^{2dm(p-\omega(2+1/\beta))} \leq c_{29} \varphi^p (\hat{m} + 1) \leq c_{29} \varphi^p |\ln(\epsilon)|, \quad \kappa(p) = 0. \quad (7.65)
\]

Therefore, if \( \kappa(p) < 0 \)

\[
\mathcal{R}^p_p(g) \leq c_{31} \delta_\epsilon^{qp}. \quad (7.66)
\]

If \( \kappa(p) = 0 \) we can easily check that \( \tau(p) = \frac{\beta+1}{\beta+2} \) that yields in view of the definition of \( \hat{m} \)

\[
\mathcal{R}^p_p(g) \leq c_{32} \varphi^p |\ln(\epsilon)| = c_{33} \delta_\epsilon^p |\ln(\epsilon)|. \quad (7.67)
\]

Taking into account that the right hand sides in (7.66) and (7.67) are independent of \( g \) we obtain in view of (7.47)

\[
\mathcal{R} \leq c_{34} \delta_\epsilon^a, \quad \kappa(p) < 0; \quad \mathcal{R} \leq c_{29} \delta_\epsilon^p |\ln(\epsilon)|, \quad \kappa(p) = 0. \quad (7.68)
\]

This completes the proof of the theorem in the case \( \kappa(p) \leq 0, \tau(p^*) > 0, p^* = p \).

If \( p^* > p \) we deduce from (7.48), (7.54) and (7.55)

\[
\mathcal{R}^p_p(g) \leq c_{18} \varphi^p \sum_{m=0}^{\hat{m}} e^{2dm(p-\omega(2+1/\beta))}
\]

\[
+ c_{16} (L_\gamma/L_\beta)^{\gamma/p} \varphi^{1/(\beta-1/\gamma)} v \sum_{m=\hat{m}+1}^{\hat{m}} e^{2dm(p-v(2+1/\gamma))} + T_{\hat{m}}
\]

\[
\leq c_{35} \left[ \varphi^p \sum_{m=0}^{\hat{m}} e^{2dm(p-\omega(2+1/\beta))} + (L_\gamma/L_\beta)^{\gamma/p} (1+1/\gamma) v e^{2\hat{m}(p-v(2+1/\gamma))} \right] + T_{\hat{m}}.
\]
Here we have used that $p \leq p_{\pm} < \nu(2 + 1/\gamma) < 0$ in view of (8.18).

Using (8.20) and the definition of $\tilde{m}$ we compute that

$$
(L_{\gamma}/L_{\beta})^{\nu} \varphi^{p+(1/\beta-1/\gamma)} v e^{2\tilde{m}(p-\nu(2+1/\gamma))} \leq c_{36}(L_{\gamma}/L_{\beta})^{\omega(2+1/\beta)\nu} \varphi^{p(2+1/\beta)\nu} e^{2\tilde{m}(p-\nu(2+1/\gamma))} = c_{36}V_{p}^{\beta}(L)(\epsilon^{2}e^{\nu(\ln(\epsilon))})^{p(2+1/\beta)/2} = c_{36}\delta_{p}^{\beta}.
$$

It yields together with (7.64) and (7.65)

$$
R_{p}^{\gamma}(g) \leq c_{37}\delta_{p}^{\beta} + T_{\tilde{m}}, \quad \nu(p) < 0; \quad R_{p}^{\gamma}(g) \leq c_{29}\delta_{p}^{\beta}|\ln(\epsilon)| + T_{\tilde{m}}, \quad \nu(p) = 0.
$$

Using (7.52) and (7.55)

$$
T_{\tilde{m}} \leq c_{38}A_{\beta}^{\varphi^{p+(1/\beta-1/\gamma)}} e^{-2\tilde{m}(p-\nu(2+1/\gamma))} = c_{38}A_{\nu(p) e^{\nu(\ln(\epsilon))}} = c_{38}A_{\nu(p) e^{\nu(\ln(\epsilon))}}.
$$

in view of the definition of $\tilde{m}$ and $\tilde{m}$. Here $A = A(L_{\beta}, L_{\gamma}, L^{*})$ can be easily computed.

Thus we can assert that (7.68) holds in the case $p^{*} > p$ as well that completes the proof of the theorem. □

7.5. Proof of the theorem. Case $p \in \{1, \infty\}$

Note that $p_{\pm} = \infty$ if $p = \infty$ and therefore $\gamma = \gamma(\infty)$. The proof of the theorem in this case is the straightforward consequence of the Corollary 1.

Introduce the vectors $\tilde{u} = (u_{1}, \ldots, u_{d})$ and $\tilde{v} = (v_{1}, \ldots, v_{d})$ as follows.

$$
u_{j} = L_{j}^{\beta_{j}}(L_{\beta_{j}}\epsilon^{2}) e^{\beta_{j}(2\beta_{j}+1)} \quad \nu_{j} = L_{j}^{\beta_{j}}(L_{\beta_{j}}\epsilon^{2}) e^{\beta_{j}(2\beta_{j}+1)}.
$$

It is obvious that both vectors belongs to $H_{x}^{\text{const}}$ and without loss of generality we can assume that $\tilde{u}, \tilde{v} \in H_{x}^{d}$. Moreover,

$$
e^{\psi_{\epsilon}^{(\text{const})}}(\tilde{v}) \leq c_{38}e^{\sqrt{|\ln(\epsilon)|^{2}V_{\tilde{v}}^{-1}}} = c_{38}(L_{\gamma}\epsilon^{2}|\ln(\epsilon)|) e^{-\psi_{\epsilon}^{(\text{const})}}(\tilde{v}) = c_{38}\delta_{x}^{\alpha}.
$$

Note that $1/\gamma = \sum_{j=1}^{d} \tau_{j}(\ln(\epsilon)) = \sum_{j=1}^{d} \frac{1}{\beta_{j}(\ln(\epsilon))} = \frac{\gamma}{\gamma(\ln(\epsilon))}$ and, therefore,

$$
e^{\psi_{\epsilon}^{(\text{const})}}(\tilde{v}) = c_{38}\delta_{x}^{\alpha}.
$$

Additionally, we easily compute

$$
e^{\psi_{\epsilon}^{(\text{const})}}(\tilde{v}) \leq c_{39}e^{\epsilon^{2}V_{\tilde{v}}^{-1}} = c_{38}(L_{\beta}\epsilon^{2}) e^{-\psi_{\epsilon}^{(\text{const})}}(\tilde{v}) = c_{39}\delta_{x}^{\alpha}.
$$

Applying assertions of Lemma 6 we obtain

$$
\sum_{j=1}^{d} \left\| b_{u_{j}} \right\|_{1} \leq c_{40} \sum_{j=1}^{d} L_{j}^{u_{j}} e^{\beta_{j}} = c_{40}\delta_{x}^{\alpha}; \quad \sum_{j=1}^{d} \left\| b_{v_{j}} \right\|_{\infty} \leq c_{41} \sum_{j=1}^{d} L_{j}^{v_{j}} e^{-\gamma_{j}} = c_{41}\delta_{x}^{\alpha}.
$$

The assertion of the theorem follows now from Corollary 1. □
8. Appendix

8.1. Proof of the assertion (ii) of Lemma 1

For any given $s \in \mathbb{N}^d$ and any $\vec{h} \in \mathbb{S}_d$ define

$$\Lambda_{s_j}[h_j] = \{x \in (-b, b)^d : h_j(x) = s_j\}, \quad j = 1, \ldots, d.$$ 

Then $\Lambda_s[\vec{h}] = \cap_{j=1}^d \Lambda_{s_j}[h_j]$ and we get putting $s_j = (s_1, \ldots, s_{j-1}, s_j+1, \ldots, d)$

$$\nu_d(\Lambda_{s_j}[h_j]) = \sum_{s_j \in \mathbb{N}^d} \nu_d(\Lambda_s[\vec{h}]), \quad j = 1, \ldots, d.$$ 

It yields for any $\alpha \in (0, 1)$ we have for any $\vec{h}, \vec{\eta} \in \mathbb{S}_d$

$$\sum_{s_j=1}^{\infty} \nu^\alpha_d(\Lambda_{s_j}[h_j]) \leq \sum_{s \in \mathbb{N}^d} \nu^\alpha_d(\Lambda_s[\vec{h}]).$$ 

Since obviously $\vec{h} \lor \vec{\eta} \in \mathbb{S}_d$ for any $\vec{h}, \vec{\eta} \in \mathbb{S}_d$, we have

$$\sum_{s_j=1}^{\infty} \nu^\alpha_d(\Lambda_{s_j}[h_j \lor \eta_j]) \leq \sum_{s_j=1}^{\infty} \left\{ \nu^\alpha_d(\Lambda_{s_j}[h_j]) + \nu^\alpha_d(\Lambda_{s_j}[\eta_j]) \right\}.$$ 

Hence, for any $\alpha \in (0, 1)$ and any $\vec{h}, \vec{\eta} \in \mathbb{S}_d$, we get

$$\sum_{s_j=1}^{\infty} \nu^\alpha_d(\Lambda_{s_j}[h_j \lor \eta_j]) \leq \sum_{s \in \mathbb{N}^d} \nu^\alpha_d(\Lambda_s[\vec{h}]) + \sum_{s \in \mathbb{N}^d} \nu^\alpha_d(\Lambda_s[\vec{\eta}]) \leq L^\frac{1}{d}. \quad (8.1)$$ 

Note that $\Lambda_s[\vec{h}] = \cap_{j=1}^d \Lambda_{s_j}[h_j]$ implies for any $\vec{h} \in \mathbb{S}_d$ and $\alpha \in (0, 1)$

$$\nu^\alpha_d(\Lambda_s[\vec{h}]) \leq \prod_{j=1}^{d} \nu^\alpha_d(\Lambda_{s_j}[h_j]). \quad (8.2)$$ 

Therefore, we deduce from (8.1) and (8.2)

$$\sum_{s \in \mathbb{N}^d} \nu^\alpha_d(\Lambda_{s}[\vec{h} \lor \vec{\eta}]) \leq \prod_{s \in \mathbb{N}^d} \prod_{j=1}^{d} \nu^\alpha_d(\Lambda_{s_j}[h_j \lor \eta_j]) \leq \prod_{s \in \mathbb{N}^d} \prod_{j=1}^{d} \nu^\alpha_d(\Lambda_{s_j}[h_j \lor \eta_j]) \leq L.$$ 

Thus, we obtain that $\vec{h}, \vec{\eta} \in \mathbb{H}_d \left(d^{-1} \alpha, 2^{-1} L^\frac{1}{d}\right)$ implies $\vec{h} \lor \vec{\eta} \in \mathbb{H}_d(\alpha, L)$. Putting $\kappa = \alpha/d$ and $\mathcal{L} = 2^{-1} L^\frac{1}{d}$ we come to the assertion of the lemma since $\vec{h}, \vec{\eta} \in B(A)$ implies $\vec{h} \lor \vec{\eta} \in B(A).$
8.2. Proof of Lemma 2

Let \( \vec{h}, \vec{\eta} \in \Theta_d^{\text{const}} \) be fixed. Denote by \( \mathcal{J} = \{j = 1, \ldots, d: h_j \lor \eta_j = h_j\} \) and suppose first that \( \mathcal{J} \neq \emptyset \). Let \( \mathcal{J} = \{j_1 < j_2 < \cdots < j_k\} \), \( k = |\mathcal{J}| \), and put \( \mathcal{J}_l = \{j_1 < j_2 < \cdots < j_l\} \), \( l = 1, \ldots, k \). Note that for any \( x \in \mathbb{R}^d \)

\[
B_{\vec{h}, \vec{\eta}}(x, f) = \left| \int_{\mathbb{R}^d} K_{\vec{h} \lor \vec{\eta}}(t - x) \left[ f(t) - f(t + E[\mathcal{J}](x - t)) \right] \nu_d(dt) \right. \\
- \left. \int_{\mathbb{R}^d} K_{\vec{\eta}}(t - x) \left[ f(t) - f(t + E[\mathcal{J}](x - t)) \right] \nu_d(dt) \right|.
\]

Here we have used Assumption 1 (ii) and \( \int \mathcal{K} = 1 \). Remark also that

\[
f(t) - f(t + E[\mathcal{J}](x - t)) = \sum_{l=1}^k f(t + E[\mathcal{J}_{l-1}](x - t)) - f(t + E[\mathcal{J}_l](x - t)), \tag{8.3}
\]

where we have put \( \mathcal{J}_0 = \emptyset \). Thus we have for any \( x \in \mathbb{R}^d \)

\[
B_{\vec{h}, \vec{\eta}}(x, f) \leq \sum_{l=1}^k \int_{\mathbb{R}^d} K_{\vec{h} \lor \vec{\eta}}(t - x) \left[ f(t + E[\mathcal{J}_{l-1}](x - t)) - f(t + E[\mathcal{J}_l](x - t)) \right] \nu_d(dt) \\
+ \sum_{l=1}^k \int_{\mathbb{R}^d} K_{\vec{\eta}}(t - x) \left[ f(t + E[\mathcal{J}_{l-1}](x - t)) - f(t + E[\mathcal{J}_l](x - t)) \right] \nu_d(dt) \tag{8.4}
\]

Noting that \( h_{j_l} \lor \eta_{j_l} = h_{j_l} \) for any \( l = 1, \ldots, k \), in view of the definition of \( \mathcal{J} \) we have

\[
\left| \int_{\mathbb{R}^d} K_{\vec{h} \lor \vec{\eta}}(t - x) \left[ f(t + E[\mathcal{J}_{l-1}](x - t)) - f(t + E[\mathcal{J}_l](x - t)) \right] \nu_d(dt) \right| \tag{8.5}
\]

\[
\leq \int_{\mathbb{R}^{\mathcal{J}_l}} \left| K_{\vec{h} \lor \vec{\eta}, \mathcal{J}_l}(t_{\mathcal{J}_l} - x_{\mathcal{J}_l}) \right| b_{\vec{h}, \mathcal{J}_l}(x, t_{\mathcal{J}_l}) \nu_{\mathcal{J}_l}(dt_{\mathcal{J}_l}) = \left[ |K_{\vec{h} \lor \vec{\eta}}| \ast b_{\vec{h}, \mathcal{J}_l} \right](x),
\]

\[
\left| \int_{\mathbb{R}^{\mathcal{J}_l}} \int_{\mathbb{R}^d} K_{\vec{\eta}}(t - x) \left[ f(t + E[\mathcal{J}_{l-1}](x - t)) - f(t + E[\mathcal{J}_l](x - t)) \right] \nu_d(dt) \right| \leq \int_{\mathbb{R}^{\mathcal{J}_l}} \left| K_{\vec{\eta}, \mathcal{J}_l}(t_{\mathcal{J}_l} - x_{\mathcal{J}_l}) \right| b_{\vec{\eta}, \mathcal{J}_l}(x, t_{\mathcal{J}_l}) \nu_{\mathcal{J}_l}(dt_{\mathcal{J}_l}) = \left[ |K_{\vec{\eta}}| \ast b_{\vec{\eta}, \mathcal{J}_l} \right](x).
\]

Here we have used once again Assumption 1 (ii) and \( \int \mathcal{K} = 1 \).

Thus, for any \( \vec{h}, \vec{\eta} \in \Theta_d^{\text{const}} \) for which \( \mathcal{J} \neq \emptyset \) the first assertion of the lemma follows from (8.4), (8.5) and (8.6). It remains to note that \( B_{\vec{h}, \vec{\eta}}(\cdot, f) = 0 \) if \( \mathcal{J} = \emptyset \) and, therefore, the first assertion is true with an arbitrary choice of \( \{j_1, \ldots, j_k\} \). In particular, one can choose \( k = d \) that corresponds to \( \{j_1, \ldots, j_k\} = \{1, \ldots, d\} \).

To get the second assertion we choose \( \mathcal{J} := \{j_1, \ldots, j_k\} = \{1, \ldots, d\} \) that yields \( \mathcal{J}_l = \{1, \ldots, l\} \) and note that (8.3) remains true. Repeating the computations led to (8.6) with \( \vec{\eta} \) replaced by \( \vec{h} \) we come to the second assertion of the lemma.
8.3. Proof of Lemma 5

As it was already mentioned if \( r^*(s) = s \) the assertion of the lemma is proved in Nikol’skii (1977), Section 6.9. Thus, it remains to study the case \( r^* > s \), where we put \( r^* = \max_{j=1,\ldots,d} r_j \). Set also \( \tilde{r}^* = (r^*, \ldots, r^*) \) and denote \( J_+ = \{ j : r_j \geq s \} \) and \( J_- = \{ 1, \ldots, d \} \setminus J_+ \).

The assumption \( \tau(r^*(s)) = \tau(r^*) > 0 \) together with \( r_j \leq r^* \) for any \( j = 1, \ldots, d \) makes possible the application of the theorem of Section 6.9, Nikol’skii (1977) that yields

\[
\mathbb{N}_{r^*}(\vec{\beta}, \vec{L}) \subseteq \mathbb{N}_{r^*}(\vec{\gamma}(r^*), \vec{cL}) \tag{8.6}
\]

Note that for any \( j \in J_- \) we have \( \|f\|_{r_j} \leq L_j \) since \( f \in \mathbb{N}_{r^*}(\vec{\beta}, \vec{L}) \) and \( \|f\|_{r^*} \leq cL_j \) in view of (8.6). Noting that \( r_j < s = r_j(s) < r^* \) we have \( \|f\|_{r_j(s)} \leq c_1 L_j \) for any \( j \in J_- \) in view of Hölder inequality. It remains to note that \( r_j(s) = r_j \) for any \( j \in J_+ \) and we assert that

\[
\|f\|_{r_j(s)} \leq c_1 L_j, \quad \forall j = 1, \ldots, d. \tag{8.7}
\]

Since \( f \in \mathbb{N}_{r^*}(\vec{\beta}, \vec{L}) \) and \( \gamma_j(s) = \beta_j, r_j(s) = r_j, j \in J_+ \) one has

\[
\left\| \Delta^{k_j}_u g \right\|_{r_j(s), \mathbb{R}^d} = \left\| \Delta^{k_j}_u g \right\|_{r_j, \mathbb{R}^d} \leq L_j \|u\|_{r_j} = L_j \|u\|_{\gamma_j(s)}, \quad \forall u \in \mathbb{R}, \quad \forall j \in J_+. \tag{8.8}
\]

Let now \( j \in J_- \). If \( r^* = \infty \) we have

\[
\left\| \Delta^{k_j}_u g \right\|_{s, \mathbb{R}^d} \leq \left( \left\| \Delta^{k_j}_u g \right\|_{r_j, \mathbb{R}^d} \right)^{(s-r_j) \tau(r_j)} \left\| \Delta^{k_j}_u g \right\|_{r^*, \mathbb{R}^d}^{(s-r_j) \tau(r^*)} \leq c_1^{1+\tau(r_j)} L_j^s \|u\|_{\beta_j}, \quad \forall u \in \mathbb{R}, \quad \forall j \in J_-. \tag{8.9}
\]

in view of (8.6). If \( r^* < \infty \), writing

\[
s = r_j(r^* - s) + \frac{r^*(s - r_j)}{r^* - r_j}
\]

and applying the Hölder inequality with exponents \( \frac{r^* - r_j}{s - r_j} \) and \( \frac{s - r_j}{s - r_j} \) we obtain

\[
\left\| \Delta^{k_j}_u g \right\|^s_{s, \mathbb{R}^d} \leq \left( \left\| \Delta^{k_j}_u g \right\|_{r_j, \mathbb{R}^d} \right)^{(s-r_j) \tau(r_j)} \left( \left\| \Delta^{k_j}_u g \right\|_{r^*, \mathbb{R}^d} \right)^{(s-r_j) \tau(r^*)} \leq c_1^{1+\tau(r_j)} L_j^s \|u\|_{\beta_j}, \quad \forall u \in \mathbb{R}, \tag{8.10}
\]

in view of (8.6) with

\[
a_j = \frac{(r^* - s)\beta_j r_j}{r^* - r_j} + \gamma_j(r^*)(s - r_j)r^* \frac{(r^* - s)\beta_j r_j}{r^* - r_j} + \frac{\gamma_j(r^*)(s - r_j)\beta_j r^*}{r^* - r_j} \frac{(r^* - s)\beta_j r_j}{(r^* - r_j)} \frac{\tau(r^*)(s - r_j)\beta_j r^*}{(r^* - r_j)}.
\]

Note that (8.9) is a particular case of (8.10).

We easily compute that \( b_j := \tau(r_j)(r^* - s)\beta_j r_j + \tau(r^*)(s - r_j)\beta_j r^* = s\beta_j \tau(s)(r^* - r_j) \) and, therefore,

\[
a_j = \frac{b_j}{\tau(r_j)(r^* - r_j)} = \frac{s\tau(s)\beta_j}{\tau(r_j)} = s\gamma_j(s).
\]

Thus, we obtain from (8.6)

\[
\left\| \Delta^{k_j}_u g \right\|_{s, \mathbb{R}^d} \leq c_1 L_j^s \|u\|_{\gamma_j(s)}, \quad \forall u \in \mathbb{R}, \quad \forall j \in J_-.
\tag{8.11}
\]

The required embedding follows now from (8.7), (8.8) and (8.11).
8.4. Proof of Lemma 6

We obviously have

\[ b_{n,j}^{-}(x) = \sup_{\eta \leq h_j, \eta \in \mathcal{H}} \left| \int_{\mathbb{R}} w(\delta) [f(x + 3\eta e_j) - f(x)] \nu_1(d\delta) \right| \]

\[ = \sup_{\eta \leq h_j, \eta \in \mathcal{H}} \left| \int_{\mathbb{R}} w(\delta) [\Delta_{2\eta,j} f(x)] \nu_1(d\delta) \right|. \]

For \( j = 1, \ldots, d \) we have

\[
\int_{\mathbb{R}} w(\delta) \Delta_{\eta,j} f(x) \nu_1(d\delta) = \int_{\mathbb{R}} \sum_{i=1}^{\ell} \binom{\ell}{i} (-1)^{i+1} \frac{1}{i} \left[ w\left(\frac{\delta}{i}\right) \Delta_{\eta,j} f(x) \right] \nu_1(d\delta)
= (-1)^{\ell-1} \int_{\mathbb{R}} w(z) \sum_{i=1}^{\ell} \binom{\ell}{i} (-1)^{i+1} \left[ \Delta_{i\eta,j} f(x) \right] \nu_1(dz) = (-1)^{\ell-1} \int_{\mathbb{R}} w(z) \left[ \Delta_{i\eta,j} f(x) \right] \nu_1(dz).
\]

The last equality follows from the definition of \( \ell \)-th order difference operator (3.1). Thus, for any \( j = 1, \ldots, d \) and any \( x \in (-b, b)^d \)

\[
b_{n,j}^{-}(x, f) = \sup_{\eta \leq h_j, \eta \in \mathcal{H}} \left| \int_{\mathbb{R}} w(z) \left[ \Delta_{i\eta,j} f(x) \right] \nu_1(dz) \right| \leq \sum_{s=\mathcal{H}}^{r} \left| \int_{\mathbb{R}} w(z) \left[ \Delta_{i\eta,j} f(x) \right] \nu_1(dz) \right| \tag{8.12}
\]

since \( \mathcal{H} \) is a discrete set. Therefore, by the Minkowski inequality for integrals [see, e.g., (Folland 1999, Section 6.3)] and the triangle inequality, choosing \( s \) from the relation \( e^{-s-2} = h_j \) (recall that \( h_j \in \mathcal{H} \)) we obtain

\[
\| b_{n,j}^{-}(\cdot, f) \|_{r,\mathbb{R}^d} \leq \sum_{s=\mathcal{H}}^{\infty} \int_{-1/(2\ell)}^{1/(2\ell)} |w(z)||\Delta_{ze^{-s-2},j} f|_{r,\mathbb{R}^d} \nu_1(dz).
\]

Here we have also used that \( w \) is compactly supported on \([-1/(2\ell), 1/(2\ell)]\).

Note that \( \Delta_{ze^{-s-2},j} f \) is supported on \( \mathcal{Y} := (-b - 1/2, b + 1/2)^d \) for any \( z \in [-1/(2\ell), 1/(2\ell)] \).

Hence, taking into account that \( r \leq r_j \) we get

\[
\| \Delta_{ze^{-s-2},j} f \|_{r,\mathbb{R}^d} = \| \Delta_{ze^{-s-2},j} f \|_{r,\mathcal{Y}} \leq (2b + 1) \frac{d}{r} \left( \frac{1}{r_j} \right) \| \Delta_{ze^{-s-2},j} f \|_{r_j,\mathcal{Y}} \leq (2b + 1)^d \| \Delta_{ze^{-s-2},j} f \|_{r_j,\mathbb{R}^d} \leq (2b + 1) M_j (ze^{-s-2})^{\beta_j},
\]

since \( f \in N_{r,d}(\beta, M) \). Hence, for any \( r \in [1, r_j] \)

\[
\| b_{n,j}^{-}(\cdot, f) \|_{r,\mathbb{R}^d} \leq (2b + 1)^d M_j \int_{-1/(2\ell)}^{1/(2\ell)} |w(z)||z|^{\beta_j} \nu_1(dz) \sum_{s=\mathcal{H}}^{\infty} (e^{-s-2})^{\beta_j} \leq (2b + 1)^d \| w \|_{1,\mathbb{R}^d} (1 - e^{-\beta_j})^{-1} M_j h_j^{\beta_j}.
\]

This proves (7.5).

The inequality in (7.6) follows by the same reasoning with \( r_j \) replaced by \( q_j, \beta_j \) replaced by \( \gamma_j \) and with the use of embedding (7.4).
8.5. Proof of Lemma 7

We will analyze the set $\mathcal{H}_\varepsilon(\vartheta, p)$ separately for different values of $(\vartheta, p)$.

1. Case $\varkappa(p) > 0$. If $\varkappa(p^*) \geq 0$ we have $r_j \leq p^* \leq \omega(2 + 1/\beta)$ for all $j = 1, \ldots d$. Therefore, for any $m \geq 0$

$$\tilde{\eta}_j(m) \leq e^{-2} \left( L_j^{-1} \varphi \right)^{1/\beta_j}, \quad \forall j = 1, \ldots d.$$  

Thus, for all $\varepsilon > 0$ small enough $\tilde{\eta}_j(m) := \tilde{\eta}_j(m) < h_\varepsilon$. It yields

$$h_{s_j(m)} \leq \tilde{\eta}_j(m) < e h_{s_j(m)}, \quad j = 1, \ldots, d,$$  

(8.13)

If $\varkappa(p^*) < 0$, that is possible only if $p^* > p$ in view of $\varkappa(p) > 0$, we have for any $0 \leq m \leq \tilde{m}$ and any $j = 1, \ldots d$

$$\tilde{\eta}_j(m) \leq e^{-2} \left( L_j^{-1} \varphi \right)^{1/\beta_j} e^{2d m} \left( \frac{1 - \omega(2 + 1/\beta)}{\beta_j} \right) \leq e^{-2} \left( L_j^{-1} \varphi e^{2d \tilde{m} \left( -\frac{\varkappa(p^*)}{\omega - p^*} \right)} \right)^{1/\beta_j}.$$  

The definition of $\tilde{m}$ implies $L_j^{-1} \varphi e^{2d \tilde{m} \left( -\frac{\varkappa(p^*)}{\omega - p^*} \right)} \leq h_\varepsilon$ and we assert that for all $\varepsilon > 0$ small enough

$$\tilde{\eta}_j(m) := \tilde{\eta}_j(m) < h_\varepsilon^{\ell/\beta_j} \leq h_\varepsilon$$  

since $\beta_j \leq \ell$ and $h_\varepsilon < 1$. Thus, we conclude that for any $(\vartheta, p) \in \mathcal{P}^\text{consist}$ provided $\varkappa(p) > 0$ and for all $\varepsilon > 0$ small enough

$$\mathcal{H}_\varepsilon(\vartheta, p) \subset \mathcal{H}_\varepsilon^d(h_\varepsilon).$$  

(8.14)

It implies, in particular, that (8.13) takes place when $\varkappa(p^*) < 0$ as well. Hence we obtain

$$e^{-d} \prod_{j=1}^d h_{s_j(m)} \leq \prod_{j=1}^d \tilde{\eta}_j(m) = e^{-2d \tilde{m}} \varphi^\frac{1}{\beta} e^{-4d m} \leq \prod_{j=1}^d h_{s_j(m)}.$$  

(8.15)

It yields

$$s(m) \neq s(n), \quad \forall m \neq n, \quad m, n = 0, \ldots, \tilde{m}.$$  

(8.16)

2. Case $\varkappa(p) \leq 0$, $\tau(p^*) \leq 0$. Since we consider $(\vartheta, p) \in \mathcal{P}^\text{consist}$ the later case is possible only if $p^* > p$. It implies $\varkappa(p^*) < 0$, and as previously we have

$$\tilde{\eta}_j(m) \leq e^{-2} \left( L_j^{-1} \varphi e^{2d \tilde{m} \left( 1 - \frac{\varkappa(p^*)}{\omega - p^*} \right)} \right)^{1/\beta_j}.$$  

It yields in view of the definition of $\tilde{m}$

$$\tilde{\eta}_j(m) \leq e^{-2} \left( (L_0^{-1} \varphi) e^{-2d \tilde{m} \left( \frac{\varkappa(p^*)}{\omega - p^*} \right)} \right)^{1/\beta_j} \leq e^{-2}.$$  

We conclude that for any $(\vartheta, p) \in \mathcal{P}^\text{consist}$ such that $\varkappa(p) \leq 0$ and $\tau(p^*) \leq 0$ for all $\varepsilon > 0$

$$\mathcal{H}_\varepsilon(\vartheta, p) \subset \mathcal{H}_\varepsilon^d,$$  

(8.17)
We obtain in view of the definition of $\tau$ since

$$\frac{1}{\omega} - \frac{1}{v} = \beta \left( \frac{1}{1/\gamma} - \frac{1}{\beta} \right) \left( 1 - \frac{1}{\omega} \right).$$

We deduce from the equality (8.19)

$$v(2 + 1/\gamma) - \omega(2 + 1/\beta) = \omega v \left[ (2 + 1/\beta)(1/\omega - 1/v) + (1/\gamma - 1/\beta)\omega^{-1} \right] = 2\beta\tau(2)v(1/\gamma - 1/\beta).$$

Using (8.20) we easily get for any $r > 0$

$$1 - \frac{r - v(2 + 1/\gamma)}{2r\beta\omega\tau(2)} - \frac{(1/\gamma - 1/\beta)v}{r} = \frac{(2 + 1/\beta)\tau(r)}{2\tau(2)}. \tag{8.21}$$

Since $v(2 + 1/\gamma) \geq p_\pm$, $\tilde{m} > \hat{m}$ in view of the definition of $\tilde{m}$ and $q_j \leq p_\pm, j \in J_\pm$ and $q_j = \infty, j \in J_\infty$ we get

$$\tilde{n}_j(m) = \tilde{n}_j(m) \leq e^{-2(L_j^{-1}\varphi)^{1/\beta_j} e^{2d\tilde{m}} \left( \frac{1}{\beta_j} \frac{\omega(2 + 1/\beta)}{\beta_j p^*} \right)}, \quad m \leq \tilde{m};$$

$$\tilde{n}_j(m) = \tilde{n}_j(m) \leq e^{-2(L_j^{-1}\varphi)^{1/\gamma_j} e^{2d\tilde{m}} \left( \frac{1}{\gamma_j} \frac{\omega(2 + 1/\gamma)}{\gamma_j q_j} \right) \left[ \frac{L_j\nu^{1/\beta}}{L_\beta \varphi^{1/\gamma}} \right]^{\nu}}, \quad m > \hat{m}. \tag{8.22}$$

We obtain in view of the definition of $\hat{m}$

$$\left\{ \tilde{n}_j(m) \right\}^{\beta_j} \leq e^{-2\beta_j L_j^{-1}\varphi^{(2 + 1/\beta)\tau(p^*)}} \frac{2\gamma_j}{2\tau(2)} \hat{m}, \quad m \leq \tilde{m};$$

$$\left\{ \tilde{n}_j(m) \right\}^{\gamma_j} \leq e^{-2\gamma_j T_1 L_j^{-1}\varphi^{1 - \frac{q_j - v(2 + 1/\gamma)}{2\gamma_j \omega \tau(2)} \frac{(1/\gamma - 1/\beta)v}{q_j}}, \quad m > \hat{m}, j \in J_\pm;$$

$$\left\{ \tilde{n}_j(m) \right\}^{\gamma_j} \leq e^{-2\gamma_j T_2 L_j^{-1}\varphi^{(2 + 1/\beta)(1 - 1/\omega)}} \frac{2\gamma_j}{2\tau(2)}, \quad m > \hat{m}, j \in J_\infty,$$

where $T_1 = T_1(L_\beta/L_\gamma)$ and $T_2 = T_2(L_\gamma/L_\beta)$ can be easily deduced.

Thus, we assert that for any $j = 1, \ldots, d$ and any $\varepsilon > 0$ small enough

$$\tilde{n}_j(m) \leq h_\varepsilon, \quad \forall m \leq \hat{m}. \tag{8.23}$$

Moreover, if $j \in J_\pm$ we have in view of (8.21)

$$\left\{ \tilde{n}_j(m) \right\}^{\gamma_j} \leq e^{-2\gamma_j T_1 L_j^{-1}\varphi^{(2 + 1/\beta)\tau(q_j)}} \frac{2\gamma_j}{2\tau(2)} \to 0, \quad \varepsilon \to 0,$$

since $\tau(q_j) > 0$ for any $j = 1, \ldots, d$ in view of $\tau(p^*) > 0$.

Note also that if $J_\infty \neq \emptyset$ then $p^* = \infty$ and therefore, $\tau(\infty) = 1 - 1/\omega > 0$ and, therefore,

$$e^{-2\gamma_j T_2 L_j^{-1}\varphi^{(2 + 1/\beta)(1 - 1/\omega)}} \frac{2\gamma_j}{2\tau(2)} \to 0, \quad \varepsilon \to 0.$$
Hence, for all $\varepsilon > 0$ small enough $\tilde{\eta}_j(m) \leq \varepsilon$, $\forall m > \tilde{m}$. Taking into account (8.23), we conclude that (8.13) and (8.14) hold in the case $\kappa(p) \leq 0$, $\tau(p^*) > 0$. Moreover, (8.16) is fulfilled if $m \leq \tilde{m}$ as well in view of (8.15).

On the other hand, in view of (8.13)

$$e^{-d} \prod_{j=1}^{d} \beta_{s_j(m)} \leq \prod_{j=1}^{d} \eta_j(m) = e^{-2d} L_{\beta}^{-1} \frac{1}{\varphi} e^{-4dm} \leq \prod_{j=1}^{d} \beta_{s_j(m)}, \quad \forall m > \tilde{m},$$

(8.24)

and, therefore, (8.16) is fulfilled for any $m \geq 0$.

8.6. Proof of Lemma 8

Let $\mu \in (0, 1)$ be the number whose choice will be done later and put $\tilde{\mu} = (\mu, \ldots, \mu)$. Without loss of generality one can assume that $\tilde{\mu} \in \mathbb{S}^{\text{const}}_d$. For any $f \in \mathbb{N}_{T.d}(\bar{\beta}, \bar{L})$ introduce

$$S_{\tilde{\mu}}(x, f) = \int_{\mathbb{R}^d} K_{\tilde{\mu}}(t - x) f(t) \nu_d(dt), \quad x \in \mathbb{R}^d,$$

where, recall, $K$ is given in (3.5).

Let us prove that for any $\mu \in (0, 1)$

$$S_{\tilde{\mu}}(\cdot, f) \in \mathbb{N}^*_T,d(\bar{\beta}, \bar{aL}), \quad \forall f \in \mathbb{N}_{T,d}(\bar{\beta}, \bar{L}). \quad (8.25)$$

First, we note that $S_{\tilde{\mu}}(\cdot, f)$ is compactly supported on $(-b - 1, b + 1)^d$ in view of the definition of the kernel $K$, since $\mu \in (0, 1)$. Next, taking into account that $K$ is Lipschitz-continuous and compactly supported as well as $f \in L_\infty(\mathbb{R}^d)$, $r^* = \max_{t=1, \ldots, d} r_t$, since $f \in \mathbb{N}_{T,d}(\bar{\beta}, \bar{L})$, and applying Hölder inequality, we can assert that $S_{\tilde{\mu}}(\cdot, f) \in \mathbb{C}(\mathbb{R}^d)$ and moreover

$$S_{\tilde{\mu}}(\cdot, f) \in \mathbb{L}_q(\mathbb{R}^d), \quad \forall q \geq 1. \quad (8.26)$$

Thus, $S_{\tilde{\mu}}(\cdot, f) \in \mathbb{C}_K(\mathbb{R}^d)$. It remains to prove that $S_{\tilde{\mu}}(\cdot, f) \in \mathbb{N}_{T,d}(\bar{\beta}, \bar{aL})$. Indeed, applying the Young inequality we obtain for any $j = 1, \ldots, d$

$$\|S_{\tilde{\mu}}(\cdot, f)\|_{r_j, \mathbb{R}^d} \leq \|K\|_{1, \mathbb{R}^d} \|f\|_{r_j, \mathbb{R}^d} \leq L_j \|K\|_{1, \mathbb{R}^d},$$

since $f \in \mathbb{N}_{T,d}(\bar{\beta}, \bar{L})$. Moreover, for any $j = 1, \ldots, d$, $k \in \mathbb{N}^*$ and any $u \in \mathbb{R}$

$$\Delta_{u,j}^k S_{\tilde{\mu}}(x, f) := \Delta_{u,j}^k \left\{ \int_{\mathbb{R}^d} K_{\tilde{\mu}}(z) f(x + z) \nu_d(dz) \right\} = \int_{\mathbb{R}^d} K_{\tilde{\mu}}(z) \{ \Delta_{u,j}^k f(x + z) \} \nu_d(dz)$$

$$= \int_{\mathbb{R}^d} K_{\tilde{\mu}}(t - x) \{ \Delta_{u,j}^k f(t) \} \nu_d(dt).$$

Thus, applying the Young inequality, we have for any integer $k_j > \beta_j$

$$\|\Delta_{u,j}^k S_{\tilde{\mu}}(\cdot, f)\|_{r_j, \mathbb{R}^d} \leq \|K\|_{1, \mathbb{R}^d} \|\Delta_{u,j}^k f\|_{r_j, \mathbb{R}^d} \leq L_j \|K\|_{1, \mathbb{R}^d} |u|^{\beta_j}, \quad \forall u \in \mathbb{R},$$

since $f \in \mathbb{N}_{T,d}(\bar{\beta}, \bar{L})$. Moreover, $S_{\tilde{\mu}}(\cdot, f) \in \mathbb{L}_2(\mathbb{R}^d)$ in view of (8.26).
We conclude that $S_{\vec{\mu}}(\cdot, f) \in N_{\tau,d}(\vec{\beta}, a\vec{L})$ and, therefore, (8.25) is established.

2°. We will need the following auxiliary result. For any $(\vartheta, p) \in \mathcal{P}_{\text{consist}}$ there exists $p > p$ such that

$$f \in N_{\tau,d}(\vec{\beta}, \vec{L}) \implies f \in L_p(\mathbb{R}^d).$$

Indeed, if $p^* > p$ we can choose $p = p^*$ in view of the definition of an anisotropic Nikol’skii class. If $p < 2$ one can choose $p = 2$ since the definition of $N_{\tau,d}(\vec{\beta}, \vec{L})$ implies that $f \in L_2(\mathbb{R}^d)$.

It remains to consider the case $p^* = p$ and $p \geq 2$. Since $(\vartheta, p) \in \mathcal{P}_{\text{consist}}$ necessarily in this case $\tau(p) > 0$ and, therefore, one can find $p > p$ such that $\tau(p) > 0$. In view of $p^* = p < p$ and $\tau(p) > 0$ the assertion of Lemma 5 holds with $s = p$ and $\vec{r}(s) = (p, \ldots, p)$ and, therefore, $f \in L_p(\mathbb{R}^d)$ in view of the definition of an anisotropic Nikol’skii class. Thus, (8.27) is established.

3°. Let $f, g \in L_p(\mathbb{R}^d)$ be arbitrary functions. We obviously have

$$\sup_{\vec{h} \in \mathcal{G}_d} \left| B^{(p)}_{\vec{h}}(g) - B^{(p)}_{\vec{h}}(f) \right| \leq 3 \sup_{\vec{h} \in \mathcal{G}_d} \| S_{\vec{h}}(\cdot, g - f) \|_p + \| g - f \|_p.$$

Since $K$ is compactly supported on $[-1/2, 1/2]^d$ we obviously have that

$$\left| S_{\vec{h}}(x, g - f) \right| \leq \| K \|_{\infty, \mathbb{R}^d} M(\| g - f \|)(x), \quad x \in \mathbb{R}^d.$$

Applying $(p, p)$-strong maximal inequality (7.8) we obtain for any $p > 1$

$$\| S_{\vec{h}}(\cdot, g - f) \|_p \leq \bar{C}(p) \| K \|_{\infty, \mathbb{R}^d} \| g - f \|_{p, \mathbb{R}^d}.$$

Noting that the right hand side of the latter inequality is independent of $\vec{h}$ we obtain finally

$$\sup_{\vec{h} \in \mathcal{G}_d} \left| B^{(p)}_{\vec{h}}(g) - B^{(p)}_{\vec{h}}(f) \right| \leq (3 \bar{C}(p) \| K \|_{\infty, \mathbb{R}^d} + 1) \| g - f \|_{p, \mathbb{R}^d}.$$

Choosing $g = S_{\vec{\mu}}(\cdot, f)$ and noting that $| S_{\vec{\mu}}(\cdot, f) - f(\cdot) | =: B_{\vec{\mu}}(\cdot, f)$ we get

$$\sup_{\vec{h} \in \mathcal{G}_d} \left| B^{(p)}_{\vec{h}}(S_{\vec{\mu}}(\cdot, f)) - B^{(p)}_{\vec{h}}(f) \right| \leq (3 \bar{C}(p) \| K \|_{\infty, \mathbb{R}^d} + 1) \| B_{\vec{\mu}}(\cdot, f) \|_{p, \mathbb{R}^d}.$$  

(8.28)

4°. Some remarks are in order. First, $B_{\vec{\mu}}(\cdot, f)$ is compactly supported on $\mathbb{K}$ for any $\mu \in (0, 1)$. Next, $B_{\vec{\mu}}(\cdot, f) \in L_p(\mathbb{R}^d)$ in view of (8.26) and (8.27). At last, in view of (5.6) and the first assertion of Lemma 6 we have $\limsup_{\mu \to 0} \| B_{\vec{\mu}}(\cdot, f) \|_{1, \mathbb{R}^d} = 0$.

All saying above allows us to assert that $\limsup_{\mu \to 0} \| B_{\vec{\mu}}(\cdot, f) \|_{p, \mathbb{R}^d} = 0$. It yields together with (8.28), that for any $\nu > 0$ and any $f \in N_{\tau,d}(\vec{\beta}, \vec{L})$ one can find $\mu = \mu(\nu, f)$ such that

$$\sup_{\vec{h} \in \mathcal{G}_d} \left| B^{(p)}_{\vec{h}}(S_{\vec{\mu}}(\cdot, f)) - B^{(p)}_{\vec{h}}(f) \right| \leq \nu,$$

where as previously $\vec{\mu} = (\mu, \ldots, \mu)$.

This obviously implies, for any $f \in N_{\tau,d}(\vec{\beta}, \vec{L})$ and any $\mathbb{H} \subseteq \mathcal{G}_d$

$$\inf_{\vec{h} \in \mathbb{H}} \left[ B^{(p)}_{\vec{h}}(f) + \varepsilon \Psi_{\varepsilon,p}(\vec{h}) \right] \leq \inf_{\vec{h} \in \mathbb{H}} \left[ B^{(p)}_{\vec{h}}(S_{\vec{\mu}}(\cdot, f)) + \varepsilon \Psi_{\varepsilon,p}(\vec{h}) \right] + \nu \leq \sup_{g \in N^{\ast}_{\tau,d}(\vec{\beta}, a\vec{L})} \inf_{\vec{h} \in \mathbb{H}} \left[ B^{(p)}_{\vec{h}}(g) + \varepsilon \Psi_{\varepsilon,p}(\vec{h}) \right] + \nu,$$
where to get the last inequality we have used (8.25). Since the right hand side of the latter inequality is independent of \( f \) one gets
\[
\sup_{f \in N_{r,d}(\vec{\beta},\vec{L})} \inf_{\vec{h} \in \Omega} \left[ B_{\vec{h}}^{(p)}(f) + \varepsilon \Psi_{\varepsilon,p}(\vec{h}) \right] \leq \sup_{g \in N_{r,d}^*(\vec{\beta},\vec{a}\vec{L})} \inf_{\vec{h} \in \Omega} \left[ B_{\vec{h}}^{(p)}(g) + \varepsilon \Psi_{\varepsilon,p}(\vec{h}) \right] + \varkappa,
\]
and the assertion of the lemma follows since \( \varkappa \) is an arbitrary number.

\[\boxed{\varkappa = 1} \]

\section*{8.7. Proof of Lemma 9}

We obviously have \( U_{\varnothing,p}(x,g) \leq b_{\vec{h}_{\vec{a}(0)}}^*(x,g) + \varpi_{\varepsilon} V_{s(0)}^{-\frac{1}{2}} \) and, therefore,
\[
U := \sup_{g \in N_{r,d}^*(\vec{\beta},\vec{a}\vec{L})} \| U_{\varnothing,p}(\cdot,g) \|_{p^*} \leq \sup_{g \in N_{r,d}^*(\vec{\beta},\vec{a}\vec{L})} \| b_{\vec{h}_{\vec{a}(0)}}^*(x,g) \|_{p^*} + (2b_0^*) \varpi_{\varepsilon} V_{s(0)}^{-\frac{1}{2}}.
\]
Note that in view of (7.28) \( \varpi_{\varepsilon} V_{s(0)}^{-\frac{1}{2}} \to 0, \varepsilon \to 0 \) and, therefore, for all \( \varepsilon > 0 \) small enough
\[
U \leq \Upsilon_1 \sup_{g \in N_{r,d}^*(\vec{\beta},\vec{a}\vec{L})} \| b_{\vec{h}_{\vec{a}(0)}}^*(x,g) \|_{p^*} + L^*.
\]
(8.29)
Recall that \( b_{\vec{h}}^*(x,g) = \sup_{j \in J} \sup_{j = 1, \ldots, d} M_{\vec{h}}[b_{\vec{h}_{\vec{a}(0)},j}(x)] \) and, therefore, we obtain first, applying (7.9)
\[
\| b_{\vec{h}_{\vec{a}(0)}}^*(\cdot,g) \|_{p^*} \leq 2^d C_{p^*} \sum_{j=1}^{d} \| b_{\vec{h}_{\vec{a}(0),j}}^* \|_{p^*}.
\]
(8.30)
Next, we have for any \( j = 1, \ldots, d \) and any \( x \in \mathbb{R}^d \)
\[
b_{\vec{h}_{\vec{a}(0),j}}^*(x) := \sup_{k: \vec{h}_k \leq \vec{h}_{\vec{a}(0),j}} \left| \int_{\mathbb{R}} w_k(u) g(x + uh_k e_j) \nu_1(du) - g(x) \right|
\]
\[
\leq \| w_k \|_{\infty,\mathbb{R}^d} M_{\vec{h}}[g](x) + |g(x)|,
\]
where we have denoted \( J_j = \{1, \ldots, d\} \setminus \{j\} \). Thus, applying once again (7.9) we obtain
\[
\| b_{\vec{h}_{\vec{a}(0),j}}^* \|_{p^*} \leq (C_{p^*} \| w_k \|_{\infty,\mathbb{R}^d} + 1) \| g \|_{p^*}.
\]
Noting that in view of the definition of the Nikolskii class \( \| g \|_{p^*} \leq aL^* \) for any \( g \in N_{r,d}^*(\vec{\beta},\vec{a}\vec{L}) \) and the assertion of the lemma follows from (8.29) and (8.30).

\section*{8.8. Proof of formulas (8.18) and (8.19)}

In view of the definition of \( \vec{\gamma} \) we have
\[
\frac{1}{\gamma} = \sum_{j \in J_\pm} \frac{\tau(r_j)}{\tau(p_{\pm}) \beta_j} + \sum_{j \in J_\infty} \frac{1}{\beta_j} \geq \frac{1}{\beta}
\]
since $\tau(r_j) \geq \tau(p_\pm)$. In view of the definition $v$

$$
p_{\pm} = \sum_{j \in J_{\pm}} \frac{1}{\gamma_j} \leq \sum_{j \in J_{\pm}} \frac{1}{\gamma_j} + \sum_{j \in J_{\infty}} \frac{1}{\beta_j} = \frac{1}{\gamma}
$$

and, therefore, $p_{\pm} \leq v/\gamma < \tau(2 + 1/\gamma)$.

**Proof of (8.19).** First, we remark that

$$
p_{\pm} \left(\frac{1}{\omega} - \frac{1}{\nu}\right) + \frac{1}{\gamma} - \frac{1}{\beta} = \sum_{j \in J_{\pm}} \left(\frac{p_{\pm}}{r_j \beta_j} - \frac{1}{\gamma_j} \right) + \left(\frac{1}{\gamma_j} - \frac{1}{\beta_j}\right)
$$

$$
= p_{\pm} \sum_{j \in J_{\pm}} \left(\frac{1}{r_j \beta_j} - \frac{1}{p_{\pm} \beta_j}\right) =: A p_{\pm}.
$$

Next,

$$
\sum_{j \in J_{\pm}} \frac{1}{\gamma_j} = \sum_{j \in J_{\pm}} \frac{\tau_j}{\tau(p_{\pm})\beta_j} = \frac{1}{\tau(p_{\pm})} \sum_{j \in J_{\pm}} \frac{1 - 1/\omega + 1/(r_j \beta)}{\beta_j}
$$

$$
= \frac{1 - 1/\omega}{\tau(p_{\pm})} \sum_{j \in J_{\pm}} \frac{1}{\beta_j} + \frac{1}{\tau(p_{\pm})} \sum_{j \in J_{\pm}} \left(\frac{1}{r_j \beta_j} - \frac{1}{p_{\pm} \beta_j}\right) + \frac{1}{\tau(p_{\pm})} p_{\pm} \sum_{j \in J_{\pm}} \frac{1}{\beta_j}
$$

$$
= \sum_{j \in J_{\pm}} \frac{1}{\beta_j} + \frac{A}{\tau(p_{\pm})} \beta
$$

It yields, $\frac{1}{\gamma} - \frac{1}{\beta} = \sum_{j \in J_{\pm}} \left(\frac{1}{\gamma_j} - \frac{1}{\beta_j}\right) = \frac{A}{\tau(p_{\pm})} \beta$ and, therefore,

$$
p_{\pm} \left(\frac{1}{\omega} - \frac{1}{\nu}\right) = (1/\gamma - 1/\beta) (\tau(p_{\pm})\beta p_{\pm} - 1) = (1/\gamma - 1/\beta) \beta p_{\pm} (1 - 1/\omega).
$$

The relation (8.19) is proved.
