Spectrum and energy of the Sombor matrix

Ivan Gutman
University of Kragujevac, Faculty of Science, Kragujevac

Abstract:
Introduction/purpose: The Sombor matrix is a vertex-degree-based matrix associated with the Sombor index. The paper is concerned with the spectral properties of the Sombor matrix. Results: Equalities and inequalities for the eigenvalues of the Sombor matrix are obtained, from which two fundamental bounds for the Sombor energy (= energy of the Sombor matrix) are established. These bounds depend on the Sombor index and on the “forgotten” topological index. Conclusion: The results of the paper contribute to the spectral theory of the Sombor matrix, as well as to the general spectral theory of matrices associated with vertex-degree-based graph invariants.

Keywords: Sombor matrix; Sombor energy; Sombor index; vertex-degree-based graph invariant; spectrum (of matrix)

INTRODUCTION

In this paper, we are concerned with simple graphs, i.e., graphs without directed, weighted, or multiple edges, and without self-loops. Let \( G \) be such a graph, with the vertex set \( V(G) \) and the edge set \( E(G) \). Let \( |V(G)| = n \) and \( |E(G)| = m \) be the number of vertices and edges of \( G \). By \( uv \in E(G) \) we denote the edge of \( G \), connecting the vertices \( u \) and \( v \). The degree (= number of first neighbors) of a vertex \( u \in V(G) \) is denoted by \( d(u) \). If \( d(u) = r \) for all \( u \in V(G) \), then \( G \) is said to be a regular graph or a degree \( r \).

For other graph-theoretical notions, the readers are referred to standard textbooks (Harary, 1969; Bondy & Murthi, 1975).

In the mathematical and chemical literature, degree-based graph invariants of the form

\[
(1) \quad TI(G) = \sum_{uv \in E(G)} f(d(u), d(v))
\]

have been and are currently studied, where \( f(x, y) \) is an appropriately chosen function with the property \( f(x, y) = f(y, x) \). The oldest such invariants were put forward as early as in the 1970s, and by now their number exceeds several dozens (Kulli, 2020; Todeschini & Consonni, 2009). Among the newest invariants of this type are the forgotten index for which \( f(x, y) = x^2 + y^2 \) (Furtula & Gutman, 2015), and the Sombor index for which \( f(x, y) = \sqrt{x^2 + y^2} \) (Gutman, 2021). Thus, these indices are defined as

\[
(2) \quad F(G) = \sum_{uv \in E(G)} [d(u)^2 + d(v)^2]
\]

\[
(3) \quad SO(G) = \sum_{uv \in E(G)} \sqrt{d(u)^2 + d(v)^2}
\]
Recall that $F$ is often written in the form

$$F(G) = \sum_{uv \in E(G)} d(u)^3$$

which, of course, is equivalent to (2).

The first paper on the Sombor index was published only a few months ago (Gutman, 2021). Because this graph invariant is based on using Euclidean metrics, it promptly attracted the attention of quite a few colleagues. As a consequence of this, numerous papers on Sombor index have already been published (Alikhani & Ghanbari, 2021; Cruz & Rada, 2021; Došlić et al, 2021; Horoldagva & Xu, 2021; Kulli, 2021), and more will appear in the near future. Bearing this in mind, we were motivated to investigate the matrix constructed from the Sombor index in an earlier proposed manner (Das et al, 2018), and to study some of its spectral properties.

Let the vertices of the graph $G$ be labeled by $1, 2, \ldots, n$. Then the $(0,1)$-adjacency matrix of $G$, denoted by $A(G)$, is defined as the symmetric square matrix of order $n$, whose $(i,j)$-element is

$$A(G)_{ij} = \begin{cases} 1 & \text{if } ij \in E(G) \\ 0 & \text{if } ij \notin E(G) \\ 0 & \text{if } i = j \end{cases}$$

The eigenvalues of $A(G)$ form the spectrum of the graph $G$. For the details of the spectral graph theory see (Cvetković et al, 2010).

Some time ago (Das et al, 2018), it was attempted to combine the spectral graph theory with the theory of vertex-degree-based graph invariants. For this, using formula (1), an adjacency-matrix-type square symmetric matrix $A_F(G)$ was introduced, whose $(i,j)$-element is defined as

$$A_F(G)_{ij} = \begin{cases} f(d(i), d(j)) & \text{if } ij \in E(G) \\ 0 & \text{if } ij \notin E(G) \\ 0 & \text{if } i = j \end{cases}$$

The theory based on the matrix $A_F(G)$ and its spectrum was recently elaborated in some detail (Li & Wang, 2021; Shao et al, 2021).

In this paper, we examine a special case of $A_F(G)$, associated with the Sombor index $SO(G)$, Eq. (3). We call it the Sombor matrix, denote it by $A_{SO}(G)$, and define via

$$A_{SO}(G)_{ij} = \begin{cases} \sqrt{d(i)^2 + d(j)^2} & \text{if } ij \in E(G) \\ 0 & \text{if } ij \notin E(G) \\ 0 & \text{if } i = j \end{cases}$$

The eigenvalues of $A_{SO}(G)$ are denoted by $\sigma_1, \sigma_2, \ldots, \sigma_n$, and are said to form the Sombor spectrum of the graph $G$. Then, as usual, the Sombor characteristic polynomial is defined as

$$\phi_{SO}(G, \lambda) = \det(\lambda I_n - A_{SO}(G))$$

in analogy to the ordinary characteristic polynomial (Cvetković et al, 2010)

$$\phi(G, \lambda) = \det(\lambda I_n - A(G))$$
where $I_n$ is the unit matrix of order $n$. Recall that $\sigma_1, \sigma_2, \ldots, \sigma_n$ are the zeros of $\phi_{SO}(G, \lambda)$, i.e., satisfy $\phi_{SO}(G, \sigma_i) = 0$ for $i, 2, \ldots, n$.

**Spectral properties of the Sombor matrix**

**Lemma 1.** Let $\sigma_1 \geq \sigma_2 \geq \cdots \geq \sigma_n$ be the eigenvalues of the Sombor matrix. Then,

$$\sum_{i=1}^{n} \sigma_i = 0$$

and

$$\sum_{i=1}^{n} \sigma_i^2 = 2F(G)$$

where $F(G)$ is the forgotten topological index, Eq. (2).

**Proof.** The first equality is a direct consequence of $A_{SO}(G)_{ij} = 0$ for all $1, 2, \ldots, n$.

The second equality is obtained from (4) as follows. Suppose that the vertices of $G$ are labeled by $1, 2, \ldots, n$. Then,

$$\sum_{i=1}^{n} \sigma_i^2 = Tr(A_{SO}(G)^2) = \sum_{i=1}^{n} \sum_{j=1}^{n} A_{SO}(i, j)A_{SO}(j, i)$$

$$= 2 \sum_{i,j \in E(G)} A_{SO}(i, j)A_{SO}(j, i) = 2 \sum_{i,j \in E(G)} \sqrt{d(i)^2 + d(j)^2} \sqrt{d(i)^2 + d(j)^2}$$

$$= 2 \sum_{i,j \in E(G)} [d(i)^2 + d(j)^2] = 2F(G).$$

This completes the proof of Lemma 1.

Recalling that the sum of squares of the eigenvalues of the ordinary adjacency matrix is equal to $2m$, from Lemma 1 we realize that in the spectral theory of the Sombor matrix, the forgotten topological index plays an analogous role as the number of edges plays in the ordinary spectral graph theory. This will be seen from the bounds for the Sombor energy, deduced in the forthcoming section (Theorems 1, 2, and 3).

**Lemma 2.** Let $\sigma_1$ be the greatest eigenvalue in the spectrum of the Sombor matrix. Then,

$$\sigma_1 \geq \frac{SO(G)}{n}$$

where $SO(G)$ is the Sombor index, Eq. (3). Equality is attained if and only if the graph $G$ is regular.

**Proof.** According to the Rayleigh-Ritz variational principle, if $\Omega$ is any $n$-dimensional column-vector, then
\[
\frac{\Omega^T A_{SO}(G) \Omega}{\Omega^T \Omega} \leq \sigma_1.
\]

Setting \( \Omega = (1, 1, \ldots, 1)^T \), we get
\[
\Omega^T A_{SO}(G) \Omega = \sum_{i=1}^{n} \sum_{j=1}^{n} A_{SO}(G)_{ij} = 2 \sum_{(i,j) \in E(G)} A_{SO}(G)_{ij}
\]
\[
= 2 \sum_{(i,j) \in E(G)} \sqrt{d(i)^2 + d(j)^2} = 2SO(G)
\]
and
\[
\Omega^T \Omega = n.
\]

In the case of regular graphs, \( \Omega = (1, 1, \ldots, 1)^T \) is an eigenvector of \( A_{SO}(G) \), corresponding to the eigenvalue \( \sigma_1 \). To see this, note that if \( G \) is a regular graph of a degree \( r \), then \( A_{SO}(G) = \sqrt{2r} A(G) \). That \( \Omega = (1, 1, \ldots, 1)^T \) is an eigenvector of \( A(G) \) is a well-known fact (Cvetković et al, 2010). Then, and only then, equality in Lemma 2 holds.

By this, the proof of Lemma 2 has been completed.

**Sombor energy and its bounds**

The energy \( En(G) \) of a graph \( G \) is, by definition, equal to the sum of the absolute values of the eigenvalues of \( A(G) \). For the details of the mathematical theory of graph energy see (Li et al, 2012). In analogy to this, we define the Sombor energy of \( G \) as
\[
En_{SO}(G) = \sum_{i=1}^{n} |\sigma_i|.
\]

It is now reasonable to expect that \( En_{SO}(G) \) and \( En(G) \) have analogous properties. In what follows, we establish two such results.

**Theorem 1.** (McClelland-type bound for the Sombor energy)

If \( G \) is a graph on \( n \) vertices, and \( F(G) \) is its forgotten topological index, then
\[
En_{SO}(G) \leq \sqrt{2nF(G)}.
\]

This result is the analogue of the classical McClelland bound for graph energy, namely, \( En(G) \leq \sqrt{2nm} \) (McClelland, 1971).

**Proof.** Start with the inequality whose validity is obvious:
\[
(5) \sum_{i=1}^{n} \sum_{j=1}^{n} (|\sigma_i| - |\sigma_j|)^2 \geq 0
\]

and take into account Lemma 1 and the definition of \( En_{SO}(G) \). The McClelland-type upper bound for \( En_{SO}(G) \) follows then from (5) by direct calculation.
Equality in Theorem 1 will hold if and only if \(|\sigma_1| = |\sigma_2| = \cdots = |\sigma_n|\). Graphs that satisfy this equality condition are the edgeless graph (for which \(m = 0\)) and the regular graph of degree 1.

**Theorem 2.** (Koolen-Moulton-type bound for the Sombor energy)

Let \(G\) be a graph on \(n\) vertices, with Sombor and forgotten indices \(SO(G)\) and \(F(G)\), respectively. Then

\[
En_{SO}(G) \leq \frac{2SO(G)}{n} + \sqrt{(n-1)\left[2F(G) - \left(\frac{2SO(G)}{n}\right)^2\right]}
\]

which is the analogue of the Koolen-Moulton bound (Koolen & Moulton, 2001), namely

\[
En(G) \leq \frac{2m}{n} + \sqrt{(n-1)\left[2m - \left(\frac{2m}{n}\right)^2\right]}
\]

**Proof.** We follow the reasoning from the paper (Koolen & Moulton, 2001), modified for the Sombor energy. In an analogous way as in the proof of Theorem 1, our starting point is

\[
\sum_{i=2}^{n} \sum_{j=2}^{n} (|\sigma_i| - |\sigma_j|)^2 \geq 0
\]

from which it follows

\[
\sum_{i=2}^{n} |\sigma_i| \leq \sqrt{2(n-1)F^*(G)}
\]

where

\[
2F^*(G) = \sum_{i=2}^{n} \sigma_i^2 = 2F(G) - \sigma_1^2.
\]

This yields

\[
En_{SO}(G) - |\sigma_1| \leq \sqrt{(n-1)[2F(G) - \sigma_1^2]}
\]

and

\[
(6) \quad En_{SO}(G) \leq \sigma_1 + \sqrt{(n-1)[2F(G) - \sigma_1^2]}
\]

since \(\sigma_1 > 0\).

Consider the function

\[
\psi(x) \leq x + \sqrt{(n-1)[2F(G) - x^2]}
\]

It monotonously decreases in the interval \((a, b)\) where
\[ a = \sqrt{\frac{2F(G)}{n}} \quad \text{and} \quad b = \sqrt{2F(G)}. \]

Therefore, inequality (6) remains valid if on the right-hand side of \( \psi(x) \), the variable \( x \) is replaced by the lower bound for \( \sigma_i \) from Lemma 2. This results in Theorem 2.

**Theorem 3.** Let \( G \) be a bipartite graph on \( n \) vertices, with Sombor and forgotten indices \( SO(G) \) and \( F(G) \), respectively. Then

\[ En_{SO}(G) \leq \frac{4SO(G)}{n} + \sqrt{(n - 2) \left[ 2F(G) - 2 \left( \frac{2SO(G)}{n} \right)^2 \right]} \]

which, again is analogous to another Koolen-Moulton bound (Koolen & Moulton, 2003):

\[ En(G) \leq \frac{4m}{n} + \sqrt{2(n - 2) \left[ m - \left( \frac{2m}{n} \right)^2 \right]} \]

**Proof.** Theorem 3, valid for bipartite graphs, is deduced in an analogous manner as Theorem 2, by starting with

\[ \sum_{i=2}^{n-1} \sum_{j=2}^{n-1} (|\sigma_i| - |\sigma_j|)^2 \geq 0 \]

and by taking into account that for bipartite graphs \(|\sigma_i| = |\sigma_n|\).

Spektar i energija somborske matrice

Sažetak:
Uvod/cilj: Somborska matrica zavisna je od stepena čvorova, a izvedena je iz somborskog indeksa. U radu su prikazane neke njene spektralne osobine. Rezultati: Dobijene su jednakosti i nejednakosti za sopstvene vrednosti somborske matrice. Iz njih su izvedene dve fundamentalne granice za somborsku energiju (energija somborske matrice). Ove granice zavise od somborskog indeksa, kao i od takozvanog "zaboravljenog" topološkog indeksa. Zaključak: Rezultati izloženi u radu predstavljaju doprinos spektralnoj teoriji somborske matrice, kao i opštoj teoriji spektara matrica zavisnih od stepena čvorova.

Ključne reči: somborska matrica; somborska energija; somborski indeks; invariante zavisne od stepena čvorova; spektar (matrice)

Спектр и энергия сомборской матрицы

Резюме:
Введение/цель: Сомборская матрица введена из индекса Сомбора на основании степени вершин. В данной статье представлены спектральные свойства сомборской матрицы. Результаты: Получены равенства и неравенства собственных значений сомборской матрицы, из которых выведены два фундаментальных ограничения сомборской энергии (= энергии сомборской матрицы). Данные ограничения зависят от индекса Сомбора и от так называемого «забытого» топологического индекса. Выводы: Результаты исследования, представленные в данной статье, вносят вклад в спектральную теорию сомборской матрицы, а также в общую спектральную теорию матриц, связанных с инвариантами графов, основанных на степени вершин.

Ключевые слова: Сомборская матрица, энергия Сомбора, индекс Сомбора, инварианты графа, зависящие от степени вершин, спектр (матрицы).
