Abstract

A new species, *Zyginella menghaiensis* sp. n. (Hemiptera: Cicadellidae: Typhlocybinae: Zyginellini), is described from China and a key to species of *Zyginella* from China is provided.

Keywords

Morphology, taxonomy

Introduction

The leafhopper genus *Zyginella* was established by Löw in 1885. The genus belongs in the tribe Zyginellini of Typhlocybinae and consists of twenty-two species distributed in the Oriental, Palaeartic and Afrotropical Regions. Members of the genus can be distinguished by the distinct dark spot on the 3rd apical cell of the forewing (Fig. 3) and in the male genitalia by the male pygofer with short ventral caudal process and long macrosetae on the posterodorsal margin (Fig. 5) and style elongate, slender throughout length with truncate base (Fig. 7).
Recent taxonomic work on the genus includes Dworakowska (1969, 1970, 1974, 1977), Chiang, Lee and Knight (1988) and Zhang (1990); up to now, eight species of *Zyginella* have been recorded from China in these studies. In the current work, a new species from Yunnan Province, China is described and illustrated and a key to Chinese species of *Zyginella* is given. All specimens examined are deposited to the collection of the Institute of Entomology, Guizhou University, Guiyang, China (GUGC).

### Taxonomy

**Zyginella Löw**  
http://species-id.net/wiki/Zyginella

*Zyginella* Löw, 1885: 346; Dworakowska 1969: 433, 1970: 707, 1974: 161, 1977: 24; Chiang et al. 1988: 109; Zhang 1990: 170. Type species: *Zyginella pulchra* Löw, 1885.

*Pyramidotettix* Matsumura, 1932: 59; Dworakowska 1970: 707; Chiang et al. 1988: 109; Yang 1965: 197. Type species: *Conometopius citri* Matsumura, 1907. Synonymized by Dworakowska 1970: 707.

*Remmia* Vilbaste, 1968: 91; Dworakowska 1970: 707; Chiang et al. 1988: 109. Type species: *Remmia orbignera* Vilbaste, 1968. Synonymized by Dworakowska 1970: 707.

**Description.** Forewing (Fig. 3) with distinct dark spot on 3rd apical cell.  
Head (Fig. 1) acutely produced medially, about as wide as greatest width of pronotum; coronal suture prominent. Forewing (Fig. 3) with 1st apical cell short. Hind wing (Fig. 11) with submarginal vein confluent with Cu$_1$ markedly distad of point of fusion of Cu$_1$ with M$_3$,4.

Male pygofer (Fig. 5) with short process on lateroventral margin and numerous long macrosetae on posterodorsal surface. Subgenital plate usually forming a pocket-like structure at tip or tapering towards apex (Fig. 6). Style (Fig. 7) broadened and truncate at base. Aedeagal shaft (Figs 8, 9) usually curved dorsally; preatrium long or short; dorsal apodeme narrow. Connective (Fig. 10) V- or Y-shaped; lateral arms long; central lobe absent.

**Distribution.** Oriental region, Palaearctic region, Afrotropical region.

**Key to Chinese species of the genus Zyginella** (males only couplets 5–7)

Figures 1–11

**Description.** Head and thorax yellowish brown; vertex with lateral margins with soft red tinge; eyes brownish grey; pronotum brownish with two longitudinal darker stripes; scutellum with basal triangles testaceous. Forewing (Fig. 3) reddish brown near base, dark red between 4th apical cell and brochosome-field and light brown around apex; 3rd apical cell with a blackish brown spot.

Coronal suture (Fig. 1) extending nearly to anterior margin of vertex. Forewing (Fig. 3) with 3rd apical cell not petiolate at base.

Abdominal apodemes (Fig. 4) slender, slightly extended beyond 4th sternite.

Pygofer lobe (Fig. 5) broad, with a large sclerotized process near dorsal margin and another process arising from about ventro-caudal margin; six long macrosetae distributed along caudal margin and numerous short microsetae scattered on lateral surface. Subgenital plate (Fig. 6) long, gradually tapered towards apex and curved apically, beak-like; with three long macrosetae along upper margin. Style (Fig. 7) elongate, slender throughout length with truncate base. Aedeagal shaft (Figs 8, 9) curved dorsad in lateral view with single small dorsal process subapically; gonopore large, apical on ventral surface with small tooth on each lateral margin; preatrium long, about as long as aedeagal shaft; dorsal apodeme narrow. Connective (Fig. 10) Y-shaped with very short stem and long strongly divergent lateral arms; central lobe absent.

**Measurement.** Body length males 2.9–3.1 mm.

**Type material.** *Holotype*, male, China: Yunnan Province, Menghai County, 23 July 2008, coll. YUE-HUA SONG. *Paratypes*: two males, same date as holotype.
Figures 1–13. *Zyginella* species 1–11 *Zyginella menghaiensis* sp. n. 1 Head and thorax, dorsal view 2 Face 3 Forewing 4 Abdominal apodemes 5 Pygofer lobe, lateral view 6 Subgenital plate 7 Style 8 Aedeagus, lateral view 9 Aedeagus, ventral view 10 Connective 11 Hindwing 12–13 *Zyginella minuta* (after Yang, 1965) 12 Adult, dorsal view 13 Forewing.
Remarks. The new species is similar to *Z. tsauri* Chiang, Hsu and Knight (1989), but the forewing has a large dark costal patch (Fig. 3) and the aedeagus has a single short dorsal process subapically and a small tooth on each lateral margin of the gonopore (Figs 8, 9).

Etymology. The new species is named for its type locality: Menghai.

Acknowledgements

We would like to express our sincere gratitude to Mr. M. D. Webb (Natural History Museum, London, UK) for his detailed remarks and suggestions on the manuscript. The project was supported partly by the “Scientific Research Foundation for Doctor's Degree Members, Guizhou Normal University: Taxonomic Study of Erythroneurini and Zyginellini from South China Karst Area”, the “Social Development and Science & Technology of People's Livelihood Program of Guiyang City (No. 201110362)”, the “Key Technologies R&D Program of Guizhou Province (SV[2010]3068)” and the “Guizhou Provincial Natural Science Foundation of China (No. [2010]2063)”.
