In this study, some new results on convergence properties for $m$-coordinatewise negatively associated random vectors in Hilbert space are investigated. The weak law of large numbers, strong law of large numbers, complete convergence, and complete moment convergence for linear process of $H$-valued $m$-coordinatewise negatively associated random vectors with random coefficients are established. These results improve and generalise some corresponding ones in the literature.

1. Introduction

The random variables $X_1, X_2, \ldots, X_n$ are said to be negatively associated (NA, in short) if, for every pair of disjoint subsets $A$ and $B$ of $\{1, 2, \ldots, n\}$ and any real coordinatewise nondecreasing (or nonincreasing) functions $f_1$ on $\mathbb{R}^{|A|}$ and $f_2$ on $\mathbb{R}^{|B|}$,

\[ \text{Cov}\left( f_1(X_i, i \in A), f_2(X_j, j \in B) \right) \leq 0, \]  

whenever the covariance above exists, where $|A|$ and $|B|$ denote the cardinalities of $A$ and $B$, respectively. A sequence $\{X_i, i \geq 1\}$ of random variables is NA if every finite subcollection is NA.

The concept of NA random variables can be seen in Joag-Dev and Proschan [1], which also illustrated that many well-known multivariate distributions, such as multinomial, convolution of unlike multinomial, multivariate hyper-geometric, permutation distribution, negatively correlated normal distribution, and joint distribution of ranks, all satisfy the NA property.

Because of its wide applications, the concept of NA random variables was extended to many different directions. For example, Chandra and Ghosal [2] extended NA to asymptotically almost negative association (AANA); Hu et al. [3] extended the concept of NA random variables to $m$-NA random variables; Zhang and Wang [4] generalised it to a more broad case, i.e., asymptotically negative association (ANA); Zhang [5] extended it to $\mathbb{R}^d$-valued random vectors; Ko et al. [6] introduced the concept of NA random vectors taking values in real separable Hilbert spaces.

Huan et al. [18] first introduced the concept of coordinatewise negatively associated (CNA) random vectors in Hilbert spaces. Huan et al. [18] exemplified that a sequence of NA random vectors is also CNA in Hilbert spaces while the reverse is not true in general. There are also some interesting results concerning the CNA random vectors in

Let $H$ be a real separable Hilbert space with the norm $\| \cdot \|$ generated by an inner product $\langle \cdot, \cdot \rangle$. Denote $X^{(j)} = \langle X, e^j \rangle$, where $\{e^j, j \in \mathcal{B}\}$ is an orthonormal basis in $H$, $X$ is also a random vector taking values in $H$, and $\mathcal{B}$ is a subset of $\{1, 2, \ldots\}$.

Huan et al. [18] first introduced the concept of coordinatewise negatively associated (CNA) random vectors in Hilbert spaces. Huan et al. [18] exemplified that a sequence of NA random vectors is also CNA in Hilbert spaces while the reverse is not true in general. 1. Introduction

The random variables $X_1, X_2, \ldots, X_n$ are said to be negatively associated (NA, in short) if, for every pair of disjoint subsets $A$ and $B$ of $\{1, 2, \ldots, n\}$ and any real coordinatewise nondecreasing (or nonincreasing) functions $f_1$ on $\mathbb{R}^{|A|}$ and $f_2$ on $\mathbb{R}^{|B|}$,

\[ \text{Cov}\left( f_1(X_i, i \in A), f_2(X_j, j \in B) \right) \leq 0, \]  

whenever the covariance above exists, where $|A|$ and $|B|$ denote the cardinalities of $A$ and $B$, respectively. A sequence $\{X_i, i \geq 1\}$ of random variables is NA if every finite subcollection is NA.

The concept of NA random variables can be seen in Joag-Dev and Proschan [1], which also illustrated that many well-known multivariate distributions, such as multinomial, convolution of unlike multinomial, multivariate hyper-geometric, permutation distribution, negatively correlated normal distribution, and joint distribution of ranks, all satisfy the NA property.

Because of its wide applications, the concept of NA random variables was extended to many different directions. For example, Chandra and Ghosal [2] extended NA to asymptotically almost negative association (AANA); Hu et al. [3] extended the concept of NA random variables to $m$-NA random variables; Zhang and Wang [4] generalised it to a more broad case, i.e., asymptotically negative association (ANA); Zhang [5] extended it to $\mathbb{R}^d$-valued random vectors; Ko et al. [6] introduced the concept of NA random vectors taking values in real separable Hilbert spaces.

Huan et al. [18] first introduced the concept of coordinatewise negatively associated (CNA) random vectors in Hilbert spaces. Huan et al. [18] exemplified that a sequence of NA random vectors is also CNA in Hilbert spaces while the reverse is not true in general. There are also some interesting results concerning the CNA random vectors in

Let $H$ be a real separable Hilbert space with the norm $\| \cdot \|$ generated by an inner product $\langle \cdot, \cdot \rangle$. Denote $X^{(j)} = \langle X, e^j \rangle$, where $\{e^j, j \in \mathcal{B}\}$ is an orthonormal basis in $H$, $X$ is also a random vector taking values in $H$, and $\mathcal{B}$ is a subset of $\{1, 2, \ldots\}$.

Huan et al. [18] first introduced the concept of coordinatewise negatively associated (CNA) random vectors in Hilbert spaces. Huan et al. [18] exemplified that a sequence of NA random vectors is also CNA in Hilbert spaces while the reverse is not true in general. There are also some interesting results concerning the CNA random vectors in
Hilbert spaces, most of which mainly extended the following Bauman–Katz type convergence theorem from independent and identically distributed (i.i.d.) random variables in classical probability space to CNA random vectors in Hilbert space.

Bauman–Katz theorem (see [19]): let $p > 1$, $\alpha > (1/2)$ and $\alpha p > 1$. Let $\{X_n, n \geq 1\}$ be a sequence of i.i.d. random variables with zero mean. Then, the following statements are equivalent:

1. $E[|X_i|^p] < \infty$
2. $\sum_{i=1}^{\infty} n^{\alpha p - 2} p(\sum_{i=1}^{n} |X_i| > \varepsilon) < \infty$
3. $\sum_{i=1}^{\infty} n^{\alpha p - 2} p(\sup_{k \geq 1} k^{-\alpha} \sum_{i=1}^{k} |X_i| > \varepsilon) < \infty$

Huan et al. [18] proved the sufficient conditions of the Bauman–Katz type complete convergence with $1 \leq p < 2$ and $\alpha p > 1$, which partially extends Theorem A to CNA random vectors in Hilbert space. Huan [20] considered the case $\alpha p = 1$ with $1 < p < 2$. Ko [21] extended the result of Huan et al. [18] to the complete moment convergence, where, however, the case $p = 1$ is wrongly proved as pointed out by Huang and Wu [22]. Ko [23] also established the complete moment convergence with $\alpha p = 1$ and $1 \leq p < 2$. However, there are still some mistakes for $\alpha = p = 1$. To be specific, it shows in equation (2.9) of [23] that $\int_{1}^{\infty} y^{1/(\alpha-2)} \log y \frac{dy}{C_{\alpha}(\log n)^{\alpha-1}} \leq C_{\alpha}(\log n)^{\alpha-1}$, where we know it is wrong when $\alpha = 1$; furthermore, the formula $\sum_{m=1}^{\infty} (\log n/n^\alpha) \leq C (\log m/n^\alpha)$ in equation (2.11) of [23] is yet invalid for $\alpha = 1$. One goal of this work is to further investigate the Bauman–Katz type convergence theorem such as complete convergence and complete moment convergence under a much broad dependence assumption and obtain some new results including the interesting case $\alpha = p = 1$. Moreover, to the best of my knowledge, there was no paper investigating the limit properties of random vectors with random coefficients in Hilbert spaces. Therefore, the work will mainly focus on this topic to obtain some results which were not established before.

In this paper, some new results on the weak law of large numbers, strong law of large numbers, complete convergence, and complete moment convergence for linear processes of $H$-valued $m$-coordinatewise negatively associated (m-CNA, in short) random vectors with random coefficients are established successfully. The results improve and generalise the corresponding ones of Hien and Thanh [9], Huan et al. [18], Huan [20], Ko [21], and Ko [23].

In what follows, let $C$ denote a generic positive constant whose value may vary in different lines. $x_\ast = \max\{x, 0\}$ and $I(A)$ implies the indicator function of the set $A$. $\mathbb{Z} = \{\ldots, -2, -1, 0, 1, 2, \ldots\}$ represents the set of integers.

The paper is organized as follows. Section 2 gives some preliminary definitions and lemmas. Section 3 presents the main results and their proofs. Section 4 contains the conclusion of the paper.

2. Preliminaries

In this section, we will present some concepts and important lemmas as below.

Definition 1 (see [18]). A sequence $\{X_i, i \geq 1\}$ of random vectors taking values in $H$ is said to be CNA if, for each $j \in B$, the sequence $\{X_{ij}, i \geq 1\}$ of random variables is NA, where $X_{ij} = \langle X_i, e_j \rangle$. Inspired by Hu et al. [3] and Huan et al. [18], we introduce the concept of $m$-CNA random vectors in Hilbert space as follows.

Definition 2. Let $m \geq 1$ be a given integer. A sequence $\{X_n, n \geq 1\}$ of random variables is said to be $m$-CNA if, for any $n \geq 2$ and any $(i_1, i_2, \ldots, i_n)$ such that $|i_j - i_{j+1}| \geq m$ for all $1 \leq k \neq j \leq n$, we have that $(X_{i_1}, X_{i_2}, \ldots, X_{i_n})$ is CNA. Obviously, if $m = 1$, then $m$-CNA random vectors is CNA. Hence, the concept of $m$-CNA random vectors is a natural extension of that of CNA random vectors. We also present an example of $m$-CNA random vectors which are not CNA, as follows.

Example 1. Let $\{\xi_i, i \geq 1\}$ be a sequence of independent random vectors, where $\xi_i$ follows the standard multivariate normal distribution for each $i \geq 1$. Take $X_i = \xi_i + \theta_1 \xi_{i+1} - \theta_2 \xi_{i+2}$ for each $i \geq 1$, where $0 < \theta_1, \theta_2 < 1$. Then, it is easy to check that, for any $j \in B$ and $i \geq 1$, $\text{Cov}(X_{ij}, X_{i+1j}) = \theta_1(1 - \theta_2) > 0$ but $\text{Cov}(X_{ij}, X_{i+1j}) = -\theta_2 < 0$ and $\text{Cov}(X_{ij}, X_{i+2j}) = 0$ for $i \geq 3$. That is to say, $\{X_n, n \geq 1\}$ is a sequence of $m$-CNA random vectors with $m = 2$. We also introduce the following concept of the linear process of random vectors in Hilbert spaces with random coefficients.

Definition 3. Assume that $\{X_n, -\infty < i < \infty\}$ is a sequence of $H$-valued random vectors, and $\{A_n, -\infty < i < \infty\}$ is a sequence of random variables. The sequence $\{Y_i, t \geq 1\}$ of random vectors is said to be $\{A_n, -\infty < i < \infty\}$ to be linear process with random coefficients if

\[
Y_i = \sum_{j=-\infty}^{\infty} A_j X_{i-j}.
\]

The following concept is often used in the literature while dealing with the convergence theorems of random vectors in Hilbert spaces.

Definition 4. A sequence $\{X_n, n \geq 1\}$ is said to be coordinatewise weakly upper bounded by $X$ if there exists a positive constant $C$ such that $\sup_{n \geq 1} n^{-1} \sum_{i=1}^{n} P(|X_i| > x) \leq CP(|X_i| > x)$, for all $j \in B$ and $x \geq 0$.

Lemma 1. Let $\{X_i, -\infty < i < \infty\}$ be a sequence of $m$-CNA random vectors. If $\{f(j), -\infty < i < \infty\}$ is a sequence of coordinatewise nondecreasing (or nonincreasing) continuous real functions, then $\{f(k) X_{i-k}, -\infty < i < \infty\}$ is still a sequence of $m$-CNA random vectors.

Proof. It follows from Definitions 1 and 2 that, for any $n \geq 2$ and any $(i_1, i_2, \ldots, i_n)$, taking values in $\mathbb{Z}$ such that $|i_j - i_{j+1}| \geq m$ for all $1 \leq k \neq j \leq n$, $\{X_{i_1}, X_{i_2}, \ldots, X_{i_n}\}$ is a sequence of NA random variables for each $j \in B$. By Lemma 2.1 of [24], one can see that $\{f_{i_1}(X_{i_1}), f_{i_2}(X_{i_2}), \ldots, f_{i_n}(X_{i_n})\}$ is still a sequence of
NA random variables for each $j \in \mathcal{B}$. Hence, by Definitions 1 and 2 again, it follows that $f_i^+(X_i)$, $f_i^-(X_i)$, ..., $f_i^{(k)}(X_i)$ are CNA, i.e., $\{\sum_{i \in \mathcal{B}} f_i^+(X_i) \}_i^{(b)}$, $-\infty < i < \infty$ is $m$-CNA. □

Lemma 2 (see [18]). Let $\{x_m, n \geq 1\}$ be a sequence of $H$-valued CNA random vectors with zero mean and $E\|X_m\|^2 < \infty$, for all $n \geq 1$. Then,

$$E \max_{1 \leq i \leq n} \left| \begin{array}{c} \sum_{j=1}^{i} X_j \end{array} \right|^2 \leq 2 \sum_{i=1}^{n} E \|X_i\|^2. \quad (3)$$

Lemma 3. Let $\{x_m, n \geq 1\}$ be a sequence of $H$-valued $m$-CNA random vectors with zero mean and $E\|X_m\|^2 < \infty$ for all $n \geq 1$. Then,

$$E \max_{1 \leq i \leq n} \left| \begin{array}{c} \sum_{j=1}^{i} X_j \end{array} \right|^2 \leq 2m \sum_{i=1}^{n} E \|X_i\|^2. \quad (4)$$

Proof. Notice that

$$\max_{1 \leq i \leq n} \left| \begin{array}{c} \sum_{j=1}^{i} X_j \end{array} \right| \leq \sum_{i=1}^{m-1} \max_{1 \leq j \leq k} E \left| \begin{array}{c} \sum_{l=1}^{i} X_{m+l} \end{array} \right| \quad (5)$$

where we can define without loss of generality that $X_0 = 0$. From Definition 1, we see that $\{X_{m+i}, i \geq 0\}$ is CNA for each $(l = 1, 2, \ldots, m)$. Hence, by $c_r$ inequality and Lemma 2, we have

$$E \max_{1 \leq i \leq n} \left| \begin{array}{c} \sum_{j=1}^{i} X_j \end{array} \right|^2 \leq m \sum_{i=1}^{n} E \left| \begin{array}{c} \sum_{l=1}^{i} X_{m+i} \end{array} \right|^2 \leq 2m \sum_{i=0}^{n-1} \sum_{l=0}^{m-1} E \|X_{m+i}\|^2 \quad (6)$$

$$\leq 2m \sum_{i=0}^{n} E \|X_i\|^2. \quad (7)$$

Proof. It follows by Hölder inequality and Lemma 3 that

$$E \max_{1 \leq i \leq n} \left| \begin{array}{c} \sum_{l=1}^{i-1} A_l X_l \end{array} \right|^{2} = E \max_{1 \leq i \leq n} \left| \begin{array}{c} \sum_{l=1}^{i} A_l \sum_{j=1}^{k} X_j \end{array} \right|^{2}$$

$$\leq E \left| \begin{array}{c} \sum_{i=1}^{\infty} |A_i| \max_{1 \leq k \leq n} \left| \begin{array}{c} \sum_{l=1}^{i} X_l \end{array} \right| \end{array} \right|^2$$

$$= E \left| \begin{array}{c} \sum_{i=1}^{\infty} |A_i| \left[ \left( \sum_{i=1}^{\infty} |A_i| \max_{1 \leq k \leq n} \left| \begin{array}{c} \sum_{l=1}^{i} X_l \end{array} \right| \right) \right] \right|^{2}$$

$$\leq E \left| \sum_{i=1}^{\infty} |A_i| \left[ \sum_{i=1}^{\infty} \left| \sum_{l=1}^{i} X_l \right| \right] \right|^{2} \quad (8)$$

The proof is therefore complete. □
Lemma 5 (see [25]). Let \( \{X_n, n \geq 1\} \) be a sequence of random variables satisfying \( n^{-1} \sum_{i=1}^{n} P(|Z_i| > x) \leq CP(|Z| > x) \) for a random variable \( Z \) and any \( x \geq 0 \). Then, for any \( a > 0 \) and \( b > 0 \), there exist some positive constants \( c_1 \) and \( c_2 \) such that

\[
\begin{align*}
n^{-1} \sum_{i=1}^{n} E[Z_i]^a I(|Z_i| > b) & \leq c_1 E[Z]^a I(|Z| > b), \\
n^{-1} \sum_{i=1}^{n} E[X_i]^a I(|Z_i| \leq b) & \leq c_2 E[Z]^a I(|Z| \leq b) + b^a P(|Z| > b).
\end{align*}
\]

(9)

Following the method of Lemma 2.3 in [26], we can obtain the following inequality in Hilbert spaces.

\[
E\left( \max_{1 \leq k \leq n} \sum_{i=1}^{k} (Y_i + Z_i) \right) - \varepsilon a \leq \left( \frac{1}{\varepsilon^q} + \frac{1}{q-1} \right) a^{1-q} E\left( \max_{1 \leq k \leq n} \sum_{i=1}^{k} Y_i \right)^q + E \max_{1 \leq k \leq n} \sum_{i=1}^{k} Z_i.
\]

(10)

3. Main Results and Their Proofs

In this section, we will present our main results. The first one is the weak law of large numbers for linear process \( \{Y_t, t \geq 1\} \) of \( m \)-CNA random vectors in Hilbert spaces with random coefficients.

Theorem 1. Let \( \{X_i, -\infty < i < \infty\} \) be a sequence of zero mean \( H \)-valued \( m \)-CNA random vectors coordinatewise weakly upper bounded by a random vector \( X \). Suppose that \( \{A_i, -\infty < i < \infty\} \) is a sequence of random variables

\[
X_m^{(j)} = -n I(X_i^{(j)} < -n) + X_i^{(j)} I\left(X_i^{(j)} \leq n\right) + n I(X_i^{(j)} > n);
\]

\[
Z_m^{(j)} = X_i^{(j)} - X_m^{(j)} = (X_i^{(j)} + n) I(X_i^{(j)} < -n) + (X_i^{(j)} - n) I(X_i^{(j)} > n),
\]

\[
X_m = \sum_{j \in \mathcal{B}} X_m^{(j)} e_j, \quad Z_m = \sum_{j \in \mathcal{B}} Z_m^{(j)} e_j.
\]

(12)

Proof. For each \( -\infty < i < \infty \) and \( j \in \mathcal{B} \), denote

\[
\sum_{t=1}^{n} Y_t = \sum_{t=1}^{n} \sum_{i=-\infty}^{\infty} A_i X_{t-i} = \sum_{l=-\infty}^{\infty} \sum_{i=1-l}^{n-l} A_i X_i,
\]

\[
= \sum_{l=-\infty}^{\infty} \sum_{i=1-l}^{n-l} A_i (X_i - EX_i) + \sum_{l=-\infty}^{\infty} \sum_{i=1-l}^{n-l} A_i (Z_i - EZ_i)
\]

\[
= \sum_{l=-\infty}^{\infty} \sum_{i=1-l}^{n-l} A_i (X_i - EX_i) + \sum_{t=1}^{\infty} \sum_{i=1-t}^{n-t} A_i (Z_i - EZ_i).
\]

(13)
It is sufficient to prove that, for any $\varepsilon > 0$,

$$P\left( \left\| \sum_{l=-\infty}^{\infty} \sum_{i=1}^{n-l} A_l (X_{id} - EX_{id}) \right\| > n\varepsilon \right) \longrightarrow 0, \quad (14)$$

$$P\left( \left\| \sum_{l=1}^{n} \sum_{i=-\infty}^{\infty} A_l (Z_{ni} - EZ_{ni}) \right\| > n\varepsilon \right) \longrightarrow 0. \quad (15)$$

It follows from Lemma 1 that $\{X_{ni}, -\infty < i \leq \infty\}$ is still a sequence of $m$-CNA random vectors. Furthermore, it is easy to check that, as $n \longrightarrow \infty$,

$$n^{-1} \sum_{j \in \mathcal{B}} \int_0^1 xP\left( |X^{(j)}| > x \right) dx \leq n^{-1} \sum_{j \in \mathcal{B}} E|X^{(j)}| \longrightarrow 0, \quad \text{if } |\mathcal{B}| = \infty,$$

$$n^{-1} \sum_{j \in \mathcal{B}} \int_0^1 xP\left( |X^{(j)}| > x \right) dx \leq n^{-1}|\mathcal{B}| \longrightarrow 0, \quad \text{if } |\mathcal{B}| < \infty. \quad (16)$$

Hence, we obtain by Chebyshev inequality, $E(\sum_{j=1}^{\infty} A_j)^2 < \infty$, Lemmas 4 and 5, and integration by parts that

$$P\left( \left\| \sum_{l=-\infty}^{\infty} \sum_{i=1}^{n-l} A_l (X_{id} - EX_{id}) \right\| > n\varepsilon \right) \leq Cn^{-2} \left( \sum_{l=-\infty}^{\infty} \sum_{i=1}^{n-l} A_l (X_{id} - EX_{id}) \right)^2$$

$$\leq Cn^{-2} \sup_{-\infty < i < \infty} \sum_{l=1}^{n-l} E\|X_{id} - EX_{id}\|^2$$

$$\leq Cn^{-2} \sup_{-\infty < i < \infty} \sum_{l=1}^{n-l} \left\{ \sum_{j \in \mathcal{B}} E|X^{(j)}| \left| I\left( |X^{(j)}| \leq n \right) + n^2 P\left( |X^{(j)}| > n \right) \right| \right\}$$

$$= Cn^{-1} \sum_{j \in \mathcal{B}} \int_0^n x \left( P\left| X^{(j)} \right| > x \right) dx$$

$$= Cn^{-1} \sum_{j \in \mathcal{B}} \sum_{k=0}^{n-1} \int_{k}^{k+1} x \left( P\left| X^{(j)} \right| > x \right) dx$$

$$\leq Cn^{-1} \sum_{j \in \mathcal{B}} \int_0^1 x P\left( |X^{(j)}| > x \right) dx + Cn^{-1} \sum_{j \in \mathcal{B}} \sum_{k=1}^{n} ((k+1)^2 - k^2) P\left( |X^{(j)}| > k \right)$$

$$\leq Cn^{-1} \sum_{j \in \mathcal{B}} \int_0^1 x P\left( |X^{(j)}| > x \right) dx + Cn^{-1} \sum_{k=1}^{n} \left( \sum_{j \in \mathcal{B}} k P\left( |X^{(j)}| > k \right) \right)$$

$$\leq Cn^{-1} \sum_{j \in \mathcal{B}} \int_0^1 x P\left( |X^{(j)}| > x \right) dx + Cn^{-1} \sum_{k=1}^{n} \left( \sum_{j \in \mathcal{B}} E|X^{(j)}| I\left( |X^{(j)}| > k \right) \right),$$

which converges to 0 as $n \longrightarrow \infty$, and thus, equation (14) holds true. On the contrary, we have, by Markov inequality, Lemma 5, and Jensen inequality, that
\[
P\left( \left\| \sum_{i=1}^{n} \sum_{i=0}^{\infty} A_i (Z_{n,t-i} - EZ_{n,t-i}) \right\| > n \varepsilon \right) \leq Cn^{-1} E \left\| \sum_{i=1}^{n} \sum_{i=0}^{\infty} A_i (Z_{n,t-i} - EZ_{n,t-i}) \right\| \leq Cn^{-1} \sum_{i=1}^{n} \sum_{i=0}^{\infty} E|A_i| E(\|Z_{n,t-i} - EZ_{n,t-i}\|) \leq CE \left( \sum_{j \in \mathcal{B}} |A_j| \right) \sum_{i=1}^{n^{-1}} \sum_{i=0}^{n} E X_{i,j}^{(i)} I(\|X_{i,j}^{(i)}\| > n) \leq C \left[ E \left( \sum_{i=0}^{\infty} |A_i| \right)^{1/2} \right] \sum_{j \in \mathcal{B}} E X_{j,j}^{(j)} I(\|X_{j,j}^{(j)}\| > n), \tag{18}
\]

which obtains equation (15) as \( n \to \infty \) by the assumption of Theorem 1, and the proof is thus complete. \( \square \)

**Remark 1.** Hien and Thanh [9] obtained the weak law of large numbers for NA random vectors under the moment condition \( \sum_{j \in \mathcal{B}} E|X_{j,j}^{(j)}| < \infty \). Contrasting to Corollary 2.5 of Hien and Thanh [9], Theorem 1 not only extends the assumption of NA random vectors to linear process of \( m \)-CNA random vectors with random coefficients but also improves the moment condition when \( |\mathcal{B}| < \infty \).

**Theorem 2.** Let \( 1 < p < 2 \) and \( ap \geq 1 \). Let \( \{X_i, - \infty < i < \infty\} \) be a sequence of zero mean \( H \)-valued \( m \)-CNA random vectors coordinatewise weakly upper bounded by a random vector \( X \) with \( \sum_{j \in \mathcal{B}} E|X_{j,j}^{(j)}|^p < \infty \). Suppose that \( \{A_i, - \infty < i < \infty\} \) is a sequence of random variables independent of \( \{X_i, - \infty < i < \infty\} \) and \( E(\sum_{i=0}^{\infty} A_j)^2 < \infty \). Then, for any \( \varepsilon > 0 \),

\[
\sum_{n=1}^{\infty} n^{ap-a-2} E \max_{1 \leq k \leq n} \left\| \sum_{i=1}^{k} Y_i \right\|^2 - \varepsilon n^a < \infty, \tag{19}
\]

and thus,

\[
\sum_{n=1}^{\infty} n^{ap-2} P \left( \max_{1 \leq k \leq n} \left\| \sum_{i=1}^{k} Y_i \right\| > \varepsilon n^a \right) < \infty. \tag{20}
\]

**Proof.** Define for each \( - \infty < i < \infty \) and \( j \in \mathcal{B} \) that

\[
W_{ni}^{(j)} = -n I(X_{i,j}^{(j)} < -n^a) + X_{i,j}^{(j)} I(\|X_{i,j}^{(j)}\| \leq n^a) + n I(X_{i,j}^{(j)} > n^a),
\]

\[
T_{ni}^{(j)} = X_{i,j}^{(j)} - W_{ni}^{(j)} = (X_{i,j}^{(j)} + n^a) I(X_{i,j}^{(j)} < -n^a) + (X_{i,j}^{(j)} - n^a) I(X_{i,j}^{(j)} > n^a),
\]

\[
W_{n} = \sum_{j \in \mathcal{B}} W_{ni}^{(j)} e_j,
\]

\[
T_{n} = \sum_{j \in \mathcal{B}} T_{ni}^{(j)} e_j.
\]

Similar to the argument of equation (13), we have that, for each \( 1 \leq k \leq n \),

\[
\sum_{t=1}^{k} Y_t = \sum_{l=-\infty}^{\infty} \sum_{i=-l}^{l-k} A_i X_i = \sum_{l=-\infty}^{\infty} \sum_{i=-l}^{l-k} A_i (W_{ni} - EW_{ni}) + \sum_{t=1}^{k} \sum_{l=-\infty}^{\infty} A_i (T_{ni-t} - ET_{ni-t}). \tag{22}
\]

On the one hand, noting that \( \{W_{ni}, - \infty < i \leq \infty\} \) is still a sequence of \( m \)-CNA random vectors by Lemma 1, we obtain by Lemmas 4 and 5 that
\begin{equation}
\sum_{n=1}^{\infty} n^{p-2r-2} E \max_{1 \leq k \leq n} \left\| \sum_{l=-\infty}^{k-1} \sum_{i=1}^{l} A_i (W_{nl} - EW_{nl}) \right\|^2 \\
\leq C \sum_{n=1}^{\infty} n^{p-2r-2} \sup_{-\infty < q < \infty} \sum_{i=1}^{n} \left\{ \sum_{j \in \mathcal{B}} \left[ E |X_j|^2 I \left( |X_j| \leq n^a \right) + n^{2a} P \left( |X_j| > n^a \right) \right] \right\} \\
\leq C \sum_{j \in \mathcal{B}} \sum_{n=1}^{\infty} n^{p-2r-1} E |X_j|^2 I \left( |X_j| \leq n^a \right) + C \sum_{j \in \mathcal{B}} \sum_{n=1}^{\infty} n^{p-1} P \left( |X_j| > n^a \right) \\
\leq C \sum_{j \in \mathcal{B}} \sum_{n=1}^{\infty} n^{p-2r-1} \sum_{l=1}^{n} E |X_j|^2 I \left( (l-1)^a < |X_j| \leq l^a \right) + C \sum_{j \in \mathcal{B}} E |X_j|^p \\
\leq C \sum_{j \in \mathcal{B}} E |X_j|^p < \infty.
\end{equation}

On the other hand, it follows from Lemma 5 and Jensen inequality that

\begin{equation}
\sum_{n=1}^{\infty} n^{p-2r-2} E \max_{1 \leq k \leq n} \left\| \sum_{l=1}^{\infty} \sum_{i=-\infty}^{l} A_i (T_{nt-i} - ET_{nt-i}) \right\|^2 \\
\leq C \sum_{n=1}^{\infty} n^{p-2r-2} \sum_{t=1}^{n} \sum_{i=-\infty}^{\infty} E |A_i| E \left\| T_{nt-i} - ET_{nt-i} \right\| \\
\leq C \sum_{n=1}^{\infty} n^{p-2r-1} E \left( \sum_{i=-\infty}^{\infty} |A_i| \right) \sum_{i=-1}^{\infty} n^{-1} \sum_{j \in \mathcal{B}} E |X_j|^2 I \left( |X_j| > n^a \right) \\
\leq C \sum_{j \in \mathcal{B}} \sum_{n=1}^{\infty} n^{p-2r-1} \left[ E \left( \sum_{i=-\infty}^{\infty} |A_i| \right)^2 \right] E |X_j|^2 I \left( |X_j| > n^a \right) \\
\leq C \sum_{j \in \mathcal{B}} \sum_{n=1}^{\infty} E |X_j|^2 I \left( (l^a - 1)^a \leq (l+1)^a \right) \sum_{n=1}^{\infty} n^{p-2r-1} \\
\leq C \sum_{j \in \mathcal{B}} \sum_{n=1}^{\infty} n^{p-2r-1} E |X_j|^2 I \left( (l^a - 1)^a \leq (l+1)^a \right) \\
\leq C \sum_{j \in \mathcal{B}} E |X_j|^p < \infty.
\end{equation}

Hence, it follows from Lemma 6 (with $q = 2$) and equations (22)–(24) that
have that, for any $\varepsilon > 0$

\begin{align*}
&\sum_{n=1}^{\infty} n^{a_p - 2} E \left( \max_{1 \leq k \leq n} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon n^a \right)_+ \\
&\leq C \sum_{n=1}^{\infty} n^{a_p - 2} \left( \max_{1 \leq k \leq n} \left\{ \sum_{i=1}^{k} A_i(W_{n+1} - EW_{n+1}) \right\} \right)^2 + C \sum_{n=1}^{\infty} n^{a_p - 2} \max_{1 \leq k \leq n} \left\{ \sum_{m=-\infty}^{n} A_i(\mathcal{T}_{n+1} - ET_{n+1}) \right\}
\end{align*}

(25)

which obtains equation (19). Now, we prove equation (20). It follows from equation (19) that

\begin{align*}
&\sum_{n=1}^{\infty} n^{a_p - 2} E \left( \max_{1 \leq k \leq n} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon n^a \right)_+ \\
&\geq \sum_{n=1}^{\infty} n^{a_p - 2} \int_0^{n^a} P \left( \max_{1 \leq k \leq n} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon n^a > s \right) \, ds \\
&\geq \varepsilon \sum_{n=1}^{\infty} n^{a_p - 2} P \left( \max_{1 \leq k \leq n} \left\{ \sum_{i=1}^{k} Y_i \right\} > 2 \varepsilon n^a \right),
\end{align*}

(26)

which combining with the arbitrariness of $\varepsilon$ gets equation (20). The proof is complete. $\square$

**Remark 2.** Huan et al. [18] and Huan [20] established equation (20) for CNA random vectors, respectively, for $1 \leq p < 2$, $a_p > 1$, and $1 < p < 2$, $a_p = 1$. Although Ko [21] extended the result of Huan et al. [18] to complete moment convergence, it only holds for $1 < p < 2$, $a_p > 1$, as illustrated in Section 1. Hence, Theorem 2 improves and extends the results of Huan et al. [18], Huan [20], and Ko [21] from CNA random vectors to linear process of $m$-CNA random vectors with random coefficients. By Theorem 2, we can easily get the following conclusion.

**Corollary 1.** Under the conditions of Theorem 2, if $a_p > 1$, we have that, for any $\varepsilon > 0$,

\begin{align*}
&\sum_{n=1}^{\infty} n^{a_p - 2} E \left( \sup_{k \geq n} k^{-a} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon \right)_+ < \infty,
\end{align*}

and thus,

\begin{align*}
&\sum_{n=1}^{\infty} n^{a_p - 2} P \left( \sup_{k \geq n} k^{-a} \left\{ \sum_{i=1}^{k} Y_i \right\} > \varepsilon \right) < \infty.
\end{align*}

**Proof.** It follows from Theorem 2 that

\begin{align*}
&\sum_{n=1}^{\infty} n^{a_p - 2} E \left( \sup_{k \geq n} k^{-a} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon \right)_+ = \sum_{l=1}^{\infty} \sum_{2^{l-1} \leq n < 2^l} n^{a_p - 2} E \left( \sup_{k \geq n} k^{-a} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon \right)_+ \\
&\leq C \sum_{l=1}^{\infty} \sum_{2^{l-1} \leq n < 2^l} n^{a_p - 2} \left( \sup_{k \geq n} k^{-a} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon \right) \\
&\leq C \sum_{l=1}^{\infty} E \left( \max_{2^{l-1} \leq k \leq 2^l} k^{-a} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon \right) \sum_{l=1}^{\infty} n^{a_p - 2} \left( \sup_{k \geq n} k^{-a} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon \right)_+ \\
&\leq C \sum_{l=1}^{\infty} \sum_{2^{l-1} \leq n < 2^l} n^{a_p - 2} E \left( \max_{2^{l-1} \leq k \leq 2^l} k^{-a} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon 2^{-a} n^a \right)_+ \\
&\leq C \sum_{l=1}^{\infty} \sum_{2^{l-1} \leq n < 2^l} n^{a_p - 2} E \left( \max_{2^{l-1} \leq k \leq 2^l} k^{-a} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon 2^{-a} n^a \right)_+ \leq \sum_{n=1}^{\infty} n^{a_p - 2} E \left( \sup_{k \geq n} k^{-a} \left\{ \sum_{i=1}^{k} Y_i \right\} - \varepsilon 2^{-a} n^a \right)_+ < \infty.
\end{align*}

Furthermore, similar to the proof of equation (20), we have that
\[ \sum_{n=1}^{\infty} n^{a-2} \ln n E \max_{1 \le k \le n} \left[ \sum_{i=1}^{k} A_i (W_{ni} - EW_{ni}) \right]^2 \]

\[ \le C \sum_{j \in \mathbb{N}} \sum_{k \in \mathbb{N}} n^{-a-1} \ln n E X^{(j)} I \left( X^{(j)} \le n^a \right) + C \sum_{j \in \mathbb{N}} \sum_{k \in \mathbb{N}} n^{-1} \ln n P \left( X^{(j)} > n^a \right) \]

\[ \le C \sum_{j \in \mathbb{N}} \sum_{l=1}^{1/a} \ln^4 l E (X^{(j)})^2 I \left( (1-\delta) X^{(j)} \le l^a \right) + C \sum_{j \in \mathbb{N}} \sum_{l=1}^{1/a} \ln^4 l P \left( l^a < X^{(j)} \le (1+\delta) l^a \right) \]

\[ \le C \sum_{j \in \mathbb{N}} \sum_{l=1}^{1/a} E (X^{(j)})^2 \ln^4 \left( 1 + X^{(j)} \right)^{1/(1-a)} \ln \left( l^a \right)^{1/(1-a)} + C \sum_{j \in \mathbb{N}} \sum_{l=1}^{1/a} E (X^{(j)}) \ln^4 \left( 1 + X^{(j)} \right) I \left( (1-\delta) X^{(j)} \le l^a \right) \]

\[ \le C \sum_{j \in \mathbb{N}} \sum_{l=1}^{1/a} E (X^{(j)}) \ln^4 \left( 1 + X^{(j)} \right) < \infty. \]

Hence, by Lemma 1 and equations (22), (33), and (34), we can obtain equation (31). Following the proof of equation (20), we can also get equation (32) by equation (31). The proof is complete.

Remark 3. Ko [23] proved the complete moment convergence for coordinatewise asymptotically almost negatively associated (CAANA) random vectors with \( a = 1 \) and \( (1/2) < \alpha \le 1 \). However, as stated in Section 1, the meaningful case \( \alpha = 1 \) is wrongly proved. Note that Theorem 3 also works if \( \alpha = p = 1 \). Thus, Theorem 3 fills the vacancy and extends it to some more general settings. By Theorems 2 and 3, one can obtain the following strong law of large numbers for linear process of m-CNA random vectors with random coefficients.

Corollary 2. Let \( 1 \le p < 2 \). Let \( \{ X_i, -\infty < i < \infty \} \) be a sequence of zero mean \( H \)-valued \( m \)-CNA random vectors
coordinate weakly upper bounded by a random vector $X$ with $\sum_{j=1}^{\infty} E|X^{(j)}|^p < \infty$ if $p > 1$ or $\sum_{j=1}^{\infty} E|X^{(j)}|\ln(1 + |X^{(j)}|) < \infty$ if $p = 1$. Suppose that $\{A_i, -\infty < i < \infty\}$ is a sequence of random variables independent of $\{X_i, -\infty < i < \infty\}$ and $E(\sum_{i=-\infty}^{\infty} A_i)^2 < \infty$. Then, with probability 1,

$$n^{-1/p}\left\|\frac{1}{n}\sum_{i=1}^{n} A_i\right\| \longrightarrow 0, \quad \text{as } n \longrightarrow \infty. \quad (35)$$

Proof. Let $\alpha = (1/p)$. It follows from equations (20) and (32) (with $\delta = 0$) that

$$\lim_{n \rightarrow \infty} n^{-1/p}\left\|\frac{1}{n}\sum_{i=1}^{n} A_i\right\| = 0. \quad (36)$$

By Borel–Cantelli lemma, the formula above implies that, as $l \longrightarrow \infty$, with probability 1,

$$n^{-1/p}\left\|\frac{1}{n}\sum_{i=1}^{n} A_i\right\| = 0. \quad (37)$$

Meanwhile, for any fixed $n$, there exists positive integer $l$ such that $2^{l-1} \leq n < 2^l$. Hence, with probability 1, one has

$$n^{-1/p}\left\|\frac{1}{n}\sum_{i=1}^{n} A_i\right\| \leq \frac{1}{(2^{l-1})^{1/p}} \max_{1 \leq k \leq n} \left\|\frac{1}{k}\sum_{i=1}^{k} A_i\right\| \longrightarrow 0. \quad (38)$$

4. Conclusion

In this study, the concept of $m$-CNA random vectors is introduced as a natural extension of CNA random vectors. The weak law of large numbers, complete convergence, and complete moment convergence for linear process of $H$-valued $m$-CNA random vectors with random coefficients are established. As a corollary of the complete convergence, the strong law of large numbers is also obtained. These results improve and generalise the corresponding ones of recent works such as Hien and Thanh [9], Huan et al. [18], Huan [20], Ko [21], and Ko [23].

However, there are still two open problems should be conquered. In specific, the Baum–Katz type theorem is only extended under the restriction $1 \leq p < 2$; the first problem is that whether it is possible to release to $p \geq 2$? Another problem is whether the moment condition $\sum_{j=1}^{\infty} E|X^{(j)}|\ln(1 + |X^{(j)}|) < \infty$ for the strong law of large numbers with $p = 1$ can be weakened to $\sum_{j=1}^{\infty} E|X^{(j)}| < \infty$?
