Computing Topological Invariants of Triangular Chandelier Lattice

Nazeran Idrees\textsuperscript{1,*}, Raghisa Khalid\textsuperscript{1}, Fozia Bashir Farooq\textsuperscript{2} and Sumiya Nasir\textsuperscript{3}

Abstract: A numerical parameter mathematically derived from the graph structure is a topological index. The topological index is the first actual choice in QSAR research and these indices are used to build the correlation model between the chemical structures of various chemicals compounds. Here, we investigate some old degree-based topological indices like Randic index, sum connectivity index, $ABC$ index, $GA$ index, 1\textsuperscript{st} and 2\textsuperscript{nd} Zagreb indices, modified second Zagreb index, redefined version of 1\textsuperscript{st}, 2\textsuperscript{nd} and 3\textsuperscript{rd} Zagreb indices, hyper and augmented Zagreb indices, forgotten index and symmetric division degree index, and some new degree-based indices like $SK$ index, $SK_1$ index, $SK_2$ index, and $AG_1$ index of triangular chandelier-lattice (TCL). The results are generalized by using edge partition and closed formulas for topological indices of triangular chandelier-lattice are analysed.

Keywords: Topological index, Zagreb index, graph, triangular chandelier-lattice, network.

1 Introduction

In the previous two decades topological indices of graphs are being widely applied in analyzing the topology of theoretical and computer-aided models of different physical and chemical phenomena and have found extensive usage in such different areas of scientific research as theoretical physics, chemistry, pharmacology and pharmaceutical chemistry, toxicology, engineering, computer science, sociology, geography, architecture and linguistics. A topological index is a unique mathematical quantity associated with a graph or network which is associated with different properties of the network like connectivity, stability, stress and many others. In the case of chemical graphs, topological indices predict different physiochemical properties like boiling point, biological reactivity, stress, kovat’s constant. The study of topological indices is now one of the most vital research field in the chemical graph theory. Topological indices define the structure of molecules mathematically and are

used in the growth of qualitative structure-activity relationships (QSARs). Most frequently known invariants of such kinds are degree-based topological indices.

In this work, all molecular graphs are considered to be connected, finite and deprived of parallel edges. Let $\zeta$ be a graph with $n$ vertices and $m$ edges. The degree of a vertex is the number of vertices adjacent to $r$ and is signified as $\Delta_r$. By these expressions, certain topological indices are well-defined as follows.

A much-investigated degree-based topological index is Randic index and is indicated as $\chi(\zeta)$ and proposed by Randic [Randic (1975)] while analyzing the boiling point of paraffin. This index is certainly the most extensively applied in chemistry and pharmacology.

**Definition 1.1** Consider a molecular graph $\zeta$, then the Randic index is defined as

$$\chi(\zeta) = \prod_{rs \in E(\zeta)} \frac{1}{\sqrt{\Delta_r \Delta_s}}$$

(1)

The sum connectivity index [Zhou and Trinajstic (2009)] is a variation of the Randic connectivity index.

**Definition 1.2** Consider a molecular graph $\zeta$, then the sum connectivity index is defined as

$$S(\zeta) = \prod_{rs \in E(\zeta)} \frac{1}{\sqrt{\Delta_r + \Delta_s}}$$

(2)

Estrada et al. [Estrada, Torres and Rodriguez (1998)] offered a degree based topological invariant of graph, called the atom-bond connectivity index. After that, he investigated the $\text{ABC}$ index of branched alkanes [Estrada (2008)].

**Definition 1.3** Consider a molecular graph $\zeta$, then the $\text{ABC}$ index is defined as

$$\text{ABC}(\zeta) = \prod_{rs \in E(\zeta)} \sqrt{\frac{\Delta_r + \Delta_s - 2}{\Delta_r \Delta_s}}$$

(3)

Vukicevic et al. [Vukicevic and Furtula (2009)] presented the geometric-arithmetic index.

**Definition 1.4** Consider a molecular graph $\zeta$, then the geometric-arithmetic index is defined as

$$\text{GA}(\zeta) = \prod_{rs \in E(\zeta)} \frac{2\sqrt{\Delta_r \Delta_s}}{\Delta_r + \Delta_s}$$

(4)

**Definition 1.5** Fajtlowicz [Fajtlowicz (1987)] proposed harmonic index defined as

$$H(\zeta) = \prod_{rs \in E(\zeta)} \frac{2}{\Delta_r + \Delta_s}$$

(5)

For simple connected graphs and trees Zhong [Zhong (2012)] computed the minimum and maximum values of harmonic index.

**Definition 1.6** The first and second Zagreb invariants [Gutman and Trinajstic (1972)] are the oldest vertex degree-based topological indices. These indices are defined as

$$M_1(\zeta) = \prod_{rs \in E(\zeta)} [\Delta_r + \Delta_s]$$

(6)
Computing Topological Invariants of Triangular Chandelier Lattice

\[ M_1(\zeta) = \prod_{r \in E(\zeta)} [\Delta_r \Delta_s] \]  \hspace{1cm} (7)

**Definition 1.7** Nikolic et al. [Nikolic, Kovacevic, Milcevic et al. (2003)] introduced modified Zagreb indices. The second modified Zagreb index is defined as

\[ M'_2(\zeta) = \prod_{r \in E(\zeta)} \left[ \frac{1}{\Delta_r \Delta_s} \right] \]  \hspace{1cm} (8)

After this, Hao [Hao (2011)] proposed the connection between the Zagreb and modified Zagreb indices and Hao [Hao (2012)] proposed the modified Zagreb indices of Nanotubes and Dendrimer Nanostars.

**Definition 1.8** Ranjini et al. [Ranjini, Lokesha and Usha (2013)] introduced a Re-defined version of Zagreb indices \( R_eM_1(\zeta) \), \( R_eM_2(\zeta) \) and \( R_eM_3(\zeta) \) defined as

\[ R_eM_1(\zeta) = \prod_{r \in E(\zeta)} \left[ \Delta_r + \Delta_s \right] \]  \hspace{1cm} (9)

\[ R_eM_2(\zeta) = \prod_{r \in E(\zeta)} \left[ \frac{\Delta_s \Delta_s}{\Delta_r + \Delta_s} \right] \]  \hspace{1cm} (10)

\[ R_eM_3(\zeta) = \prod_{r \in E(\zeta)} \Delta_s \Delta_s \left[ \Delta_r + \Delta_s \right] \]  \hspace{1cm} (11)

**Definition 1.9** Shirdel et al. [Shirdel, Rezapour and Sayadi (2013)] proposed a new vertex degree-based index named as a hyper-Zagreb index and defined as

\[ HM(\zeta) = \prod_{r \in E(\zeta)} [\Delta_r + \Delta_s]^2 \]  \hspace{1cm} (12)

Gao et al. [Gao, Siddiqui, Naeem et al. (2017)] computed the closed formula of hyper Zagreb index, first and second multiple Zagreb indices and first and second Zagreb polynomials of carbon graphite and crystal structure of cubic carbon.

**Definition 2.0** Furtula et al. [Furtula, Graovac, and Vukicevic (2010)] proposed a topological index named as augmented Zagreb index and defined as

\[ AZI(\zeta) = \prod_{r \in E(\zeta)} \left[ \frac{\Delta_r \Delta_s}{\Delta_r + \Delta_s - 2} \right]^3 \]  \hspace{1cm} (13)

Ali et al. [Ali, Bhatti and Raza (2017)] established inequalities between augmented Zagreb index and various other degree-based topological indices.

**Definition 2.1** Inspired by the first topological index Furtula et al. [Furtula and Gutman (2015)] established a new vertex degree-based topological index named as “Forgotten index” and defined as

\[ F(\zeta) = \prod_{r \in E(\zeta)} [\Delta^2_r + \Delta^2_s] \]  \hspace{1cm} (14)

Ajmal et al. [Ajmal, Nazeer, Khalid et al. (2017)] computed forgotten index and forgotten polynomial of line graphs of Firecracker graph, Banana tree graph, and subdivision graph.

**Definition 2.2** Vukicevic [Vukicevic (2010)] presented the symmetric division degree index and defined as
The objective of this article is to analyze the degree-based topological indices of triangular Chandelier lattice. Computing topological indices are one of the central problems in chemical graph theory and are being extensively used quantitative structure-activity relations and network topologies. For further interesting results see: Khalid et al. [Khalid and Idrees (2018); Idrees, Said, Rauf et al. (2017); Idrees, Hussain and Sadiq (2018); Qiong and Li (2019)].

2 Main results for triangular chandelier-lattice (TCL)

Lattices are important mathematical objects which have been successfully employed to study different models in biology, chemistry, and physics. For instance, many researchers have employed the Ising and Potts models [Akin (2018); Uguz and Akin (2010)] in conjunction with the Triangular chandelier lattice (Cayley tree-like lattice).

Chandelier lattices can be realized as simple connected undirected graphs \( \zeta := (V, E) \), where \( V \) denotes the set of nodes and \( E \) denotes the relation between the nodes. Let \( T^k = (V, E) \) be order \( k \) chandelier lattice with a root vertex \( x(0) \in V \), where each vertex has \( (k + 3) \) nearest neighbors with \( V \) as the set of vertices and the set of edges. It is clear that the root vertex \( x(0) \) has \( k \) the nearest neighbors (see Fig. 1). For \( k = 3 \), chandelier lattice is termed as triangular chandelier lattice, similarly for \( k = 4, 5, \ldots \), we have a terminology of rectangular lattice, pentagonal lattice and so forth. Our object of interest in the present study is triangular chandelier lattice (TCL). We compute several well-established degree-based topological indices of triangular chandelier-lattice (TCL).
Computing Topological Invariants of Triangular Chandelier Lattice

We use edge partition method to compute the topological indices of TCL. A TCL is said to be 1-chandelier if it comprises of a root vertex along with three neighboring vertices. A TCL is obtained from 1-chandelier by successively attaching 1-chandeliers with all vertices except the root vertex. Let \( c \) denotes the number of 1-chandeliers in a TCL. The graph of TCL is denoted by \( T_c \) has \( 4c+1 \) number of total vertices or nodes and \( 6c \) edges. Degree of root vertex is three and all the vertices in middle layers of TCL have degree 6 except the boundary layer vertices which again have degree three. So all edges of TCL has degrees of end vertices as \((3,3)\), \((3,6)\) and \((6,6)\). We denote each type of edges as \( E_{3,3} \), \( E_{3,6} \) and \( E_{6,6} \), respectively. The number of these types of edges is analyzed by considering different values of \( c \). These results are summarised in Tab. 1 below.

**Table 1**: Edge partition of TCL with respect to degrees of end vertices

| Edge of the form \( E_{\Delta_{r},\Delta_s} \) | Sum of edges |
|---------------------------------------------|-------------|
| \( E_{3,3} \)                             | \( 2c+1 \)  |
| \( E_{3,6} \)                             | \( 2c-4 \)  |
| \( E_{6,6} \)                             | \( 2c-5 \)  |

**Theorem 2.1**

Let \( T_c \) be triangular chandelier-lattice. Then

i. The Randic index of TCL is \( \chi(T_c) = \frac{2c-1}{2} + \frac{2c-4}{3\sqrt{2}} \).
ii. The sum connectivity index of TCL is \( S(T_c) = \frac{2c + 1}{\sqrt{6}} + \frac{2c - 4}{3} + \frac{2c - 5}{2\sqrt{3}} \).

iii. The atom bond connectivity index of TCL is

\[
ABC(T_c) = \frac{4c + 2}{3} + \frac{(2c - 4)\sqrt{7}}{3\sqrt{2}} + \frac{(2c - 5)\sqrt{10}}{6}.
\]

iv. The geometric-arithmetic index of TCL is \( GA(T_c) = 4(c - 1) + 4(c - 2)\sqrt{2} \).

v. The harmonic index of TCL is \( H(T_c) = \frac{13c}{9} - \frac{25}{18} \).

Proof: For the triangular chandelier-lattice \((TCL)\) graph \(T_c\) having \(c\) 1-chandeliers, we divide the edges of \(T_c\) into edges of the form \(E_{\Delta_s,\Delta_s}\) where \(rs\) is an edge. We develop the edges of the form \(E_{3,3}, E_{3,6}\) and \(E_{6,6}\). In Fig. 1, \(E_{3,3}, E_{3,6}\) and \(E_{6,6}\) are colored in blue, red and green respectively. The number of edges of these forms is given in Tab. 1.

i. From Eq. (1), we have

\[
\chi(T_c) = \prod_{rs \in E(T_c)} \frac{1}{\sqrt{\Delta_s \Delta_s}}
\]

\[
= \frac{(2c + 1)}{\sqrt{9}} + \frac{(2c - 4)}{\sqrt{18}} + \frac{(2c - 5)}{\sqrt{36}}
\]

\[
= \frac{(2c + 1)}{3} + \frac{(2c - 4)}{3\sqrt{2}} + \frac{(2c - 5)}{6}
\]

\[
\chi(T_c) = \frac{2c - 1}{2} + \frac{2c - 4}{3\sqrt{2}}.
\]

ii. From Eq. (2), we have

\[
S(T_c) = \prod_{rs \in E(T_c)} \frac{1}{\sqrt{\Delta_s + \Delta_s}}
\]

\[
= \frac{(2c + 1)}{\sqrt{6}} + \frac{(2c - 4)}{\sqrt{9}} + \frac{(2c - 5)}{\sqrt{12}}
\]

\[
= \frac{2c + 1}{\sqrt{6}} + \frac{2c - 4}{3} + \frac{2c - 5}{2\sqrt{3}}.
\]

iii. From Eq. (3), we have

\[
ABC(T_c) = \prod_{rs \in E(T_c)} \sqrt{\frac{\Delta_s + \Delta_s - 2}{\Delta_s \Delta_s}}
\]
Computing Topological Invariants of Triangular Chandelier Lattice

\[ ABC(T_c) = |E_{(3,3)}| \prod_{r \in E(c)} \sqrt{\frac{\Delta_r + \Delta_i - 2}{\Delta_r \Delta_i}} + |E_{(3,6)}| \prod_{r \in E(c)} \sqrt{\frac{\Delta_r + \Delta_i - 2}{\Delta_r \Delta_i}} + |E_{(6,6)}| \prod_{r \in E(c)} \sqrt{\frac{\Delta_r + \Delta_i - 2}{\Delta_r \Delta_i}} \]

\[ = (2c+1)\sqrt{\frac{3 + 3 - 2}{9}} + (2c - 4)\sqrt{\frac{3 + 6 - 2}{18}} + (2c - 5)\sqrt{\frac{6 + 6 - 2}{36}} \]

\[ = (2c+1)\frac{2}{3} + (2c - 4)\frac{\sqrt{7}}{3\sqrt{2}} + (2c - 5)\frac{\sqrt{10}}{6} \]

\[ ABC(T_c) = \frac{4c + 2}{3} + \frac{(2c - 4)\sqrt{7}}{3\sqrt{2}} + \frac{(2c - 5)\sqrt{10}}{6}. \]

iv. From Eq. (4), we have \( GA(\xi) = \prod_{r \in E(c)} \frac{2\sqrt{\Delta_r \Delta_i}}{\Delta_r \Delta_i} \)

\[ GA(T_c) = |E_{(3,3)}| \prod_{r \in E(c)} \frac{2\sqrt{\Delta_r \Delta_i}}{\Delta_r \Delta_i} + |E_{(3,6)}| \prod_{r \in E(c)} \frac{2\sqrt{\Delta_r \Delta_i}}{\Delta_r \Delta_i} + |E_{(6,6)}| \prod_{r \in E(c)} \frac{2\sqrt{\Delta_r \Delta_i}}{\Delta_r \Delta_i} \]

\[ = (2c+1)\frac{2\sqrt{9}}{6} + (2c - 4)\frac{2\sqrt{18}}{9} + (2c - 5)\frac{2\sqrt{36}}{12} \]

\[ = (2c+1) + (2c - 4)2\sqrt{2} + (2c - 5) \]

\[ = (4c - 4) + (2c - 4)2\sqrt{2} \]

\[ GA(T_c) = 4(c - 1) + 4(c - 2)\sqrt{2}. \]

v. From Eq. (5), we have \( H(\xi) = \prod_{r \in E(c)} \frac{2}{\Delta_r + \Delta_i} \)

\[ H(T_c) = |E_{(3,3)}| \prod_{r \in E(c)} \frac{2}{\Delta_r + \Delta_i} + |E_{(3,6)}| \prod_{r \in E(c)} \frac{2}{\Delta_r + \Delta_i} + |E_{(6,6)}| \prod_{r \in E(c)} \frac{2}{\Delta_r + \Delta_i} \]

\[ = (2c+1)\frac{2}{3+3} + (2c - 4)\frac{2}{3+6} + (2c - 5)\frac{2}{6+6} = \frac{(2c+1)}{3} + \frac{2(2c - 4)}{9} + \frac{(2c - 5)}{6} \]

\[ H(T_c) = \frac{13c}{9} - \frac{25}{18}. \]

Theorem 2.2

Let \( T_c \) be triangular chandelier-lattice. Then

i. The first Zagreb index of TCL is \( M_1(T_c) = 54c - 90. \)

ii. The second Zagreb index of TCL is \( M_2(T_c) = 126c - 243. \)

iii. The modified second Zagreb index of TCL is \( M_1^*(T_c) = \frac{1}{36}(15c - 9). \)

iv. The redefined version of first Zagreb index of TCL is \( R^c ZM_1(T_c) = 3(c - 1). \)
v. The redefined version of second Zagreb index of TCL is \( R_{ZM_2}(T_c) = 13c - \frac{19}{2} \).

vi. The redefined version of third Zagreb index of TCL is
\[
R_{ZM_3}(T_c) = 1296c - 2754.
\]

vii. The hyper Zagreb index of TCL is
\[
HM(T_c) = 522c - 1008.
\]

viii. The augmented Zagreb index of TCL is
\[
AZI(T_c) = 729\left(\frac{c}{32} + \frac{1}{64}\right) + \frac{11664}{343}(c - 2) + 5832\left(\frac{2c}{125} - \frac{1}{25}\right).
\]

ix. The forgotten index of TCL is
\[
F(T_c) = 270c - 522.
\]

x. The symmetric division degree index of TCL is
\[
SDD(T_c) = 13c - 18.
\]

Proof: Using edge partition given in Tab. 1, we deduce the following results

i. From Eq. (6), we know that \( M_1(\varsigma) = \prod_{rs \in E(\varsigma)} \left[ \Delta_r + \Delta_s \right] \).

\[
M_1(T_c) = \left[ E_{(3,3)} \prod_{rs \in E(\varsigma)} \left[ \Delta_r + \Delta_s \right] + E_{(3,6)} \prod_{rs \in E(\varsigma)} \left[ \Delta_r + \Delta_s \right] + E_{(6,6)} \prod_{rs \in E(\varsigma)} \left[ \Delta_r + \Delta_s \right] \right]
= \left(2c + 1\right)(3 + 3) + \left(2c - 4\right)(3 + 6) + \left(2c - 5\right)(6 + 6)
= \left(2c + 1\right)(6) + \left(2c - 4\right)(9) + \left(2c - 5\right)(12)
= 54c - 90.
\]

\[
M_2(T_c) = 126c - 243.
\]

ii. From Eq. (7), we know that \( M_2(\varsigma) = \prod_{rs \in E(\varsigma)} [\Delta_r, \Delta_s] \).

\[
M_2(T_c) = \left[ E_{(3,3)} \prod_{rs \in E(\varsigma)} [\Delta_r, \Delta_s] + E_{(3,6)} \prod_{rs \in E(\varsigma)} [\Delta_r, \Delta_s] + E_{(6,6)} \prod_{rs \in E(\varsigma)} [\Delta_r, \Delta_s] \right]
= \left(2c + 1\right)(3 \times 3) + \left(2c - 4\right)(3 \times 6) + \left(2c - 5\right)(6 \times 6)
= \left(2c + 1\right)(9) + \left(2c - 4\right)(18) + \left(2c - 5\right)(36)
= 126c - 243.
\]

iii. From Eq. (8), we know that \( M_3(\varsigma) = \prod_{rs \in E(\varsigma)} \frac{1}{[\Delta_r, \Delta_s]} \).

\[
M_3(T_c) = \left[ E_{(3,3)} \prod_{rs \in E(\varsigma)} \left[ \frac{1}{\Delta_r, \Delta_s} \right] + E_{(3,6)} \prod_{rs \in E(\varsigma)} \left[ \frac{1}{\Delta_r, \Delta_s} \right] + E_{(6,6)} \prod_{rs \in E(\varsigma)} \left[ \frac{1}{\Delta_r, \Delta_s} \right] \right]
= \left(2c + 1\right)\left[ \frac{1}{3 \times 3} \right] + \left(2c - 4\right)\left[ \frac{1}{3 \times 6} \right] + \left(2c - 5\right)\left[ \frac{1}{6 \times 6} \right]
= \left(2c + 1\right)\left[ \frac{1}{9} \right] + \left(2c - 4\right)\left[ \frac{1}{18} \right] + \left(2c - 5\right)\left[ \frac{1}{36} \right]
= \frac{8c + 4c + 3c}{36} + \frac{4 - 8 - 5}{36}
= \frac{3c - 3}{36}.
\]
M_1(T_c) = \frac{1}{36}(15c - 9).

iv. From Eq. (9), we know that \( R_c ZM_1(\xi) = \prod_{\epsilon \in E(\zeta)} \left[ \frac{\Delta_+ + \Delta_-}{\Delta_+ \Delta_-} \right] \).

\[
R_c ZM_1(T_c) = |E_{(3,3)}| \prod_{\epsilon \in E(\zeta)} \left[ \frac{\Delta_+ + \Delta_-}{\Delta_+ \Delta_-} \right] + |E_{(3,6)}| \prod_{\epsilon \in E(\zeta)} \left[ \frac{\Delta_+ + \Delta_-}{\Delta_+ \Delta_-} \right] + |E_{(6,6)}| \prod_{\epsilon \in E(\zeta)} \left[ \frac{\Delta_+ + \Delta_-}{\Delta_+ \Delta_-} \right]
\]

\[
= (2c + 1) \left( \frac{3 + 3}{3 \times 3} \right) + (2c - 4) \left( \frac{3 + 6}{3 \times 6} \right) + (2c - 5) \left( \frac{6 + 6}{6 \times 6} \right).
\]

\[
= (2c + 1) \left( \frac{6}{9} \right) + (2c - 4) \left( \frac{9}{18} \right) + (2c - 5) \left( \frac{12}{36} \right)
\]

\[
= \frac{4c}{3} + \frac{2}{3} c - 2 + \frac{2c}{3} - \frac{5}{3}
\]

\[
R_c ZM_1(T_c) = 3(c - 1).
\]

v. From Eq. (10), we know that \( R_c ZM_2(\xi) = \prod_{\epsilon \in E(\zeta)} \left[ \frac{\Delta_+ \Delta_-}{\Delta_+ + \Delta_-} \right] \).

\[
R_c ZM_2(T_c) = |E_{(3,3)}| \prod_{\epsilon \in E(\zeta)} \left[ \frac{\Delta_+ \Delta_-}{\Delta_+ + \Delta_-} \right] + |E_{(3,6)}| \prod_{\epsilon \in E(\zeta)} \left[ \frac{\Delta_+ \Delta_-}{\Delta_+ + \Delta_-} \right] + |E_{(6,6)}| \prod_{\epsilon \in E(\zeta)} \left[ \frac{\Delta_+ \Delta_-}{\Delta_+ + \Delta_-} \right]
\]

\[
= (2c + 1) \left( \frac{9}{6} \right) + (2c - 4) \left( \frac{18}{9} \right) + (2c - 5) \left( \frac{36}{12} \right)
\]

\[
R_c ZM_2(T_c) = 13c - \frac{19}{2}.
\]

vi. From Eq. (11), we know that \( R_c ZM_3(\xi) = \prod_{\epsilon \in E(\zeta)} \Delta_+ \Delta_- [\Delta_+ + \Delta_-] \).

\[
R_c ZM_3(T_c) = |E_{(3,3)}| \prod_{\epsilon \in E(\zeta)} \Delta_+ \Delta_- [\Delta_+ + \Delta_-] + |E_{(3,6)}| \prod_{\epsilon \in E(\zeta)} \Delta_+ \Delta_- [\Delta_+ + \Delta_-] + |E_{(6,6)}| \prod_{\epsilon \in E(\zeta)} \Delta_+ \Delta_- [\Delta_+ + \Delta_-]
\]

\[
= (2c + 1)(3 \times 3)(3 + 3) + (2c - 4)(3 \times 6)(3 + 6) + (2c - 5)(6 \times 6)(6 + 6)
\]

\[
= (2c + 1)(54) + (2c - 4)(162) + (2c - 5)(432)
\]

\[
R_c ZM_3(T_c) = 1296c - 2754.
\]

vii. From Eq. (12), we know that \( HM(\xi) = \prod_{\epsilon \in E(\zeta)} [\Delta_+ + \Delta_-]^2 \).
\( HM(T_c) = \left| E_{(3,3)} \left( \prod_{\eta \in E(\zeta)} \left[ \Delta_\eta + \Delta_\xi \right]^2 \right) \right| + \left| E_{(3,6)} \left( \prod_{\eta \in E(\zeta)} \left[ \Delta_\eta + \Delta_\iota \right]^2 \right) \right| + \left| E_{(6,6)} \left( \prod_{\eta \in E(\zeta)} \left[ \Delta_\eta + \Delta_\iota \right]^2 \right) \right| \\
= (2c+1)(3+3)^2 + (2c-4)(3+6)^2 + (2c-5)(6+6)^2 \\
= (2c+1)(6)^2 + (2c-4)(9)^2 + (2c-5)(12)^2 \\
HM(T_c) = 522c - 1008. \\
viii. From Eq. (13), we have \( AZI(\zeta) = \prod_{\eta \in E(\zeta)} \left[ \frac{\Delta_\eta}{\Delta_\eta + \Delta_\xi - 2} \right]^3. \) \\
\( AZI(T_c) = \left| E_{(3,3)} \left( \prod_{\eta \in E(\zeta)} \left[ \frac{\Delta_\eta}{\Delta_\eta + \Delta_\xi - 2} \right]^3 \right) \right| + \left| E_{(3,6)} \left( \prod_{\eta \in E(\zeta)} \left[ \frac{\Delta_\eta}{\Delta_\eta + \Delta_\iota - 2} \right]^3 \right) \right| + \left| E_{(6,6)} \left( \prod_{\eta \in E(\zeta)} \left[ \frac{\Delta_\eta}{\Delta_\eta + \Delta_\iota - 2} \right]^3 \right) \right| \\
= (2c+1) \left( \frac{3 \times 3}{3+3-2} \right)^3 + (2c-4) \left( \frac{3 \times 6}{3+6-2} \right)^3 + (2c-5) \left( \frac{6 \times 6}{6+6-2} \right)^3 \\
= (2c+1) \left( \frac{9}{4} \right)^3 + (2c-4) \left( \frac{18}{7} \right)^3 + (2c-5) \left( \frac{36}{10} \right)^3 \\
= (2c+1) \left( \frac{729}{64} \right) + (2c-4) \left( \frac{5832}{433} \right) + (2c-5) \left( \frac{46656}{1000} \right) \\
AZI(T_c) = 729 \left( \frac{c}{32} + \frac{1}{64} \right) + \frac{11664 \times (c-2) + 5832 \times \left( \frac{2c}{125} - \frac{1}{25} \right)}{343}. 
ix. From Eq. (14), we have \( F(\zeta) = \prod_{\eta \in E(\zeta)} \left[ \Delta_\eta^2 + \Delta_\xi^2 \right]. \) \\
\( F(T_c) = \left| E_{(3,3)} \left( \prod_{\eta \in E(\zeta)} \left[ \Delta_\eta^2 + \Delta_\xi^2 \right] \right) \right| + \left| E_{(3,6)} \left( \prod_{\eta \in E(\zeta)} \left[ \Delta_\eta^2 + \Delta_\iota^2 \right] \right) \right| + \left| E_{(6,6)} \left( \prod_{\eta \in E(\zeta)} \left[ \Delta_\eta^2 + \Delta_\iota^2 \right] \right) \right| \\
= (2c+1)(3^2 + 3^2) + (2c-4)(3^2 + 6^2) + (2c-5)(6^2 + 6^2) \\
= (2c+1)(18) + (2c-4)(45) + (2c-5)(72) \\
F(T_c) = 270c - 522. 
ix. From Eq. (15), we have \( SDD(\zeta) = \prod_{\eta \in E(\zeta)} \left[ \frac{\Delta_\eta}{\Delta_\eta + \Delta_\xi} \right]. \) \\
\( SDD(T_c) = \left| E_{(3,3)} \left( \prod_{\eta \in E(\zeta)} \left[ \frac{\Delta_\eta}{\Delta_\eta + \Delta_\xi} \right] \right) \right| + \left| E_{(3,6)} \left( \prod_{\eta \in E(\zeta)} \left[ \frac{\Delta_\eta}{\Delta_\eta + \Delta_\iota} \right] \right) \right| + \left| E_{(6,6)} \left( \prod_{\eta \in E(\zeta)} \left[ \frac{\Delta_\eta}{\Delta_\eta + \Delta_\iota} \right] \right) \right| \\
= (2c+1) \left[ \frac{3}{3} + \frac{3}{3} \right] + (2c-4) \left[ \frac{3}{6} + \frac{6}{3} \right] + (2c-5) \left[ \frac{6}{6} + \frac{6}{6} \right] \\
= (2c+1)[2] + (2c-4) \left[ \frac{1}{2} + \frac{2}{1} \right] + (2c-5)[2] \\
SDD(T_c) = 13c - 18. \)
Theorem 2.3

Consider a triangular chandelier-lattice \( T_c \). Then

i. The arithmetic-geometric index is \( AG_1(T_c) = (4c - 4) + \frac{3c}{\sqrt{2}} - \frac{6}{\sqrt{2}} \).

ii. The SK index is \( SK(T_c) = 27c - 45 \).

iii. The \( SK_1 \) index is \( SK_1(T_c) = 63c - 126 + \frac{9c}{2} \).

iv. The \( SK_2 \) index is \( SK_2(T_c) = 90c + \frac{81c}{2} - 252 \).

Proof: Partitioning edges according to Tab. 1, we have following results

i. From Eq. (16), we have

\[
AG_1(T_c) = \prod_{\alpha \in E(c)} \frac{\Delta_\alpha + \Delta_{\bar{\alpha}}}{\sqrt{2\Delta_\alpha \Delta_{\bar{\alpha}}}}
\]

\[
AG_1(T_c) = |E_{(3,3)}| \prod_{\alpha \in E(c)} \frac{\Delta_\alpha + \Delta_{\bar{\alpha}}}{\sqrt{2\Delta_\alpha \Delta_{\bar{\alpha}}}} + |E_{(3,6)}| \prod_{\alpha \in E(c)} \frac{\Delta_\alpha + \Delta_{\bar{\alpha}}}{\sqrt{2\Delta_\alpha \Delta_{\bar{\alpha}}}} + |E_{(6,6)}| \prod_{\alpha \in E(c)} \frac{\Delta_\alpha + \Delta_{\bar{\alpha}}}{\sqrt{2\Delta_\alpha \Delta_{\bar{\alpha}}}}
\]

\[
= (2c + 1) \frac{6}{2\sqrt{9}} + (2c - 4) \frac{9}{2\sqrt{18}} + (2c - 5) \frac{12}{2\sqrt{36}}
\]

\[
= (4c - 4) + \frac{6c}{2\sqrt{2}}
\]

\[
AG_1(T_c) = (4c - 4) + \frac{3c}{\sqrt{2}} - \frac{6}{\sqrt{2}}
\]

ii. From Eq. (17), we have

\[
SK(T_c) = \prod_{\alpha \in E(c)} \frac{\Delta_\alpha + \Delta_{\bar{\alpha}}}{2}
\]

\[
SK(T_c) = |E_{(3,3)}| \prod_{\alpha \in E(c)} \frac{\Delta_\alpha + \Delta_{\bar{\alpha}}}{2} + |E_{(3,6)}| \prod_{\alpha \in E(c)} \frac{\Delta_\alpha + \Delta_{\bar{\alpha}}}{2} + |E_{(6,6)}| \prod_{\alpha \in E(c)} \frac{\Delta_\alpha + \Delta_{\bar{\alpha}}}{2}
\]

\[
= (2c + 1) \frac{6}{2} + (2c - 4) \frac{9}{2} + (2c - 5) \frac{12}{2}
\]

\[
= 6c + 3 - 9c + 18c - 30
\]

\[
SK(T_c) = 27c - 45
\]

iii. From Eq. (18), we have

\[
SK_1(T_c) = \prod_{\alpha \in E(c)} \frac{\Delta_\alpha \Delta_{\bar{\alpha}}}{2}
\]

\[
SK_1(T_c) = |E_{(3,3)}| \prod_{\alpha \in E(c)} \frac{\Delta_\alpha \Delta_{\bar{\alpha}}}{2} + |E_{(3,6)}| \prod_{\alpha \in E(c)} \frac{\Delta_\alpha \Delta_{\bar{\alpha}}}{2} + |E_{(6,6)}| \prod_{\alpha \in E(c)} \frac{\Delta_\alpha \Delta_{\bar{\alpha}}}{2}
\]

\[
= (2c + 1) \frac{9}{2} + (2c - 4) \frac{18}{2} + (2c - 5) \frac{36}{2}
\]

\[
= 18c + 9 + 18c - 36 + 36c - 90
\]

\[
SK_1(T_c) = 63c - 126 + \frac{9}{2}
\]
iv. From Eq. (19), we have $SK_2(\xi) = \prod_{\nu \in \xi} \left( \frac{\Delta_\nu + \Delta_\nu}{2} \right)^2$.

$SK_2(T_c) = |E_{(3,3)}| \prod_{\nu \in \xi} \left( \frac{\Delta_\nu + \Delta_\nu}{2} \right)^2 + |E_{(3,6)}| \prod_{\nu \in \xi} \left( \frac{\Delta_\nu + \Delta_\nu}{2} \right)^2 + |E_{(6,6)}| \prod_{\nu \in \xi} \left( \frac{\Delta_\nu + \Delta_\nu}{2} \right)^2$

$= (2c + 1) \left( \frac{6}{2} \right)^2 + (2c - 4) \left( \frac{9}{2} \right)^2 + (2c - 5) \left( \frac{12}{2} \right)^2$

$= 18c + 9 + \frac{162c - 324}{4} + 72c - 180$

$SK_2(T_c) = 90c + \frac{81c}{2} - 252$.

3 Conclusion

In this paper, we investigate some well-known degree-based topological indices like Randic index, sum connectivity index, $ABC$ index, $GA$ index, first and second Zagreb indices, modified second Zagreb index, redefined version of first, second and third Zagreb indices, hyper Zagreb index, augmented Zagreb indices, forgotten index and symmetric division degree index are computed for triangular chandelier lattice. Moreover, some recently introduced degree-based indices like $SK$ index, $SK_1$ index, $SK_2$ index, and $AG_i$ index of TCL are computed. These results, in turn, can be of great use in QSAR/QSPR studies and analyzing the network topologies and scientific models.
