**Experimental**

**General.** All reactions and subsequent manipulations were performed under anaerobic and anhydrous conditions under an atmosphere of nitrogen. Hexanes, Et$_2$O, pentane, and toluene were dried using a Vacuum Atmospheres DRI-SOLV Solvent Purification system and stored over 3Å sieves for 24 h prior to use. THF was dried by distillation from sodium/benzophenone, and stored over 3Å sieves for 24 h prior to use. Benzene-$d_6$ and THF-$d_8$ were dried over 3Å molecular sieves for 24 h prior to use. $[\text{U} \{N(R)(\text{SiMe}_2\text{C}_2\text{H}_2)(\text{NR}_2)\}_2]^1$ $[\text{K(DME)}][\text{Th}\{N(R)(\text{SiMe}_2\text{C}_2\text{H}_2)\}_2(\text{NR}_2)\}_2]^2$ $[\text{Na(THF)}][\text{U}\{N(R)(\text{SiMe}_2\text{C}_2\text{H}_2)\}_2(\text{NR}_2)\}_3]^3$ and $[\text{Th}(\text{NR}_2)_3(\text{NH}_2)]^4$ ($R = \text{SiMe}_3$) were synthesized according to the previously reported procedures. All other reagents were purchased from commercial suppliers and used as received.

NMR spectra were recorded on an Agilent Technologies 400-MR DD2 400 MHz Spectrometer, a Varian UNITY INOVA 500 spectrometer, or a Varian Unity Inova 600 MHz spectrometer. $^1$H NMR spectra were referenced to external tetramethylsilane (TMS) using the residual protio solvent peaks as internal standards. $^{13}$C{$^1$H} NMR spectra were referenced indirectly with the $^1$H resonance of TMS at 0.0 ppm, according to IUPAC standard,\(^5\)\(^6\) using the residual solvent peaks as internal standards. IR spectra were recorded on a Nicolet 6700 FT-IR spectrometer. Electronic absorption spectra were recorded on a Shimadzu UV3600 UV-NIR Spectrometer. NIR-Visible data were fit using PseudoVoigt peaks in Excel. Elemental analyses were performed by the Micro-Analytical Facility at the University of California, Berkeley.

**EPR Spectroscopy.** A ca. 20 mg of crystalline powered sample of 4 was finely ground using a mortar and pestle in the glovebox. The ground sample was transferred into a quartz
tube (5 mm) and a small amount of glass wool was placed inside. The tube was placed under vacuum and then flame sealed with a propane/oxygen torch. Data were recorded at 4 K on a Bruker X-band EPR EMX Plus spectrometer equipped with a Bruker dual-mode cavity (ER 4116DM) for both parallel and perpendicular modes and an Oxford Instruments SPE62NT900 liquid helium quartz cryostat using an Oxford Instruments ITC503 temperature and gas flow controller. Microwave frequency = 9.646641 GHz; microwave power = 100.2 mW; number of scans = 10.

**SQUID Magnetometry.** A sample of 4 (18.2 mg) was sandwiched between two pieces of quartz wool (8.7 mg total) inside a 3 mm OD quartz tube and compressed with quartz rods to form a pellet. The ends of the tube were sealed with septa. The middle of the tube was wrapped with a Kimwipe and cooled with liquid nitrogen. One end of the tube was flame sealed with a propane/oxygen torch. The sealed end of the tube was immersed in liquid nitrogen and the other end of the tube was flame-sealed. Data was recorded at 6 T, 5 T, 4 T, 3 T, 2 T, and 1 T using a Quantum Designs MPMS magnetometer. Data were corrected for inherent diamagnetism of the compound using Pascal’s constants. The data showed the presence of a ferromagnetic impurity, and the appropriate correction was applied. The correction, 2 x 10\(^{-3}\) emu, is large relative to the magnetization of the sample at fields below 4 T. As a result, the high temperature data is not usable at low field. For this reason, only the data at 6, 5, and 4 T are used.

An additional complication of the SQUID measurement is the presence (or absence) of two pentane molecules of solvation, which are present in the crystal structure. Since we do not know whether these pentane molecules were lost while drying and preparing the magnetic susceptibility sample, the magnetic susceptibility of 4 was calculated both with
and without these pentane molecules. The fitting residual for the fit using the data that did not include the pentane molecules had an error that was half of that determined with the pentane molecules included. For this reason, we assume that the pentane molecules of solvation are not present in the susceptibility sample, and the results given here are based on this assumption.

Magnetic susceptibility of 4 and the energies of its excited states were fit using Condon 3.0, a crystal field theory analysis package. One issue with analyzing magnetic susceptibility data is the number of independent data present in the experiment, which may be estimated using van Vleck’s theory. The energy of a state, \( \psi_i \), in a magnetic field is given by eqn 1, where the superscripts are the orders of the energy using perturbation theory, H is the magnetic field, \( \mu_m \) is the magnetic moment operator, and the other symbols have their usual meanings. The magnetic susceptibility of a complex is given by eqn 2. To second order, each thermally occupied excited state in the susceptibility measurement contributes three data: \( E_i^{(0)} \), \( E_i^{(1)} \), and \( E_i^{(2)} \), and the ground state contributes two data since \( E_i^{(0)} \) is zero. As discussed in the main manuscript, one excited state becomes thermally occupied above 160 K, so the variable temperature magnetic susceptibility experiment contains five data. For this reason, the magnetic susceptibility is fit at only 5 temperatures, 10, 50, 100, 200, and 300 K.

\[
E_i = E_i^{(0)} + HE_i^{(1)} + H^2E_i^{(2)} + \cdots, \text{ where } E_i^{(1)} = \langle \psi_i | \mu_M | \psi_i \rangle \text{ and } E_i^{(2)} = \\
\sum_j \left| \langle \psi_i | \mu_M | \psi_j \rangle \right|^2 \frac{1}{E_i^{(0)} - E_i^{(0)}}
\]

\[
\chi = \frac{N}{p_i} \sum_i p_i \left( \frac{(E_i^{(1)})^2}{kT} - 2E_i^{(2)} \right), \text{ where } p_i = e^{-E_i^{(0)}/kT}
\]
X-ray Crystallography. Data for 1, 2, 3, and 4·2C5H12 were collected on a Bruker KAPPA APEX II diffractometer equipped with an APEX II CCD detector using a TRIUMPH monochromator with a Mo Kα X-ray source (α = 0.71073 Å). The crystals were mounted on a cryoloop under Paratone-N oil. Complex 1 and 3 were collected at 100(2) K and complexes 2 and 4·2C5H12 were collected at 110(2) K, using an Oxford nitrogen gas cryostream. Data were collected using ω scans with 0.5° frame widths. Frame exposures of 10, 20, 10, and 10 s were used for 1, 2, 3, and 4·2C5H12, respectively. Data collection and cell parameter determinations were conducted using the SMART program. Integration of the data frames and final cell parameter refinements were performed using SAINT software. Absorption corrections of the data were carried out using the multi-scan method SADABS. Subsequent calculations were carried out using SHELXTL. Structure determination was done using direct or Patterson methods and difference Fourier techniques. All hydrogen atom positions were idealized, and rode on the atom of attachment. Structure solution, refinement, graphics, and creation of publication materials were performed using SHELXTL or Olex2.

As a consequence of the crystal symmetry, the structure of 1 is disordered over two positions in a 50:50 ratio, such that there are two –NH2 groups and six –N{SiMe3}2 groups. Additionally, the N{SiMe3}2 groups exhibited some unresolved positional disorder. As a result, their carbon and silicon atoms were constrained with the SADI and EADP commands.

For 2, one N(SiMe3)2 group was found to be disordered over two positions in a 50:50 ratio. As a result, this N(SiMe3)2 group was constrained using SADI and EADP to all have the same temperature factors and geometries. In addition, the THF fragment ligated to the
K\(^+\) cation was also disordered over two positions in a 50:50 ratio. Its carbon and oxygen atoms were also constrained using SADI and EADP. Hydrogen atoms were not added to these disordered carbon atoms. Finally, the actinide position was modelled as a 50:50 mixture of Th and U using the EXYZ command.

For 3, the Et\(_2\)O fragment ligated to the K\(^+\) cation exhibited unresolved positional disorder. Its carbon atoms were constrained with the SADI, EADP, and DFIX commands.

For 4·2C\(_5\)H\(_{12}\), the two actinide positions were modelled as a 50:50 mixture of Th and U using the EXYZ command. Additionally, the two pentane solvates exhibited mild unresolved positional disorder. As a result, their carbon atoms were constrained with the SADI and EADP commands.

Further crystallographic details can be found in Table S1. Complexes 1-4·2C\(_5\)H\(_{12}\) have been deposited in the Cambridge Structural Database (1: CCDC 2108832; 2: CCDC 2108833; 3: CCDC 2108834; 4·2C\(_5\)H\(_{12}\): CCDC 2108835).

**Synthesis of [U(NR\(_2\))\(_3\)(NH\(_2\))] (R = SiMe\(_3\)) (1).** To a stirring, cold (-25 °C), orange solution of [U(N(R)(SiMe\(_2\))\(_2\))\(_2\)] (111.6 mg, 0.162 mmol) in THF (2 mL) was added a THF solution of NH\(_3\) (1.2 mL, 0.47 mmol, 0.4 M). The orange reaction mixture was allowed to warm to room temperature with stirring. After 1 h, the volatiles were removed \textit{in vacuo} to provide a dark brown-orange solid. The solid was then extracted into pentane (3 mL) and the resulting dark-brown, cloudy suspension was filtered through a Celite column supported on glass wool (0.5 × 2 cm). The filtrate was transferred to a 4 mL vial, which was placed inside a 20 mL scintillation vial and iso-octane (2 mL) was added to the outer vial. Storage of this two-vial system at -25 °C for 5 d resulted in the deposition of dark brown-orange blocks. The solid was isolated by decanting the supernatant and then dried
in vacuo to yield 1 (17.0 mg). The supernatant was transferred to a new 4 mL vial, which was placed inside a 20 mL scintillation vial and iso-octane (2 mL) was added to the outer vial. Storage of this two-vial system at -25 °C for 2 d resulted in the deposition of more dark brown-orange crystalline solid (62.3 mg). Total yield: 0.0793 g, 69% yield. Anal. Calcd for C_{18}H_{56}N_{4}Si_{6}U: C, 29.41; H, 7.68; N, 7.62. Found: C, 29.38; H, 7.38; N, 7.24. ¹H NMR (400 MHz, 25 °C, C₆D₆): δ -2.95 (s, SiCH₃). IR (KBr pellet, cm⁻¹): 432 (s), 525 (s), 609 (s), 613 (s), 864 (w), 1180 (s), 1246 (s), 1402 (m), 1504 (s), 1618 (m), 1919 (m), 2949 (w), 3336 (s, νNH).

Synthesis of [K(18-crown-6)(THF)₂][(NR₂)₃U(μ⁻N)Th(NR₂)₃] (2) and [(K(18-crown-6))[K(18-crown-6)(Et₂O)₂][(NR₂)₂U(μ⁻N)(µ⁻κ²-C,N-SiMe₂NR)Th(NR₂)₂]₂ (3). To a stirring, cold (-25 °C), dark brown solution of 1 (90.7 mg, 0.123 mmol) in THF (2 mL) was added a cold (-25 °C), pale-yellow solution of [K(DME)][Th{N[R(SiMe₂CH₂)]₂}₃(NR₂)] (103 mg, 0.123 mmol) and 18-crown-6 (33.2 mg, 0.126 mmol) in THF (4 mL). After 24 h, the solution was filtered through a Celite column supported on glass wool (0.5 × 2 cm), concentrated in vacuo to 2 mL, and layered with pentane (4 mL). Storage at -25 °C for 24 h resulted in the deposition of pale orange crystalline material, which was isolated by decanting the supernatant and then dried in vacuo to yield 2, which co-crystallized with small amounts of [(R₂N)₃Th(μ⁻N)Th(NR₂)₃] and [(R₂N)₃U⁺⁺(μ⁻N)U⁺⁺(NR₂)₃]. Total yield: 0.111 g, 48% yield. According to the -75 °C ¹H NMR spectrum, complexes 2, [(R₂N)₃U⁺⁺(μ⁻N)U⁺⁺(NR₂)₃], and [(R₂N)₃Th(μ⁻N)Th(NR₂)₃]⁻ are present in this sample in a ca. 20:3.3:1 ratio. Anal. Calcd for C₅₆H₁₄₈KN₇O₈Si₁₂ThU: C, 35.51; H, 7.88; N, 5.18. Found: C, 35.64; H, 7.74; N, 5.00. ¹H NMR (400 MHz, 25 °C, THF-d₈): δ 0.39 (s, SiCH₃, [(R₂N)₃Th(μ⁻N)Th(NR₂)₃]), 3.39 (s,
18-crown-6), 9.93 (br s, 54H, SiCH3, 2). 1H NMR (500 MHz, -10 °C, THF-d8): δ -44.66 (br s, SiCH3, [(R2N)3UIV(μ-N)UIV(NR2)3]), 0.37 (s, SiCH3, [(R2N)3Th(μ-N)Th(NR2)3]), 3.56 (s, 24H, 18-crown-6), 8.71 (br s, 27H, SiCH3, 2), 13.81 (br s, 27H, SiCH3, 2). 1H NMR (500 MHz, -75 °C, THF-d8): δ -98.95 (br s, SiCH3, 2), -62.34 (br s, SiCH3, 2), -61.27 (br s, SiCH3, [(R2N)3UIV(μ-N)UIV(NR2)3]), -48.34 (br s, SiCH3, 2), -37.78 (br s, SiCH3, [(R2N)3UIV(μ-N)UIV(NR2)3]), -34.80 (br s, SiCH3, 2), -14.82 (br s, SiCH3, [(R2N)3UIV(μ-N)UIV(NR2)3]), -2.49 (br s, SiCH3, 2), 3.57 (s, 24H, 18-crown-6), 9.77 (br s, SiCH3, 2), 13.43 (br s, SiCH3, 2), 14.59 (br s, SiCH3, 2), 18.51 (br s, SiCH3, [(R2N)3UIV(μ-N)UIV(NR2)3]), 23.39 (br s, SiCH3, 2). Three methyl resonances for 2 were not observed in the -75 °C spectrum, presumably because of paramagnetic broadening. UV-vis/NIR (THF, 0.5 mM, 25 °C, L mol⁻¹cm⁻¹): 326 (ε = 260), 370 nm (ε = 200). IR (KBr pellet, cm⁻¹): 594 (s), 656 (s), 744 (s), 843 (w), 930 (w), 1111 (m), 1250 (m), 1352 (s), 2895 (w), 2949 (w), 3448 (w).

The supernatant was dried *in vacuo* to yield a dark solid which was extracted with Et2O (4 mL). The resulting dark brown solution was filtered through a Celite column supported on glass wool (0.5 × 2 cm), concentrated *in vacuo* to 2 mL, and layered with pentane (4 mL). Storage at -25 °C for 2 weeks resulted in the deposition of golden brown crystalline material, which was isolated by decanting the supernatant and then dried *in vacuo* to yield 3, which co-crystallized with small amounts of [K(solvent)][(NR2)2U(μ-N)(μ-CH2SiMe2NR)U(NR2)2] and the known uranium bis(metallacycle), [K(DME)][U{N(R)(SiMe2CH2)}2(NR2)]. According to the 1H NMR spectrum, 3, [K(solvent)][(NR2)2U(μ-N)(μ-CH2SiMe2NR)U(NR2)2], and [K(solvent)][U{N(R)(SiMe2CH2)}2(NR2)] are present in an 21:3.5:1 ratio. Total yield:
0.070 g, 34% yield. Anal. Calcd for C_{46}H_{123}KN_{6}O_{7}Si_{10}ThU: C, 33.23; H, 7.46; N, 5.06. Found: C, 32.87; H, 7.32; N, 5.04.\(^1\)H NMR (400 MHz, 25 °C, THF-\(d_8\)): \(\delta\)-52.97 (br s, 6H, Si\(\text{Me}_2\text{CH}_2\), [(NR\(_2\))\(_2\)U(\(\mu\)-N)(\(\mu\)-\(\text{CH}_2\)Si\(\text{Me}_2\)NR)U(NR\(_2\))\(_2\)])\(^{-}\), -42.43 (br s, 6H, Si\(\text{Me}_2\text{CH}_2\), \(\text{3}\)), -36.44 (br s, 18H, N(SiMe\(_3\))\(_2\), [(N(R)(SiMe\(_2\)CH\(_2\))\(_2\)NR)U(NR\(_2\))\(_2\)])\(^{-}\), -8.90 (br s, 36H, NSiMe\(_3\), \(\text{3}\)), -5.49 (br s, 36H, NSiMe\(_3\), [(NR\(_2\))\(_2\)U(\(\mu\)-N)(\(\mu\)-\(\text{CH}_2\)SiMe\(_2\)NR)U(NR\(_2\))\(_2\)])\(^{-}\)), 3.31 (s, 18-crown-6), 5.45 (s, 9H, Me\(_2\)SiNSiMe\(_2\)CH\(_2\), [(NR\(_2\))\(_2\)U(\(\mu\)-N)(\(\mu\)-\(\text{CH}_2\)SiMe\(_2\)NR)U(NR\(_2\))\(_2\)])\(^{-}\), 5.95 (s, 9H, Me\(_2\)SiNSiMe\(_2\)CH\(_2\), \(\text{3}\)), -9.56 (br s, N(SiMe\(_3\))\(_2\), [(NR\(_2\))\(_2\)U(\(\mu\)-N)(\(\mu\)-\(\text{CH}_2\)SiMe\(_2\)NR)U(NR\(_2\))\(_2\)])\(^{-}\), 10.51 (br s, 36H, NSiCH\(_3\), \(\text{3}\)), 31.40 (br s, 6H, Si(CH\(_3\))\(_2\), [U\{N(R)(SiMe\(_2\)CH\(_2\))\(_2\)NR)U(NR\(_2\))\(_2\)])\(^{-}\), 38.82 (br s, 18H, N(SiMe\(_3\))\(_2\), [U\{N(R)(SiMe\(_2\)CH\(_2\))\(_2\)NR)U(NR\(_2\))\(_2\)])\(^{-}\)). The methylene resonance of \(\text{3}\) was not observed. IR (KBr pellet, cm\(^{-1}\)): 596 (s), 663 (s), 746 (sh w), 773 (w), 837 (w), 849 (w), 1109 (m), 1250 (m), 1352 (s), 1454 (m), 2895 (w), 2900 (w).

**Synthesis of [(NR\(_2\))\(_3\)UV(\(\mu\)-N)ThIV(NR\(_2\))\(_3\)] (4).** To a stirring, cold (-25 °C), pale orange solution of \(\text{2}\) (65.6 mg, 0.0346 mmol) in THF (2 mL) was added a cold (-25 °C), red-orange solution of I\(_2\) (4.80 mg, 0.0189 mmol) in THF (2 mL). After 2 min of stirring, the volatiles were removed in vacuo to provide a dark red-brown solid. The solid was then extracted into diethyl ether (3 mL) and the resulting dark red-brown solution was filtered through a Celite column supported on glass wool (0.5 × 2 cm). The solution was concentrated in vacuo and stored at -25 °C for 24 h, which resulted in the deposition of red-brown solid. The sample (supernatant and solid) was again dried in vacuo and extracted into 3 mL pentane and the resulting dark red-brown solution was filtered through a Celite column supported on glass wool (0.5 × 2 cm). (Note: the reaction mixture can be extracted directly into pentane (skipping the Et\(_2\)O extraction step); however, direct extraction into pentane...
results in slightly lower yields of 4). The filtrate was transferred to a 4 mL vial, which was placed inside a 20 mL scintillation vial and iso-octane (2 mL) was added to the outer vial. Storage of this two-vial system at -25 °C for 24 h resulted in the deposition of dark brown blocks. The crystalline solid was isolated by decanting the supernatant and then dried in vacuo to yield 4, which co-crystallized with a small amount of \([(\text{NR}_2)_3\text{U}^\text{V}(\mu-\text{N})\text{U}^\text{IV}(\text{NR}_2)_3)]^{17} (20.8 \text{ mg}, 42\% \text{ yield}). According to the -75 °C \(^1\text{H} \text{NMR spectrum, complexes } 4 \text{ and } [(\text{NR}_2)_3\text{U}^\text{V}(\mu-\text{N})\text{U}^\text{IV}(\text{NR}_2)_3] \text{ are present in a 12:1 ratio in this sample.}

\text{Anal. Calcd for } C_{36}H_{108}N_7Si_{12}ThU·2C_5H_{12}: C, 34.73; H, 8.36; N, 6.16. \text{ Anal. Calcd for } C_{36}H_{108}N_7Si_{12}ThU: C, 29.89; H, 7.53; N, 6.78. \text{ Found: C, 30.11; H, 7.97; N, 6.44.} \text{ \(^1\text{H} \text{NMR (400 MHz, } 25 °\text{C, THF-}d_8): } \delta -12.47 \text{ (br s, SiCH}_3\text{), 4.79 (br s, SiCH}_3\text{).} \text{ \(^1\text{H} \text{NMR (500 MHz, } -75 °\text{C, THF-}d_8): } \delta -39.77 \text{ (br s, SiCH}_3\text{, 4), -21.91 (br s, SiCH}_3\text{, 4), -19.57 (br s, SiCH}_3\text{, 4), -12.22 (br s, SiCH}_3\text{, 4), -10.71 (br s, SiCH}_3\text{, } [(\text{R}_2\text{N})_3\text{U}^\text{V}(\mu-\text{N})\text{U}^\text{IV}(\text{NR}_2)_3]), -9.11 (br s, SiCH}_3\text{, } [(\text{R}_2\text{N})_3\text{U}^\text{V}(\mu-\text{N})\text{U}^\text{IV}(\text{NR}_2)_3]), 4.67 \text{ (br s, SiCH}_3\text{, 4), 5.40 (br s, SiCH}_3\text{, 4), 7.16 (br s, SiCH}_3\text{, } [(\text{R}_2\text{N})_3\text{U}^\text{V}(\mu-\text{N})\text{U}^\text{IV}(\text{NR}_2)_3]), 10.56 \text{ (br s, SiCH}_3\text{, 4), 18.13 (br s, SiCH}_3\text{, 4), 29.13 (br s, SiCH}_3\text{, } [(\text{R}_2\text{N})_3\text{U}^\text{V}(\mu-\text{N})\text{U}^\text{IV}(\text{NR}_2)_3]), 47.78 \text{ (br s, SiCH}_3\text{, 4).} \text{ UV-vis/NIR (THF, } 10.44 \text{ mM, } 25 °\text{C, L mol}^{-1}\text{cm}^{-1}): 979 \text{ nm (} \varepsilon = 83.4\text{), 1221 (} \varepsilon = 56.5\text{), 1410 (} \varepsilon = 70.0\text{), 1599 (} \varepsilon = 69.2\text{).} \text{ IR (KBr pellet, cm}^{-1}: 609 \text{ (s), 654 (m), 725 (s), 773 (s), 849 (w), 879 (w), 912 (s), 1182 (s), 1248 (m), 1401 (m), 2899 (m), 2954 (m).}

**NMR scale reaction of \([\text{Na(THF)}][U\{N(R)(\text{SiMe}_2\text{CH}_2)\}_2(\text{NR})_2]\) with \([\text{Th(NR}_2)_3(\text{NH}_2)]\).**

An NMR tube fitted with a J-Young valve was charged with \([\text{Th(NR}_2)_3(\text{NH}_2)]\)^4 (14.6 mg, 0.02 mmol). A bright green THF-\(d_8\) (0.5 mL) solution of \([\text{Na(THF)}][U\{N(R)(\text{SiMe}_2\text{CH}_2)\}_2(\text{NR})_2]\)^3 (16.7 mg, 0.02 mmol) was then added to the
NMR tube, along with a colorless THF-$d_8$ (0.5 mL) solution of 18-crown-6 (5.4 mg, 0.02 mmol). A $^1$H NMR spectrum was then recorded (Figures S6-S7). $^1$H NMR (400 MHz, 25 °C, THF-$d_8$): δ -36.94 (s, 18H, N(SiMe$_3$)$_2$, [U{N(R)(SiMe$_2$CH$_2$)}$_2$(NR$_2$)])$^-$, -6.16 (br s, 6H, Si(CH$_3$)$_2$, [U{N(R)(SiMe$_2$CH$_2$)}$_2$(NR$_2$)])$^-$, 0.38 (s, 54H, [Th(NR$_2$)$_3$(NH$_2$)]), 2.07 (s, 24H, 18-crown-6), 4.06 (t, 2H, NH$_2$, [Th(NR$_2$)$_3$(NH$_2$)]), 31.88 (br s, 6H, Si(CH$_3$)$_2$, [U{N(R)(SiMe$_2$CH$_2$)}$_2$(NR$_2$)])$^-$, 39.47 (s, 18H, N(SiMe$_3$)$_2$, [U{N(R)(SiMe$_2$CH$_2$)}$_2$(NR$_2$)])$^-$). After 24 h, a $^1$H NMR spectrum was re-recorded, which revealed no change. The reaction mixture was then heated at 50 °C for 24 h, whereupon the solution turned an orange color.

The $^1$H NMR spectrum was re-recorded, which revealed an increase in the resonances assignable to HN(SiMe$_3$)$_2$, along with decreases in the resonances assigned to uranium bis(metallacycle) anion and thorium parent amide. However, no signals attributable to complex 2 were observed.

**NMR scale reaction of [Na(THF)]{U{N(R)(SiMe$_2$CH$_2$)}$_2$(NR)$_2$} with [U(NR)$_2$]$_3$(NH$_2$)** (I). An NMR tube fitted with a J-Young valve was charged with a bright green THF-$d_8$ (0.5 mL) solution of [Na(THF)]{U{N(R)(SiMe$_2$CH$_2$)}$_2$(NR)$_2$}$_3$ (13.8 mg, 0.017 mmol). [U(NR)$_2$]$_3$(NH$_2$) (12.6 mg, 0.017 mmol) was then added to the NMR tube, along with a colorless THF-$d_8$ (0.5 mL) solution of 18-crown-6 (4.4 mg, 0.017 mmol). A $^1$H NMR spectrum was then recorded (Figure S10). $^1$H NMR (400 MHz, 25 °C, THF-$d_8$): δ -36.73 (br s, 18H, N(SiMe$_3$)$_2$, [U{N(R)(SiMe$_2$CH$_2$)}$_2$(NR)$_2$])$^-$, -6.19 (br s, 6H, Si(CH$_3$)$_2$, [U{N(R)(SiMe$_2$CH$_2$)}$_2$(NR)$_2$])$^-$, -2.93 (br s, 54H, 1), 2.26 (s, 24H, 18-crown-6), 31.54 (br s, 6H, Si(CH$_3$)$_2$, [U{N(R)(SiMe$_2$CH$_2$)}$_2$(NR)$_2$])$^-$, 39.11 (s, 18H, N(SiMe$_3$)$_2$, [U{N(R)(SiMe$_2$CH$_2$)}$_2$(NR)$_2$])$^-$). After 36 h, a $^1$H NMR spectrum was re-recorded revealing the presence of two new broad peaks assignable to [(R$_2$N)$_3$U$^{IV}$($\mu$-N)U$^{IV}$(NR$_2$)$_3$]$^-$.
(400 MHz, 25 °C, THF-\textit{d}8): \delta -36.69 (br s, 18H, N(SiMe3)2, [U\{N(R)(SiMe2CH2)\}2(NR2)]^{-}), -25.36 (br s, 54H, SiCH3, [(R2N)3U^{IV}(\mu-N)U^{IV}(NR2)3]{)}^{-}), -6.17 (br s, 6H, Si(CH3)2, [U\{N(R)(SiMe2CH2)\}2(NR2)]^{-}), -2.91 (br s, 54H, 1), 2.26 (s, 24H, 18-crown-6), 22.13 (br s, 54H, SiCH3, [(R2N)3U^{IV}(\mu-N)U^{IV}(NR2)3]{)}^{-}), 31.58 (br s, 6H, Si(CH3)2, [U\{N(R)(SiMe2CH2)\}2(NR2)]^{-}), 39.14 (s, 18H, N(SiMe3)2, [U\{N(R)(SiMe2CH2)\}2(NR2)]^{-}).

**Figure S18.** Magnetic moment of 4 versus temperature with ferromagnetic impurity correction.

**Figure S19.** Magnetic susceptibility of 4 versus temperature without correction for a ferromagnetic impurity.
Figure S20. Magnetic moment of 4 versus temperature without correction for a ferromagnetic impurity.

As shown in Figure S18, the data at different fields are in good agreement once corrected for the presence of a ferromagnetic impurity. The ferromagnetic impurity is assumed to be iron, chromium, and nickel oxides from the surface of stainless steel equipment. The corrected data are shown as $\chi T$ vs $T$ in Figure 4 of the main manuscript. From 50 to 150 K, $\chi T$ is linear in $T$, which indicates that a single state (the ground state) is occupied over this temperature range. The deviation from linearity above 150 K is due to excited states becoming thermally populated. The deviation from linearity below 50 K is due to magnetization of 4 no longer being linear in $H$. This is a property of the magnetization vs field curve (the magnetization is no longer in the linear region of the Brillouin function). The $\chi T$ vs $T$ curve can be fit with a linear function between 50 and 150 K to determine the value of $\chi T$ extrapolated to 0 K ($\chi T_0$).
**Figure S21.** X-band EPR spectrum of a powdered sample of 4, recorded at 4 K.
Figure S22. Qualitative relationship between the f-orbitals in $T_d$ symmetry and in $C_{3v}$ symmetry. The $T_d$ molecule has 4 ligands (red dots) equidistant from the metal (black circle). In the $C_{3v}$ molecule, one of the ligands (the one above the metal) has been shorted to simulate a uranium nitride bond.
