Abstract: Some derivatives of dolastatin 16, a depsipeptide natural product first obtained from the sea hare Dolabella auricularia, were synthesized through second-generation synthesis of two unusual amino acids, dolaphenvaline and dolamethylleuine. The second-generation synthesis enabled derivatizations such as functionalization of the aromatic ring in dolaphenvaline. The derivatives of fragments and whole structures were evaluated for antifouling activity against the cypris larvae of Amphibalanus amphitrite. Small fragments inhibited the settlement of the cypris larvae at potent to moderate concentrations (EC₅₀ = 0.60–4.62 μg/mL), although dolastatin 16 with a substituent on the aromatic ring (24) was much less potent than dolastatin 16.

Keywords: natural product; antifouling; dolastatin 16; peptide; Amphibalanus amphitrite

1. Introduction

Dolastatin 16 (1, Figure 1), a depsipeptide natural product obtained from the sea hare Dolabella auricularia, was first reported by Pettit and co-workers in 1997 [1], and includes two unusual amino acids, dolaphenvaline and dolamethylleuine (Figure 1). Absolute configurations of the two amino acids were determined through X-ray crystallographic analysis in 2011 [2]. Pettit’s group showed strong growth inhibitions of human cancer cell lines such as NCI-H460, KM20L2 and SF-295 with 1 isolated from the natural sample. The same group also synthesized 1, and evaluated the anticancer activities of synthetic 1 to reveal it to be much less potent than the isolated compound [3].

Figure 1. Unusual amino acids in dolastatin 16 and previous total synthesis.
Highly powerful antifouling activity of 1 toward the larval settlement and metamorphosis of the barnacle *Amphibalanus amphitrite* was shown by Tan and co-workers in 2010 [4]. EC50 (50% effective concentration) and LC50 (50% lethal concentration) values of 1 are 0.003 and 20 μg/mL, respectively, suggesting it to be a promising lead compound for the development of a novel antifouling material. Organotin compounds such as tributyltin (TBT) or triphenyltin (TPT) were employed as antifouling compounds, resulting in serious pollution of the ocean environment [5–14]. Due to these negative influences, the use of organotin compounds was prohibited by the International Maritime Organization (IMO) in 2008 [15]. Alternative antifouling compounds, sea-nine 211 or copper pyrithione, have also been revealed to exert harmful influence on the ocean environment [16,17]. Thus, green alternative antifouling materials must be found to preserve the ocean environment. Toward this goal, many academic researchers have reported new antifouling compounds derived from natural products [18–30]. We have also engaged in the study of the antifouling natural products, 10-isocyano-4-cadinene [31–33], omaezallene [34–36] and dolastatin 16 (1) [37,38].

In 2017, we reported the total synthesis and antifouling activity of 1 and two intermediates, northern carboxylic acid fragment 2 and southern amine fragment 3, to reveal highly potent activity of 1 (EC50 < 0.03 μg/mL) and moderate to low activities of 2 and 3 (EC50 > 10 and 1.17 μg/mL, respectively) [38]. With these results in hand, we envisioned that additional compounds related to 1 would show further potential toward the development of a green antifouling material. For quick access to these compounds, second-generation synthesis of the two unusual amino acids was required because derivatization of the amino acids was difficult with the previous methodology [37]. In this paper, we describe our efforts to synthesize derivatives of dolaphenvaline and dolamethyline as well as some derivatives of 1. Evaluations of the antifouling activity toward the cypris larvae of the barnacle *A. amphitrite* were also conducted.

2. Results and Discussions

For the preparation of dolaphenvaline derivatives, the C-H activation reaction focused on amide 4, which was obtained from L-valine in 3 steps according to known method [39]. The synthetic details to obtain dolaphenvaline derivatives 7 and 8 are shown in Scheme 1. The installment of the aromatic ring on 4 was accomplished in a regio- and diastereoselective manner, confirmed by 1H NMR, in the presence of a palladium catalyst and silver salt without solvent to give amide 5 [39] (see Supplementary Material Figures S1–S14 for NMR spectra). This high diastereoselectivity was rationalized by steric repulsion between the methyl group and the phthaloyl group in the transition state shown in the brackets. Acidic hydrolysis, followed by protection with a Boc group, afforded Boc-dolaphenvaline 7, previously reported by us [37]. First synthesis of 8, having a p-hydroxy group on the benzene ring, was also possible through the same pathway when p-siloxyiodobenzene was employed in the C-H activation step.

![Scheme 1. Syntheses of dolaphenvaline derivatives.](image-url)
Boc-dolamethylleuine 15 was accessed through a [2+2] addition reaction in the presence of organocatalyst 11 as the key step to construct two contiguous asymmetric carbon centers, as shown in Scheme 2 [40]. The reaction between isovaleraldehyde (9) and propionyl chloride (10) at $-40^\circ$C provided volatile lactone 12 in a highly stereoselective manner (minor diastereomer could not be observed in crude $^1$H NMR), which was next converted into carboxylic acid 13 by the treatment with NaN$_3$ and NH$_4$Cl in DMSO. Before the Staudinger reaction, i.e., the conversion of the azide group to an amino group, benzyl ester formation was necessary since the Staudinger reaction of 13 resulted in low yield (<20%). The Staudinger reaction with benzyl ester 14 and subsequent protection with Boc$_2$O proceeded smoothly to give 15 in 59% yield, previously reported by us (specific rotation of the current compound was completely identical with that of the previous one).

Scheme 2. Synthesis of dolamethylleuine derivatives.

With the effective synthetic route to the two unusual amino acids established, we launched the preparation of dolastatin 16 derivatives according to the previous report [38]. Condensation between 8 and proline benzyl ester gave amide 16 in which the hydroxy group was then acetylated under standard conditions (Scheme 3). After hydrogenolysis of peptide 17, coupling of resulting 18 with dolamethylleuine benzyl ester 19 gave peptide 20. In order to proceed with structure-activity relationship studies, 20 was converted into benzyl ether 22 in two steps through methanolysis of the acetate, followed by treatment of the resultant peptide 21 with BnBr, K$_2$CO$_3$ and KI.

Scheme 3. Synthesis of southern fragments. EDCI, 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride; DMAP, 4-dimethylaminopyridine; DMTMM, 4-(4,6-dimethoxy-1,3,5-triazin-2-yl)-4-methylmorpholinium tetrafluoroborate.
Functionalized southern fragment 20 was further coupled with the northern fragment 2 to give peptide 23 for the macrolactonization reaction (Scheme 4). In the previous studies by Pettit and us, Shina’s conditions by 2-methyl-6-nitrobenzoic anhydride (MNBA) [41–43] provided a low yield of 1 (22% by Pettit, 31% by us). In order to improve the reaction yield, extensive optimizations were performed, eventually finding that Mukaiyama’s conditions using 2-chloro-1-methylpyridinium iodide (CMPI) [44] gave the target compound 24 in 64% yield over 2 steps (deprotection of benzyl groups and macrolactonization).

Scheme 4. Synthesis of dolastatin 16 derivative. DMTMM, 4-(4,6-dimethoxy-1,3,5-triazin-2-yl)-4-methylmorpholinium tetrafluoroborate; CMPI, 2-chloro-1-methylpyridinium iodide.

Additional syntheses of northern fragments, benzyl ester 25 and benzyl ether 29, were carried out as shown in Scheme 5. Benzyl ester 25 was prepared by esterification reaction of 2 in the presence of 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride (EDCI). For the synthesis of 29, installation of a benzyl group to the prolinol moiety at the stage of 26 was essential because direct etherification into 29 from the corresponding alcohol resulted in a complex mixture. The subsequent condensation reaction between carboxylic acid 28 and the amine obtained by removal of the Boc group of 27 [45] proceeded cleanly to give 29 in good yield.

Scheme 5. Synthesis of northern fragments. EDCI, 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride; DMAP, 4-dimethylaminopyridine; PyBrop: bromotripyrrolidinophosphonium hexafluorophosphate.
The antifouling activities of synthetic samples were evaluated as EC$_{50}$ values against the cypris larvae of *A. amphitrite* by exposure of each compound for 48 h (Table 1, Figure 2). For comparison, EC$_{50}$ values for the previous compounds 1–3 are also shown in the table. Installation of a functional group on the aromatic ring of 1 decreased the antifouling activity to moderate (24, EC$_{50}$ = 1.74 µg/mL). We next investigated the biological activity of the fragments. All samples showed antifouling profiles with low toxicity against cypris larvae of the barnacle *A. amphitrite*. Among the fragments examined, compounds Boc-3, 21, and 25 were more active with EC$_{50}$ values below 1 µg/mL. Protection of the southern fragment with a Boc group improved the EC$_{50}$ value (Boc-3, EC$_{50}$ = 0.79 µg/mL). We believe this improvement is due to its lower polarity than 3 (EC$_{50}$ = 1.17 µg/mL) by protection of the amino group. It was revealed that functional groups at the p-position of the aromatic ring affected the antifouling activity of the southern fragment: a hydroxy group (EC$_{50}$ = 0.79 µg/mL) had a slightly decreased EC$_{50}$ value compared to Boc-3, but a benzyloxy group (22, EC$_{50}$ = 4.62 µg/mL) dramatically reduced the antifouling activities to 4.62 µg/mL. These results indicate that steric bulkiness at this position affected the activity. A benzyl ester of the northern fragment (25, EC$_{50}$ = 0.90 µg/mL) showed much higher potency than 2 (EC$_{50}$ > 10 µg/mL). Again, the less polar fragment was more active than the corresponding more polar one. Interestingly, a benzyl ether (29, EC$_{50}$ = 3.27 µg/mL) weakened the antifouling activity, suggesting the importance of the lactate moiety or the presence of a carbonyl group for the northern fragment.

**Table 1.** Antifouling activities of synthetic samples against cypris larvae of *A. amphitrite*.

| Compound | EC$_{50}$ (µg/mL) $^1$ | EC$_{50}$ (µM) | LC$_{50}$ (µg/mL) $^2$ |
|----------|----------------------|---------------|----------------------|
| 1 $^3$   | <0.03                | <0.03         | >10                  |
| 2 $^3$   | >10                  | >17.0         | >10                  |
| 3 $^3$   | 1.17                 | 1.92          | >10                  |
| 24       | 1.74                 | 1.86          | >10                  |
| Boc-3    | 0.79                 | 1.30          | >10                  |
| 21       | 0.60                 | 0.96          | >10                  |
| 22       | 4.62                 | 6.47          | >10                  |
| 25       | 0.90                 | 1.32          | >10                  |
| 29       | 3.27                 | 6.52          | >10                  |
| CuSO$_4$ $^3$ | 0.10             | 0.63          | >10                  |

$^1$ EC$_{50}$ (50% effective concentration), $^2$ LC$_{50}$ (50% lethal concentration), $^3$ according to [38].

**Figure 2.** Compounds for evaluation of antifouling activity.
3. Materials and Methods

3.1. General Methods

The IR spectra were recorded on a JASCO FTIR-4100 Type A spectrometer (JASCO corporation, Tokyo, Japan) using a NaCl cell. The $^1$H NMR and $^{13}$C NMR spectra were recorded using a JNM-EX 400 (400 MHz and 100 MHz) spectrometer (JEOL Ltd., Tokyo, Japan). Chemical shifts were reported in ppm relative to CHCl$_3$ (δ = 7.26) and $^{13}$C NMR (δ = 77.0) and CHD$_3$OH in CD$_3$OD for $^1$H NMR (δ = 3.35) and $^{13}$C NMR (δ = 49.3). Splitting patterns for $^1$H NMR were designated as “s, d, t, q, m, dt, dd, and td”. These symbols indicate “singlet, doublet, triplet, quartet, multiplet, doublettriplet, doubledoublet, and tripleddoublet”, respectively. All commercially obtained reagents were employed as received. Analytical TLC was carried out using pre-coated silica gel plates (Wako TLC Silicagel 70F$_{254}$, FUJIFILM Wako Pure Chemical Corporation, Osaka, Japan). Wakogel 60N 63-212 μm was used for column chromatography.

3.2. Phth-Dpv-NH(8-quinoline) 5

Amide 4 (1.00 g, 2.67 mmol), AgOAc (891 mg, 5.36 mmol), Pd(OAc)$_2$ (118 mg, 0.540 mmol) and iodobenzene (0.600 mL, 5.36 mmol) were added to a flask. The mixture was stirred for 6 h at 90 °C under Ar atmosphere. After being cooled to room temperature, the reaction was diluted with AcOEt and then filtered through a pad of celite wash with AcOEt and concentrated in vacuo. The residue was purified by silica gel column chromatography (Hexane:EtOAc = 90:10 then 80:20) to afford 5 (840 mg, 70%) as a white solid: $[\alpha]_D^{25} = 36.1$ (c 0.18, CHCl$_3$); IR (neat) 3650, 2924, 1717, 1530, 1327, 1261, 1070, 792, 721 cm$^{-1}$; $^1$H NMR (400 MHz, CDCl$_3$) δ 8.78 (1H, t, $J = 10.7$ Hz), 8.77 (1H, t, $J = 13.7$ Hz), 8.86 (1H, d, $J = 4.4$ Hz), 8.86 (1H, d, $J = 4.4$ Hz), 10.68 (1H, brs); $^{13}$C NMR (CDCl$_3$, 100 MHz) δ 16.9, 34.6, 40.8, 61.7, 117.3, 121.9, 122.3, 124.0, 127.5, 128.6, 129.7, 131.8, 134.1, 134.5, 136.5, 139.0, 139.8, 148.8, 166.3; HRMS (ESI) m/z: [M + Na]$^+$; Calcd for C$_{28}$H$_{23}$N$_3$O$_3$Na 472.1631; Found 472.1632.

3.3. Boc-Dpv-OH 7

Amide 5 (148 mg, 0.330 mmol) was dissolved in 3.0 mL of aqueous HCl (6.0 M) and refluxed for 24 h and then cooled to room temperature. The reaction mixture was concentrated in vacuo. To a solution of compound in THF (3.0 mL), saturated NaHCO$_3$ and refluxed for 24 h and then cooled to room temperature. The reaction mixture was diluted with EtOAc, washed with HCl (0.10 M) and brine, dried over Na$_2$SO$_4$. The residue was purified using silica gel column chromatography (Hexane:EtOAc = 50:50) to afford 7 (45.7 mg, 47%) as a colorless oil:

3.4. Phth-Dpv(OTBS)-NH(8-quinoline) 6

Amide 4 (840 mg, 2.24 mmol), AgOAc (750 mg, 4.48 mmol), Pd(OAc)$_2$ (0.100 g, 0.450 mmol), and p-iodophenyl tert-butyldimethylsilyl ether (3.00 g, 8.97 mmol) were added to a flask. The mixture was stirred at 90 °C under Ar atmosphere. After being cooled to room temperature, the reaction was diluted with AcOEt and then filtered through a pad of celite wash with AcOEt and concentrated in vacuo. The residue was purified by silica gel column chromatography (Hexane:EtOAc = 90:10 then 80:20) to afford 6 (590 mg, 1.02 mmol, 86%) as a white solid: $[\alpha]_D^{25} = 56.7$ (c 0.45, CHCl$_3$); IR (neat) 2929, 1772, 1718, 1530, 1509, 1382, 1260, 0.45, CHCl$_3$; $^{1}$H NMR (400 MHz, CDCl$_3$) δ 1.21 (t, $J = 7.3$ Hz), 0.97 (9H, s), 2.38 (1H, dd, $J = 13.7$, 10.3 Hz), 3.17 (1H, dd, $J = 13.7$, 3.4 Hz), 3.33–3.35 (1H, m), 4.88 (1H, d, $J = 10.7$ Hz), 6.74 (2H, d, $J = 7.6$ Hz), 7.16 (2H, d, $J = 7.6$ Hz), 7.43 (1H, dd, $J = 8.3$, 4.4 Hz), 7.51 (2H, d, $J = 3.4$ Hz), 7.71 (2H, dd, $J = 5.4$, 2.9 Hz), 7.87 (2H, dd, $J = 5.4$, 2.9 Hz), 8.13 (1H, dd, $J = 8.3$, 1.5 Hz), 8.78 (1H, dd, $J = 5.4$, 3.4 Hz), 8.84 (1H, dd, $J = 4.4$, 1.5 Hz), 10.68 (1H, brs); $^{13}$C NMR (100 MHz, CDCl$_3$)
1419, 893, 852, 663 cm$^{-1}$; HRMS (ESI) $m/z$: [M + Na]$^+$; Calcd for C$_{13}$H$_{17}$N$_2$O$_3$SiNa 602.2447; Found 602.2446.

3.5. Benzocysteine (OH)-OH 8

Amide 6 (290 mg, 0.500 mmol) was dissolved in 14 mL of aqueous HCl (6.0 M) was heated at 130 $^\circ$C in a sealed tube for 24 h and then cooled to room temperature. The reaction mixture was concentrated in vacuo. To a solution of compound in THF (2.5 mL), saturated NaHCO$_3$ (2.5 mL) was added Boc$_2$O (0.20 mL, 1.00 mmol) at 0 $^\circ$C. The mixture was stirred at room temperature for 2 h. The solution was diluted with EtOAc, washed with HCl (0.1 M) and brine, dried over Na$_2$SO$_4$. The residue was purified using silica gel column chromatography (Hexane:EtOAc = 50:50) to afford 8 (120 mg, 0.387 mmol, 77%) as a colorless oil: $[\alpha]_{D}^{25b} +3.5$ (c 0.49, CH$_3$OH); IR (neat) 3748, 2976, 1702, 1514, 1398, 1244, 1160, 1073, 774, 641 cm$^{-1}$; $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 0.86 (3H, brs), 1.47 (9H, s), 2.33–2.43 (1H, m), 2.62–2.66 (1H, m), 4.34 (1H, brs), 5.10 (1H, d, $J$ = 9.3 Hz), 6.73 (2H, d, $J$ = 7.8 Hz), 6.98 (2H, d, $J$ = 7.8 Hz); $^{13}$C NMR (100 MHz, CD$_2$OD) $\delta$ 4.7, 28.4, 38.6, 39.8, 57.7, 80.3, 115.9, 119.3, 129.6, 130.8, 131.8, 156.5, 171.0; HRMS (ESI) $m/z$: [M + Na]$^+$; Calcd for C$_{18}$H$_{23}$NO$_5$Na 332.1471; Found 332.1468.

3.6. N$_2$-Dml-OH 13

Lithium perchlorate (2.12 g, 20.0 mmol), was dissolved in 10 mL anhydrous Et$_2$O. TMS-quicine I (400 mg, 1.00 mmol) and CH$_2$Cl$_2$ (20 mL) were added to this solution which was then cooled to $-40$ $^\circ$C. DIEA (4.36 mL, 25.0 mmol) and isobutyraldehyde (0.920 mL, 0.920 mL, 10.0 mmol) were then added to the solution. Propionyl chloride (1.74 mL, 20.0 mmol) was dissolved in CH$_2$Cl$_2$ (5.0 mL). The solution of propionyl chloride was then added dropwise to the reaction over the course of 3 h. Upon completion of the addition, the reaction was allowed to stir at $-40$ $^\circ$C for 16 h. After this time, Et$_2$O was added to the solution. The resulting mixture was filtered through a pad of celite and washed with Et$_2$O. The solution was concentrated at a light vacuum and diluted with CH$_2$Cl$_2$. The solution was washed with sat. NH$_4$Cl and brine, dried over Na$_2$SO$_4$ and concentrated at a light vacuum to give crude lactone, which was used in the next step without further purification.

To a solution of the crude lactone in THF (2.5 mL) were added BnBr (0.0200 mL, 0.180 mmol), NaH (4.00 mg, 0.160 mmol) at 0 $^\circ$C. The mixture was stirred at room temperature for overnight, quenched with saturated NaHCO$_3$, heated at 50 $^\circ$C for 16 h. After this time, Et$_2$O was added to the solution. The mixture was stirred at room temperature for 16 h. After this time, Et$_2$O was added to the solution. The mixture was stirred at room temperature for overnight, quenched with saturated NaHCO$_3$, extracted with EtOAc, washed with brine, dried over Na$_2$SO$_4$, and concentrated in vacuo. The crude product was purified using silica gel column chromatography (Hexane:EtOAc = 20:80) to afford 14 (718 mg, 4.20 mmol, 42%) as a colorless oil: $[\alpha]_{D}^{20} +8.1$ (c 0.92, CHCl$_3$); IR (neat) 2967, 2878, 2157, 2106, 1713, 1419, 893, 852, 663 cm$^{-1}$; $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 0.89 (3H, d, $J$ = 6.8 Hz), 1.08 (3H, d, $J$ = 6.8 Hz), 1.23 (3H, d, $J$ = 7.3 Hz), 1.95–2.05 (1H, m), 2.61–2.68 (1H, m), 3.42 (1H, dd, $J$ = 8.8, 4.4 Hz); $^{13}$C NMR (100 MHz, CDCl$_3$) $\delta$ 14.5, 15.7, 20.5, 29.5, 42.4, 70.6, 180.4; HRMS (ESI) $m/z$: [M + Na]$^+$; Calcd for C$_{18}$H$_{23}$NO$_5$Na 194.0909; Found 194.0910.

3.7. N$_2$-Dml-OBn 14

To a solution of 13 (20.0 mg, 0.120 mmol) in DMF (0.60 mL) were added BnBr (0.0200 mL, 0.180 mmol), NaH (4.00 mg, 0.160 mmol) at 0 $^\circ$C under Atmosphere. The mixture was stirred at room temperature for overnight, quenched with saturated NaHCO$_3$, extracted with EtOAc, washed with brine, dried over Na$_2$SO$_4$, and concentrated in vacuo. The crude product was purified using silica gel column chromatography (Hexane:EtOAc = 20:80) to afford 14 (20.0 mg, 0.0800 mmol, 64%) as a colorless oil: $[\alpha]_{D}^{18} +19.8$ (c 0.68, CHCl$_3$); IR (neat) 2966, 2103, 1734, 1456, 1366, 1341, 1261, 1171, 1147, 1027, 978, 907, 751, 697 cm$^{-1}$; $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 0.86 (3H, d, $J$ = 6.8 Hz), 1.05 (3H, d, $J$ = 6.8 Hz), 1.17 (3H, d, $J$ = 7.3 Hz), 1.93–1.99 (1H, m), 2.62–2.69 (1H, m), 3.45 (1H, dd, $J$ = 9.3, 3.9 Hz), 5.17 (1H, s), 7.25–7.37 (5H, m); $^{13}$C NMR (100 MHz, CDCl$_3$) $\delta$14.5, 15.5, 20.6, 29.3, 42.7, 66.6, 70.8, 128.27,
128.28, 128.5, 135.7, 174.4; HRMS (ESI) m/z: [M + Na]+; Calcd for C_{14}H_{19}N_{3}O_{2}Na 284.1375; Found 284.1377.

3.8. Boc-Dml-OBn 15

To a solution of 14 (1.52 g, 5.82 mmol) in THF/water (10:1 v/v, 29 mL) were added Ph3P (4.60 g, 17.4 mmol) at 60 °C for 2 h. The reaction solution was cooled to room temperature, concentrated under reduced pressure, and the residue obtained was dissolved in THF/NaHCO3 (1:1 v/v, 17 mL). Cool the solution to 0 °C, add Boc2O (1.60 mL, 6.80 mmol), return to ambient temperature and stir overnight. Extracted with EtOAc, washed with brine, dried over Na2SO4, and concentrated in vacuo. The crude product was purified using silica gel column chromatography (Hexane:EtOAc = 50:50) to afford the dipeptide 15 (1.09 g, 3.40 mmol, 59%) as a colorless oil: [α]D^{25} +18.1 (c 0.23, CHCl3); IR (neat) 3750, 2974, 2876, 1716, 1507, 1166, 772, 669 cm\(^{-1}\); \(^1\)H NMR (400 MHz, CDCl3) δ 0.89 (3H, d, J = 6.8 Hz), 0.91 (3H, d, J = 6.8 Hz), 1.22 (3H, d, J = 6.8 Hz), 1.43 (9H, s), 1.61 (1H, sep, J = 6.8 Hz), 2.80-2.87 (1H, m), 3.38 (1H, ddd, J = 10.1, 7.3, 4.4 Hz), 5.10 (1H, d, J = 15.6 Hz), 5.11 (1H, d, J = 15.6 Hz), 5.24 (1H, d, J = 10.2 Hz), 7.32-7.39 (5H, m); \(^13\)C NMR (100 MHz, CDCl3) δ 15.7, 19.2, 19.9, 28.4, 31.8, 40.5, 58.6, 66.3, 78.8, 128.1, 128.3, 128.6, 135.7, 156.4, 175.6; HRMS (ESI) m/z: [M + Na]+ Calcd for C_{19}H_{29}NO_{4}Na 358.1989; Found 358.1992.

3.9. Boc-Dpv(OH)-Pro-OBn 16

To a solution of 8 (850 mg, 2.70 mmol) and L-proline benzylester (670 mg, 3.24 mmol) in CH2CN (13.5 mL) was added EDCl (620 mg, 3.24 mmol), HOAt (440 mg, 3.24 mmol) and NaHCO3 (230 mg, 2.70 mmol) under Ar atmosphere. After 24 h of stirring at room temperature, the mixture was concentrated in vacuo. The residue was purified using silica gel column chromatography (Hexane:EtOAc = 50:50) to afford the dipeptide 16 (1.02 g, 2.05 mmol, 76%) as colorless oil: [α]D^{25} -35.4 (c 1.20, CHCl3); IR (neat) 3326, 2927, 2931, 1744, 1715, 1637, 1514, 1260, 1168, 1016, 753 cm\(^{-1}\); \(^1\)H NMR (400 MHz, CDCl3) δ 0.85 (3H, d, J = 6.8 Hz), 1.45 (9H, s), 1.82-1.89 (2H, m), 2.01-2.02 (1H, m), 2.13-2.17 (1H, m), 2.35 (1H, dd, J = 13.7, 7.3 Hz), 2.67 (1H, dd, J = 13.7, 6.8 Hz), 3.18-3.24 (1H, m), 3.30-3.32 (1H, m), 4.41 (1H, d, J = 6.3 Hz), 4.55 (1H, dd, J = 8.3, 4.4 Hz), 5.13 (2H, s), 5.30 (1H, d, J = 9.8 Hz), 5.91 (1H, brs), 6.74 (2H, d, J = 8.3 Hz), 7.05 (2H, d, J = 8.3 Hz), 7.28-7.33 (5H, m); \(^13\)C NMR (100 MHz, CDCl3) δ 14.2, 15.3, 24.9, 28.4, 28.9, 36.3, 38.4, 39.1, 46.5, 58.8, 65.9, 66.9, 115.1, 128.1, 128.3, 128.5, 130.3, 132.2, 135.6, 154.2, 171.9; HRMS (ESI) m/z: [M + Na]+ Calcd for C_{29}H_{36}N_{2}O_{4}Na 519.2465; Found 519.2466.

3.10. Boc-Dpv(OAc)-Pro-OBn 17

To a solution of 16 (520 mg, 1.05 mmol) in CH2Cl2 (5.25 mL) was added Ac2O (120 µL, 1.26 mmol) and DMAP (50.0 mg, 0.42 mmol) under Ar atmosphere. After 2 h of stirring at room temperature, the mixture was concentrated in vacuo. The residue was purified using silica gel column chromatography (Hexane:EtOAc = 50:50) to afford the dipeptide 17 (510 mg, 0.97 mmol, 92%) as colorless oil: [α]D^{25} -38.7 (c 1.20, CHCl3); IR (neat) 3735, 3308, 2970, 2963, 2931, 1744, 1715, 1651, 1433, 1168, 753, 711 cm\(^{-1}\); \(^1\)H NMR (400 MHz, CDCl3, mixture of rotamers) δ 0.84 (3H, d, J = 6.8 Hz), 1.34 (9H, s), 1.72-1.89 (3H, m), 1.97-2.07 (1H, m), 2.13-2.17 (1H, m), 2.25 (3H, s), 2.35 (1H, dd, J = 13.7, 7.3 Hz), 2.67 (1H, dd, J = 13.7, 6.8 Hz), 3.17-3.24 (1H, m), 3.29-3.32 (1H, m), 4.41 (1H, d, J = 6.3 Hz), 4.55 (1H, dd, J = 8.3, 4.4 Hz), 5.13 (2H, s), 5.30 (1H, d, J = 9.8 Hz), 5.91 (1H, brs), 6.74 (2H, d, J = 8.3 Hz), 7.05 (2H, d, J = 8.3 Hz), 7.28-7.33 (5H, m); \(^13\)C NMR (100 MHz, CDCl3, mixture of rotamers) δ 14.3, 15.3, 24.0, 28.2, 28.9, 36.3, 37.8, 39.1, 46.5, 58.8, 65.9, 67.0, 115.1, 128.1, 128.2, 128.5, 130.5, 132.2, 135.6, 154.2, 172.3; HRMS (ESI) m/z: [M + Na]+; Calcd for C_{30}H_{36}N_{2}O_{5}Na 562.2463; Found 562.2467.
3.11. Boc-Dpv(OAc)-Pro-Dml-OBn 20

To 15 (1.09 g, 3.40 mmol) was added TFA/CH₂Cl₂ (1:4 v/v, 25 mL). After 1 h of stirring at room temperature, the solution was concentrated in vacuo to afford crude 19, which was used in the next step without further purification.

To a solution of 17 (550 mg, 1.05 mmol) in CH₃OH (5.25 mL) was carefully added Pd(OH)₂/C (110 mg, 20 wt%) under Ar atmosphere. The solution was purged with H₂ gas and stirring was continued under H₂ atmosphere at room temperature for 16 h. The solution was filtered through celite and concentrated in vacuo to afford crude 18, which was used in the next step without further purification.

To a solution of the crude 19 (610 mg, 2.60 mmol) and crude 18 (1.25 g, 2.60 mmol) in CH₂CN (26 mL) were added DMTMM (740 mg, 2.60 mmol) and Et₃N (2.17 mL, 15.6 mmol) under Ar atmosphere. After 24 h of stirring at room temperature, the mixture was concentrated in vacuo. The crude product was purified using silica gel column chromatography (Hexane:EtOAc = 75:25) to afford in vacuo. The residue was purified using silica gel column chromatography (Hexane:Acetone = 80:20) to afford 21.

3.12. Boc-Dpv(OH)-Pro-Dml-OBn 21

To a solution of 20 (184 mg, 0.276 mmol) in CH₃OH (0.14 mL) were added TEA (7.00 μL, 0.502 μmol) under Ar atmosphere. After 24 h of stirring at room temperature, the mixture was concentrated in vacuo. The crude product was purified using silica gel column chromatography (Hexane:Acetone = 75:25) to afford 21 (155 mg, 0.205 mmol, 90%) as a colorless oil: [α]D⁰ +6.3 (c 1.18, CHCl₃); IR (neat) 3403, 3311, 3009, 2975, 2935, 2878, 1715, 1652, 1615, 1594, 1516, 1455, 1391, 1367, 1235, 1172, 1101, 1057, 1003, 877, 826, 755, 698, 666 cm⁻¹; ¹H NMR (400 MHz, CDCl₃, mixture of rotamers) δ 0.72–0.94 (9H, m), 1.20 (3H, d, J = 7.3 Hz), 1.35–1.58 (10H, m), 1.70–1.92 (2H, m), 1.96–2.10 (4H, m), 2.15–2.25 (1H, m), 2.40 (1H, dd, J = 13.7, 6.8 Hz), 2.59–2.69 (1H, m), 2.81–2.92 (1H, m), 3.21–3.35 (2H, m), 3.69 (1H, dd, J = 9.76, 3.4 Hz), 4.45–4.55 (2H, m), 5.06 (2H, s), 5.38 (1H, d, J = 9.8 Hz), 6.74 (2H, d, J = 8.3 Hz), 6.90 (1H, d, J = 10.2 Hz), 7.06 (2H, d, J = 7.8 Hz), 7.18–7.41 (5H, m); ¹³C NMR (100 MHz, CDCl₃, mixture of rotamers) δ 3.0, 13.7, 14.5, 16.2, 19.8, 20.1, 21.4, 25.2, 28.6, 28.7, 29.4, 32.2, 38.9, 40.0, 47.0, 53.8, 57.3, 61.0, 66.6, 79.8, 121.7, 128.3, 128.6, 128.9, 130.8, 135.9, 138.4, 149.3, 169.7, 171.8, 172.1, 176.3; HRMS (ESI) m/z: [M + Na]⁺; Calcd for C₃₇H₃₁N₃O₈Na 688.3568; Found 688.3568.

3.13. Boc-Dpv(OBn)-Pro-Dml-OBn 22

To a solution of 21 (12.1 mg, 0.0194 mmol) in CH₂CN (0.16 mL) were added K₂CO₃ (8.90 mg, mmol), BnBr (8.00 μL, 0.0669 mmol) and KI (1.10 mg, 6.63 μmol) under Ar atmosphere at room temperature. The mixture was stirred for 24 h, quenched with sat. NaHCO₃, extracted with EtOAc, washed with brine, dried over Na₂SO₄, filtered, and concentrated in vacuo. The crude product was purified using silica gel column chromatography (Hexane:Acetone = 80:20) to afford 22 (14.6 mg, 0.0205 mmol, 95%) as a colorless oil: [α]D⁰ +13.1 (c 1.22, CHCl₃); IR (neat) 3416, 3315, 2972, 2932, 2876, 1714, 1652, 1507, 1436, 1409, 1367, 1241, 1172, 1099, 1026, 907, 808, 751, 697, 666 cm⁻¹; ¹H NMR (400 MHz, CDCl₃, mixture of rotamers) δ 0.72–0.95 (9H, m), 1.17 (3H, d, J = 7.3 Hz), 1.35–1.52 (10H, m), 1.79–2.23 (5H, m), 2.44 (1H, dd, J = 13.7, 6.8 Hz), 2.61–2.75 (1H, m), 2.80–2.92 (1H, m), 3.20–3.39 (2H, m), 3.83 (1H, dd, J = 13.7, 6.8 Hz), 5.35 (2H, s), 6.74–6.98 (2H, m), 7.06 (2H, d, J = 7.8 Hz), 7.18–7.41 (5H, m); HRMS (ESI) m/z: [M + Na]⁺; Calcd for C₃₅H₃₃N₃O₈Na 646.3478; Found 646.3463.
161.8, 169.0, 169.50, 169.54, 170.95, 170.99, 171.1, 172.3, 174.6; HRMS (ESI) m/z: [M + Na]+

13C NMR (100 MHz, CDCl3, mixture of rotamers) δ 14.0, 15.9, 19.5, 19.8, 24.9, 29.2, 29.6, 31.7, 31.8, 38.4, 39.7, 46.7, 53.4, 53.8, 53.8, 57.0, 60.6, 66.3, 69.9, 79.5, 114.6, 127.3, 127.8, 128.0, 128.5, 128.6, 130.7, 132.7, 135.3, 137.1, 155.9, 157.1, 171.5, 172.0, 175.9; HRMS (ESI) m/z: [M + Na]+

3.14. **BnO-Lac-Pro-O-Hiv-D-MeVal-Pro-Dpv(OAc)-Pro-Dml-OBn 23**

To a solution of 20 (380 mg, 0.570 mmol) was added TFA/CH2Cl2 (1:4 v/v, 19 mL). After 1 h of stirring at room temperature, the solution was concentrated in vacuo to afford crude amine, which was used in the next step without further purification.

To a solution of the crude amine and 2 (340 mg, 0.570 mmol) in CH2CN (5.70 mL) were added Et3N (0.480 mL, 3.42 mmol) and DMTMM (160 mg, 0.570 mmol) under Ar atmosphere. After 24 h of stirring at room temperature, the solution was concentrated in vacuo. The residue was purified using silica gel column chromatography to afford 23 (368 mg, 0.325 mmol, 57% over 2 steps) as a colorless foam: [α]D25 +12.7 (c 1.20, CHCl3); IR (neat) 3733, 3410, 3309, 2973, 2965, 2876, 1730, 1663, 1510, 1430, 1183, 1100, 753 cm−1; 1H NMR (400 MHz, CDCl3, mixture of rotamers) δ 0.69–1.17 (20H, m), 1.24–1.27 (4H, m), 1.38–1.59 (4H, m), 1.70–2.16 (9H, m), 2.28 (3H, s), 2.23–2.94 (11H, m), 3.08 (3H, s), 3.10–3.77 (14H, m); 13C NMR (100 MHz, CDCl3, mixture of rotamers) δ 13.8, 14.2, 15.85, 16.0, 16.6, 17.0, 17.2, 17.8, 18.0, 19.2, 19.4, 19.60, 19.67, 19.7, 20.0, 20.9, 21.0, 24.6, 24.9, 25.5, 26.3, 29.0, 29.8, 30.0, 31.7, 31.8, 38.6, 39.5, 46.6, 46.7, 56.8, 58.6, 59.1, 59.9, 60.5, 60.6, 66.15, 66.19, 70.8, 71.0, 74.8, 75.6, 121.1, 121.2, 127.56, 127.59, 127.77, 127.82, 128.4, 128.25, 128.27, 128.4, 128.5, 130.3, 130.4, 135.4, 137.6, 137.9, 148.8, 167.5, 169.2, 169.7, 170.9, 171.0, 171.2, 171.3, 171.5, 171.6, 175.86, 175.88; HRMS (ESI) m/z: [M + Na]+; Calcd for C42H55N3O7Na 736.3932; Found 736.3931.

3.15. **Dolastatin 16 Acetate 24**

To a solution of 23 (110 mg, 0.100 mmol) in CH3OH (1.00 mL) was carefully added Pd(OH)2/C (22.0 mg, 20 wt%) under Ar atmosphere. The solution was purged with H2 gas and stirring was continued under H2 atmosphere at room temperature for 16 h. The solution was filtered through celite and concentrated in vacuo to afford crude carboxylic acid, which was used in the next step without further purification.

A solution of the crude carboxylic acid 23 (340 mg, 0.570 mmol) in CH2CN (5.70 mL) was dropwised to a refluxing solution of 2-chloro-1-methylpyridinium iodide (13.0 mg, 0.100 mmol) in CH2CN (5.70 mL) under Ar atmosphere at room temperature for 16 h. After being cooled to ambient temperature, the mixture was concentrated in vacuo. The residue was purified by silica gel column chromatography on silica gel (Hexane:EtOAc = 20:80) to afford 24 as a colorless oil (4.90 mg, 0.005 mmol, 64% over 2 steps): [α]D25 +29.4 (c 0.38, CHCl3); IR (neat) 3394, 3324, 2965, 2876, 1750, 1732, 1650, 1507, 1458, 1426, 1386, 1298, 1194, 1090, 1019, 753, 666 cm−1; 1H NMR (400 MHz, CDCl3) δ 0.82–0.93 (14H, m), 1.01–1.09 (9H, m), 1.43 (3H, d, J = 6.8 Hz), 1.45–1.60 (2H, m), 1.65–2.26 (9H, m), 2.28 (3H, s), 2.30–2.44 (6H, m), 2.45–2.55 (2H, m), 2.78–2.90 (2H, m), 3.08 (3H, s), 3.35–3.50 (2H, m), 3.60–3.70 (2H, m), 3.85–3.92 (1H, m), 4.44 (1H, d, J = 6.8 Hz), 4.54 (1H, d, J = 7.8 Hz), 4.60–4.64 (1H, m), 4.94 (1H, d, J = 8.8 Hz), 5.12–5.20 (2H, m), 5.41 (1H,d, J = 2.9 Hz), 6.72 (1H, d, J = 8.8 Hz), 6.74 (1H, d, J = 8.7 Hz), 7.00 (2H, d, J = 8.3 Hz), 7.41 (2H, d, J = 8.8 Hz), 7.68 (1H, d, J = 10.2 Hz); 13C NMR (100 MHz, CDCl3) δ 14.8, 15.2, 16.0, 17.1, 17.7, 19.6, 19.7, 20.3, 21.1, 21.7, 24.7, 24.8, 24.9, 25.4, 25.5, 28.2, 29.5, 30.6, 30.7, 32.2, 38.6, 41.0, 45.9, 46.4, 47.5, 50.2, 56.2, 57.8, 58.8, 59.4, 59.5, 61.2, 66.6, 120.1, 121.4, 130.6, 138.2, 149.0, 161.8, 169.0, 169.50, 169.54, 170.95, 170.99, 171.1, 172.3, 174.6; HRMS (ESI) m/z: [M + Na]+; Calcd for C40H72N6O12Na 959.5108; Found 959.5100.
3.16. BnO-Lac-Pro-O-Hiv-D-MeVal-Pro-OBn 25

To a solution of 2 (6.3 mg, 0.0107 mmol) in CH2Cl2 (0.30 mL) were added BnOH (1.30 µL, 0.0126 mmol), DMAP (catalytic) and EDCI (3.00 mg, 0.0156 mmol) under Ar atmosphere. The mixture was stirred for 24 h at room temperature, and then concentrated in vacuo. The residue was purified using column chromatography (5% EtOAc in hexane) to afford 25 (4.70 mg, 0.00694 mmol, 64%) as a colorless oil:

\[ \text{[a]}_{D}^{25} +35.1 \ (c = 0.47, \text{CHCl}_3) \]

IR (neat), 2963, 2927, 2874, 1742, 1644, 1454, 1426, 1370, 1257, 1186, 1092, 1014, 738, 699 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz, mixture of rotamers) δ 1.03–1.35 (12H, m), 1.34–1.45 (3H, m), 1.59–2.24 (10H, m), 2.82 (2H, s), 2.97 (1H, s), 3.30–3.59 (5.5H, m), 3.60–3.70 (0.5H, m), 4.23–4.38 (1.5H, m), 4.40–4.60 (2.5H, m), 4.94 (0.6H, d, J = 10.7 Hz), 4.95–5.05 (1H, m), 5.20 (0.4H, dd, J = 10.7, 8.3), 7.22–7.40 (5H, m); ¹³C NMR (CDCl₃, mixture of rotamers) δ 16.3, 16.3, 16.4, 18.1, 18.2, 19.5, 19.6, 19.6, 19.7, 19.8, 20.0, 20.0, 21.7, 23.2, 24.0, 24.0, 26.5, 27.4, 28.1, 28.3, 28.5, 28.5, 28.8, 29.0, 29.1, 29.6, 29.9, 30.4, 30.5, 45.7, 46.3, 46.3, 46.9, 55.5, 56.6, 56.6, 58.2, 58.5, 58.5, 59.5, 60.3, 60.3, 69.6, 71.3, 72.8, 73.0, 75.1, 75.2, 75.5, 79.6, 79.6, 79.7, 127.4, 127.5, 127.5, 127.6, 128.3, 128.4, 135.9, 167.8, 168.0, 169.2, 127.8; HRMS (ESI) m/z: [M + Na]⁺ Calcd for C₃₈H₅₃N₃O₇Na 700.3574; Found 700.3578.

3.17. Boc-Pro-O-Hiv-D-MeVal-Pro-CH₂OBn 29

To peptide 27 (51.4 mg, 0.127 mmol) was added TFA/DCM (1:4 v/v, 2.2 mL). After 1 h of stirring at room temperature, the mixture was concentrated in vacuo. The residue TFA salt was added 0.5 M NaOH aq, extracted with DCM, washed with brine, dried over Na₂SO₄, and concentrated in vacuo to afford crude amine, which was used in the next step without further purification.

To a solution of the crude amine in MeCN (0.65 mL) was added 4 N HCl in dioxane (31.0 µL, 0.127 mmol) under Ar atmosphere. After 30 min of stirring at room temperature, to the mixture were added PyBroP (71.1 mg, 0.152 mmol) and NEt (66.0 µL, 0.47 µmol) 59.6, 70.9, 72.6, 75.2, 75.4, 77.2, 127.6, 127.7, 127.7, 127.8, 128.1, 128.2, 128.31, 128.38, 128.52, 128.58, 135.5, 137.7, 167.8, 168.1, 169.1, 169.6, 171.3, 171.71, 171.78, 172.0, 172.3; HRMS (ESI) m/z: [M + Na]⁺ Calcd for C₃₈H₅₂N₃O₈Na 700.3574; Found 700.3578.

3.18. Antifouling Assay

Antifouling assay against larvae of the barnacle Amphibalanus amphitrite was conducted according to the previous literature [18,19,38]. The adult barnacles, *A. amphitrite*, obtained from oyster farms in Lake Hamana and a pier of Shimizu bay, Shizuoka, were kept in an aquarium at 20 °C and were fed on Artemia salina nauplii. Broods were released as I–II stage nauplii upon immersion in seawater after drying overnight. The nauplii (1.0–3.0 indiv./mL) thus obtained were cultured in 2.0 L filtered (0.2 µm) natural seawater (diluted by DW: salinity 28) containing penicillin G (20 µg/mL) and streptomycin sulfate (30 µg/mL) at 25 °C and were fed on the diatom Chaetoceros gracilis at concentrations of 40 × 10⁶ cells/mL. Larvae reached the cyprid stage in 5 days. The cyprids were collected, then stored at 4 °C until use (0-day-old).

The test compounds were dissolved in ethanol and aliquots of the solution (20 µL) were transferred to wells of a 24-well polystyrene culture plates and then air-dried for 3 h...
at room temperature and CuSO\textsubscript{4} was used as positive compound. Four wells were used for each concentration (0.03, 0.1, 0.3, 1.0, 3.0, 10.0 µg/mL). To each well were added filtered (0.2 mm) natural seawater (2.0 mL, salinity 28) and six 2-day-old cyprids. The plates were kept in the dark at 25 °C for 48 h. The numbers of cyprids that attached, metamorphosed, died, or did not settle were counted under a microscope. Three or four trials were carried out for each concentration. Antifouling activity (EC\textsubscript{50}) indicates the concentration reducing the larval settlement to 50% of the control (non-treatment) by Probit analysis. Toxicity of compounds were expressed as LC\textsubscript{50} value, which indicates the concentration showing 50% mortality estimated by Probit analysis. If mortality rate did not show over 50% at most hagh concentration (10.0 µg/mL), then LC\textsubscript{50} value was indicated as over 10.0 µg/mL.

4. Conclusions

In summary, we have developed new methodologies for the derivatives of the two unusual amino acids found in dolastatin 16 through a C-H activation reaction for dolaphen-valine and an enantio- and diastereoselective [2+2] addition reaction for dolamethylleuine. These synthetic routes enabled effective access to especially the southern fragment of dolastatin 16. Many trends of the derivatives towards antifouling activity were exhibited. Specifically, less polar small fragments showed strong antifouling activity against the cypris larvae of \textit{A. amphitrite} without detectable toxicity, although the whole structure was required for extremely potent activity. These results will be useful toward the development of green antifouling materials, and further studies are in progress in our laboratory.
