**General methods and procedures**

$^1$H NMR spectra were recorded in CDCl$_3$ or D$_2$O on Varian Merc-300 or Varian Inova-500 spectrometers equipped with Sun workstations at 300 K. TMS ($\delta_H 0.00$) or D$_2$O ($\delta_H 4.67$) was used as the internal reference. $^{13}$C NMR spectra were recorded in CDCl$_3$ or D$_2$O at 75 MHz on a Varian Merc-300 spectrometer, respectively, using the central resonance of CDCl$_3$ ($\delta_C 77.0$) as the internal reference. COSY, HSQC, HMBC and TOCSY experiments were used to assist signal assignment of the spectra. Mass spectra were obtained on Applied Biosystems Voyager DE-Pro MALDI-TOF (no calibration), Bruker Daltonics 9.4T (FTICR, external calibration with BSA) or JEOL AccuToF. Optical rotatory power was obtained on Jasco P-1020 polarimeter at 300 K. Chemicals were purchased from Aldrich or Fluka and used without further purification. CH$_2$Cl$_2$, acetonitrile and toluene were distilled from calcium hydride; THF from sodium; and CH$_3$OH from magnesium and iodine. Mariculture keyhole limpet hemocyanin (mcKLH), maleimide activated bovine serum albumin (BSA-MI), and succinimidyl 3-(bromoacetamido)propionate (SBAP) were purchased from Pierce Endogen, Rockford, IL. Aqueous solutions are saturated unless otherwise specified. All reactions were performed under anhydrous conditions under argon and monitored by TLC on Kieselgel 60 F254 (Merck). Detection was by examination under UV light (254 nm) and by charring with 10% sulfuric acid in methanol. Silica gel (Merck, 70-230 mesh) was used for chromatography. Analytical reversed-phase high performance liquid chromatography (RP-HPLC) was performed on a Shimadzu LC-2010AH HPLC using an analytical reversed-phase RPC18 column (Varian intersil ODS-3, 100 Å, 5 µm, 150 mm x 4.6 mm) and a Shimadzu UV detector operating at 254 nm. Elution was effected using a gradient of 10-70% of CH$_3$CN in water (both containing 0.1% TFA) over 30 minutes at a flow rate of 1.0 mL/min.
Procedures for preparation and analytical data of nitrones 4a-f.

Nitrones 4a, b, d-f were prepared according to the method described by Parhi et al.\textsuperscript{[1]} Nitrone 4c was prepared according to Tian et al.\textsuperscript{[2]}

Nitrones 4a\textsuperscript{[3]}, 4b\textsuperscript{[4]}, 4c\textsuperscript{[2]} and 4e\textsuperscript{[3]} are known compounds. Analytical data for nitrones 4d and 4f are given below.

General procedure for cycloaddition of 2 and 4a-f leading to isoxazolines 5a-f.

To a solution of 2 (0.1 mmol) in a 1:1 mixture of CH₃CN and H₂O (2 mL) was added 4a-f (0.1 mmol). The mixture was stirred at room temperature until TLC analysis indicated complete consumption of starting materials. The reaction mixture was concentrated in vacuo, and the residue was purified by column chromatography on silica gel.

General procedure kinetic experiments

NMR experiments

Stock solution A: alkyne 2 (79 mg, 0.36 mmol) was dissolved in a mixture of CD$_3$CN and D$_2$O (ratio 3:1, 10 mL) to give a 36 mM solution.

Stock solution B (32.8 mM): nitrone 4a-d (0.338 mmol) was dissolved in a mixture of CD$_3$CN and D$_2$O (ratio 3:1, 10 mL) to give a 32.8 mM solution.

$^1$H-NMR monitoring of cycloaddition of 2 and 4 was performed by rapid mixing (t=0) of stock solutions A and B (0.3 mL each) in an NMR tube and immediate insertion into a 400 MHz NMR spectrometer. NMR spectra were measured at preset time-intervals.

Kinetics of the reaction of 2 with nitrone 4a (Table 1, entry 1) were determined by the measuring the decrease of the integral of the signal caused by the nitrone methyl groups, with the integral of the acetonitrile solvent-peak as internal standard. A starting value for the integral of the methyl signals was estimated, due to the fact that cycloaddition had already proceeded significantly by the time of the first measurement. The conversion was determined by dividing the combined integrals of the methyl groups of 5a and 6a by the estimated starting value.

For the reaction of 2 with nitrone 4b (Table 1, entry 2), kinetics were determined by integration of the methyl peaks of the nitrone in starting material and product. The sum of these two integrals was taken as internal standard, due to the fact that the acetonitrile peak was not distinct from other signals. Now, conversion was determined by the relative increase of methyl signals of product 5 and 6, compared to the sum of both signals.

The reaction of 2 with nitrone 4c was too fast to follow by NMR. By the time of the first measurement, the reaction had already reached such a conversion that no reliable kinetic plot could be made. Therefore only a rough estimate was made based on the first measurement.

From the conversion plots thus obtained, the second order rate plots were calculated according to equation (1).

\[
kt = \frac{1}{[B]_0-[A]_0} \times \ln \frac{[A]_0([B]_0-[P])}{([A]_0-[P])[B]_0} \quad (1)
\]

with \( k = 2^{nd} \) order rate constant (M$^{-1}$s$^{-1}$), \( t = \) reaction time (s), \([A]_0 = \) the initial concentration of substrate A (mmol/mL), \([B]_0 = \) the initial concentration of substrate B (mmol/mL) and \([P] = \) the concentration of product (mmol/mL). As an example, the logarithmic plot of the reaction between nitrone 4b and 2 is shown in Graph S1.
Graph S1. Logarithmic plot of the reaction of nitrone 4b with dibenzocyclooctyne 2.

**UV-experiments**

Stock solution A: alkyne 2, 2b or 3 (110 mg, 0.5 mmol) was dissolved in CH$_3$CN (50 mL) to give a 10 mM solution.

Stock solution B: nitrone 4e or f (0.5 mmol) was dissolved in CH$_3$CN (50 mL) to give a 10 mM solution.

To achieve the desired CH$_3$CN:H$_2$O ratio, to 1 mL of stock solution A or B was added the correct amount of H$_2$O, giving solutions A’ and B’. Solutions A’ and B’ were left to adjust to room temperature for at least 30 minutes.

UV monitoring of cycloaddition of dibenzocyclooctyne (2 or 3) and nitrone 4 was performed by rapid mixing (t=0) of solutions A’ and B’ (1 mL each) and immediate insertion into a 1 mm UV-cuvette.

Next, UV-absorption was measured at preset time intervals (in general every five seconds) at 304 nm. The graphs thus obtained showed a decrease of the absorption over time, sloping to a final absorption that was subtracted from the measured absorptions to obtain a relative absorption. To determine conversion, the relative absorption was divided by the difference between the maximal and the minimal absorption. Since the reactions already proceeded before measurement of the first absorption, the maximum absorption was adjusted to an estimated starting point.
From the conversion plots thus obtained, the second order rate plots were calculated according to equation (1).

In Graph S2 the logarithmic plot of nitrone 4e with dibenzocyclooctyne 2 is shown.

In Graph S3 the logarithmic plots of the reaction of nitrone 4f with dibenzocyclooctyne 2b[5] in different solvent mixtures is visualized. The graph clearly shows an increase of reaction rate upon increase of the polarity of the solvent mixture. When the reaction was performed in the same solvent mixture but at different concentration and with a different ratio between the two reactants (Table 2, entry 2 and 3), identical logarithmic plots were obtained.

HRMS (ESI+) m/z calcld for 3' C$_{30}$H$_{29}$N$_3$O$_5$Na [M+Na]$^+$: 534.2005, found 534.2002.
Synthesis of nitrone sugars

Scheme 1. Reagents and conditions (a) CH₂=CHC(O)Cl, i-Pr₂EtN, CH₂Cl₂ (62%); (b) OsO₄, NaIO₄, t-BuOH, H₂O; (c) MeHNOH.HCl, NaHCO₃, Et₂O, H₂O (46% for three steps).

1,3,4,6-Tetra-O-acetyl-N-(methyliminoacetyl N-oxide)-β-d-mannosamine pyranose (6)

To a solution of A[6] (39 mg, 0.11 mmol) in CH₂Cl₂ (3 mL) at 0 °C was added i-Pr₂EtN (48 μL, 0.28 mmol) and dropwise acryloyl chloride (1 mL from a stock solution of 90 μL in 5 mL CH₂Cl₂ (0.17 mmol) sequentially and the mixture was stirred at 0 °C for 2 h, when TLC chromatography indicated the complete conversion of A into a more lipophilic product (EtOAc, Rf 0.8). The reaction mixture was quenched with saturated NaHCO₃ (1 mL), and the layers were separated. The organic layer was dried (MgSO₄), filtered and concentrated in vacuo in the dark at 20 °C to give compound B. Without further purification and in the dark, crude compound B was dissolved in a 3:1 mixture of 1,4-dioxane:H₂O (400 μL), and solid NaIO₄ (72 mg, 0.33 mmol) was added. followed by a stock solution of OsO₄ in t-BuOH (2.5% solution, 9 μL). The solution was stirred rigorously for 16 h, until TLC chromatography indicated the complete conversion of B into a more hydrophilic product (EtOAc, Rf 0.2). The reaction mixture was diluted with MeOH (3 mL), filtered over Celite and concentrated. Rapid elution over a pad of silica gel (EtOAc/heptane, 6/1) and concentration gave crude C as an oil (35 mg, 0.087 mmol). Crude C was immediately dissolved in a 1:1 mixture of diethyl ether and H₂O (1 mL). To the solution was added N-methylhydroxylamine hydrochloride (7 mg, 0.11 mmol) and NaHCO₃ (23 mg, 0.27 mmole). The mixture was stirred at room temperature for 30 min and after this time TLC analysis indicated the formation of two products (EtOAc, Rf 0.2 and 0.1). The reaction mixture was filtered and the mixture was extracted with EtOAc (3 × 3 mL). The organic combined layers were washed with H₂O (1 mL) and brine (1 mL), before drying (MgSO₄), filtration and concentration. The oily residue was purified by column chromatography on silica gel (eluent: EtOAc). Compound 6 (22 mg, 46% for three steps) eluted first, as a 6:1 mixture of anomeric acetates. MALDI HRMS: m/z 455.2220 [M + Na⁺]. Calcd for C₁₇H₂₄N₂O₁₁Na⁺ 455.1273. ¹H NMR (300 MHz, CDCl₃, major α-anomer shown): δ 7.04 (s, 1H), 6.02 (d, 1H, J = 1.8 Hz), 5.31
(dd, 1H, J = 5.1, 9.0 Hz), 5.27 (t, 1H, J = 9.3 Hz), 4.66 (ddd, 1H, J = 2.1, 3.6, 9.1 Hz), 4.10-4.23 (m, 2H), 3.93-3.99 (m, 1H), 3.77 (s, 3H), 2.11, 2.09, 1.99, 1.94 (4 × s, 12H).

The more polar compound eluted next (8 mg, 18% for three steps). Mass spectral analysis by MALDI HRMS showed mass peaks of 413.2127 [M + Na\(^+\)] and 429.1974 [M + K\(^+\)], indicative of a molecular mass of 390.13, corresponding to 6 with loss of one acetyl group.

2,4,7,8,9-Penta-O-acetyl-N-(methyliminoacetyl N-oxide)-α-D-neuraminic acid methyl ester (8)
To a stirred solution of G (28 mg, 0.05 mmol) in anhydrous CH₂Cl₂ was added Dess–Martin periodinane reagent (30 mg, 0.075 mmol) at 0 °C. The reaction mixture was allowed to stir at ambient temperature for 2 h then quenched with saturated Na₂S₂O₃ solutions (10 mL), and left to stir for a further 30 min. The aqueous phase was then extracted with EtOAc (10 mL ×3) and the recombinant organic extracts washed with distilled water (2 × 5 mL), and brine (5 mL). Drying over anhydrous MgSO₄, filtered and the mixture was evaporated in vacuo. The residue was dissolved in a mixture of Et₂O (10 mL) and H₂O (2 mL). And then mixture was added N-methylhydroxylamine hydrochloride (8.3 mg, 1.0 mmol) and NaHCO₃ (16 mg, 0.2 mmol). The mixture was stirred at room temperature for 8h and after this time the reaction mixture was filtered and the mixture was evaporated in vacuo. The residue was purified by column chromatography on silica gel (eluent: CH₂Cl₂: CH₃OH 15:1) to give 8 (11 mg, 39%). ¹H NMR (300 MHz, CDCl₃): δ 6.75 (m, 1H, CH=NO), 5.45 (m, 1H, NH), 5.23-5.15 (m, 2H, H-6, NH), 4.91 (m, 1H, H-7), 4.38-3.60 (m, 12H, H-9, H-8, H-5, H-4, H-3', OCH₃, NCH₃), 2.82 (m, 1H, H-3), 2.13-1.86 (5 × s, 15H, 5Ac). **Cell-surface labeling experiments**\textsuperscript{[5]}

Human Jurkat cells (Clone E6-1; ATCC) were cultured in RPMI 1640 medium (ATCC) with L-glutamine (2 mM), adjusted to contain sodium bicarbonate (1.5 g L\(^{-1}\)), glucose (4.5 g L\(^{-1}\)), HEPES (10 mM), and sodium pyruvate (1.0 mM) and supplemented with penicillin (100 u mL\(^{-1}\))/streptomycin (100 μg mL\(^{-1}\); Mediatech) and fetal bovine serum (FBS, 10%; Hyclone). Cells were maintained in a humid 5% CO\(_2\) atmosphere at 37 °C.

Jurkat cells were grown in the presence of compounds 6-9 (10, 20, 50 and 100 μM, final concentration) for 3 days. The metabolically labeled and untreated control cells were incubated with the biotinylated compound J (0-100 μM) in labeling buffer (DPBS, supplemented with FBS, 1%) for 0-180 min at room temperature. The cells were washed three times with labeling buffer and then incubated with avidin conjugated with fluorescein (Molecular Probes) for 15 min at 4 °C. Following three washes and cell lysis, cell lysates were analysed for fluorescence intensity (485 ex / 520 em) using a microplate reader (BMG, Labtech). Data points were collected in triplicate and are representative of three separate experiments. Cell viability was assessed at different points in the procedure with exclusion of trypan blue. No statistical significant increase in fluorescent intensity was observed for the metabolically labeled cells over control.
SKYRAG procedure

Oxazoline 13

Peptide 10 (SKYRAG, 5.5 mg, 8.08 µmol) was dissolved in 0.1 M NH₄OAc buffer (1 mL, pH 6.9), and NaIO₄ (1.9 mg, 8.89 µmol) was added. The resulting mixture was stirred at room temperature until mass spectral analysis (LCQ, 30 min) indicated oxidative cleavage was complete. Subsequently, 4-MeOPhSH (7.5 mg, 0.053 mmol) was added to give a white cloudy solution, and the new mixture was stirred for 1 h at room temperature, until the reaction mixture turned colourless. p-Anisidine (5.0 mg, 0.040 mmol) was then added and the solution was stirred until dissolved completely (15 min). N-methylhydroxylamine hydrochloride (1.5 mg, 0.018 mmol) and 2 (3.9 mg, 0.018 mmol) were added. The resulting reaction mixture was stirred at room temperature for 30 min to give isoxazoline 13. HRMS (ESI +) m/z calcd for C₄₅H₅₉N₁₀O₁₀ [M+H]⁺ 899.4410, found 899.4446.

**Labeling of IL-8**

**IL-8 labeling with cyclooctyne 2**

A solution of IL-8\(^{11}\) (5 µg, 0.60 nmol) in PBS buffer (10 µL) was diluted with NH\(_4\)OAc buffer pH 6.9 (10 µL). Subsequently, NaIO\(_4\) (0.66 nmol, 0.14 µg) was added. The reaction was allowed to take place for 1 h at room temperature, and 4-MeOPhSH was added (3.9 nmol, 0.55 µg, 0.5 nL). After stirring for 1 h at room temperature, p-anisidine (5.6 nmol, 0.69 µg) was added. After stirring for 15 min at room temperature, N-methylhydroxylamine hydrochloride (5.6 nmol, 0.47 µg) and 2 (14.0 nmol, 1.24 µg) were added. The reaction mixture was shaken overnight at 25 °C to give conjugate 15. MS (Accu-TOF) measurement gave 8599 Da as the main peak after deconvolution.

IL-8 labeling with PEG-cyclooctyne 16

A solution of IL-8 (5 µg, 0.60 nmol) in PBS buffer (10 µL) was diluted with NH₄OAc buffer pH 6.9 (10 µL). Subsequently, NaIO₄ (0.66 nmol, 0.14 µg) was added. The reaction was allowed to take place for 1 h at room temperature, and 4-MeOPhSH was added (3.9 nmol, 0.55 µg, 0.5 nL). After stirring for 1 h at room temperature, p-anisidine (5.6 nmol, 0.69 µg) was added. After stirring for 15 min at room temperature, N-methylhydroxylamine hydrochloride (5.6 nmol, 0.47 µg) and 16[12] (14.0 nmol, 28 µg) were added. The reaction mixture was shaken overnight at 25 °C to give conjugate 17. The product was analysed by RP-HPLC. Retention time IL-8 11.54 min; retention time PEGylated IL-8 (17) 13.01 min.
