Abstract
The conundrum of *Ptomaphagus* (s. str.) *sibiricus* Jeannel, 1934 (Coleoptera, Leiodidae, Cholevinae, *Ptomaphagini*) is solved, and it is redescribed and newly recorded in South Korea. A new species is also described from the Russian Far East: *P* (s. str.) *hayashii* sp. n. Relevant morphological characters of the concerned species are illustrated with colour plates, and their known distributions are mapped.

Keywords
Leiodidae, Cholevinae, *Ptomaphagus*, taxonomy, new species, the Russian Far East, the Korean Peninsula

Introduction

*Ptomaphagus* Hellwig, 1795 is the most speciose genus (including 137 known species worldwide) in the tribe Ptomaphagini (Coleoptera, Leiodidae, Cholevinae). However, the nominotypical subgenus, which is limited to the Palaeartic and north Oriental regions has only 29 species (Perreau 2000, Nishikawa 2011, Wang et al. 2016a, 2016b).

In the fauna of the Russian Far East, only one species in the subgenus *Ptomaphagus* s. str. had been recorded before this study, namely *P*. (s. str.) *sibiricus* Jeannel, 1934.

However, when we examined specimens previously identified as *Ptomaphagus* (s. str.) *sibiricus* from various collections, we discovered that three species were identified under this name by different authors. One of them with conspicuous differences from Japan was already described in a previous paper: *P*. (s. str.) *piccoloi* Wang, Růžička, Nishikawa, Perreau & Hayashi, 2016 (Wang et al. 2016a). In this paper, we solve the conundrum of *P*. (s. str.) *sibiricus*, and redescribe it and report it for the first time in South Korea. The third species from the Russian Far East is also new, and is described and illustrated here: *P*. (s. str.) *hayashii* sp. n. Relevant morphological characters of examined species of *Ptomaphagus* are illustrated with colour plates, and their known distributions are mapped.

Material and methods

Specimens were relaxed and softened in a hot saturated solution of potassium hydroxide for 4 minutes (for mounted dry specimens) or 8 minutes (for alcohol-preserved specimens), and then transferred to distilled water to rinse the residual potassium hydroxide off and stop any further bleaching. The softened specimens were moved into glycerin and dissected there to observe morphological details. After examination, the body parts were mounted on a glass slip with Euparal Mounting Medium for future studies. Habitus photographs were taken using a Canon macro photo lens MP-E 65mm on a Canon 550D. Observations, photographs and measurements of morphological details were performed using an Olympus BX53 microscope with an Olympus DP73. The final deep focus images were created with Zerene Stacker 1.04 stacking software. Adobe Photoshop CS6 was used for post processing. Exact label data are cited for specimens examined. Authors’ remarks and addenda are placed in square brackets, separate label lines are indicated by a slash (/), and separate labels by a double slash (///). Measurements are averaged over 5 specimens.

The material examined for this study is deposited in the following collections and museums:

**BMNH**  Natural History Museum (formerly British Museum), London, United Kingdom (M. Barclay)

**CCBW**  Collection of Cheng-Bin Wang, Chengdu, Sichuan, China

**CJRZ**  Collection of Jan Růžička, Prague, Czech Republic

**CMNE**  Collection of Masaaki Nishikawa, Ebina, Japan

**CNUIC**  Chungnam National University Insect Collection, Daejeon, Korea
Revision of the genus Ptomaphagus Hellwig (Coleoptera, Leiodidae, Cholevinae)...

The following abbreviations are used for the measurements in millimetres (mm):

- **AL** (antennal length): length from the antennal base to apex.
- **BTW** (basitarsal width): maximum width of 1st protarsomere.
- **EBL** (extended body length): summation of HL, PL, ELL and length of exposed scutellum, preventing the error introduced by exposed or retracted head.
- **ELL** (elytral length): length from the tail end of scutellum to the elytral apex.
- **ELW** (elytral width): maximum width of the widest portion of two elytra combined together.
- **EW** (eye width): width of a single compound eye in dorsal view.
- **HL** (head length): axial length from the anterior apex of clypeus through the posterior margin of occipital carina.
- **HW** (head width): width of the widest portion of head (usually including eyes).
- **PL** (pronotal length): axial length of the pronotum.
- **PW** (pronotal width): maximum width of pronotum.
- **TW** (tibial width): maximum width of protibia (excluding spines along outer margin etc.).

Results

Genus *Ptomaphagus* Hellwig, 1795

**Distribution.** Holarctic, north Oriental, north Neotropical.

Subgenus *Ptomaphagus* s. str.

**Distribution.** Palaearctic, north Oriental.

*Ptomaphagus* (s. str.) *hayashii* sp. n.

Description. Male. EBL: 3.8–4.3 mm (4.2 mm in holotype). Length of different body parts: HL : AL : PL : ELL = 0.7 : 1.1 : 1.1 : 2.3 mm; width: HW : EW : PW : ELW = 1.1 : 0.1 : 1.6 : 1.8 mm. Proportion of antennomeres from base to tip in μm (length × width): 149 × 75, 109 × 67, 95 × 70, 64 × 79, 58 × 92, 41 × 100, 91 × 128, 39 × 128, 87 × 151, 90 × 156, 161 × 143.

Habitus (Fig. 1B) elongated oval, regularly convex and sublustrous. Well pigmented: mostly blackish brown; mouthparts, antennae (apical half of ultimate antennomere yellowish) and tarsi reddish brown. Dorsum continuously clothed with fine, recumbent, yellowish pubescence. Insertions of pubescence on dorsal surfaces of pronotum, elytra and femora aligned along transverse striolations; interspace between two striolations glabrous.

Head transverse, HW/HL = 1.6. Clypeofrontal suture absent. Clypeus with anterior margin slightly rounded. Compound eyes well developed, EW/HW = 0.11. Antennae (Fig. 2A) slender, AL/HW = 1.0; antennomere III shorter than II; VI with length/width = 0.4; XI peach-shape.

Pronotum (Fig. 2B) transverse, widest just before hind angles, PW/PL = 1.5. Sides gently arched, simply narrowing from posterior to anterior; hind angles slightly projected backwards and acute. Posterior margin widely protruded in middle part, emarginate near hind angles.

Elytra oval, widest at about basal 1/4, ELL/EW = 1.3. Sides weakly arched, gradually narrowing from widest part to apices; apices (Fig. 2G) narrowly rounded. Sutural striae present. Metathoracic wings fully developed.

Prolegs robust, with basal three protarsomeres (Fig. 2C) strongly expanded: TW/ BTW = 1.2. Protibiae (Fig. 2E) strongly expanded towards apex. Profemora broad. Mesotibiae arcuate, mesotarsi simply linear. Metatibiae slender and straight.

Abdominal ventrite VIII (Fig. 2I) round at posterior edge and with an inconspicuous median notch. Spiculum gastrale (Fig. 2J) of genital segment with about 1/5 of length protruding beyond anterior edge of epipleurite IX.

Aedeagus (Fig. 3A) long and slender, with median lobe gradually narrowing towards a lanceolate apex and terminated to a widely rounded knob in dorsal view; opening of genital orifice situated on dorsal surface, deeply cut inwards on preapical left margin of median lobe. Ventral surface of the apex of the median lobe (Fig. 3C) inserted with 5 ventrally oriented setae on both sides; parameres narrow, reaching about apical 1/5 of median lobe, each apex (Fig. 3D) with 2 lateral setae and 1 apical seta distinctly shorter. In lateral view (Fig. 3B), median lobe regularly bent ventrad and gradually tapering to a flat apex. Endophallus with stylus quite slender, a subelliptical nodule in middle region, a cheliform complex just below base of stylus, and a circular complex in the basal region.

Female. Similar to male in general appearance (Fig. 1C), including elytral apices (Fig. 2H), but distinguished by the following characteristics: protarsi (Fig. 2D) simply linear; protibiae (Fig. 2F) narrower; abdominal ventrite VIII (Fig. 3E) narrowly rounded at posterior edge; genital segment and ovipositor as shown in Fig. 3F; spermatheca (Fig. 3F) curved in distal part and coiled in proximal part.
Revision of the genus *Ptomaphagus* Hellwig (Coleoptera, Leiodidae, Cholevinae)... 39

**Figure 3.** *Ptomaphagus* (s. str.) *hayashii* sp. n. (♂: holotype). A aedeagus (dorsal view) B aedeagus (lateral view) C aedeagal apex (ventral view) D paramere apex (lateral view) E ventrite VIII ♀ (ventral view) F spermatheca, genital segment and ovipositor (ventral view). Scales: 0.1 mm.

**Diagnosis.** *Ptomaphagus* (s. str.) *sibiricus* is sympatric with *P. (s. str.) hayashii* sp. n. in some locations of the Russian Far East, and they are very similar to each other (including spermatheca (Figs 3F; 5F), which is only more roundly curved in the stem part in *P. (s. str.) hayashii* sp. n.). For external characters, the body size of *P. (s. str.) sibiricus* (Figs 1A, D–F) is a little smaller than *P. (s. str.) hayashii* sp. n. (Figs 1B, C). However, their aedeagi provide critical characters to distinguish the two species: in *P. (s. str.) hayashii* sp. n., the aedeagus is much larger and more slender (Fig. 3A), the right apicoventral piece of the median lobe is slenderly lanceolate (Fig. 3C), the apical half of median lobe much flatter in lateral view (Fig. 3B); while in *P. (s. str.) sibiricus*, the aedeagus is stouter (Fig. 5A), the right apicoventral piece of median lobe is much wider and subpentagonal (Fig. 5C), the apical half of the median lobe thicker in lateral view (Fig. 5B).
Furthermore, based on specimens examined, *P. (s. str.) sibiricus* seems to be much more widely distributed, extending southward to South Korea; while *P. (s. str.) hayashii* sp. n. is presently known only in the Russian Far East.

**Etymology.** The specific epithet is dedicated to Mr. Yasuhiko Hayashi (Kawani-shi, Japan), a famous independent taxonomist on Staphylinoidea, for his continual generous help to our study.

**Distribution.** Russia (Far East) (Fig. 6).

Redescription. Male. EBL: 3.1–3.8 mm (3.1 mm in holotype). Length of different body parts: HL : AL : PL : ELL = 0.6 : 1.0 : 1.0 : 1.8 mm; width: HW : EW : PW : ELW = 1.0 : 0.1 : 1.5 : 1.6 mm. Proportion of antennomeres from base to tip in μm (length × width): 134 × 66, 107 × 65, 77 × 67, 55 × 81, 54 × 88, 47 × 102, 88 × 125, 35 × 128, 82 × 140, 82 × 140, 147 × 127.

Habitus (Figs 1D, E) elongated oval, regularly convex and sublustrous. Well pigmented: mostly dark brown; mouthparts, basal three antennomeres and apical half of ultimate antennomere, protarsi, and apex of meso- and metatarsi more or less paler. Dorsum continuously clothed with fine, recumbent, yellowish pubescence. Insertions of pubescence on dorsal surfaces of pronotum, elytra and femora align along transverse striolations; interspace between two striolations glabrous.

Figure 5. *Ptomaphagus* (s. str.) *sibiricus* Jeannel, 1934 (Vladivostok). A aedeagus (dorsal view) B aedeagus (lateral view) C aedeagal apex (ventral view) D paramere apex (lateral view) E ventrite VIII ♀ (ventral view) F spermatheca, genital segment and ovipositor (ventral view). Scales: 0.1 mm.
Head quite transverse, HW/HL = 1.7. Clypeofrontal suture absent. Clypeus with anterior margin almost straight. Compound eyes well developed, EW/HW = 0.1. Antennae (Fig. 4A) slender, AL/HW = 1.0; antennomere III shorter than II; VI with length/width = 0.5; XI peach-shape.

Pronotum (Fig. 4B) transverse, widest just before hind angles, PW/PL = 1.4. Sides gently arched, gradually narrowing from posterior to anterior; hind angles projected backwards and acute. Posterior margin widely protruded in middle part, distinctly emarginate near hind angles.

Elytra oval, widest at about basal 1/3, ELL/EW = 1.2. Sides weakly arched, gradually narrowing from widest part to apices; apices (Fig. 4G) narrowly to widely rounded (all examined specimens from South Korea with wide elytral apices). Sutural striae present. Metathoracic wings fully developed.

Prolegs robust, with basal three protarsomeres (Fig. 4C) strongly expanded: TW/BTW = 1.3. Protibiae (Fig. 4E) distinctly expanded towards apex. Profemora broad. Mesotibiae arcuate, mesotarsi simply linear. Metatibiae slender and straight.

Abdominal ventrite VIII (Fig. 4I) rounded and with an inconspicuous median notch at posterior edge. Spiculum gastrale (Fig. 4J) of genital segment with about 1/5 of length protruding beyond anterior edge of epipleurite IX.
Aedeagus (Fig. 5A) long, slender but relatively strong, with median lobe gradually narrowing towards a wide subpentagonal apex and terminated to a widely rounded knob in dorsal view; opening of genital orifice situated on dorsal surface, deeply cut inwards on preapical left margin of median lobe. Ventral surface of the apex of the median lobe (Fig. 5C) inserted with 6 ventrally oriented setae on the left side and 5 ventrally oriented setae on the right side; parameres narrow, reaching about apical 1/6 of median lobe, each apex (Fig. 5D) with 2 lateral setae and 1 apical seta distinctly shorter. In lateral view (Fig. 5B), median lobe thick, regularly bent ventrad, and gradually tapering to a thin apex. Endophallus with stylus quite slender, a cheliform complex just below base of stylus, and a circular complex in the basal region.

Female. Similar to male in general appearance (Fig. 1A, F), including elytral apices (Fig. 4H) and protibiae (Fig. 4F), but distinguished by the following characteristics: protarsi (Fig. 4D) simply linear; abdominal ventrite VIII (Fig. 5E) rounded at posterior edge; genital segment and ovipositor as shown in Fig. 5F; spermatheca (Fig. 5F) curved in distal part and coiled in proximal part.

Diagnosis. See under P. (s. str.) hayashii sp. n. above. Other remarks on this species see Wang et al. (2016a).

Distribution. Russia (Far East), South Korea (Fig. 6).

Acknowledgements

We would like to express our sincere thanks to Kee-Jeong Ahn (Chungnam National University, Daejeon, Republic of Korea), Maxwell V. L. Barclay (BMNH, London, United Kingdom), Young-Bok Cho (Hannam University, Daejeon, Republic of Korea), Yasuhiro Hayashi (Kawanishi, Japan), Hideto Hoshina (Fukui University, Fukui, Japan), Alfred F. Newton (Field Museum of Natural History, Chicago, USA), Stewart B. Peck (Carleton University, Ottawa, Canada), Vadim Zinchenko (Russian Academy of Sciences, Siberian Branch, Novosibirsk, Russia) and Hong-Zhang Zhou (Institute of Zoology, Chinese Academy of Sciences, Beijing, China) for their considerable help in our study. We are obliged to Pavel Jakubec (Czech University of Life Sciences, Prague, Czech Republic) for helping with habitus photographs with the camera system. All the collectors mentioned in the text are acknowledged for their field work. We thank Maxwell V. L. Barclay for linguistic revision of the text. We are grateful to Leonardo Latella (Verona, Italy) as a reviewer who provided constructive comments on previous version of the manuscript. This study was supported by the Ministry of the Interior of the Czech Republic (no. VI20152018027).
