ABSTRACT

The article presents the results of the comparison of the variability of the psychosocial development of the personality in the adolescent, youth and adult age. At the first stage of the empirical study, the types of development in adolescence and youth age. Personality (motivation, value orientations, focus, communicative features), subject (autonomy, self-regulation, locus of control), as well as social and behavioural (distinctive features of social functioning) characteristics were used as typing criteria. The types of the psychosocial development of adolescents and youths are interpreted as constructive, non-constructive and destructive models of coming of age. At the second stage of the study the theoretical generalization of the types of personality existing in psychology and strategies of personality functioning during the period of adult age. The analysis is based on the theories of A. Adler, K. Horney, D. Marsh, E. Desi and R. Rayen, E. Fromm et al.

The types of the psychosocial development of adolescents and youths was compared with variants (types, patterns) of the development in adulthood. The dynamics and continuity of the types of the psychosocial development and strategies for functioning adolescents, youths and adults were determined. It was revealed that the main features of continuity can be found along the lines of constructive or non-constructive development, focus on oneself or other people, self-sufficiency or dependence on the milieu and circumstances. The process of typing of the psychosocial development is the result of the integration of traits of the personality and the way it functions (behaves), which is inherent to it. The factors of that process were identified: regulation by the personality of his/her behavior and activities and his/her position in the system of relationships. The type of the psychosocial development is a complex structural and functional unity. The crystallization of that type from the adolescent age to adulthood is a targeted and logical process associated with the emergence of the self-concept, the ability to self-determination and self-
regulation mechanisms in the adolescent age. The article emphasizes the importance of prevention and correction of the preconditions of non-constructive development models.

**Keywords:** type of the psychosocial development, adolescent age, young age, adult age, personality, continuity of development, locus of control, focus on oneself (on people), (non) constructive (destructive) development.

**Introduction.**

The way to handle the problem of individualization of the personality development is the identification of the general, the typical and the individual, as well as the individually psychological and the socio-typical in that development. It is therefore relevant to research the substance and continuity of variably typological forms of the personality development during the main periods of that development, i.e. during childhood, adolescence and adulthood.

In the previous publications, the results of an empirical study of the types of the psychosocial development in adolescent (a sample of 455 schoolboys of 12 to 16 years of age) (Shamne, 2015) and youths (a sample of 430 students of 20 to 23 years of age) (Shamne, 2017) were presented.

**Research methods.**

A set of valid diagnostic techniques was used: the Biographical Questionnaire (BIV); 16PF Questionnaire by R. Cattell (the A, H, E, Q2, N and L scales); the questionnaire «The person orientation» by V. Smekal – M. Kucher (QPO); the Personal (semantic) Differential (PD) method (an adapted version in the St. Petersburg Psychoneurological Research Institute named after V.M. Bekhterev; School Anxiety Questionnaire (B. N. Phillips); the test-questionnaire on personality self-attitude «Self-Relationship» by V. Stolin; Author's test-questionnaire «Psychosocial Development of Adolescents» (PDA) and Author's Questionnaire «Crisis of adolescence» (factors: crisis of relations, crisis of activity) (Shamne, 2015); Test of sense-of-life orientation (SLO) by D. Leontyev; «Questionnaire on the level of subjective control» (LSC) by E.F. Bazhin, E.A. Golynkina and A. M. Etkind; The Personal Orientation Inventory (POI); the Thomas-Kilmann Conflict Mode Instrument (TKI); the technique of T. Leary «Diagnostics of interpersonal relations» (DIR) (Octants I-VIII); «Individualism -Collectivism Indicators» by L. G. Pochebut; Coping Strategy Indicator (CSI) by J. Amirkhan; «Coping behavior in stressful situations» technique (S. Norman, D. Endler, D. James, M. Parker, an adapted version by T. Kryukova); Socio-metric method. As research tools, the method of modelling, the variable patterns method, the comparative method and the method of genetic analysis were used. Personality (motivation, value orientations, focus, communicative features), subject (autonomy, self-regulation, locus of control), as well as social and behavioural (distinctive features of social functioning) characteristics were

© Shamne Anzhelika
used as typing criteria.

Statistical data processing was carried out using the factor analysis. In both age groups, the four-factor model had significant meaningful and statistical benefits (59.6% and 49.96% of the sample data variance, respectively). On the basis of those factor models, the types of the psychosocial development in the adolescent (autonomously self-sufficient, internally dominant, friendly dependent, frustrated/crisis-stricken) and youth (harmonious, dominant-subject, depending adaptive, disintegrated) age were described.

**Aim and Tasks**

The comparison of the substance of the main types (patterns) of the psychosocial development in the adolescent, youth and adult age, as well as determining their dynamics and continuity is the purpose of this phase of the study. The aim involves coping with the following tasks: 1) to explore the typological picture development in the adolescent, youth and adult age; 2) compare these types of development; 3) substantiate dynamics and continuity these types.

The idea of «dynamic typology» in psychology is to recognize the variability and, at the same time, the continuity of the basic features of the personality type and those of the pattern of functioning (behaviour) in ontogeny. The combination of typological and dynamic approaches is a heuristic resource for modelling the processes of the individual development. We assumed that the individualization and typing («crystallization») (Magnusson, 1996) of the psychosocial development in the period from the juvenile age to adulthood is a targeted and logical process. In the adolescent and youth age, the structure of the basic traits of the personality and the pattern of functioning shaped on the latter's basis integrate into a more or less stable type (pattern) of the psychosocial development of the personality. That type (pattern), in turn, predetermines the further deployment of a «scenario» for life and development of the personality in adulthood.

The juvenile age is sensitive as to the type of the psychosocial development. According to L. Vygotskyi, it is precisely in the adolescent age that a qualitatively new type of development in ontogeny appears. Its appearance is related, firstly, to the emergence of the so-called «tertiary (after heredity and environment) features», i.e. reflection, self-awareness, self-formation and, secondly, to the action of «the law of transition from external to internal processes», which «transforms the development process, changes its structure and functions». Consequently, in the adolescent age, the personality of a teenager enters the developmental drama as a «new, qualitatively distinct factor» (Vygotskyi, 1984).

As the main criterion of the meaningful psychosocial development, we examined the efficiency of solving by an individual of coming-of-age problems, viz. the «dichotomies of development» (Kapustin, 2014), in particular, finding by

© Shamne Anzhelika
the individual of a balance (compromise): 1) between the tendency to assert oneself (the desire of superiority) and at the same time the need to be accepted by other people; 2) between the need for self-actualization and the simultaneous aspiration to honour conventions; 3) between the awareness of personal responsibility for self-determination and at the same time taking into account the real possibilities that are dictated by the biological and social circumstances of life.

The types of the psychosocial development in the adolescent and youth age are represented by diverse variations of constructive (the «autonomously self-sufficient» and «harmonious» types), non-constructive (the «internally dominant»/«dominant-subject» and «friendly dependent»/«depending adaptive» types) and destructive development (the «frustrated/crisis-stricken» and «disintegrated» types) (Fig. 1).

**Discussion.**

The substance of the constructive development in the adolescent and youth age is represented by the «autonomously self-sufficient» and «harmonious» types (in the group of juveniles, that factor explains 18.51% of the data variance while in the group of adolescents it does 19.52%). The continuity of those types is evidenced by their common characteristics: autonomy, social activity, subjective well-being, sociability, spontaneity, internal locus of control, reliance on one's own values and beliefs, the ego power, adequate self-appraisal; proactive stance, orientation towards cooperation with other people, benevo-

---

© Shamne Anzhelika
lence, humanistic orientation and social interest (Table 1).

However, there are significant differences between them that reflect the age-specific dynamics of development. For the «autonomously self-sufficient» type, the key features are perseverance, commitment to achieving goals and influence on others. It illustrates the formation of the key components of the subject of activity, viz. internality, self-regulation, motivation for achievement. For the «harmonious» type, the key features are self-sufficiency, self-sympathy and trust in the world. It illustrates the formation of the key components of the subject of living, viz.

The internally dominant/dominant-subject (13.03% and 16.56% variability) and friendly dependent/socially adaptive types (11.63% and 12.23%) are the variants of the non-constructive development.

The following characteristics are typical of representatives of the «internally dominant» and «dominant-subject» types: dominant style of communication, tendency towards rivalry, autonomy, focus on oneself (individualism), independence from the group, internality in various aspects of life.
spheres of life, active coping behaviour strategies, etc. (Table 2).

**Table 2**

| Factor’s name                        | Basic components of the factor and their weight                                           | Weight |
|--------------------------------------|------------------------------------------------------------------------------------------|--------|
| Internally dominant (adolescents)    | Octant III (0.798), Octant I (0.793), Octant II (0.768), internality (total) (0.682), Octant VIII (0.671), internality (interpersonal) (0.624), avoidance (-0.614), emotions (coping) (0.569), collectivism (-0.560), dominance (0.494), Octant IV (0.466), problem solving (coping) (0.431), individualism (0.452), formal criterion according to sociometry (0.399), crisis of the personality (0.39) | 13.0   |
| Dominant-subject (youths)            | Competition (0.709), Octant I (0.693), avoidance (-0.669), Octant III (0.642), autonomy (0.636), internality (achievements) (0.575), internality (total) (0.569), internality (interpersonal) (0.529), SOZAKT (test BIV) (-0.508), Octant II (0.508), material values (0.454), internality (family) (0.443), crisis of the individual (-0.433), focus on business (problem) (0.431), In. (0.426), individualism (0.416), problem solving (coping) (0.403) | 16.56  |

However, the youths of the «dominant-subject» type tend to have no traits inherent in the «internally dominant» type of adolescents such as empathy, responsibility in relations with people, aspiration for activities that are beneficial to others. Those adolescents are characterized by a greater focus on achievement (money, career, power) and the influence on the milieu (leadership in the milieu), more focus on themselves and on material security, as well as more pronounced offensive behavior strategies. The dynamics of those types shows that a complete mature identity develops in unity with humanism, the acceptance of others and the development of spiritual values. The pronounced individualism, egocentrism, pragmatism, the desire to dominate and the absence of deep, close relationships constitute **risks** for the constructive psychosocial development.

The «friendly dependent» type of adolescents and the «depending adaptive» type of youths are similar to each other by the following characteristics: orientation towards others, collectivism, standard behaviour, social activity, benevolence and focus on interaction. Those traits are favourable for the development of personality in the adolescent age. However, in youth age, they tend to lead to complications in shaping the identity. The low level of autonomy, self-understanding and popularity among peers, as far as the representatives of the «depending adaptive» type are concerned, testify to the frustrated
need for self-affirmation and social activity in youth age (Table 3).

The substance of the destructive development is represented by the «frustrated/crisis-stricken» type in the adolescent age (the 16.54% variability) and the «disintegrated» one in youth (9.681%). The factor weight of the destructive type in youth is significantly lower, which indirectly bears witness to an increase in the stabilization tendencies of development and the end of the critical juvenile period (Table 4).

Table 3

| Factor's name                      | Basic components of the factor and their weight                                                                 | Weight |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------|--------|
| Friendly dependent (adolescents)  | Friendliness (0.701), focus on the interaction (0.629), Factor Q2 (-0.582), focus on business (0.529), autonomy (-0.492), social activity (E) (-0.482), crisis of the personality (-0.471), collectivism (0.465), support search (coping) (0.457), Factor A (0.457), Octant VI (0.447), externals ego (0.445), material values (-0.427), evaluation (S) (0.422), Octant V (0.415), spontaneity (-0.415), adaptation (0.401), Octant VII (0.400) | 11.6   |
| Depending adaptive (youths)       | Octant VII (0.903), self-understanding (-0.807), adaptation (0.707), Octant VIII (0.618), A (0.566), crisis of the personality (-0.470), Q2 (-0.469), flexibility (0.450), autonomy (-0.445), compromise (0.398), Octant VI (0.448), Octant II (-0.420), sociability (0.413), collectivism (0.400), formal criterion according to sociometry (-0.390) | 12.23  |

Table 4

| Factor's name                      | Basic components of the factor and their weight                                                                 | Weight |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------|--------|
| Frustrated /crisis-stricken (adolescents) | Process of living (-0.608), external locus of life (0.589), crisis of the personality (0.585), orientation in time (-0.584), PSYKON (test BIV) (0.583), ERZIEN (test BIV) (0.566), N (0.565), FAM (0.534), material values (0.515), negative ego-identity (0.505), internal locus of control-ego (-0.494), the values of life (-0.492), evaluation (S) (-0.470), focus on business (problem) (-0.454), SOZLAG (test BIV) (0.433), emotions (coping) (0.428), problem solving (coping) (-0.411), avoidance (0.403), internality (total) (-0.403), dominance (-0.402), general anxiety (0.401) | 16.5   |
| Disintegrated (negative identity) (youths) | Octant VI (0.733), sociability (0.701), values (-0.698), Octant V (0.570), negative ego-identity (0.534) view of human nature (-0.514), focus on the interaction (-0.471), creativity (-0.457), SOZAKT (test BIV) (0.454), spontaneity (-0.441), subjective well-being (-0.441), crisis of the individual (0.433), self-sympathy (-0.430), orientation in time (-0.427), S (-0.417), general anxiety (0.417), SOZLAG (test BIV) (0.390), crisis of the personality (0.39) | 9.68   |
The «disintegrated» type is an enhanced version of the «frustrated/crisis-stricken» type. Both are similar to each other by the following criteria: dissatisfaction with oneself (low self-appraisal, negative attitude to oneself); the «negative identity» syndrome (externality, low level of understanding of the authorship of one's own life); heightened feeling of frustration, pronounced tension in personal and social situations, difficulties of social adaptation. The differences between those types lie in the principal development problem. In adolescents, it is the problem of the formation of the subject agency of activities (externality, low self-regulation of activities, etc.). In youths, the main problem area is the formation of the subject agency (authorship) of life.

During the second stage of the study, we systematized the known types of development in adulthood and compared them with the preliminary empirical results (Table 5). As shown by the

| Authors | The comparison of the types (patterns) of the psychosocial development in the juvenile and adolescent age with the development typologies in adulthood |

© Shamne Anzhelika
Theoretical analysis, psychologists use different terms (types of personality, types of behavior, those of orientation, social character, identity, adaptation, development strategies, etc.). However, it is always a question of the general direction of the development and functioning (behavior) of a person, which direction defines the essence of the latter's individuality.

The autonomously self-sufficient/harmonious types of adolescents and youths generally match the productive (Fromm, 1990; Adler, 1993), autonomous (Deci, Ryan, 2004), conscious (Loevinger, 1976) type with a humanistic orientation (Yegorycheva, 1999), accomplished identity (Marcia, 1966), relativistic worldview (Tytarenko, 2000), high level of social adaptation (Caprara, 2003) and the constructive life strategy (Kharlamenkova, 2007).

Consequently, the main tendency of the constructive psychosocial development in the period from adolescent age to adulthood is the acquisition of psychosocial integrity, accomplished identity and, ultimately, self-actualization. The favourable resources for the development of the mature identity in adulthood are such qualities of adolescents and youths as autonomy, social activity, personalization in intimate-personal communication, internal locus of control, orientation towards spiritual values, positive attitude to oneself and subjective well-being.

The main psychological problems of the non-constructive types become more profound in adulthood. The internally dominant/dominant-subject types of development can transform into dominant (Adler, 1993), narcissistic (Fromm, 1990), aggressive (K. Horney, 1995), autonomous (Deci, Ryan, 2004; Loevinger, 1976) type with the selfish orientation (Yegorycheva, 1999; Tytarenko, 2000) and the dominant life strategy (Kharlamenkova, 2007). This is a personality, which is oriented only to himself or herself and his or her own goals and which is characterized by fixation on dominance over others, aspiration for superiority and rivalry, high assertiveness, selfishness, and the desire to make use of other people.

The friendly dependent/socially adaptive types are described in psychology, with certain variations, as dependent (Adler, 1993; Kharlamenkova, 2007), symbiotic (Fromm, 1990), compliant (K. Horney, 1995), conformal (Tytarenko, 2000; Loevinger, 1976), socio-centric (Yegorycheva, 1999), subordinated (Deci, Ryan, 2004) type with high control (Caprara, 2003), borrowed identity (Marcia, 1966) and the dependent life strategy (Kharlamenkova, 2007).

In adults, based on the friendly dependent/socially adaptive types, there functions a dependent, non-self-sufficient personality oriented in a standard way. It is characterized by conformal behavior, search for social support, hyper-social mindset, dependence on circumstances and opinions of others, high affiliation level, heightened feeling of commitment, control over one's behavior and emotions, low level of self-actualization.

Consequently, the non-constructive deve-
Development of personality in adulthood is actually an adaptation activity, which is effected on the basis of either dominance (desire for superiority, hypersocial mindset, individualism) or conformism (search for social support, hyper-social mindset, dependence). The leading orientation of behavioural activity of the non-constructive types in adulthood is a pronounced desire to either conquer the milieu or obey the milieu. In both cases, that orientation has a pseudo-compensatory character.

The «disintegrated» and «frustrated/crisis-stricken» types of adolescents and youths generally match the non-productive, appropriating (Adler, 1993), alienated (K. Horney, 1995), «rebellious» (Fromm, 1990), self-defending, impulsive (Loevinger, 1976), neurotic (Caprara, 2003) type with the impersonal orientation (Deci, Ryan, 2004), negativistic type (Yegorycheva, 1999), diffuse identity (Marcia, 1966) and the strategy of self-suppression (Kharlamenkova, 2007).

Both during coming-of-age and during adulthood, the destructive development is associated with such traits as externality, pronounced pragmatism (focus on material values), fatalism, dissatisfaction with life, dependency, passive coping strategies, deformed self-concept, low self-appraisal, high sensitivity to rejection, shortage of social skills, selfish orientation, distrust of the world and people.

So, as the analysis showed, there is a certain similarity and continuity of the types of development and functioning in the adolescent/youths age and in adulthood. This bears witness to the fact that the process of individualization of development is a logical and targeted process characterized by irreversibility, continuity and teleological nature. The mechanisms and determinants of that process require further research. However, we can assume that during coming-of-age (in persons 12 to 18 years old), the basic traits of personality (its structure) and individual style of functioning (acts of behaviour, choices, actions, every-day relationships and activities) operate in the manner of a ring-connection mechanism. Gradually, those structural and functional relationships crystallize into a more or less stable basis for the deployment of a «development scenario» in adulthood. There are therefore grounds to believe that the adolescent and youth age is sensitive and decisive as to the crystallization of a development type and the «choice» of a development scenario (life) in adulthood. On the other hand, the psychosocial development in that period is characterized by a fundamental incompleteness and openness to various possibilities and influences. That development has great plasticity and variability, which determine the potential for the implementation of various forms of behaviour and development in ontogeny.

Conclusions. The type of the psychosocial development is a complex structural and functional unity, which is shaped in ontogeny by means of the interconnection of the type of personality and functioning thereof (behaviour).
crystallization of that type from the adolescent age to adulthood is a targeted and logical process associated with the emergence of the self-concept, the ability to self-determination and self-regulation mechanisms in the adolescent age.

As shown by the analysis, the main determinants of the crystallization of a certain type of the personality development in the period from the adolescent age to adulthood are two groups of internal factors: 1) regulation of behaviour and activity (locus of control; autonomy/dependence; orientation towards internal criteria (values, beliefs) or external ones (social approval, norms); self-reliance or seeking support in solving one's problems, etc.; 2) position in the system of relationships (collectivism/individualism, benevolence/aggressiveness, selfish/humanistic orientation; conformism/non-conformism; focus on individual achievement or group interests, etc.).

The results of the comparison of the types of development and strategies of personality functioning during the three age periods (adolescent, youth and adults) have shown that there is a certain meaningful similarity and continuity between them. The main features of continuity can be found along the lines of constructive (harmonious type) or non-constructive (disharmonious type) development, orientation towards oneself or towards other people, self-reliance or dependence on the milieu and circumstances. There are grounds to believe that the adolescent age is sensitive to the «choice» of one or another direction of development in adulthood.

Therefore, psychological support, prediction and correction of non-constructive and destructive manifestations of the development in the adolescent and youth age, with the age-specific and individual characteristics of the youth taken into account, are practically significant.

PSYCHOSOCIAL PERSONALITY DEVELOPMENT: CONTINUITY AND CHANGE IN ADOLESCENT, YOUTH AND ADULT AGE

ABSTRACT

The article presents the results of the comparison of the variability of the psychosocial development of the personality in the adolescent, youth and adult age. The types of the psychosocial development of adolescents and youths are interpreted as constructive, non-constructive and destructive models of coming of age. Their substance was compared with variants (types, patterns) of the development in adulthood. The dynamics and continuity of the types of the psychosocial development and strategies for functioning adolescents, youths and adults were determined. It was revealed that the main features of continuity can be found along the lines of constructive or non-constructive development, focus on oneself or other people, self-sufficiency or dependence.
on the milieu and circumstances. The process of typing of the psychosocial development is the result of the integration of traits of the personality and the way it functions (behaves), which is inherent to it. The factors of that process were identified: regulation by the personality of his/her behavior and activities and his/her position in the system of relationships.

**Keywords:** type of the psychosocial development, adolescent age, young age, adult age, personality, continuity of development, locus of control, focus on oneself (on people), (non) constructive (destructive) development.

**ПСИХОСОЦІАЛЬНИЙ РОЗВИТОК ОСОБИСТОСТІ: БЕЗПЕРЕРВНІСТЬ І ЗМІНИ В ПІДЛІТКОВОМУ, ІЮНАЦЬКОМУ І ДОРОСЛОМУ ВІЦІ**

**Анотація.**

У статті представлено порівняння варіативності психосоціального розвитку особистості в періоди підліткового віку, юнацького віку і дорослості. На першому етапі емпіричного дослідження виділено типи розвитку у підлітковому віці (автономно-самодостатній, інтернально-домінантний, доброзичливо-залежний, фрустровано-кризовий) та у юнацькому віці (гармонійний, суб’єктно-домінантний, залежно-адаптивний, дезінтегрсований). В якості критеріїв типізації розвитку використовувалися особистісні, суб’єктні і соціально-поведінкові паттерни функціонування. Здійснено порівняння змісту автономно-самодостатнього та гармонійного, інтернально-домінантного та суб’єктно-домінантного, доброзичливо-залежного та залежно-адаптивного, фрустровано-кризового та дезінтеґрованого типів розвитку. Їх інтерпретовано як конструктивну, неконструктивну і деструктивну моделі дорослішання. В якості основного критерія було використано ефективність розв’язання підлітками та юнаками основних задач дорослішання. Виділено дві групи дестермінант оформлення типу розвитку особистості в період дорослішання: регуляція поведінки та діяльності (інтернальний/екстернальний локус контролю; орієнтація на внутрішні чи на зовнішні критерії тощо) і позиція у системі стосунків ( доброзичливість/агресивність, егоїстична/гуманістична орієнтація тощо).

На другому етапі здійснено теоретичне узагальнення описаного у психології типів особистості і стратегій функціонування особистості у період дорослішання. Аналіз здійснено на основі теорій А. Адлера, К. Хорні, Д. Марша, Е. Десі і Р. Райєна, Е. Фромма та ін. Здійснено співставлення типів (паттернів) психосоціального розвитку у період підліткового та юнацького віку з описаними типологіями розвитку у дорослості. Аналіз показав, що між ними існує пев...
на змістовна подібність і наступність. Основні напрями наступності від підліткового віку до дорослості проходять за наступними напрямами: становлення конструктивного (гармонійного типу) або неконструктивного (дисгармонійного типу) типу розвитку, спрямованість на себе чи на інших людей, опора на себе чи залежність від оточення і обставин. Виходячи з отриманих даних, підкреслюється, що підлітковий і юнацький вік є сензитивним до процесу оформлення індивідуального паттерну функціонування і стратегії подальшого розвитку у період дорослості. Постулюється принципова незавершеність процесу становлення особистості у підлітковому та юнацькому віці, пластичність, сенситивність, відкритість для різних можливостей і впливів.

**Ключові слова:** тип психосоціального розвитку, підлітковий вік, юнацький вік, дорослий вік, особистість, безперервність розвитку, локус контролю, орієнтація на себе (на людей), (не) конструктивний (деструктивний) розвиток.

**Аннотация.**
В статье представлено сравнение вариативности психосоциального развития личности в периоды подросткового возраста, юношеского возраста и взрослости. На первом этапе эмпирического исследования выделены типы развития в подростковом возрасте (автономно-самодостаточный, интернально-домinantный, доброжелательно-зависимый, фрустрированно-кризисный) и в юношеском возрасте (гармоничный, субъектно-домinantный, зависимо-адаптивный, дезинтегрированный). В качестве критериев типизации развития использовались личностные, субъектные и социально-поведенческие паттерны функционирования. Проведено сравнение содержания автономно-самодостаточного и гармоничного, интернально-домinantного и субъектно-домinantного, доброжелательно-зависимого и зависимо-адаптивного, фрустрированно-кризисного и дезинтегрированного типов развития. Их интерпретировано как конструктивную, неконструктивную и деструктивную модели взросления современной молодежи. В качестве основного критерия были использованы эффективность решения подростками и юношами основных задач взросления. Выделены две группы детерминант оформления типа развития личности в период взросления: регуляция поведения и деятельности (интернальный / экстернальный локус контроля, ориентация на внутренние или на внешние критерии и т.д.) и позиция в...
системе отношений (доброжелательность / агрессивность, эгоистичная / гуманистическая ориентация и т.д.).

На втором этапе осуществлено теоретическое обобщение описанных в психологии типов личности и стратегий функционирования личности в период взрослости. Анализ осуществлен на основе теорий А. Аллера, К. Хорни, Д. Марша, Е. Деси и Р. Райена, Э. Фромма и др. Осуществлено сопоставление типов (паттернов) психосоциального развития в период подросткового и юношеского возраста с описанными типологиями развития во взрослости. Анализ показал, что между ними существует определенное содержательное сходство и преемственность. Основные направления преемственности от подросткового возраста к взрослости проходят по следующим направлениям: становление конструктивного (гармоничного типа) или неконструктивного (дисгармоничного типа) развития, направленность на себя или на других людей, опора на себя или зависимость от окружения и обстоятельств. Исходя из полученных данных, подчеркивается, что подростковый и юношеский возраст является сенсибельным к процессу оформления индивидуального паттерна функционирования и стратегии дальнейшего развития в период взрослости. Постулируется принципиальная незавершенность процесса становления личности в подростковом и юношеском возрасте, его пластичность, сензитивность, открытость для различных возможностей и влияний.

**Ключевые слова:** тип психосоциально-го развития, подростковый возраст, юношеский возраст, взрослость, личность, непрерывность развития, локус контроля, ориентация на себя (на людей), (не) конструктивное (деструктивное) развитие.
