Abstract: This paper is concerned with the open-loop time-consistent solution of time-inconsistent mean-field stochastic linear-quadratic optimal control. Different from standard stochastic linear-quadratic problems, both the system matrices and the weighting matrices are dependent on the initial times, and the conditional expectations of the control and state enter quadratically into the cost functional. Such features will ruin Bellman’s principle of optimality and result in the time-inconsistency of the optimal control. Based on the dynamical nature of the systems involved, a kind of open-loop time-consistent equilibrium control is investigated in this paper. It is shown that the existence of open-loop time-consistent equilibrium control for a fixed initial pair is equivalent to the solvability of a set of forward-backward stochastic difference equations with stationary conditions and convexity conditions. By decoupling the forward-backward stochastic difference equations, necessary and sufficient conditions in terms of linear difference equations and generalized difference Riccati equations are given for the existence of open-loop time-consistent equilibrium control with a fixed initial pair. Moreover, the existence of open-loop time-consistent equilibrium control for all the initial pairs is shown to be equivalent to the solvability of a set of coupled constrained generalized difference Riccati equations and two sets of constrained linear difference equations.

Key words: Time-inconsistency, time-consistent solution, mean-field stochastic linear-quadratic optimal control, indefinite stochastic linear-quadratic optimal control

1 Introduction

Though not mentioned frequently, time-consistency is indeed an essential notion in optimal control theory, which relates to Bellman’s principle of optimality. To see this, let us begin with a standard discrete-time stochastic optimal control problem, whose system dynamics and cost functional are given, respectively, by

\[
\begin{align*}
X_{k+1} &= f_k(X_k, u_k, w_k), \\
X_t &= x \in \mathbb{R}^n, \quad k \in \mathbb{T}, \quad t \in \mathbb{T},
\end{align*}
\]

(1.1)
and

\[ J(t, x; u) = \sum_{k=t}^{N-1} \mathbb{E}\left[L_k(X_k, u_k)\right] + \mathbb{E}\left[h(X_N)\right]. \quad (1.2) \]

Here, \( T_t = \{ t, \cdots, N - 1 \} \), \( T = \{ 0, 1, \cdots, N - 1 \} \), and \( N \) is a positive integer; \( \{ X_k, k \in T_t \} \) and \( \{ u_k, k \in T_t \} \) are the state process and the control process, respectively; \( \{ w_k, k \in T_t \} \) is a stochastic disturbance; \( \mathbb{E} \) is the operator of mathematical expectation. Without loss of generality, \( f_k, L_k, k \in T_t, \) and \( h \) are assumed to be bounded. Let \( \mathcal{U}[t, N - 1] \) be a set of admissible controls. We then have the following optimal control problem.

**Problem (C).** Concerned with (1.1), (1.2) and the initial pair \((t, x) \in T \times \mathbb{R}^n\), find a \( \bar{u} \in \mathcal{U}[t, N - 1] \) such that

\[ J(t, x; \bar{u}) = \inf_{u \in \mathcal{U}[t, N - 1]} J(t, x; u). \]

Any \( \bar{u} \in \mathcal{U}[t, N - 1] \) satisfying the above is called an optimal control for the initial pair \((t, x)\); \( \bar{X} = \{ X_k = \bar{X}(k; t, x, \bar{u}), k \in T_t \} \) is called the optimal trajectory corresponding to \( \bar{u} \), and \((\bar{X}, \bar{u})\) is referred to as an optimal pair for the initial pair \((t, x)\).

By Bellman’s principle of optimality, if \( \bar{u} \) is an optimal control of Problem (C) for the initial pair \((t, x)\), then for any \( \tau \in T_{t+1} = \{ t + 1, \cdots, N - 1 \} \); \( \bar{u}|_{T_{\tau}} \) (the restriction of \( \bar{u} \) on \( T_{\tau} = \{ \tau, \cdots, N - 1 \} \)) is an optimal control of Problem (C) for the initial pair \((\tau, \bar{X}(\tau; t, x, \bar{u}))\). This property is essential to handle optimal control problems like Problem (C) and its continuous-time counterpart, which provides the theoretical foundation of dynamic programming approach. Such a phenomenon is referred to as the time-consistency of the optimal control, which ensures that one needs only to solve an optimal control problem for a given initial pair, and the obtained optimal control is also optimal along the whole optimal trajectory.

However, in reality, the time-consistency fails quite often. For instance, when the initial time or initial state enters into the system dynamics or cost functional explicitly, or even more, the conditional expectations of the state or control enters nonlinearly into the cost functional, the corresponding problems are time-inconsistent. See examples in [13] and [5] about the hyperbolic discounting and quasi-geometric discounting. The problem with nonlinear terms of conditional expectation in the cost functional is called as mean-field stochastic optimal control. In this case, the smoothing property of conditional expectation will not be sufficient to ensure the time-consistency of the optimal control. A well-known example of this case is the mean-variance utility [3] [5].

To handle the time-inconsistency, we have two different ways. The first one is static formulation or pre-commitment formulation. If one is able to commit to his/her initial policy and does not revisit the problem in the future, then this policy can be implemented as planned. This approach neglects the time-inconsistency and the optimal control is optimal only when viewed at the initial time. Though the static formulation is of some practical and theoretical values, it has not really addressed the time-inconsistency nor provided solution in a dynamic sense. Relative to this, another approach addresses the time-inconsistency in a dynamic manner. Instead of seeking an “optimal control”, some kinds of equilibrium solutions are concerned with. This is mainly motivated by practical applications such as in mathematical finance and economics, and has recently attracted considerable interest and efforts. The mathematical formulation of the time-inconsistency was first reported by [22], and its qualitative analysis might be traced back to [21]. Following [22], the works [10], [13], [14] and [19] are for systems described by difference equations or ordinary differential equations (ODEs). Recently, [6] and [7] studied the non-exponential discounting problems both for simple ODEs and stochastic differential equations (SDEs), and introduced the notion of time-consistent control. [5] discussed the problems of general Markovian time-inconsistent stochastic optimal control. [24] and [25] addressed the deterministic continuous-time linear-quadratic (LQ) optimal control using a cooperative game.
approach. Different from [24] and [25], [12] studied another kind of time-consistent equilibrium solution of a continuous-time time-inconsistent stochastic LQ problem. In [27], the author investigated both the open-loop and the closed-loop time-consistent solutions for the general mean-field stochastic LQ problems, and showed that the existence of open-loop equilibrium control and closed-loop equilibrium strategy is ensured via the solvability of certain sets of Riccati-type equations. It is worth noting that all these existing results about LQ problems are focusing on the definite case. Here, by the definiteness, we mean that in the cost functionals the state weight matrices are nonnegative definite and the control weight matrices are positive definite. Furthermore, no necessary and sufficient condition is reported on the existence of time-consistent solutions for time-inconsistent LQ problems.

In this paper, we shall investigate a time-inconsistent mean-field stochastic LQ optimal control problem, whose system dynamics and cost functional are also dependent on the initial time. No definiteness constraint is required for either the state or the control weighting matrices, and a class of open-loop equilibrium control is studied for the considered LQ problem. The main idea and results of this paper are as follows.

• After giving the definition of open-loop equilibrium pair, we show in Theorem 2.3 that the existence of open-loop equilibrium pair for a fixed initial pair is equivalent to the solvability of a set of forward-backward stochastic difference equations (FBSΔEs) with stationary conditions and convexity conditions. Different from [16], the equivalent conditions are proved based on a formula of cost functional difference (Lemma 2.2).

• If for a fixed initial pair, Problem (LQ) admits an open-loop equilibrium pair, then a set of constrained linear difference equations (LDEs) is solvable, and the open-loop equilibrium control admits a closed-loop representation (Theorem 2.8). Here, the closed-loop representation is a linear feedback of current value of the equilibrium state, whose gains are computed via the solutions of a set of constrained LDEs (2.27), a set of LDEs (2.33) and a set of generalized difference Riccati equations (GDREs) (2.32).

• If for a fixed initial pair \((t, x)\) Problem (LQ) admits an open-loop equilibrium pair, then for any \((k, \zeta)\) with \(k \in T_t\) and \(\zeta \in L^2_T(k; \mathbb{R}^n)\), Problem (LQ) is point-wisely convex at \((k, \zeta)\). In this case, we equivalently have the solvability of the constraint LDEs (2.27).

Conversely, if a version of (2.27) (with \(T_t\) replaced by \(T\), i.e., (2.47)) is solvable, then we can take a perturbation of the cost functional by adding \(\varepsilon E[u_k^T u_k]\) to \(J(k, \zeta; (u_k, ..., u_{N-1}))\), \(k \in T\); and the obtained problem is denoted as Problem (LQ)\(\varepsilon\), which admits an open-loop equilibrium pair \((X_{t.t.x, \varepsilon}, u_{t.t.x, \varepsilon})\) for any initial pair \((t, x)\). Furthermore, if \(\{u_{t.t.x, \varepsilon}, \varepsilon > 0\}\) is bounded, then Problem (LQ) for the initial pair \((t, x)\) will admit an open-loop equilibrium pair.

• For any initial pair, Problem (LQ) admitting an open-loop equilibrium pair is shown to be equivalent to that two sets of constrained LDEs (2.47) (2.56) and a set of constrained GDREs (2.55) are solvable. It is worth pointing out that if solvable, the set of GDREs (2.55) does not have symmetric structure, i.e., its solution is not symmetric.

In [16], a simplified version of Problem (LQ) is considered, where there are no mean-field terms in the system dynamics and cost functional. Hence, this paper is a continuation of [16]. Concerned with the necessary and sufficient condition on the existence of open-loop equilibrium pair, [16] just gives a counterpart of Corollary 3.2 of this paper with (3.6) replaced by (3.11). This is because in [16] we do not have a result similar to Lemma 2.6, which gives the representation of the backward state via the forward state. If the system dynamics and cost functional are both independent of the initial time, the corresponding LQ problem will be a dynamic version of that considered in [17], where the conditional expectation operators are replaced by the expectation operators. For details on mean-field stochastic
optimal control and related mean-field games, we refer to [4] [8] [11] [15] [17] [26] and the references therein.

Though the equilibrium control (2.35) is of feedback form, it is indeed an open-loop control. To clarify, the closed-loop expression (2.35) is not a closed-loop/feedback equilibrium solution of Problem (LQ) at all. Instead, a closed-loop or feedback equilibrium solution of Problem (LQ) is concerned with the time-consistency of the strategy. Here, by a strategy we mean a decision rule that a player/controller adopts to select her actions, based on available information. Therefore, mathematically, a strategy is a measurable function of the information set. When the information set is available and substituted into the strategy, a control is obtained, which is then viewed as the open-loop realization of that strategy. Due to their intrinsical difference between an open-loop control and a strategy, the open-loop equilibrium control of this paper differs clearly from the closed-loop/feedback equilibrium strategy, which is studied in [18] by the authors.

The rest of this paper is organized as follows. Section 2 introduces the notion of open-loop equilibrium control of Problem (LQ), and presents necessary and sufficient conditions on its existence for both the case with a fixed initial pair and the case with all the initial pairs. Section 3 studies two special cases of Problem (LQ). Section 4 gives an example, and some concluding remarks are given in Section 5.

2 Open-loop Time-Consistent Solution

Consider the following controlled stochastic difference equation (S∆E)

\[
\begin{aligned}
X_{t+1}^k &= (A_{t,k}X_k^k + \tilde{A}_{t,k}E_tX_k^k + B_{t,k}u_k + \tilde{B}_{t,k}E_tu_k + f_{t,k}) \\
&\quad + (C_{t,k}X_k^k + \tilde{C}_{t,k}E_tX_k^k + D_{t,k}u_k + \tilde{D}_{t,k}E_tu_k + d_{t,k})w_k,
\end{aligned}
\]

where \(A_{t,k}, \tilde{A}_{t,k}, C_{t,k}, \tilde{C}_{t,k} \in \mathbb{R}^{n_x \times n_x}, B_{t,k}, \tilde{B}_{t,k}, D_{t,k}, \tilde{D}_{t,k} \in \mathbb{R}^{n_x \times m} \) are deterministic matrices, and \(f_{t,k}, d_{t,k} \in \mathbb{R}^n \) are deterministic vectors; \(X_0^k, k \in \mathbb{T}_t \) \(\triangleq X^t \) and \(\{u_k, k \in \mathbb{T}_t \} \triangleq u \) are the state process and the control process, respectively. The noise \(\{w_k, k \in \mathbb{T} \} \) is assumed to be a martingale difference sequence defined on a probability space \((\Omega, F, \mathbb{P})\) with

\[
\mathbb{E}_{k+1}[w_{k+1}] = 0, \quad \mathbb{E}_{k+1}[(w_{k+1})^2] = 1, \quad k \geq 0.
\]

\(\mathbb{E}_t \) in (2.1) is the conditional mathematical expectation \(\mathbb{E}[\cdot | F_t] \) with respect to \(F_t = \sigma\{w_l, l = 0, 1, \cdots, t - 1\} \), and \(F_0 \) is understood as \(\{\emptyset, \Omega\} \). The cost functional associated with the system (2.1) is

\[
J(t, x; u) = \sum_{k=t}^{N-1} \mathbb{E}_t \{X_k^TQ_{t,k}X_k + (E_tX_k^TQ_{t,k}E_tX_k + u_k^T\tilde{R}_{t,k}u_k + (E_tu_k)^T\tilde{R}_{t,k}E_tu_k
+ 2\tilde{q}_{t,k}^TX_k^T + 2\tilde{p}_{t,k}^Tu_k)\}
+ \mathbb{E}_t [(X_N^T\tilde{G}_tX_N) + (E_tX_N^T\tilde{G}_tE_tX_N + 2\tilde{g}_t^TX_N^t)],
\]

(2.3)

where \(Q_{t,k}, \tilde{Q}_{t,k}, R_{t,k}, \tilde{R}_{t,k}, \tilde{G}_t, \tilde{G}_t \) are deterministic symmetric matrices of appropriate dimensions, and \(\tilde{q}_{t,k}, \tilde{p}_{t,k}, \tilde{g}_t \) are deterministic vectors. In (2.1), \(x \in L_2^2(t; \mathbb{R}^n) \), which is a set of random variables such that any \(\xi \in L_2^2(t; \mathbb{R}^n) \) is \(F_t\)-measurable and \(\mathbb{E}[x^2] < \infty \). Let further \(L_2^2(\mathbb{T}_t; \mathcal{H}) \) be a set of \(\mathcal{H}\)-valued processes such that for any its element \(\nu = \{\nu_k, k \in \mathbb{T}_t\} \), \(\nu_k \) is \(F_k\)-measurable and \(\mathbb{E}[\nu_k^2] < \infty \). Then, we pose the following optimal control problem.

**Problem (LQ).** Concerned with (2.1), (2.3) and the initial pair \((t, x)\), find a \(u^* \in L_2^2(\mathbb{T}_t; \mathbb{R}^m) \), such that

\[
J(t, x; u^*) = \inf_{u \in L_2^2(\mathbb{T}_t; \mathbb{R}^m)} J(t, x; u).
\]

(2.4)
Then, we have

\[ u \]

Here, the statement on the admissible controls of continuous-time stochastic optimal control; see [77].

For any \( k \in T_t \) and any \( u_k \in L^2_T (k; \mathbb{R}^m) \), the initial pair \((k, X_{t,x}^k)\) with (noting \( \Delta \) and the \( S \)) holds for any \( u \in \mathbb{R} \).

Let \( u \in L^2 (k; \mathbb{R}^m) \). Noting that \( u^{t,x,*} |_{x_k} = (u^{t,x,*} |_{x_{k+1}}) \), the control \( u_k, u^t |_{x_k} \) on the right-hand side of (2.5) differs from \( u^{t,x,*} |_{x_k} \) only at time instant \( k \). Intuitively, the cost functional will increase if one deviates from \( u^{t,x,*} \).

For any \( k \in T_t \), \( u^{t,x,*} |_{x_k} \) is an open-loop equilibrium control for the initial pair \((t, x)\), and \( X^{t,x,*} \) is the corresponding equilibrium state.

The following result is concerned with the difference of cost functionals, which is characterized via the solutions of an SDE and a backward stochastic difference equation (BSDE).

**Lemma 2.2.** Let \( \zeta \in L^2_T (k; \mathbb{R}^n) \), \( u = \{ u_t, k \in T_k \} \in L^2_T (T_k; \mathbb{R}^m) \), \( \bar{u}_k \in L^2_T (k; \mathbb{R}^m) \) and \( \lambda \in \mathbb{R} \). Then, we have

\[
J(k, \zeta; (u_k + \lambda \bar{u}_k, u_{|T_{k+1}})) - J(k, \zeta; u) = 2 \lambda \left[ (R_{k, \bar{k}) + \bar{R}_{k, \bar{k})}) u_k + (B_{k, \bar{k}) + \bar{B}_{k, \bar{k})})^T X_{\bar{k}+1} u_k + \rho_k, k \right.
\]

**Definition 2.1.** Given \( t \in T \) and \( x \in L^2_T (t; \mathbb{R}^n) \), a state-control pair \((X^{t,x,*}, u^{t,x,*})\) with \( u^{t,x,*} \in L^2_T (T_t; \mathbb{R}^m) \) is called an open-loop equilibrium pair of Problem (LQ) for the initial pair \((t, x)\), and

\[
J(k, X^{t,x,*}; u^{t,x,*}) \leq J(k, X^{t,x,*}; (u_k, u^{t,x,*}|_{T_{k+1}}))
\]

holds for any \( k \in T_t \) and any \( u_k \in L^2_T (k; \mathbb{R}^m) \). Here, \( u^{t,x,*} |_{T_k} \) and \( u^{t,x,*} |_{T_{k+1}} \) (with \( T_k = \{ k, ..., N - 1 \}, T_{k+1} = \{ k + 1, ..., N - 1 \} \)) are the restrictions of \( u^{t,x,*} \) on \( T_k \) and \( T_{k+1} \), respectively. Furthermore, such a \( u^{t,x,*} \) is called an open-loop equilibrium control for the initial pair \((t, x)\), and \( X^{t,x,*} \) is the corresponding equilibrium state.

**Lemma 2.2.** Let \( \zeta \in L^2_T (k; \mathbb{R}^n) \), \( u = \{ u_t, k \in T_k \} \in L^2_T (T_k; \mathbb{R}^m) \), \( \bar{u}_k \in L^2_T (k; \mathbb{R}^m) \) and \( \lambda \in \mathbb{R} \). Then, we have

\[
J(k, \zeta; (u_k + \lambda \bar{u}_k, u_{|T_{k+1}})) - J(k, \zeta; u) = 2 \lambda \left[ (R_{k, \bar{k}) + \bar{R}_{k, \bar{k})}) u_k + (B_{k, \bar{k}) + \bar{B}_{k, \bar{k})})^T X_{\bar{k}+1} u_k + \rho_k, k \right.
\]

with (noting \( Y^{k, \bar{u}_k} = 0 \))

\[
\tilde{J}(k, \bar{u}_k) = \sum_{t=k}^{N-1} \mathbb{E}_k \left[ (Y^{k, \bar{u}_k})^T Q_{k,t} Y^{k, \bar{u}_k} + (E_{k} Y^{k, \bar{u}_k})^T Q_{k,t} E_{k} Y^{k, \bar{u}_k} \right]
\]

where \( u_{|T_{k+1}} \) is the restriction of \( u \) on \( T_{k+1} \), and \( Z^{k,u_k} \) are given, respectively, by the BSDE

\[
Z^{k, u_k}_{\bar{k}+1} = A_{k,\bar{k}} Y^{k, \bar{u}_k} + A_{k,\bar{k}} E_{k} Y^{k, \bar{u}_k} + C_{k,\bar{k}} E_{k} E_{k} Y^{k, \bar{u}_k} + Q_{k,\bar{k}} Y_{\bar{k}+1} + Q_{k,\bar{k}} E_{k} X^{k, u_k} + q_{k, \bar{k}} \quad \text{for} \quad \bar{k} \in T_k,
\]

and the SDE

\[
Y^{k, \bar{u}_k}_{\bar{k}+1} = A_{k,\bar{k}} Y^{k, \bar{u}_k} + \bar{A}_{k,\bar{k}} E_{k} Y^{k, \bar{u}_k} + (C_{k,\bar{k}} Y^{k, \bar{u}_k} + \bar{C}_{k,\bar{k}} E_{k} Y^{k, \bar{u}_k}) w_{\bar{k}, \bar{k}}
\]

\[
Y^{k, \bar{u}_k}_{\bar{k}+1} = (B_{k,\bar{k}} + \bar{B}_{k,\bar{k}}) \bar{u}_k + (D_{k,\bar{k}} + \bar{D}_{k,\bar{k}}) \bar{u}_k w_{\bar{k}, \bar{k}}
\]

\[
Y^{k, \bar{u}_k}_{\bar{k}+1} = 0, \quad \bar{k} \in T_{k+1}.
\]
2.2 Then, (initial pair)

Under any of above conditions, (ii) There exists a open-loop equilibrium pair of Problem (L Q) for the initial pair

Proof. See Appendix A.

From Lemma 2.2, we have the following result, which gives the necessary and sufficient condition to the existence of open-loop equilibrium pair for a given initial pair.

Theorem 2.3. Given \( t \in T \) and \( x \in L^2_T(t; \mathbb{R}^n) \), the following statements are equivalent.

(i) There exists an open-loop equilibrium pair of Problem (L Q) for the initial pair \((t, x)\).

(ii) There exists a \( u^{t,x,*} \in L^2_T(T_t; \mathbb{R}^m) \) such that for any \( k \in T_t \), the following FBS\(\Delta E\) admits a solution \((X^{k,t,x}, Z^{k,t,x})\)

\[
\begin{align*}
X^{k,t,x}_{t+1} &= (A_{k,t}X^{k,t,x}_t + \tilde{A}_{k,t}E_k X^{k,t,x}_t + B_{k,t}u^{t,x,*}_t + \tilde{B}_{k,t}E_k u^{t,x,*}_t + f_{k,t}) \\
&+ (C_{k,t}X^{k,t,x}_t + \tilde{C}_{k,t}E_k X^{k,t,x}_t + D_{k,t}u^{t,x,*}_t + \tilde{D}_{k,t}E_k u^{t,x,*}_t + d_{k,t})w_t, \\
Z^{k,t,x}_t &= A_{k,t}E_k Z^{k,t,x}_{t+1} + \tilde{A}_{k,t}E_k Z^{k,t,x}_{t+1} + C_{k,t}E_k (Z^{k,t,x}_{t+1} w_t) + \tilde{C}_{k,t}E_k (Z^{k,t,x}_{t+1} w_t) \\
&+ Q_{k,t}X^{k,t,x}_t + \tilde{Q}_{k,t}E_k X^{k,t,x}_t + g_{k,t}, \\
X^{k,t,x}_t &= X^{t,x,*}_k, \\
Z^{k,t,x}_t &= G_k X^{k,t,x}_n + \tilde{G}_k E_k X^{k,t,x}_n + g_k, \quad \ell \in T_k
\end{align*}
\]

with the stationary condition

\[
0 = (R_{k,k} + \tilde{R}_{k,k})u^{t,x,*}_k + (B_{k,k} + \tilde{B}_{k,k})^T E_k Z^{k,t,x}_{k+1} + (D_{k,k} + \tilde{D}_{k,k})^T E_k (Z^{k,t,x}_{k+1} w_k) + \rho_k, 
\]

and the convexity condition

\[
\inf_{u_k \in L^2_T(k; \mathbb{R}^n)} \tilde{J}(k, 0; u_k) \geq 0. 
\]

Here, \( \tilde{J}(k, 0; u_k) \) is given in (2.7), and \( X^{t,x,*} \) in (2.10) is given by

\[
\begin{align*}
X^{k,t,x}_{k+1} &= [(A_{k,k} + \tilde{A}_{k,k})X^{t,x,*}_k + (B_{k,k} + \tilde{B}_{k,k})u^{t,x,*}_k + f_{k,k}] \\
&+ [(C_{k,k} + \tilde{C}_{k,k})X^{t,x,*}_k + (D_{k,k} + \tilde{D}_{k,k})u^{t,x,*}_k + d_{k,k}]w_k, \\
X^{t,x,*}_t &= x, \quad k \in T_t.
\end{align*}
\]

Under any of above conditions, \((X^{t,x,*}, u^{t,x,*})\) given in (ii) is an open-loop equilibrium pair for the initial pair \((t, x)\).

Proof. See Appendix B.

To simplify the notations, let

\[
\begin{align*}
A_{k,t} &= A_{k,t}^e + \tilde{A}_{k,t}, \\
B_{k,t} &= B_{k,t} + \tilde{B}_{k,t}, \\
C_{k,t} &= C_{k,t}^e + \tilde{C}_{k,t}, \\
D_{k,t} &= D_{k,t} + \tilde{D}_{k,t}, \\
Q_{k,t} &= Q_{k,t} + \tilde{Q}_{k,t}, \\
R_{k,t} &= R_{k,t} + \tilde{R}_{k,t}, \\
G_k &= G_k + \tilde{G}_k, \quad k \in T_t, \quad \ell \in T_k.
\end{align*}
\]

Then, (2.13) can be rewritten as

\[
\begin{align*}
X^{t,x,*}_{k+1} &= [(A_{k,k} + \tilde{A}_{k,k})X^{t,x,*}_k + (B_{k,k} + \tilde{B}_{k,k})u^{t,x,*}_k + f_{k,k}] \\
&+ [(C_{k,k} + \tilde{C}_{k,k})X^{t,x,*}_k + (D_{k,k} + \tilde{D}_{k,k})u^{t,x,*}_k + d_{k,k}]w_k, \\
X^{t,x,*}_t &= x, \quad k \in T_t.
\end{align*}
\]
For any \( k \in T_t \), from (2.10) it follows that
\[
\begin{cases}
X_{k+1}^{k,t,x} = [A_{k,k}X_k^{k,t,x} + B_{k,k}u_{k}^{t,x,*} + f_{k,k}] + [C_{k,k}X_k^{k,t,x} + D_{k,k}u_{k}^{t,x,*} + d_{k,k}] w_k, \\
X_k^{k,t,x} = X_k^{t,x,*}.
\end{cases}
\]
Therefore, we have
\[
X_{k+1}^{k,t,x} = X_{k+1}^{t,x,*}, \quad k \in T_t.
\]
We now study the condition (2.12). The following result gives an expression of \( \hat{J}(k, 0; \bar{u}_k) \).

**Lemma 2.4.** \( \hat{J}(k, 0; \bar{u}_k) \) can be expressed as
\[
\hat{J}(k, 0; \bar{u}_k) = \bar{u}_k^T (R_{k,k} + B_{k,k}^T P_{k,k+1} B_{k,k} + D_{k,k}^T P_{k,k+1} D_{k,k}) \bar{u}_k
\]
with \( P_{k,k+1} \) and \( P_{k,k+1} \) computed via
\[
\begin{cases}
P_{k,k} = Q_{k,k} + A_{k,k}^T P_{k,k+1} A_{k,k} + C_{k,k}^T P_{k,k+1} C_{k,k}, \\
P_{k,k} = Q_{k,k} + A_{k,k}^T P_{k,k+1} A_{k,k} + C_{k,k}^T P_{k,k+1} C_{k,k}, \\
P_{k,N} = G_k, \quad P_{k,N} = G_k, \quad \ell \in T_k.
\end{cases}
\]

**Proof.** From (2.9), it follows that
\[
\begin{aligned}
E_kY_{\ell+1}^{k,\bar{u}_k} &= A_{k,\ell} E_kY_\ell^{k,\bar{u}_k}, \quad \ell \in T_{k+1}, \\
E_kY_{k+1}^{k,\bar{u}_k} &= B_{k,k} E_k \bar{u}_k, \\
E_kY_k^{k,\bar{u}_k} &= 0.
\end{aligned}
\]
By adding to and subtracting
\[
\sum_{\ell=k}^{N-1} E_k \left[ (Y_{\ell+1}^{k,\bar{u}_k})^T P_{\ell+1} Y_{\ell+1}^{k,\bar{u}_k} - (Y_{\ell}^{k,\bar{u}_k})^T P_{\ell} Y_{\ell}^{k,\bar{u}_k} \right]
\]
from (2.7), we have
\[
\hat{J}(k, 0; \bar{u}_k) = \sum_{\ell=k}^{N-1} E_k \left[ (Y_{\ell}^{k,\bar{u}_k})^T Q_{\ell,k} Y_{\ell}^{k,\bar{u}_k} + (E_k Y_{\ell}^{k,\bar{u}_k})^T Q_{\ell,k} E_k Y_{\ell}^{k,\bar{u}_k} + (Y_{\ell}^{k,\bar{u}_k})^T P_{\ell+1} Y_{\ell+1}^{k,\bar{u}_k} \\
- (Y_{\ell}^{k,\bar{u}_k})^T P_{\ell} Y_{\ell}^{k,\bar{u}_k} + (E_k Y_{\ell}^{k,\bar{u}_k})^T P_{\ell+1} E_k Y_{\ell}^{k,\bar{u}_k} - (E_k Y_{\ell}^{k,\bar{u}_k})^T P_{\ell} E_k Y_{\ell}^{k,\bar{u}_k} \right] + \bar{u}_k^T R_{k,k} \bar{u}_k
\]
\[
= \sum_{\ell=k}^{N-1} E_k \left[ (E_k Y_{\ell}^{k,\bar{u}_k})^T (Q_{\ell,k} + A_{k,k}^T P_{k,k+1} A_{k,k} + C_{k,k}^T P_{k,k+1} C_{k,k}) E_k Y_{\ell}^{k,\bar{u}_k} \\
+ (Y_{\ell}^{k,\bar{u}_k} - E_k Y_{\ell}^{k,\bar{u}_k})^T (Q_{\ell,k} + A_{k,k}^T P_{k,k+1} A_{k,k} + C_{k,k}^T P_{k,k+1} C_{k,k} - P_{k,k}) (Y_{\ell}^{k,\bar{u}_k} - E_k Y_{\ell}^{k,\bar{u}_k}) \right] \\
+ \bar{u}_k^T (R_{k,k} + B_{k,k}^T P_{k,k+1} B_{k,k} + D_{k,k}^T P_{k,k+1} D_{k,k}) \bar{u}_k
\]
\[
= \bar{u}_k^T (R_{k,k} + B_{k,k}^T P_{k,k+1} B_{k,k} + D_{k,k}^T P_{k,k+1} D_{k,k}) \bar{u}_k.
\]
This completes the proof. □

Letting \( u_k = 0, \lambda = 1 \) in (2.6), from Lemma 2.4 we have
\[
J(k, \zeta; (\bar{u}_k, u_{T_k+1})) = \bar{u}_k^T (R_{k,k} + B_{k,k}^T P_{k,k+1} B_{k,k} + D_{k,k}^T P_{k,k+1} D_{k,k}) \bar{u}_k
\]
Here, \( \langle \cdot, \cdot \rangle \) is the inner product on \( \mathbb{R}^m \), and \( M_{k,2}, M_{k,1} \) are defined as
\[
\begin{align*}
M_{k,2} &= \mathcal{R}_{k,k} + B_{k,k}^T P_{k,k+1} B_{k,k} + D_{k,k}^T P_{k,k+1} D_{k,k}, \\
M_{k,1} &= B_{k,k}^T \mathbb{E}_k Z^{k,0}_{k+1} + \rho_{k,k} + D_{k,k}^T \mathbb{E}_k (Z^{0,0}_{k+1} w_k).
\end{align*}
\] (2.21)

In (2.21), \( Z^{k,0}_{k+1} \) is computed via a version of (2.8) with \( u_k \) replaced by 0. It can be seen that \( Z^{k,0}_{k+1} \) is a functional of \( \zeta \) and \( u|_{\tau_{k+1}} \).

Fixing \( \zeta \) and \( u|_{\tau_{k+1}}, J(k, \zeta; (\bar{u}_k, u|_{\tau_{k+1}})) \) is a quadratic functional of \( \bar{u}_k \), and is convex with respect to \( \bar{u}_k \) if \( M_{k,2} \geq 0 \).

Throughout this paper, Problem (LQ) will be called point-wisely convex at \( (k, \zeta) \) (with \( \zeta \in L_2^k(k; \mathbb{R}^n) \)) if for fixed \( u|_{\tau_{k+1}}, J(k, \zeta; (\bar{u}_k, u|_{\tau_{k+1}})) \) is convex with respect to \( \bar{u}_k \). By this, Lemma 2.4 and Theorem 2.3, we have the following result, whose proof is omitted here.

**Proposition 2.5.** The following statements are equivalent.

(i) The convexity condition (2.12) is satisfied.

(ii) The following inequality holds
\[
M_{k,2} = \mathcal{R}_{k,k} + B_{k,k}^T P_{k,k+1} B_{k,k} + D_{k,k}^T P_{k,k+1} D_{k,k} \geq 0,
\] (2.22)

where \( P_{k,k+1} \) and \( P_{k,k+1} \) are computed via (2.18).

(iii) Problem (LQ) is point-wisely convex at \( (k, \zeta) \) with some \( \zeta \in L_2^k(k; \mathbb{R}^n) \).

(iv) Problem (LQ) is point-wisely convex at \( (k, \zeta) \) with any \( \zeta \in L_2^k(k; \mathbb{R}^n) \).

Furthermore, if Problem (LQ) admits an open-loop equilibrium pair for the initial pair \((t,x)\), then for any \( k \in T_t \) and any \( \zeta \in L_2^k(k; \mathbb{R}^n) \), Problem (LQ) is point-wisely convex at \( (k, \zeta) \).

Now let us switch to the stationary condition (2.11). The following lemma gives an expression of the backward state \( Z^{t,x}_{t,x} \).

**Lemma 2.6.** Let \( u^{t,x}_{t,x} = \Psi X^{t,x}_{t,x} + \alpha_t, \ell \in T_k \), in (2.10) with \( \Psi, \alpha, \ell \in T_k \), being deterministic matrices. Then, the backward state \( Z^{t,x}_{t,x} \) of (2.10) has the following expression
\[
Z^{t,x}_{t,x} = P_{t,\ell} X^{t,x}_{t,x} + \bar{P}_{t,\ell} \mathbb{E}_t X^{t,x}_{t,x} + T_{t,\ell} X^{t,x}_{t,x} + \bar{T}_{t,\ell} \mathbb{E}_t X^{t,x}_{t,x} + \pi_{t,\ell}, \quad \ell \in T_k.
\] (2.23)

Here, \( \bar{P}_{t,\ell} = P_{t,\ell} - P_{t,\ell} \) with \( P_{t,\ell}, P_{t,\ell} \) being computed via (2.18), and \( T_{t,\ell}, \bar{T}_{t,\ell}, \pi_{t,\ell} \) are given by
\[
\begin{align*}
T_{t,\ell} &= A_{t,\ell} T_{t,\ell+1} A_{t,\ell} + C_{t,\ell} T_{t,\ell+1} C_{t,\ell} \\
&\quad + \left( A_{t,\ell} P_{t,\ell+1} B_{t,\ell} + A_{t,\ell}^T T_{t,\ell+1} B_{t,\ell} + C_{t,\ell} T_{t,\ell+1} D_{t,\ell} + C_{t,\ell} T_{t,\ell+1} D_{t,\ell} \right) \Psi, \\
\bar{T}_{t,\ell} &= \bar{A}_{t,\ell} T_{t,\ell+1} A_{t,\ell} + \bar{C}_{t,\ell} T_{t,\ell+1} C_{t,\ell} \\
&\quad + \left( \bar{A}_{t,\ell} \bar{P}_{t,\ell+1} B_{t,\ell} + \bar{A}_{t,\ell}^T T_{t,\ell+1} B_{t,\ell} + \bar{C}_{t,\ell} \bar{P}_{t,\ell+1} D_{t,\ell} + \bar{C}_{t,\ell} \bar{P}_{t,\ell+1} D_{t,\ell} \right) \Psi, \\
T_{t,N} &= 0, \quad \bar{T}_{t,N} = 0,
\end{align*}
\] (2.24)

and
\[
\begin{align*}
\pi_{t,\ell} &= A_{t,\ell} P_{t,\ell+1} B_{t,\ell} \alpha_t + f_{t,\ell} + A_{t,\ell}^T T_{t,\ell+1} (B_{t,\ell} \alpha_t + f_{t,\ell}) + A_{t,\ell}^T \pi_{t,\ell+1} \\
&\quad + C_{t,\ell} T_{t,\ell+1} (D_{t,\ell} \alpha_t + d_{t,\ell}) + C_{t,\ell} T_{t,\ell+1} (D_{t,\ell} \alpha_t + d_{t,\ell}) + g_{t,\ell}, \\
\pi_{t,N} &= g_N, \quad \ell \in T_k, \quad \bar{t} \in T_k
\end{align*}
\] (2.25)

with \( T_{t,\ell} = T_{t,\ell} + \bar{T}_{t,\ell}, \ell \in T_k \).
Proof. See Appendix C.

Noting that $P_{k,\ell}$ and $\mathcal{P}_{k,\ell}$ are symmetric, $T_{k,\ell}$ and $\tilde{T}_{k,\ell}$ are generally nonsymmetric as $A_{k,\ell}, B_{k,\ell}, C_{k,\ell}$ and $D_{k,\ell}$ appear in the expressions of $T_{k,\ell}$ and $\tilde{T}_{k,\ell}$. Recall the pseudo-inverse of a matrix. By [20], for a given matrix $M \in \mathbb{R}^{m \times n}$, there exists a unique matrix in $\mathbb{R}^{n \times m}$ denoted by $M^\dagger$ such that

$$
\begin{aligned}
\begin{cases}
MM^\dagger M = M, & M^\dagger MM^\dagger = M^\dagger, \\
(MM^\dagger)^T = MM^\dagger, & (M^\dagger M)^T = M^\dagger M.
\end{cases}
\end{aligned}
$$

(2.26)

This $M^\dagger$ is called the Moore-Penrose inverse of $M$. The following lemma is from [1].

**Lemma 2.7.** Let matrices $L$, $M$ and $N$ be given with appropriate size. Then, $LXM = N$ has a solution $X$ if and only if $L^\dagger NMM^\dagger = N$. Moreover, the solution of $LXM = N$ can be expressed as $X = L^\dagger NMM^\dagger + Y - L^\dagger LYM^\dagger$, where $Y$ is a matrix with appropriate size.

Based on above results, we have the following theorem.

**Theorem 2.8.** Given $t \in \mathbb{T}$ and $x \in L^2_T(t; \mathbb{R}^n)$, the following statements are equivalent.

(i) There exists an open-loop equilibrium pair of Problem (LQ) for the initial pair $(t, x)$.

(ii) The set of LDEs

$$
\begin{aligned}
\begin{cases}
P_{k,\ell} = Q_{k,\ell} + A^T_{k,\ell}P_{k,\ell+1}A_{k,\ell} + C^T_{k,\ell}P_{k,\ell+1}C_{k,\ell}, \\
\mathcal{P}_{k,\ell} = Q_{k,\ell} + A^T_{k,\ell}\mathcal{P}_{k,\ell+1}A_{k,\ell} + C^T_{k,\ell}\mathcal{P}_{k,\ell+1}C_{k,\ell}, \\
P_{k,N} = G_k, & \mathcal{P}_{k,N} = \mathcal{G}_k, \quad \ell \in \mathbb{T}_k, \\
R_{k,k} + B_{k,k}^T\mathcal{P}_{k,k+1}B_{k,k} + D_{k,k}^T\mathcal{P}_{k,k+1}D_{k,k} \geq 0, \\
k \in \mathbb{T}_t
\end{cases}
\end{aligned}
$$

(2.27)

is solvable in the sense

$$
R_{k,k} + B_{k,k}^T\mathcal{P}_{k,k+1}B_{k,k} + D_{k,k}^T\mathcal{P}_{k,k+1}D_{k,k} \geq 0, \quad k \in \mathbb{T}_t,
$$

(2.28)

and the following condition

$$
(I - W_k W_k^\dagger) (H_k X^{t,x,*}_k + \beta_k) = 0, \quad k \in \mathbb{T}_t
$$

(2.29)

is satisfied. Here,

$$
\begin{aligned}
X^{t,x,*}_{k+1} & = (A_{k,k} - B_{k,k} W_k^\dagger H_k) X^{t,x,*}_k - B_{k,k} W_k^\dagger \beta_k + f_{k,k} \\
& \quad + [(C_{k,k} - D_{k,k} W_k^\dagger H_k) X^{t,x,*}_k - D_{k,k} W_k^\dagger \beta_k + d_{k,k}] w_k,
\end{aligned}
$$

(2.30)

and

$$
\begin{aligned}
W_k = R_{k,k} + B_{k,k}^T \mathcal{P}_{k,k+1} B_{k,k} + D_{k,k}^T \mathcal{P}_{k,k+1} D_{k,k}, \\
H_k = B_{k,k}^T (\mathcal{P}_{k,k+1} + \mathcal{T}_{k,k+1}) A_{k,k} + D_{k,k}^T (\mathcal{P}_{k,k+1} + \mathcal{T}_{k,k+1}) C_{k,k}, \\
\beta_k = B_{k,k}^T (\mathcal{P}_{k,k+1} + \mathcal{T}_{k,k+1}) f_{k,k} + \pi_{k,k+1} + D_{k,k}^T (\mathcal{P}_{k,k+1} + \mathcal{T}_{k,k+1}) d_{k,k} + \rho_{k,k}, \\
k \in \mathbb{T}_t
\end{aligned}
$$

(2.31)

with

$$
\begin{aligned}
T_{k,\ell} & = A^T_{k,\ell} T_{k,\ell+1} A_{k,\ell} + C^T_{k,\ell} T_{k,\ell+1} C_{k,\ell} \\
& \quad - (A^T_{k,\ell} P_{k,\ell+1} B_{k,\ell} + A^T_{k,\ell} T_{k,\ell+1} B_{k,\ell} + C^T_{k,\ell} P_{k,\ell+1} D_{k,\ell} + C^T_{k,\ell} T_{k,\ell+1} D_{k,\ell}) W_k^\dagger H_{\ell,t} \\
& \quad - (A^T_{k,\ell} P_{k,\ell+1} B_{k,\ell} + A^T_{k,\ell} T_{k,\ell+1} B_{k,\ell} + C^T_{k,\ell} P_{k,\ell+1} D_{k,\ell} + C^T_{k,\ell} T_{k,\ell+1} D_{k,\ell}) W_k^\dagger H_{\ell,t}, \\
T_{k,N} & = 0, \\
k \in \mathbb{T}_k
\end{aligned}
$$

(2.32)
and
\[
\begin{align*}
\pi_{k,\ell} &= A_{k,\ell}^T P_{k,\ell+1} (f_{k,\ell} - B_{k,\ell} W_{k,\ell}^1 \beta_{\ell}) + A_{k,\ell}^T T_{k,\ell+1} (f_{k,\ell} - B_{k,\ell} W_{k,\ell}^1 \beta_{\ell}) \\
&\quad+ C_{k,\ell}^T P_{k,\ell+1} (d_{k,\ell} - D_{k,\ell} W_{k,\ell}^1 \beta_{\ell}) + C_{k,\ell}^T T_{k,\ell+1} (d_{k,\ell} - D_{k,\ell} W_{k,\ell}^1 \beta_{\ell}) \\
&\quad+ A_{k,\ell}^T \pi_{k,\ell+1} + q_{k,\ell}, \quad k \in T_k, \\
p_{k,N} &= g_k,
\end{align*}
\]  
(2.33)

Furthermore, we have
\[
\begin{align*}
Z_{k,t,x}^N &= P_{k} (X_{k,t,x}^* - F_{k} X_{k,t,x}^*) + P_{k} E_{N-1} X_{k,t,x}^* + T_{k} (X_{k,t,x}^* - F_{k} X_{k,t,x}^*) \\
&= T_{k} + P_{k} E_{N-1} X_{k,t,x}^* + \pi_{k,\ell}, \quad \ell \in T_k.
\end{align*}
\]  
(2.34)

Under any of above conditions, an open-loop equilibrium control is given by
\[
u_{k,\ell,x}^* = -W_{k}^1 H_{k} X_{k,\ell,x}^* - W_{k}^1 \beta_{k}, \quad k \in T_k
\]  
(2.35)

with $X_{k,\ell,x}^*$ given by (2.30).

**Proof.** (i)⇒(ii). Let $\nu_{k,\ell,x}^*$ be an open-loop equilibrium control. From Theorem 2.3 and Proposition 2.5, we have the solvability of (2.27). Furthermore, for any $k \in T_k$, the FBSDE (2.10) admits a solution, and (2.11) holds. As
\[
Z_{N-1,t,x}^N = G_{N-1} N_{N-1,t,x} + G_{N-1} E_{N-1} N_{N-1,t,x} + g_{N-1},
\]
from (2.11) and (2.16) we have
\[
0 = R_{N-1,N-1} N_{N-1,t,x} + B_{N-1,N-1} G_{N-1} E_{N-1} N_{N-1,t,x} + D_{N-1,N-1} g_{N-1} + \rho_{N-1,N-1}.
\]

Note that $X_{N-1,t,x}^*$ is given in (2.13). Then, substituting $X_{N-1,t,x}^*$ into the above equation, from Lemma 2.7 we have
\[
u_{N-1,t,x}^* = -W_{N-1}^1 H_{N-1} X_{N-1,t,x}^* - W_{N-1}^1 \beta_{N-1} \triangleq \Psi_{N-1} N_{N-1,t,x}^* + \alpha_{N-1},
\]  
(2.36)

and
\[(I - W_{N-1} W_{N-1}^1) (H_{N-1} X_{N-1,t,x}^* + \beta_{N-1}) = 0,
\]
where
\[
\begin{align*}
W_{N-1} &= R_{N-1,N-1} + B_{N-1,N-1} G_{N-1} B_{N-1,N-1} + D_{N-1,N-1} G_{N-1} D_{N-1,N-1}, \\
H_{N-1} &= B_{N-1,N-1} G_{N-1} A_{N-1,N-1} + D_{N-1,N-1} G_{N-1} E_{N-1,N-1}, \\
\beta_{N-1} &= B_{N-1,N-1} (G_{N-1} f_{N-1,N-1} + g_{N-1}) + D_{N-1,N-1} g_{N-1} + \rho_{N-1,N-1}.
\end{align*}
\]

Noting (2.16) and Lemma 2.6, we have
\[
Z_{N-2,t,x}^N = (P_{N-2,N-1} + T_{N-2,N-1}) X_{N-2,t,x}^* + (P_{N-2,N-1} + T_{N-2,N-1}) E_{N-2} X_{N-2,t,x}^* + \pi_{N-2,N-1},
\]
where $T_{N-2,N-1}, T_{N-2,N-1}$ are computed via (2.24) with $\Psi_{N-1}$ and $\alpha_{N-1}$ being given in (2.36). From (2.11), we have for $k = N - 2$
\[
0 = R_{N-2,N-2} N_{N-2,t,x} + B_{N-2,N-2} [(P_{N-2,N-1} + T_{N-2,N-1}) E_{N-2} X_{N-2,t,x}^* + \pi_{N-2,N-1}].
\]
we have
\[ u_{N-2}^{t,x,*} = -W_{N-2}^t(X_{N-2}^{t,x,*} - W_{N-2}^t\beta_N) \]
\[ \Delta \Psi_{N-2}X_{N-2}^{t,x,*} + \alpha_{N-2}, \]
and
\[ (I - W_{N-2}^t)(H_{N-2}X_{N-2}^{t,x,*} + \beta_{N-2}) = 0, \]
where
\[
\begin{align*}
W_{N-2} &= R_{N-2,N-2} + B_{N-2,N-2}(P_{N-2,N-1} + T_{N-2,N-1})B_{N-2,N-2} \\
H_{N-2} &= B_{N-2,N-2}(P_{N-2,N-1} + T_{N-2,N-1})A_{N-2,N-2} \\
\beta_{N-2} &= B_{N-2,N-2}(P_{N-2,N-1} + T_{N-2,N-1})C_{N-2,N-2} \\
d_{N-2} &= B_{N-2,N-2}(P_{N-2,N-1} + T_{N-2,N-1})d_{N-2,N-2} \\
+ \pi_{N-2,N-1} &+ \rho_{N-2,N-2}.
\end{align*}
\]

Backwardly repeating above procedure, by Lemma 2.6 we can get (2.32), (2.33) and (2.35).

(ii)⇒(i). By Proposition 2.5, Lemma 2.7 and reversing the proof of (i)⇒(ii), we can complete the proof.

Now let Problem (LQ) for the initial pair \((t, x)\) admit an open-loop equilibrium pair. For a \(\xi \notin x\) with \(\xi \in L_2^2(t; \mathbb{R}^n)\), we can construct a control of the form (2.35) as
\[ u_{k}^{t,\xi,*} = -W_{k}^tH_{k}X_{k}^{t,\xi,*} - W_{k}^t\beta_{k}, \quad k \in \mathbb{T}_t, \quad (2.37) \]
where
\[
\begin{align*}
X_{k+1}^{t,\xi,*} &= \left[ (A_{k,k} - B_{k,k}W_{k}^tH_{k})X_{k}^{t,\xi,*} - B_{k,k}W_{k}^t\beta_{k} + f_{k,k} \right] \\
&\quad + \left[ (A_{k,k} - B_{k,k}W_{k}^tH_{k})X_{k}^{t,\xi,*} - D_{k,k}W_{k}^t\beta_{k} + d_{k,k} \right]w_{k}, \\
X_{k}^{t,\xi,*} &= \xi, \quad k \in \mathbb{T}_t,
\end{align*}
\]
or equivalently,
\[
\begin{align*}
X_{k+1}^{t,\xi,*} &= \left[ A_{k,k}X_{k}^{t,\xi,*} + B_{k,k}u_{k}^{t,\xi,*} + f_{k,k} \right] \\
&\quad + \left[ C_{k,k}X_{k}^{t,\xi,*} + D_{k,k}u_{k}^{t,\xi,*} + d_{k,k} \right]w_{k}, \\
X_{k}^{t,\xi,*} &= \xi, \quad k \in \mathbb{T}_t.
\end{align*}
\]

Though similarly defined as \((X^{t,x,*}, u^{t,x,*})\), we cannot assert that \((X^{t,\xi,*}, u^{t,\xi,*})\) is an open-loop equilibrium pair of Problem (LQ) for the initial pair \((t, \xi)\). In fact, (2.29) reads as
\[ W_{k}X_{k}^{t,\xi,*} + \beta_{k} = H_{k}X_{k}^{t,\xi,*} + \beta_{k}, \quad k \in \mathbb{T}_t. \]
If \((X^{t,\xi,*}, u^{t,\xi,*})\) was an open-loop equilibrium pair for the initial pair \((t, \xi)\), then there would be
\[ W_{k}X_{k}^{t,\xi,*} + \beta_{k} = H_{k}X_{k}^{t,\xi,*} + \beta_{k}, \quad k \in \mathbb{T}_t. \]
However, generally speaking, (2.40) cannot be deduced from (2.39). In fact, we have
\[ W_{k}W_{k}^t(H_{k}X_{k}^{t,\xi,*} + \beta_{k}) = W_{k}W_{k}^t(H_{k}X_{k}^{t,\xi,*} + \beta_{k}) + W_{k}W_{k}^tH_{k}(X_{k}^{t,\xi,*} - X_{k}^{t,x,*}) \]
\[ = H_k X_k^{\xi_1, \xi_2} + \beta_k + (W_k W_k^* H_k - H_k) (X_k^{\xi_1, \xi_2} - X_k^{\xi_1, \xi_2}), \]

which is different from \( H_k X_k^{\xi_1, \xi_2} + \beta_k \) in general. Therefore, under the condition that Problem (LQ) has an open-loop equilibrium control for an initial pair \((t, x)\), we cannot assert the existence of open-loop equilibrium control for other initial pairs.

If \((2.27)\) is solvable, we have from Proposition 2.5 that for any \((k, \zeta) (k \in T_t, \zeta \in L_2^2(k; \mathbb{R}^n))\), \(J(k, \zeta; (\bar{u}_k, u_{\tau_{k+1}}))\) is convex with respect to \(\bar{u}_k\). By \((2.20)\), \(J(k, \zeta; (\bar{u}_k, u_{\tau_{k+1}}))\) can be rewritten as

\[
J(k, \zeta; (\bar{u}_k, u_{\tau_{k+1}})) = (M_k \bar{u}_k + J(k, \zeta; (0, u_{\tau_{k+1}}))) + 2(M_k(\zeta, u_{\tau_{k+1}}), \bar{u}_k). \tag{2.41}
\]

Here, we have used \(M_k(\zeta, u_{\tau_{k+1}})\) instead of \(M_k\) to emphasize the dependence on \((\zeta, u_{\tau_{k+1}})\). Only with the convexity condition, we cannot get the existence of the minima of a quadratic functional like \((2.41)\). To see more about this, let us consider a perturbation of the control weighting matrices. Precisely, for \(\varepsilon > 0\) and \(k \in T_t\), introduce the following cost functional

\[
J_{\varepsilon}(k, \zeta; (\bar{u}_k, u_{\tau_{k+1}})) = (M_k \bar{u}_k + J(k, \zeta; (0, u_{\tau_{k+1}}))) + \varepsilon \mathbb{E}[\bar{u}_k^T \bar{u}_k]
\]

\[
= ((M_k \varepsilon I) \bar{u}_k, \bar{u}_k) + 2(M_k(\zeta, u_{\tau_{k+1}}), \bar{u}_k) + J(k, \zeta; (0, u_{\tau_{k+1}})). \tag{2.42}
\]

Then, it holds that

\[
M_{\varepsilon,k} = M_k + \varepsilon I = R_{k,k} + \varepsilon I + B_{k,k}^T P_{k,k+1} B_{k,k} + D_{k,k}^T P_{k,k+1} D_{k,k} \geq \varepsilon I.
\]

By simple calculations, we have

\[
\bar{u}_k^* = \arg \min_{\bar{u}_k \in L_2^2(k; \mathbb{R}^n)} J_{\varepsilon}(k, \zeta; (\bar{u}_k, u_{\tau_{k+1}})) = -(M_{\varepsilon,k})^{-1} M_k(\zeta, u_{\tau_{k+1}}), \quad k \in T_t. \tag{2.43}
\]

In what follows, the version of Problem (LQ) corresponding to \(\{J_{\varepsilon}(k, \zeta, \cdot), k \in T_t\}\) will be denoted as Problem (LQ)\(_{\varepsilon}\), for which we can adopt a backward procedure to derive the open-loop equilibrium control. Specifically, letting \(k = N - 1\) in \((2.42)\) and by \((2.5)\) \((2.43)\), we have

\[
u_{N-1}^{e,t,x,*} = -(M_{\varepsilon,N-1})^{-1} M_{N-1}(X_{N-1}^{e,t,x,*}) \tag{2.44}
\]

with the process \(X_{N-1}^{e,t,x,*}\) being determined below. Substituting \((2.44)\) into \((2.5)\), from \((2.43)\) we have

\[
u_{N-2}^{e,t,x,*} = -(M_{\varepsilon,N-2})^{-1} M_{N-2}(X_{N-2}^{e,t,x,*}, u_{N-2}^{e,t,x,*}).
\]

Repeating above procedure backwardly, we get the following open-loop equilibrium pair \((X^{e,t,x,*}, u^{e,t,x,*})\):

\[
u_k^{e,t,x,*} = -(M_{\varepsilon,k})^{-1} M_k(X_k^{e,t,x,*}, u_k^{e,t,x,*}|_{\tau_{k+1}}), \quad k \in T_t,
\]

and

\[
\begin{cases}
X_{k+1}^{e,t,x,*} = [A_{k,k} X_k^{e,t,x,*} + B_{k,k} u_k^{e,t,x,*} + f_{k,k}]
+ [C_{k,k} X_k^{e,t,x,*} + D_{k,k} u_k^{e,t,x,*} + d_{k,k}] w_k,
\end{cases} \tag{2.45}
\]

\[X_t^{e,t,x,*} = x, \quad k \in T_t.
\]

By \((2.35)\), \(u^{e,t,x,*}\) can be expressed as

\[
u_k^{e,t,x,*} = -(W_k)^* H_k X_k^{e,t,x,*} - (W_k)^* \beta_k, \quad k \in T_t. \tag{2.46}
\]

Here, \(W_k, H_k^*\) and \(\beta_k\) are obtained by replacing \(R_{k,k}\) with \(R_{k,k} + \varepsilon I\) in \((2.31)\).
Theorem 2.9. Let

\[
\begin{align*}
    \begin{cases}
    P_{k,\ell} = Q_{k,\ell} + A_{k,\ell}^T P_{k,\ell+1} A_{k,\ell} + C_{k,\ell}^T P_{k,\ell+1} C_{k,\ell}, \\
    P_{k,\ell} = Q_{k,\ell} + A_{k,\ell}^T P_{k,\ell+1} A_{k,\ell} + C_{k,\ell}^T P_{k,\ell+1} C_{k,\ell}, \\
    P_{k,N} = G_k, \quad P_{k,N} = G_k, \quad \ell \in \mathbb{T}_k, \\
    \mathcal{R}_{k,k} + B_{k,k}^T P_{k,k+1} B_{k,k} + D_{k,k}^T P_{k,k+1} D_{k,k} \geq 0, \\
    k \in \mathbb{T}
    \end{cases}
\end{align*}
\]  

be solvable. Then the following statements hold.

(i) For any \( t \in \mathbb{T} \) and any \( x \in L^2_T(t; \mathbb{R}^m) \), Problem (LQ), for the initial pair \((t, x)\) admits an open-loop equilibrium pair \((X^{t,x,*}, u^{t,x,*})\), which is given in (2.45) and (2.46).

(ii) If the sequence \({u^{t,t,x,*}, \varepsilon > 0}\) is bounded in \(L^2_T(\mathbb{T}_t; \mathbb{R}^m)\), then Problem (LQ) for the initial pair \((t, x)\) admits an open-loop equilibrium pair.

Proof. (i) follows directly from the comments above.

(ii). As \({u^{t,t,x,*}, \varepsilon > 0}\) is bounded in \(L^2_T(\mathbb{T}_t; \mathbb{R}^m)\), there exists a weakly convergent subsequence \({u^{t,t,x,*}, j \in \{0, 1, 2, \ldots\}\}) of \({u^{t,t,x,*}, \varepsilon > 0}\) with its weak limit \(\tilde{\mathbf{u}}^{t,x,*}\). We can further select a subsequence of \({u^{t,t,x,*}, j \in \{0, 1, 2, \ldots\}\}) such that the subsequence converges strongly to \(\tilde{\mathbf{u}}^{t,x,*}\). Without loss of generality, we assume that \({u^{t,t,x,*}, j \in \{0, 1, 2, \ldots\}\}) converges to \(\tilde{\mathbf{u}}^{t,x,*}\) strongly. Denote \(\tilde{X}^{t,x,*}\) as the solution to the following equation

\[
\begin{align*}
    \begin{cases}
    X^{t,x,*}_{k+1} = [A_{k,k} X^{t,x,*}_k + B_{k,k} \tilde{\mathbf{u}}^{t,x,*} + f_k,k] + [C_{k,k} \tilde{X}^{t,x,*}_k + D_{k,k} \tilde{\mathbf{u}}^{t,x,*} + d_{k,k}] w_k, \\
    X^{t,x,*}_t = x, \quad k \in \mathbb{T}_t.
    \end{cases}
\end{align*}
\]

Clearly,

\[
\tilde{X}^{t,x,*}_k = X^{t,x,*}_k + \tilde{X}^{t,0,*}_k, \quad k \in \mathbb{T}_t,
\]

where \(\tilde{X}^{t,x,*}_k\) and \(\tilde{X}^{t,0,*}_k\) are computed via

\[
\begin{align*}
    \begin{cases}
    \tilde{X}^{t,x,*}_{k+1} = [A_{k,k} \tilde{X}^{t,x,*}_k + f_k,k] + [C_{k,k} \tilde{X}^{t,x,*}_k + d_{k,k}] w_k, \\
    \tilde{X}^{t,x,*}_t = x, \quad k \in \mathbb{T}_t,
    \end{cases}
\end{align*}
\]

and

\[
\begin{align*}
    \begin{cases}
    \tilde{X}^{t,0,*}_{k+1} = [A_{k,k} \tilde{X}^{t,0,*}_k + B_{k,k} \tilde{\mathbf{u}}^{t,x,*} + f_k,k] + [C_{k,k} \tilde{X}^{t,0,*}_k + D_{k,k} \tilde{\mathbf{u}}^{t,x,*} + d_{k,k}] w_k, \\
    \tilde{X}^{t,0,*}_t = 0, \quad k \in \mathbb{T}_t.
    \end{cases}
\end{align*}
\]

From (2.49), (2.48) actually introduces an affine operator, which is defined from \(L^2_T(\mathbb{T}_t; \mathbb{R}^m)\) to \(L^2_T(\mathbb{T}_t; \mathbb{R}^m)\), i.e., \(\tilde{X}^{t,x,*} = \tilde{X}^{t,x,*} + \Theta(\tilde{\mathbf{u}}^{t,x,*})\) with \(\tilde{X}^{t,0,*} = \Theta(\tilde{\mathbf{u}}^{t,x,*})\). It can be shown that the operator \(\Theta\) is linear and bounded. As \(u^{t,t,x,*}\) converges strongly to \(\tilde{\mathbf{u}}^{t,x,*}\), \(X^{t,t,x,*} = \tilde{X}^{t,x,*} + \Theta(\tilde{\mathbf{u}}^{t,x,*})\) will converge strongly to \(\tilde{X}^{t,x,*} = \tilde{X}^{t,x,*} + \Theta(\tilde{\mathbf{u}}^{t,x,*})\). Furthermore, from the definition of open-loop equilibrium control, it follows that for any \(k \in \mathbb{T}_t\) and any \(u_k \in L^2_T(k; \mathbb{R}^m)\)

\[
J(k, X^{t,t,x,*}_k; u^{t,t,x,*}_k, \mathbb{T}_k) + \varepsilon_j \mathbb{E}[|u^{t,t,x,*}_k|^2] \leq J(k, X^{t,t,x,*}_k; (u_k, u^{t,t,x,*}_k)_{1 \to k}) + \varepsilon_j \mathbb{E}[|u_k|^2].
\]

Letting \(j \to \infty\) in (2.50), we have for any \(k \in \mathbb{T}_t\) and any \(u_k \in L^2_T(k; \mathbb{R}^m)\)

\[
J(k, X^{t,t,x,*}_k; \mathbb{R}^{t,x,*}|_{\mathbb{T}_k}) \leq J(k, X^{t,t,x,*}_k; (u_k, \mathbb{R}^{t,x,*}|_{\mathbb{T}_k+1})).
\]

By (2.48), we can assert that \((\tilde{X}^{t,x,*}, \tilde{\mathbf{u}}^{t,x,*})\) is an open-loop equilibrium pair of Problem (LQ) for the initial pair \((t, x)\). \(\square\)
Under the point-wise convexity condition (2.47), above theorem tells us that Problem (LQ) is “almost” solvable: for any arbitrarily small $\varepsilon$, the perturbation version Problem (LQ)$_\varepsilon$ of Problem (LQ) is solvable for any initial pair. Naturally, we may ask: when will Problem (LQ) be solvable for all the initial pairs? The following lemma presents a sufficient condition to the existence of the open-loop equilibrium control of Problem (LQ).

**Lemma 2.10.** For $W_k, H_k, \beta_k, k \in \mathbb{T}_t$ (defined in (2.31)), if
\[ W_k W_k^T H_k - H_k = 0, \quad W_k W_k^T \beta_k - \beta_k = 0, \quad k \in \mathbb{T}_t \tag{2.52} \]
are satisfied and (2.27) is solvable, then Problem (LQ) for the initial pair $(t, x)$ admits an open-loop equilibrium pair.

**Proof.** Introduce a dynamics
\[
\begin{align*}
\dot{X}_{k+1}^{t,x} &= [(A_k - B_k W_k H_k) \dot{X}_k^{t,x} + f_k, k - B_k W_k^T \beta_k] \\
&+ [(A_k - B_k W_k H_k) \dot{X}_k^{t,x} + d_k, k - D_k W_k^T \beta_k] w_k,
\end{align*}
\tag{2.53}
\]
and a control
\[
\ddot{u}_k^{t,x} = -W_k H_k \ddot{X}_k^{t,x} - W_k^T \beta_k, \quad k \in \mathbb{T}_t.
\tag{2.54}
\]
Then, by reversing the first part of the proof of Theorem 2.8, we can show that for any $k \in \mathbb{T}_t$, the following FBS\DeltaE admits a solution
\[
\begin{align*}
\dot{Z}_{k+1}^{t,x} &= (A_k \dot{X}_k^{t,x} + A_k E_k \dot{X}_k^{t,x} + B_k u_k^{t,x} + B_k E_k \dot{u}_k^{t,x} + f_k, t) \\
&+ (C_k \dot{X}_k^{t,x} + C_k E_k \dot{X}_k^{t,x} + D_k \dot{u}_k^{t,x} + D_k E_k \ddot{u}_k^{t,x} + d_k, t) w_t,
\end{align*}
\tag{2.55}
\]
with properties
\[
\begin{align*}
Z_t^{t,x} &= P_k \dot{X}_t^{t,x} + P_k \dot{E}_k \dot{X}_t^{t,x} + T_k \dot{X}_t^{t,x} + T_k \dot{E}_k \dot{X}_t^{t,x} + \pi_k, t, \quad t \in \mathbb{T}_k,
\end{align*}
\tag{2.56}
\]
and
\[
0 = R_{k,k} \dot{u}_k^{t,x} + B_{k,k} E_k \dot{Z}_{k+1}^{t,x} + D_{k,k} E_k \ddot{Z}_{k+1}^{t,x} + \rho_{k,k}.
\tag{2.57}
\]
Furthermore, by (2.28) and (2.19) we have (2.12). From Theorem 2.3, $(\ddot{X}^{t,x}, \ddot{u}^{t,x})$ is an open-loop equilibrium pair of Problem (LQ) for the initial pair $(t, x)$. This completes the proof. \qed

**Theorem 2.11.** The following statements are equivalent.

(i) For any $t \in \mathbb{T}$ and any $x \in L^2_{\mathbb{T}}(t; \mathbb{R}^n)$, Problem (LQ) admits an open-loop equilibrium pair for the initial pair $(t, x)$.
(ii) \((2.47)\), the set of GDREs

\[
\begin{align*}
T_{k,\ell} &= A_{k,\ell}^T T_{k,\ell+1} A_{k,\ell} + C_{k,\ell}^T T_{k,\ell+1} C_{k,\ell} \\
&\quad - \left( A_{k,\ell}^T P_{k,\ell+1} B_{k,\ell} + A_{k,\ell}^T T_{k,\ell+1} B_{k,\ell} + C_{k,\ell}^T P_{k,\ell+1} D_{k,\ell} + C_{k,\ell}^T T_{k,\ell+1} D_{k,\ell} \right) W_{k,\ell}^1 H_{k,\ell}, \\
T_{k,\ell} &= A_{k,\ell}^T T_{k,\ell+1} A_{k,\ell} + C_{k,\ell}^T T_{k,\ell+1} C_{k,\ell} \\
&\quad - \left( A_{k,\ell}^T P_{k,\ell+1} B_{k,\ell} + A_{k,\ell}^T T_{k,\ell+1} B_{k,\ell} + C_{k,\ell}^T P_{k,\ell+1} D_{k,\ell} + C_{k,\ell}^T T_{k,\ell+1} D_{k,\ell} \right) W_{k,\ell}^1 H_{k,\ell}, \\
T_{k,N} &= 0, \quad T_{k,N} = 0, \\
W_k W_k^1 H_k - H_k &= 0, \\
k \in T,
\end{align*}
\]

and the set of LDEs

\[
\begin{align*}
\pi_{k,\ell} &= A_{k,\ell}^T P_{k,\ell+1} \left( f_{k,\ell} - B_{k,\ell} W_{k,\ell}^1 \beta_{k,\ell} \right) + A_{k,\ell}^T T_{k,\ell+1} \left( f_{k,\ell} - B_{k,\ell} W_{k,\ell}^1 \beta_{k,\ell} \right) \\
&\quad + C_{k,\ell}^T P_{k,\ell+1} \left( d_{k,\ell} - D_{k,\ell} W_{k,\ell}^1 \beta_{k,\ell} \right) + C_{k,\ell}^T T_{k,\ell+1} \left( d_{k,\ell} - D_{k,\ell} W_{k,\ell}^1 \beta_{k,\ell} \right) \\
&\quad + A_{k,\ell}^T N_{k,\ell+1} + g_{k,\ell}, \\
\pi_{k,N} &= g_k, \\
W_k W_k^1 \beta_k - \beta_k &= 0, \\
k \in T.
\end{align*}
\]

are solvable in the sense

\[
\begin{align*}
R_{k,k} + B_{k,k}^T P_{k,k+1} B_{k,k} + D_{k,k}^T P_{k,k+1} D_{k,k} &\geq 0, \\
W_k W_k^1 H_k - H_k &= 0, \\
W_k W_k^1 \beta_k - \beta_k &= 0, \\
k \in T.
\end{align*}
\]

Here,

\[
\begin{align*}
W_k &= R_{k,k} + B_{k,k}^T \left( P_{k,k+1} + T_{k,k+1} \right) B_{k,k} + D_{k,k}^T \left( P_{k,k+1} + T_{k,k+1} \right) D_{k,k}, \\
H_k &= B_{k,k}^T \left( P_{k,k+1} + T_{k,k+1} \right) A_{k,k} + D_{k,k}^T \left( P_{k,k+1} + T_{k,k+1} \right) C_{k,k}, \\
\beta_k &= B_{k,k}^T \left( \left( P_{k,k+1} + T_{k,k+1} \right) f_{k,k} + \pi_{k,k+1} \right) + D_{k,k}^T \left( P_{k,k+1} + T_{k,k+1} \right) d_{k,k} + \rho_{k,k}, \\
k \in T.
\end{align*}
\]

Under any of above conditions, an open-loop equilibrium control for the initial pair \((t,x)\) is given in \((2.35)\).

**Proof.** The sufficiency follows from Lemma 2.10. As for the necessity, by Theorem 2.8 we need only to prove

\[
W_k W_k^1 H_k - H_k = 0, \quad W_k W_k^1 \beta_k - \beta_k = 0, \quad k \in T. \tag{2.57}
\]

Consider Problem (LQ) for the initial pair \((N-1,x)\) with \(x \in L_2^2(N-1;\mathbb{R}^n)\). By the proof of Theorem 2.8, we have

\[
0 = W_{N-1} u_{N-1}^{N-1,x} + H_{N-1} X_{N-1}^{N-1,x} + \beta_{N-1}. \tag{2.58}
\]

Noting \(X_{N-1}^{N-1,x} = x\) and taking \(x = 0\) in \((2.58)\), we have

\[
0 = W_{N-1} u_{N-1}^{N-1,0} + \beta_{N-1}, \tag{2.59}
\]
which together with Lemma 2.7 leads to $W_{N-1}W_{N-1}^T \beta_{N-1} - \beta_{N-1} = 0$. Furthermore, by subtracting (2.59) from (2.58) we have

$$0 = W_{N-1} \left( u_{N-1}^{N-1,x,*} - u_{N-1}^{N-1,0,*} \right) + H_{N-1}x.$$ 

Let $e_i$ be a $\mathbb{R}^n$-valued vector with its $i$-th entry being 1 and other entries 0. Then, we have

$$0 = W_{N-1} \left( u_{N-1}^{N-1,e_1,*} - u_{N-1}^{N-1,0,*}, ..., u_{N-1}^{N-1,e_n,*} - u_{N-1}^{N-1,0,*} \right) + H_{N-1} (e_1, ..., e_n).$$

Noting that $(e_1, ..., e_n)$ is the identity matrix and by Lemma 2.7, we have $W_{N-1}W_{N-1}^T \beta_{N-1} - \beta_{N-1} = 0$.

Considering Problem (LQ) for the initial pair $(N-2, x)$ with $x \in L_2^2(N-2; \mathbb{R}^n)$, we can similarly prove

$$W_{N-2}W_{N-2}^T \beta_{N-2} - \beta_{N-2} = 0.$$ 

Continuing above procedure backwardly, we then achieve the conclusion. 

Note that $P_{k,t}, P_{k,t}, k \in \mathbb{T}, \ell \in \mathbb{T}_{k+1}$, are symmetric. If $Q_{k,t}, Q_{k,t}, R_{k,t}, R_{k,t}$ are selected such that $Q_{k,t} = Q_{k,t} + R_{k,t}, R_{k,t} + R_{k,t} \geq 0, k \in \mathbb{T}, \ell \in \mathbb{T}_k$, then (2.47) is solvable. Furthermore, as indicated in (2.23), $\Theta_{k,t} = \{P_{k,t}, P_{k,t}, T_{k,t}, T_{k,t}, \pi_{k,t}\}$ is used to express $Z_{k,t}^{*,*,*}$. $\{P_{k,t}, P_{k,t}\}$ is then called the symmetric part of $\Theta_{k,t}$, and $\{T_{k,t}, T_{k,t}\}$, $\pi_{k,t}$ are viewed as the nonsymmetric part and nonhomogeneous part, respectively.

To end this section, we give some comments on the open-loop equilibrium control $u^{t,x,*}$ and its closed-loop expression (2.35). Generally speaking, for deterministic problems, an open-loop control is a functional of initial state and the time variable, and a closed-loop control is a functional of the observed state information. As all the states are essentially functionals of initial state and the time variable, a closed-loop control is an open-loop control indeed. Concerned with the stochastic case, a control problem is formulated within a random background, which is characterized via a filtration. It is better to select the open-loop control to be adapted to the background filtration. For example, an open-loop control in this paper is selected to be adapted to $\{F_k\}$. The closed-loop control is similarly defined as that for the deterministic case, and also a closed-loop control is an open-loop control. Therefore, though (2.35) is of closed-loop form, it is indeed an open-loop control.

## 3 Some Special Cases

### 3.1 The state matrices and weighting matrices are independent of the initial time

In this case, the system dynamics and the cost functional are, respectively, given by

$$\begin{align*}
X_{k+1}^t & = \left( A_k X_k^t + A_k V_k X_k^t + B_k u_k + B_k E \varepsilon_t u_k + f_k \right) \\
X_k^t & = x_k, \quad k \in \mathbb{T}_l, \quad t \in \mathbb{T},
\end{align*}
$$

and

$$J(t, x; u) = \sum_{k=t}^{N-1} E_t \left[ \left( X_k^T (Q_k + (E_t X_k^T) (E_t X_k + u_k^T R_k u_k + (E_t u_k) (E_t u_k + 2g_k^T X_k + 2p_k^T u_k) \right] \\
+ E_t \left[ (X_k^T G X_k^T) + (E_t X_k^T) (E_t X_k + 2g_k^T X_k) \right] \right].$$

16
Problem (LQ) corresponding to (3.1) and (3.2) will be denoted as Problem (LQ)$_{a1}$. Now, (2.47), (2.55) and (2.56) become

$$\begin{aligned}
P_k &= Q_k + A_k^T P_{k+1} A_k + C_k^T P_{k+1} C_k, \\
P_k &= Q_k + A_k^T P_{k+1} A_k + C_k^T P_{k+1} C_k, \\
P_N &= G, \quad P_N = G, \\
\mathcal{R}_k + B_k^T P_{k+1} B_k + D_k^T P_{k+1} D_k &\geq 0, \\
k &\in T,
\end{aligned}
$$

(3.3)

and

$$\begin{aligned}
T_k &= A_k^T T_{k+1} A_k + C_k^T T_{k+1} C_k \\
&\quad - (A_k^T P_{k+1} B_k + A_k^T T_{k+1} B_k + C_k^T P_{k+1} D_k + C_k^T T_{k+1} D_k) W_k^T H_k, \\
\mathcal{T}_k &= A_k^T \mathcal{T}_{k+1} A_k + C_k^T \mathcal{T}_{k+1} C_k \\
&\quad - (A_k^T (P_{k+1} + \mathcal{T}_{k+1}) B_k + C_k^T (P_{k+1} + \mathcal{T}_{k+1}) D_k) W_k^T H_k, \\
T_N &= 0, \quad \mathcal{T}_N = 0, \\
W_k W_k^T H_k - H_k &= 0, \\
k &\in T,
\end{aligned}
$$

(3.4)

and

$$\begin{aligned}
\pi_k &= A_k^T \pi_{k+1} (f_k - B_k W_k \beta_k) + A_k^T \mathcal{T}_{k+1} (f_k - B_k W_k \beta_k) + A_k^T \pi_{k+1} \\
&\quad + C_k^T P_{k+1} (d_k - D_k W_k \beta_k) + C_k^T T_{k+1} (d_k - D_k W_k \beta_k) + q_k, \\
\pi_N &= g, \\
W_k W_k^T \beta_k - \beta_k &= 0, \\
k &\in T,
\end{aligned}
$$

(3.5)

where

$$\begin{aligned}
W_k &= \mathcal{R}_k + B_k^T (P_{k+1} + \mathcal{T}_{k+1}) B_k + D_k^T (P_{k+1} + \mathcal{T}_{k+1}) D_k, \\
\mathcal{H}_k &= B_k^T (P_{k+1} + \mathcal{T}_{k+1}) A_k + D_k^T (P_{k+1} + \mathcal{T}_{k+1}) C_k, \\
\beta_k &= B_k^T [(P_{k+1} + \mathcal{T}_{k+1}) f_k + \pi_{k+1}] + D_k^T (P_{k+1} + \mathcal{T}_{k+1}) d_k + \rho_k, \\
k &\in T.
\end{aligned}
$$

By Theorem 2.11, we have the following result.

**Corollary 3.1.** For any $t \in \mathbb{T}$ and any $x \in L^2_+(t; \mathbb{R}^n)$, Problem (LQ)$_{a1}$ for the initial pair $(t, x)$ admits an open-loop equilibrium pair if and only if (3.3), (3.4) and (3.5) are solvable.

### 3.2 The case without mean-field terms

Consider the following system dynamics and cost functional

$$\begin{aligned}
X_{k+1} &= (A_{t,k} X_k + B_{t,k} u_k + f_{t,k}) + (C_{t,k} X_k + D_{t,k} u_k + d_{t,k}) w_k, \\
X_t^i &= x, \quad k \in T_i, \quad t \in T,
\end{aligned}
$$

(3.6)

and

$$\begin{aligned}
J(t, x; u) &= \sum_{k=t}^{N-1} \mathbb{E}_t [X_k^T Q_t X_k + u_k^T R_t u_k + 2q_{t,k}^T X_k + 2p_{t,k}^T u_k] \\
&\quad + \mathbb{E}_t [(X_N^T G_1 X_N^i) + 2\mathbb{E}_t g_t^T X_N^i].
\end{aligned}
$$

(3.7)
Problem (LQ) corresponding to (3.6) and (3.7) will be denoted as Problem (LQ)_s2. In this case, we have

\[
\begin{align*}
P_{k,t} &= Q_{k,t} + A_{k,t}^T P_{k,t+1} A_{k,t} + C_{k,t}^T P_{k,t+1} C_{k,t}, \\
P_{k,k} &= G_k, \quad \ell \in \mathbb{T}, \\
R_{k,k} &= B_{k,k}^T P_{k,k+1} B_{k,k} + D_{k,k}^T P_{k,k+1} D_{k,k} \geq 0, \\
\ell \in \mathbb{T},
\end{align*}
\]  
(3.8)

\[
\begin{align*}
T_{k,t} &= A_{k,t}^T T_{k,t+1} A_{k,t} + C_{k,t}^T T_{k,t+1} C_{k,t} \\
- (A_{k,t}^T (P_{k,t+1} + T_{k,t+1}) B_{k,t} + C_{k,t}^T (P_{k,t+1} + T_{k,t+1}) D_{k,t}) W_{k,t+1}^T H_{k,t}, \\
T_{k,k} &= 0, \\
\ell \in \mathbb{T},
\end{align*}
\]  
(3.9)

\[
\begin{align*}
\pi_{k,t} &= A_{k,t}^T P_{k,t+1} (f_{k,t} - B_{k,t} W_{k,t+1}^T \beta_t) + A_{k,t}^T T_{k,t+1} (f_{k,t} - B_{k,t} W_{k,t+1}^T \beta_t) \\
+ C_{k,t}^T P_{k,t+1} (d_{k,t} - D_{k,t} W_{k,t+1}^T \beta_t) + C_{k,t}^T T_{k,t+1} (d_{k,t} - D_{k,t} W_{k,t+1}^T \beta_t) \\
+ A_{k,t}^T \pi_{k,t+1} + g_{k,t},
\end{align*}
\]  
(3.10)

where

\[
\begin{align*}
W_k &= R_{k,k} + B_{k,k}^T (P_{k,k+1} + T_{k,k+1}) B_{k,k} + D_{k,k}^T (P_{k,k+1} + T_{k,k+1}) D_{k,k}, \\
H_k &= B_{k,k}^T (P_{k,k+1} + T_{k,k+1}) A_{k,k} + D_{k,k}^T (P_{k,k+1} + T_{k,k+1}) C_{k,k}, \\
\beta_k &= B_{k,k}^T [(P_{k,k+1} + T_{k,k+1}) f_{k,k} + \pi_{k,k+1}] + D_{k,k}^T (P_{k,k+1} + T_{k,k+1}) d_{k,k} + \rho_{k,k}, \\
k \in \mathbb{T}.
\end{align*}
\]

**Corollary 3.2.** For any \( t \in \mathbb{T} \) and any \( x \in L_2^2(t; \mathbb{R}^n) \), Problem (LQ)_s2 for the initial pair \((t, x)\) admits an open-loop equilibrium pair if and only if (3.8), (3.9) and (3.10) are solvable.

In Theorem 2.2 of [16], a necessary and sufficient condition to the existence of open-loop equilibrium pair is presented for the following system

\[
\begin{align*}
X_{k+1} &= (A_k X_k + B_k u_k + f_k) + (C_k X_k + D_k u_k + d_k) w_k, \\
X_t &= x, \quad \ell \in \mathbb{T}, \quad t \in \mathbb{T},
\end{align*}
\]  
(3.11)

The matrices in (3.11) are independent of the initial time. Hence, Corollary 3.2 is an extension of Theorem 2.2 in [16].

### 4 Example

In this section, we will use an example to illustrate the theory on solving Problem (LQ).

**Example 4.1** Consider a version of Problem (LQ) with \( N = 2 \), whose system matrices and weighting matrices are given below

\[
A_{0,0} = \begin{bmatrix} 3.3 & 0.41 \\ -1.3 & 1.9 \end{bmatrix}, \quad A_{0,1} = \begin{bmatrix} 5.12 & -0.35 \\ 1.31 & 2.03 \end{bmatrix}, \quad A_{0,0} = \begin{bmatrix} 3.34 & -1.01 \\ 1.43 & 2.03 \end{bmatrix},
\]

18
\[ A_{0,1} = \begin{bmatrix} 3.45 & -0.3 \\ 1.2 & 4 \end{bmatrix}, \quad B_{0,0} = \begin{bmatrix} 3.5 & 1.6 \\ -0.2 & 3 \end{bmatrix}, \quad B_{0,1} = \begin{bmatrix} 4.45 & 2.36 \\ -1.2 & 5 \end{bmatrix}, \]
\[ B_{0,0} = \begin{bmatrix} 3.2 & 0.32 \\ 1.5 & 3 \end{bmatrix}, \quad B_{0,1} = \begin{bmatrix} 3.65 & -0.3 \\ -0.42 & 5.6 \end{bmatrix}, \quad C_{0,0} = \begin{bmatrix} 5.6 & 1 \\ 0.73 & 7.8 \end{bmatrix}, \]
\[ C_{0,1} = \begin{bmatrix} 5 & 0.73 \\ -0.47 & 5.2 \end{bmatrix}, \quad C_{0,0} = \begin{bmatrix} 5.6 & 1 \\ 0.73 & 7.8 \end{bmatrix}, \quad C_{0,1} = \begin{bmatrix} 5 & 0.73 \\ -0.47 & 5.2 \end{bmatrix}, \]
\[ D_{0,0} = \begin{bmatrix} 6 & 1.63 \\ -1.37 & 7 \end{bmatrix}, \quad D_{0,1} = \begin{bmatrix} 4 & 0.93 \\ 1.07 & 3 \end{bmatrix}, \quad D_{0,0} = \begin{bmatrix} 4.6 & 0.63 \\ -1.57 & 6.4 \end{bmatrix}, \]
\[ D_{0,1} = \begin{bmatrix} 4.4 & 1.93 \\ 2.34 & 5.63 \end{bmatrix}, \quad A_{1,1} = \begin{bmatrix} 8.5 & 3.03 \\ -2.23 & 7.2 \end{bmatrix}, \quad A_{1,1} = \begin{bmatrix} 5.67 & 1.93 \\ -1.16 & 6.54 \end{bmatrix}, \]
\[ B_{1,1} = \begin{bmatrix} 7.35 & -2.35 \\ -3.38 & 6.32 \end{bmatrix}, \quad B_{1,1} = \begin{bmatrix} 5.67 & 1.93 \\ -1.16 & 6.54 \end{bmatrix}, \quad C_{1,1} = \begin{bmatrix} 2.5 & 3.03 \\ -4.23 & 6.2 \end{bmatrix}, \]
\[ C_{1,1} = \begin{bmatrix} 10.17 & 5.93 \\ -6.16 & 7.54 \end{bmatrix}, \quad D_{1,1} = \begin{bmatrix} 8.56 & -4.75 \\ -2.8 & 0 \end{bmatrix}, \quad D_{1,1} = \begin{bmatrix} -8.72 & 2.43 \\ 1.16 & -6.54 \end{bmatrix}, \]
\[ Q_{0,0} = \begin{bmatrix} -1 & 0.8 \\ 0.8 & -1.6 \end{bmatrix}, \quad Q_{0,1} = \begin{bmatrix} 4 & 0 \\ 0 & 0 \end{bmatrix}, \quad \bar{Q}_{0,0} = \begin{bmatrix} -0.5 & -0.1 \\ -0.1 & 1 \end{bmatrix}, \quad \bar{Q}_{0,1} = \begin{bmatrix} -2 & 0 \\ 0 & -3 \end{bmatrix}, \]
\[ R_{0,0} = \begin{bmatrix} -0.5 & 0 \\ 0 & 1 \end{bmatrix}, \quad R_{0,1} = \begin{bmatrix} 1 & 0 \\ 0 & -2 \end{bmatrix}, \quad \bar{R}_{0,0} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}, \quad \bar{R}_{0,1} = \begin{bmatrix} -2 & 0 \\ 0 & 2 \end{bmatrix}, \]
\[ Q_{1,1} = \begin{bmatrix} 2 & 0.1 \\ 0.1 & 5 \end{bmatrix}, \quad Q_{1,1} = \begin{bmatrix} -1 & 0.1 \\ 0.1 & -3 \end{bmatrix}, \quad R_{1,1} = \begin{bmatrix} 4 & -0.3 \\ -0.3 & -2 \end{bmatrix}, \quad \bar{R}_{1,1} = \begin{bmatrix} -7 & -1.3 \\ -1.3 & -4 \end{bmatrix}, \]
\[ G_0 = \begin{bmatrix} 1 & 0 \\ 0 & 2 \end{bmatrix}, \quad G_1 = \begin{bmatrix} 2 & -0.3 \\ -0.3 & 3 \end{bmatrix}, \quad \bar{G}_0 = \begin{bmatrix} 2 & 0 \\ 0 & 3 \end{bmatrix}, \quad \bar{G}_1 = \begin{bmatrix} -0.5 & -0.2 \\ -0.2 & 1 \end{bmatrix}, \]
\[ f_{0,0} = \begin{bmatrix} -0.5 \\ -1 \end{bmatrix}, \quad f_{0,1} = \begin{bmatrix} -1.34 \\ 2.5 \end{bmatrix}, \quad d_{0,0} = \begin{bmatrix} 1.32 \\ 2.79 \end{bmatrix}, \quad d_{0,1} = \begin{bmatrix} -0.35 \\ 8.9 \end{bmatrix}, \]
\[ f_{1,1} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}, \quad d_{1,1} = \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \quad q_{0,0} = \begin{bmatrix} -0.85 \\ -1.8 \end{bmatrix}, \quad q_{0,1} = \begin{bmatrix} 2 \\ 7 \end{bmatrix}, \quad \rho_{0,0} = \begin{bmatrix} 3.2 \\ 2.1 \end{bmatrix}, \]
\[ \rho_{0,1} = \begin{bmatrix} 1.42 \\ 2.71 \end{bmatrix}, \quad q_{1,1} = \begin{bmatrix} 6 \\ 8 \end{bmatrix}, \quad \rho_{1,1} = \begin{bmatrix} 6.2 \\ -5.7 \end{bmatrix}, \quad g_0 = \begin{bmatrix} 5.6 \\ 7.8 \end{bmatrix}, \quad g_1 = \begin{bmatrix} -9 \\ 8.7 \end{bmatrix}. \]

Note that \( Q_{k,t}, Q_{k,t}, R_{k,t}, R_{k,t}, k = 0, 1, t = k, 1 \) are not fully nonnegative definite, since for example \( Q_{0,0} \) is negative definite and \( R_{0,0} \) is indefinite.

By the iterations of (2.47), (2.55) and (2.56), we can get the values of the solutions with

\[
R_{1,1} + B_{1,1}^T P_{1,2} B_{1,1} + D_{1,1}^T P_{1,2} D_{1,1} = \begin{bmatrix} 400.8004 & -330.6524 \\ -330.6524 & 673.2241 \end{bmatrix} > 0,
\]
\[
R_{0,0} + B_{0,0}^T P_{0,1} B_{0,0} + D_{0,0}^T P_{0,1} D_{0,0} = \begin{bmatrix} 24299 & 11560 \\ 11560 & 28652 \end{bmatrix} > 0,
\]
\[
W_1 = \begin{bmatrix} 400.8004 & -330.6524 \\ -330.6524 & 673.2241 \end{bmatrix}, \quad W_0 = \begin{bmatrix} 12637 & 932 \\ -6334 & 3464 \end{bmatrix}. \]

The sets of eigenvalues of \( W_1 \) and \( W_0 \) are \( \{179.4026, 894.6219\} \) and \( \{11940, 4160\} \), respectively. Hence, \( W_1 \) and \( W_0 \) are both invertible. Therefore, the corresponding (2.47), (2.55) and (2.56) are solvable, and for any initial pair \((t, x)\) with \( t = 0, 1, x \in L^2_x(t; \mathbb{R}^2) \) the considered LQ problem admits an open-loop
equilibrium pair. Furthermore, an open-loop equilibrium control for the initial pair \((0, x)\) is given by
\[
u_k^{0,x,*} = -\mathcal{W}_{k}^1 \mathcal{H}_k X_0^{0,x,*} - \mathcal{W}_{k}^1 \beta_k, \quad k = 0, 1,
\]
where
\[
\mathcal{W}_{1}^1 \mathcal{H}_1 = \begin{bmatrix}
1.1320 & 0.1179 \\
0.0254 & 1.0388
\end{bmatrix}, \quad \mathcal{W}_{0}^1 \mathcal{H}_0 = \begin{bmatrix}
0.8661 & -0.4704 \\
0.0520 & 0.9824
\end{bmatrix},
\]
\[
\mathcal{W}_{1}^1 \beta_1 = \begin{bmatrix}
-0.3381 \\
0.1433
\end{bmatrix}, \quad \mathcal{W}_{0}^1 \beta_0 = \begin{bmatrix}
-0.2003 \\
-0.1582
\end{bmatrix},
\]
and
\[
\begin{aligned}
X_{k+1}^{0,x,*} &= [A_{k,k} X_k^{0,x,*} + B_{k,k} u_k^{0,x,*} + f_{k,k}] \\
&+ [C_{k,k} X_k^{0,x,*} + D_{k,k} u_k^{0,x,*} + d_{k,k}] w_k,
\end{aligned}
\]
\[
X_0^{0,x,*} = x, \quad k \in \{0, 1\}.
\]

5 Conclusion

In this paper, the open-loop time-consistent equilibrium control is investigated for a kind of mean-field stochastic LQ problem, where both the system matrices and the weighting matrices are depending on the initial time, and the conditional expectations of the control and state enter quadratically into the cost functional. Necessary and sufficient conditions are presented for both the case with a fixed initial pair and the case with all the initial pairs. Furthermore, a set of constrained GDREs and two sets of constrained LDEs are introduced to characterize the closed-loop form of open-loop equilibrium control. Note that this paper is concerned with the time-consistency of open-loop control. For future research, the time-consistency of the strategy should be studied.

Appendix

A. Proof of Lemma 2.2

Proof. Let us replace \( u_k \) with \( u_k + \lambda \bar{u}_k \) in the forward SDE of (2.8), and denote its solution by \( X^{k,\lambda} \). Then, we have

\[
\begin{align*}
\frac{x_{k+1}^{k,\lambda} - x_{k+1}^{k,u_k}}{\lambda} &= \left( A_{k,\ell} \frac{x_{k}^{k,\lambda} - x_{k}^{k,u_k}}{\lambda} + \bar{A}_{k,\ell} \frac{E_{k}x_{k}^{k,\lambda} - E_{k}x_{k}^{k,u_k}}{\lambda} \right) w_{\ell}, \\
\frac{x_{k+1}^{k,\lambda} - x_{k+1}^{k,u_k}}{\lambda} &= \left( A_{k,\ell} \frac{x_{k}^{k,\lambda} - x_{k}^{k,u_k}}{\lambda} + \bar{A}_{k,\ell} \frac{E_{k}x_{k}^{k,\lambda} - E_{k}x_{k}^{k,u_k}}{\lambda} \right) w_{\ell}, \\
\frac{x_{k+1}^{k,\lambda} - x_{k+1}^{k,u_k}}{\lambda} &= 0, \quad \ell \in T_{k+1}.
\end{align*}
\]

Denoting \( \frac{x_{k+1}^{k,\lambda} - x_{k+1}^{k,u_k}}{\lambda} \) by \( Y_{k+1}^{k,u_k} \), we get

\[
\begin{align*}
Y_{k+1}^{k,u_k} &= A_{k,\ell} Y_{k}^{k,u_k} + \bar{A}_{k,\ell} E_{k} Y_{k}^{k,u_k} + (C_{k,\ell} Y_{k}^{k,u_k} + \bar{C}_{k,\ell} E_{k} Y_{k}^{k,u_k}) w_{\ell}, \\
Y_{k+1}^{k,u_k} &= (B_{k,\ell} + \bar{B}_{k,\ell} u_k + (D_{k,\ell} + \bar{D}_{k,\ell} E_{k} u_k) w_k, \quad \ell \in T_{k+1}.
\end{align*}
\] (5.1)

Here, we have used the fact \( E_{k}u_k = u_k \). Note that \( X^{k,\lambda} = X_{\ell}^{k,u_k} + \lambda Y_{\ell}^{k,u_k}, \forall \ell \in T_{k} \). Then, we have

\[
\begin{align*}
J(k, \zeta; (u_k + \lambda \bar{u}_k, u_{T_{k+1}})) &= J(k, \zeta; u) \\
&= \sum_{k=0}^{N-1} \mathbb{E}_{k} \left\{ (X_{k}^{k,u_k} + \lambda Y_{k}^{k,u_k})^T Q_{k,\ell} (X_{k}^{k,u_k} + \lambda Y_{k}^{k,u_k}) + [\mathbb{E}_{k}(X_{k}^{k,u_k} + \lambda Y_{k}^{k,u_k})]^T \bar{Q}_{k,\ell} \mathbb{E}_{k}(X_{k}^{k,u_k} + \lambda Y_{k}^{k,u_k}) \right. \\
&\quad + 2q_{k,\ell}^T (X_{k}^{k,u_k} + \lambda Y_{k}^{k,u_k}) - (X_{k}^{k,u_k})^T Q_{k,\ell} X_{k}^{k,u_k} - [\mathbb{E}_{k}X_{k}^{k,u_k}]^T \bar{Q}_{k,\ell} \mathbb{E}_{k}X_{k}^{k,u_k} - 2q_{k,\ell}^T X_{k}^{k,u_k} \right) \\
&\quad + (u_k + \lambda \bar{u}_k)^T (R_{k,\ell} + \bar{R}_{k,\ell})(u_k + \lambda \bar{u}_k) + 2p_{k,\ell}(u_k + \lambda \bar{u}_k) - u_k^T (R_{k,\ell} + \bar{R}_{k,\ell}) u_k - 2p_{k,\ell} u_k \\
&\quad + [\mathbb{E}_{k}(X_{k}^{k,u_k} + \lambda Y_{k}^{k,u_k})]^T G_{k} \mathbb{E}_{k}(X_{k}^{k,u_k} + \lambda Y_{k}^{k,u_k}) + \mathbb{E}_{k}[(X_{k}^{k,u_k} + \lambda Y_{k}^{k,u_k})^T G_{k}(X_{k}^{k,u_k} + \lambda Y_{k}^{k,u_k})] \\
&\quad + 2 \mathbb{E}_{k}[g_{k}^T (X_{k}^{k,u_k} + \lambda Y_{k}^{k,u_k})] - \mathbb{E}_{k}[(X_{k}^{k,u_k})^T G_{k} X_{k}^{k,u_k}] - (\mathbb{E}_{k}X_{k}^{k,u_k})^T G_{k} \mathbb{E}_{k}X_{k}^{k,u_k} - 2 \mathbb{E}_{k}g_{k}^T X_{k}^{k,u_k} \\
&= 2\lambda \sum_{k=0}^{N-1} \mathbb{E}_{k} \left\{ (X_{k}^{k,u_k})^T Q_{k,\ell} Y_{k}^{k,u_k} + q_{k,\ell}^T Y_{k}^{k,u_k} + [\mathbb{E}_{k}X_{k}^{k,u_k}]^T \bar{Q}_{k,\ell} \mathbb{E}_{k}Y_{k}^{k,u_k} + u_k^T (R_{k,\ell} + \bar{R}_{k,\ell}) u_k \\
&\quad + \rho_{k,\ell} u_k + \mathbb{E}_{k}[(X_{k}^{k,u_k})^T G_{k} Y_{k}^{k,u_k}] + \mathbb{E}_{k}[g_{k}^T Y_{k}^{k,u_k}] + [\mathbb{E}_{k}X_{k}^{k,u_k}]^T G_{k} \mathbb{E}_{k} Y_{k}^{k,u_k} \right. \\
&\quad + \lambda^2 \sum_{k=0}^{N-1} \mathbb{E}_{k} \left\{ (Y_{k}^{k,u_k})^T Q_{k,\ell} Y_{k}^{k,u_k} + [\mathbb{E}_{k}Y_{k}^{k,u_k}]^T \bar{Q}_{k,\ell} \mathbb{E}_{k}Y_{k}^{k,u_k} + u_k^T (R_{k,\ell} + \bar{R}_{k,\ell}) u_k \\
&\quad + \mathbb{E}_{k}[Y_{k}^{k,u_k}]^T G_{k} Y_{k}^{k,u_k}] + (\mathbb{E}_{k}Y_{k}^{k,u_k})^T G_{k} \mathbb{E}_{k} Y_{k}^{k,u_k} \right\}. \quad (5.2)
\end{align*}
\]

On the other hand, we have

\[
\sum_{k=0}^{N-1} \mathbb{E}_{k} \left\{ (X_{k}^{k,u_k})^T Q_{k,\ell} Y_{k}^{k,u_k} + q_{k,\ell}^T Y_{k}^{k,u_k} + [\mathbb{E}_{k}X_{k}^{k,u_k}]^T \bar{Q}_{k,\ell} \mathbb{E}_{k}Y_{k}^{k,u_k} + u_k^T (R_{k,\ell} + \bar{R}_{k,\ell}) u_k \\
&\quad + \rho_{k,\ell} u_k + \mathbb{E}_{k}[(X_{k}^{k,u_k})^T G_{k} Y_{k}^{k,u_k}] + [\mathbb{E}_{k}X_{k}^{k,u_k}]^T G_{k} \mathbb{E}_{k} Y_{k}^{k,u_k} \right\} \\
&= \sum_{k=0}^{N-1} \mathbb{E}_{k} \left\{ (Q_{k,\ell}(X_{k}^{k,u_k} - \mathbb{E}_{k}X_{k}^{k,u_k}) + A_{k,\ell}(\mathbb{E}_{k}Z_{k+1}^{k,u_k} - \mathbb{E}_{k}Z_{k+1}^{k,u_k}) \right) \\
&= \sum_{k=0}^{N-1} \mathbb{E}_{k} \left\{ (Q_{k,\ell}X_{k}^{k,u_k} - \mathbb{E}_{k}X_{k}^{k,u_k}) + A_{k,\ell}(\mathbb{E}_{k}Z_{k+1}^{k,u_k} - \mathbb{E}_{k}Z_{k+1}^{k,u_k}) \right\}. \quad (5.3)
\]
\[
+ C_{k,\ell}^T \left( \mathbb{E}_k \left( Z_{\ell+1}^{k,u} w_\ell \right) - \mathbb{E}_k \left( \int_{\ell+1}^{t,x} \right) \right) \mathbb{E}_k \left( Z_{\ell+1}^{k,u} w_\ell \right) + \left( \tilde{Q}_{k,\ell} + \tilde{A}_{k,\ell} \right) \mathbb{E}_k \left( \int_{\ell+1}^{t,x} \right) \mathbb{E}_k \left( Z_{\ell+1}^{k,u} w_\ell \right) + \frac{1}{2} \mathbb{E}_k \left( \int_{\ell+1}^{t,x} \mathbb{E}_k \left( Z_{\ell+1}^{k,u} w_\ell \right) \right)^2
\]

This together with (5.2) implies the conclusion.

\[\blacksquare\]

**B. Proof of Theorem 2.3**

**Proof.** (i)⇒(ii). Let \((X^{t,x*}, u^{t,x*})\) be an equilibrium pair. As (2.10) is a decoupled FBS\(\Delta\)E, (2.10) is solvable. From (2.6) we have

\[
J(k, X_k^{t,x*}; \{u_k^{t,x*} + \lambda \tilde{u}_k, u_k^{t,x*} \mid \tau_k+1 \}) - J(k, X_k^{t,x*}; u_k^{t,x*}) = 2\lambda \left( R_{k,k} + R_{k,k} \right) u_k^{t,x*} + (B_{k,k} + B_{k,k})^T \mathbb{E}_k \left( \int_{k+1}^{t,x} \mathbb{E}_k \left( Z_{k+1}^{k,u} w_k \right) + \rho_{k,k} \right)^T \tilde{u}_k
\]

\[
+ \sum_{\ell=k}^{N-1} \mathbb{E}_k \left( \left( Y_{\ell}^{k,\tilde{u}_{\ell}} \right)^T Q_{k,\ell} Y_{\ell}^{k,\tilde{u}_{\ell}} + E_k \left( \left( Y_{\ell}^{k,\tilde{u}_{\ell}} \right)^T \bar{Q}_{k,\ell} E_k \left( Y_{\ell}^{k,\tilde{u}_{\ell}} \right) \right) + \mathbb{E}_k \left( \left( Y_N^{k,\tilde{u}_N} \right)^T G_N Y_N^{k,\tilde{u}_N} + E_k \left( \left( Y_N^{k,\tilde{u}_N} \right)^T \bar{G}_N E_k \left( Y_N^{k,\tilde{u}_N} \right) \right) \right) \tilde{u}_k \neq 0,
\]

and

\[
\delta_2 = \sum_{\ell=k}^{N-1} \mathbb{E}_k \left( \left( Y_{\ell}^{k,\tilde{u}_{\ell}} \right)^T Q_{k,\ell} Y_{\ell}^{k,\tilde{u}_{\ell}} + E_k \left( \left( Y_{\ell}^{k,\tilde{u}_{\ell}} \right)^T \bar{Q}_{k,\ell} E_k \left( Y_{\ell}^{k,\tilde{u}_{\ell}} \right) \right) + \mathbb{E}_k \left( \left( Y_N^{k,\tilde{u}_N} \right)^T G_N Y_N^{k,\tilde{u}_N} + E_k \left( \left( Y_N^{k,\tilde{u}_N} \right)^T \bar{G}_N E_k \left( Y_N^{k,\tilde{u}_N} \right) \right) \right) \tilde{u}_k \neq 0,
\]

When \(\delta_2 = 0\), we select \(\lambda = -\delta_1\), which together with (5.3) implies

\[
J(k, X_k^{t,x*}; \{u_k^{t,x*} + \lambda \tilde{u}_k, u_k^{t,x*} \mid \tau_k+1 \}) - J(k, X_k^{t,x*}; u_k^{t,x*}) = -\delta_1^2 < 0.
\]

This is impossible. When \(\delta_2 \neq 0\) (which is positive), we select \(\lambda = -\theta \delta_1 < 0\) with \(\theta = -\frac{1}{\delta_2}\). In this case, we have

\[
J(k, X_k^{t,x*}; \{u_k^{t,x*} + \lambda \tilde{u}_k, u_k^{t,x*} \mid \tau_k+1 \}) - J(k, X_k^{t,x*}; u_k^{t,x*}) = 2\theta \delta_1^2 + \theta^2 \delta_2^2 \delta_2 = \delta_1^2 \theta < 0,
\]

which contradicts (5.3).

(ii)⇒(i). In this case, for any \(\lambda \in \mathbb{R}\) and \(\tilde{u}_k \in L_2^2(k; \mathbb{R}^m)\) we have

\[
J(k, X_k^{t,x*}; \{u_k^{t,x*} + \lambda \tilde{u}_k, u_k^{t,x*} \mid \tau_k+1 \}) - J(k, X_k^{t,x*}; u_k^{t,x*})
\]
We now move to the case of $k = t$. Let $u^t, x^t \in \mathbb{R}^n$. Let $X_t = \{ x^t \}$. Hence, we have

\[
X_t = \left\{ \begin{array}{l}
\{ (A_t + \delta_{1,t})X_t + (B_t + \gamma_{t,t})u_t + f_t \}
\{ (C_t + \delta_{2,t})X_t + (D_t + \gamma_{t,t})u_t + d_t \}
\end{array} \right.
\]

and for any $u_t \in L_2^2(t; \mathbb{R}^n)$,

\[
J_t(t, u; x^t, \mu_t, \gamma_t) \leq J_t(t, (u_t^t, x^t, \mu_t, \gamma_t)).
\]

We now move to the case of $k = t + 1$. We have

\[
X_{t+1} = \left\{ \begin{array}{l}
\{ (A_{t+1} + \delta_{1,t+1})X_{t+1} + (B_{t+1} + \gamma_{t,t+1})u_{t+1} + f_{t+1} \}
\{ (C_{t+1} + \delta_{2,t+1})X_{t+1} + (D_{t+1} + \gamma_{t,t+1})u_{t+1} + d_{t+1} \}
\end{array} \right.
\]

and for any $u_{t+1} \in L_2^2(t+1; \mathbb{R}^n)$,

\[
J_t(t+1, X_{t+1}^t, u^t, x^t, \mu_t, \gamma_t) \leq J_t(t+1, (u_{t+1}^t, x_{t+1}^t, \mu_t, \gamma_t)).
\]

Continuing the above procedure of obtaining (5.5)-(5.8), we have for any $k \in \mathbb{T}$

\[
X_{k+1} = \left\{ \begin{array}{l}
\{ (A_{k,k} + \delta_{1,k})X_{k+1} + (B_{k,k} + \gamma_{k,k})u_{k+1} + f_{k,k} \}
\{ (C_{k,k} + \delta_{2,k})X_{k+1} + (D_{k,k} + \gamma_{k,k})u_{k+1} + d_{k,k} \}
\end{array} \right.
\]

and for any $u_k \in L_2^2(k; \mathbb{R}^n)$,

\[
J_t(k, X_{k+1}^t, u^t, x^t, \mu_t, \gamma_t) \leq J_t(k, (u_k^t, x_k^t, \mu_t, \gamma_k)).
\]

Denote $\{ x_k, X_{k+1}^t, X_{k+2}^t, \ldots, X_{N-1}^t, X_N^t \}$ by $\{ x^t, X_{t+1}^t, X_{t+2}^t, \ldots, X_{N-1}^t, X_N^t \} = X^t$. Then, $(X^t, u^t)$ is an open-loop equilibrium pair. This proves the theorem. \hfill \Box

**C. Proof of Lemma 2.6**

Proof. Let $u^t, x^t = \Psi_{t+1}^t, x^t, \alpha_t, \ell_t \in \mathbb{R}$. Then, we have

\[
X_{k,t} = A_{k,t}X_{k,t} + B_{k,t}X_{k,t} + C_{k,t}X_{k,t} + D_{k,t}X_{k,t} + E_{k,t}X_{k,t} + G_{k,t}X_{k,t} + H_{k,t}X_{k,t} + I_{k,t}X_{k,t} + J_{k,t}X_{k,t} + K_{k,t}X_{k,t} + L_{k,t}X_{k,t} + M_{k,t}X_{k,t} + N_{k,t}X_{k,t} + O_{k,t}X_{k,t} + P_{k,t}X_{k,t} + Q_{k,t}X_{k,t} + R_{k,t}X_{k,t} + S_{k,t}X_{k,t} + T_{k,t}X_{k,t} + U_{k,t}X_{k,t} + V_{k,t}X_{k,t} + W_{k,t}X_{k,t} + X_{k,t} + Y_{k,t}X_{k,t} + Z_{k,t}X_{k,t} + \alpha_t \ell_t \in \mathbb{R}.
\]

To calculate $X_{N-1, t}^t$, we need some preparations. Noting that

\[
Z_{N-1}^t = G_kX_{N-1}^t + \bar{G}_kE_kX_{N-1}^t + g_k,
\]

we get

\[
A_{k,N-1}^T E_{N-1} Z_{N-1}^t = A_{k,N-1}^T E_{N-1} \left[ G_kX_{N-1}^t + \bar{G}_kE_kX_{N-1}^t + g_k \right]
\]
Similarly, we have the expressions of $\tilde{A}_{k,N-1}^T\mathbb{E}_k X^{k,t,x}_{N-1}$, $C_{k,N-1}^T \mathbb{E}_k \left( Z^{k,t,x}_{N-1} w_{N-1} \right)$ and $C_{k,N-1}^T \mathbb{E}_k \left( Z^{k,t,x}_{N-1} w_{N-1} \right)$. Furthermore, we calculate $Z^{k,t,x}_{N-1}$. Note that

$$Z^{k,t,x}_{N-1} = (Q_{k,N-2} + A_{k,N-2}^T \Psi_{N-2} X_{N-2}^{k,t,x} + A_{k,N-2}^T \tilde{P}_{k,N-2} A_{k,N-2}) X_{N-2}^{k,t,x}$$

and similar expressions for $C_{k,N-2}^T \mathbb{E}_k \left( Z^{k,t,x}_{N-1} w_{N-2} \right)$, $A_{k,N-2}^T \mathbb{E}_k Z^{k,t,x}_{N-2}$ and $C_{k,N-2}^T \mathbb{E}_k \left( Z^{k,t,x}_{N-2} w_{N-2} \right)$. Then, from (2.10) we have

$$Z^{k,t,x}_{N-2} = (Q_{k,N-2} + A_{k,N-2}^T \Psi_{N-2} X_{N-2}^{k,t,x} + A_{k,N-2}^T \tilde{P}_{k,N-2} A_{k,N-2}) X_{N-2}^{k,t,x}$$

and similar expressions for $C_{k,N-2}^T \mathbb{E}_k \left( Z^{k,t,x}_{N-2} w_{N-2} \right)$, $A_{k,N-2}^T \mathbb{E}_k Z^{k,t,x}_{N-3}$ and $C_{k,N-2}^T \mathbb{E}_k \left( Z^{k,t,x}_{N-3} w_{N-2} \right)$. Then, from (2.10) we have

$$Z^{k,t,x}_{N-2} = (Q_{k,N-2} + A_{k,N-2}^T \Psi_{N-2} X_{N-2}^{k,t,x} + A_{k,N-2}^T \tilde{P}_{k,N-2} A_{k,N-2}) X_{N-2}^{k,t,x}$$

and similar expressions for $C_{k,N-2}^T \mathbb{E}_k \left( Z^{k,t,x}_{N-2} w_{N-2} \right)$, $A_{k,N-2}^T \mathbb{E}_k Z^{k,t,x}_{N-3}$ and $C_{k,N-2}^T \mathbb{E}_k \left( Z^{k,t,x}_{N-3} w_{N-2} \right)$.
\[ + C_k^{T} P_{k,N-2} + \bar{A}_k^{T} P_{k,N-1} B_{k,N-2} + \bar{A}_k^{T} T_{k,N-2} \]
\[ \times (A_{N-2,N-2} + B_{N-2,N-2} \Psi_{N-2}) + C_k^{T} P_{k,N-1} D_{k,N-2} \Psi_{N-1} + \bar{C}_k^{T} T_{k,N-2} \]
\[ \times (C_{N-2,N-2} + D_{N-2,N-2} \Psi_{N-2}) \]
\[ \bar{E}_k X_{k,t,x,N-2}^{t,t,x} + \bar{A}_k^{T} P_{k,N-1} (B_{k,N-2} \alpha_{N-2} + f_{k,N-2}) \]
\[ + \bar{A}_k^{T} T_{k,N-2} (B_{N-2,N-2} + f_{N-2,N-2}) + \bar{A}_k^{T} P_{k,N-1} (B_{k,N-2} \alpha_{N-2} + d_{k,N-2}) \]
\[ + \bar{C}_k^{T} T_{k,N-1} (D_{N-2,N-2} \alpha_{N-2} + d_{N-2,N-2}) + \bar{C}_k^{T} P_{k,N-1} (D_{k,N-2} \alpha_{N-2} + d_{k,N-2}) \]
\[ + \bar{C}_k^{T} T_{k,N-1} (D_{N-2,N-2} + d_{N-2,N-2}) + \bar{A}_k^{T} \pi_{k,N-2} + q_{k,N-2} \]
\[ = P_{k,N-2} X_{N-2}^{k,t,t,x} + \bar{P}_{k,N-2} E_k X_{N-2}^{t,t,x} + T_{k,N-2} X_{N-2}^{t,t,x} + \bar{T}_{k,N-2} E_k X_{N-2}^{t,t,x} + \pi_{k,N-2}. \]

By deduction, we achieve the conclusion. This completes the proof. \qed
