FAMILIES OF LOW DIMENSIONAL DETERMINANTAL SCHEMES.

JAN O. KLEPPE

Abstract. A scheme $X \subset \mathbb{P}^n$ of codimension $c$ is called standard determinantal if its homogeneous saturated ideal can be generated by the $t \times t$ minors of a homogeneous $t \times (t + c - 1)$ matrix $(f_{ij})$. Given integers $a_0 \leq a_1 \leq \ldots \leq a_{t+c-2}$ and $b_1 \leq \ldots \leq b_t$, we denote by $W_s(b; a) \subset \text{Hilb}(\mathbb{P}^n)$ the stratum of standard determinantal schemes where $f_{ij}$ are homogeneous polynomials of degrees $a_j - b_i$ and Hilb$(\mathbb{P}^n)$ is the Hilbert scheme (if $n - c > 0$, resp. the postulation Hilbert scheme if $n - c = 0$).

Focusing mainly on zero and one dimensional determinantal schemes we determine the codimension of $W_s(b; a)$ in Hilb$(\mathbb{P}^n)$ and we show that Hilb$(\mathbb{P}^n)$ is generically smooth along $W_s(b; a)$ under certain conditions. For zero dimensional schemes (only) we find a counterexample to the conjectured value of dim$W_s(b; a)$ appearing in [26].

1. Introduction

The goal of this paper is to study maximal families of determinantal schemes. Recall that a scheme $X \subset \mathbb{P}^n$ of codimension $c$ is called determinantal if its homogeneous saturated ideal can be generated by the $r \times r$ minors of a homogeneous $p \times q$ matrix $(f_{ij})$ with $c = (p-r+1)(q-r+1)$. If $r = \min(p, q)$, then $X$ is called standard determinantal. $X$ is called good determinantal if it is standard determinantal and a generic complete intersection.

Let Hilb$(\mathbb{P}^n)$ be the Hilbert scheme (resp. postulation Hilbert scheme, i.e. the Hilbert scheme of constant Hilbert function) parameterizing closed subschemes of $\mathbb{P}^n$ of dimension $n - c > 0$ (resp. $n - c = 0$). Given integers $a_1 \leq a_2 \leq \ldots \leq a_p$ and $b_1 \leq \ldots \leq b_q$, we denote by $W_s(b; a)$ (resp. $W_s(b; a)$) the stratum in Hilb$(\mathbb{P}^n)$ consisting of good (resp. standard) determinantal schemes where $f_{ij}$ are homogeneous polynomials of degrees $a_j - b_i$. Then $W_s(b; a)$ is irreducible and $W_s(b; a) \neq \emptyset$ if and only if $W_s(b; a) \neq \emptyset$ (Corollary 2.1).

In this paper we focus, notably for zero dimensional schemes, on the following problems.

(1) Determine when the closure of $W_s(b; a)$ is an irreducible component of Hilb$(\mathbb{P}^n)$.

(2) Find the codimension of $W_s(b; a)$ in Hilb$(\mathbb{P}^n)$ if its closure is not a component.

(3) Determine when Hilb$(\mathbb{P}^n)$ is generically smooth along $W_s(b; a)$.

This paper generalizes and completes several results of [25] and [26] for schemes of dimension 0 or 1. Moreover we announced in [26], Rem. 6.3 that [25], §10 contains inaccurate results in the zero dimensional case, which we fully correct in this paper (Remark 4.26).

By successively deleting columns of the matrix associated to a determinantal scheme $X$, we get a nest ("flag") of closed subschemes $X = X_c \subset X_{c-1} \subset \ldots \subset X_2 \subset \mathbb{P}^n$. We prove our results inductively by considering the smoothness of the Hilbert flag scheme.
of pairs and its natural projections into the Hilbert schemes. Note that, for \( c = 2 \), one knows that the closure \( \overline{W(b; a)} \) is a generically smooth irreducible component of \( \text{Hilb}(\mathbb{P}^n) \) (i.e. \( \text{Hilb}(\mathbb{P}^n) \) is smooth along some non-empty open subset \( U \) of \( \text{Hilb}(\mathbb{P}^n) \) satisfying \( U \subset \overline{W(b; a)} \)), see Theorem 4.10.

In this approach we need to prove that certain (kernels of) \( \text{Ext}^1 \)-groups vanish or to compute its dimensions. If \( \dim X = 1 \) (resp. 0), then one (resp. 2 or 3) of these \( \text{Ext}^1 \)-groups may be non-zero and its dimension (resp. the sum of its dimensions) is precisely the codimension of \( W(b; a) \) in \( \text{Hilb}(\mathbb{P}^n) \) under certain assumptions, see Theorem 4.19, Proposition 4.24 and Proposition 4.15 of Section 4. These are main results of this paper, together with the key Proposition 4.6 which through Proposition 4.13 and Lemma 4.4 give the tools we need in the proofs. As a consequence, if the mentioned \( \text{Ext}^1 \)-groups vanish and \( c \leq 5 \) or 6, we get that the closure \( \overline{W(b; a)} \) is a generically smooth irreducible component of \( \text{Hilb}(\mathbb{P}^n) \) and that every deformation of a general \( X \) of \( W(b; a) \) comes from deforming the defining matrix \( (f_{ij}) \) of \( X \). Note that this conclusion holds if \( \dim X \geq 2 \) and \( 3 \leq c \leq 4 \) because the above \( \text{Ext}^1 \)-groups vanish by [20] and [25]. If the codimension of \( W(b; a) \) in \( \text{Hilb}(\mathbb{P}^n) \) is positive, there are deformations of \( X \) which do not come from deforming the matrix \( (f_{ij}) \). In the proofs we use results of [26] and [25] (see Section 3 which also contains a counterexample to the Conjectures of [26] in the case \( \dim X = 0 \), as well as the Eagon-Northcott and Buchsbaum-Rim complexes ([9], [5], [10]). We give many examples, supported by Macaulay 2 computations [13], to illustrate the results.

As an application we expect that the results for zero dimensional schemes \( X = \text{Proj}(A) \) of this paper, together with the main result of [23] in which artinian Gorenstein rings are obtained by dividing \( A \) with ideals being isomorphic to a fixed twist of the canonical module of \( A \), can be used in the classification of Gorenstein quotients of a polynomial ring of e.g. codimension 4 from the point of view of determining PGor\((H)\), cf. [20], [22].

Some of the results of this paper were lectured at the "4th World Conference on 21st Century Mathematics 2009" in Lahore in March 2009. The author thanks the organizers for their hospitality. Moreover I thank prof. R.M. Miró-Roig at Barcelona for interesting comments and our discussion on the Conjectures 3.1 and 3.2 and the counterexample 3.3.

**Notation:** In this paper \( \mathbb{P} := \mathbb{P}^n \) will be the projective \( n \)-space over an algebraically closed field \( k \), \( R = k[x_0, x_1, \ldots, x_n] \) is a polynomial ring and \( \mathfrak{m} = (x_0, \ldots, x_n) \).

We mainly keep the notations of [26]. If \( X \subset Y \) are closed subschemes of \( \mathbb{P}^n \), we denote by \( \mathcal{I}_{X/Y} \) (resp. \( \mathcal{N}_{X/Y} \)) the ideal (resp. normal) sheaf of \( X \) in \( Y \). Note that by the codimension, \( \text{codim}_Y X \), of \( X \) in \( Y \) we simply mean \( \dim Y - \dim X \), also in non arithmetically Cohen-Macaulay cases. For any closed subscheme \( X \) of \( \mathbb{P}^n \) of codimension \( c \), we denote by \( \mathcal{I}_X \) its ideal sheaf, \( \mathcal{N}_X \) its normal sheaf, \( \omega_X = R^c_{\mathcal{O}_X}(\mathcal{O}_{\mathbb{P}^n})(-n-1) \). When we write \( X = \text{Proj}(A) \) we take \( A := R/\mathcal{I}_X \) and \( K_A = \text{Ext}^c_R(\mathcal{O}_A, R)(-n-1) \). We denote the group of morphisms between coherent \( \mathcal{O}_X \)-modules by \( \text{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) \) while \( \text{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) \) denotes the sheaf of local morphisms. Moreover we set \( \text{Hom}(\mathcal{F}, \mathcal{G}) = \dim_k \text{Hom}(\mathcal{F}, \mathcal{G}) \) and we correspondingly use small letters for the dimension, as a \( k \)-vector space, of similar groups.

We denote the Hilbert scheme by \( \text{Hilb}^p(\mathbb{P}^n) \), \( p \) the Hilbert polynomial [14], and \( (X) \in \text{Hilb}^p(\mathbb{P}^n) \) for the point which corresponds to the subscheme \( X \subset \mathbb{P}^n \). We denote by
GradAlg(H), or Hilb^H(\mathbb{P}^n), the representing object of the functor which parameterizes flat families of graded quotients A of \( R \) of depth \( A \geq \min(1, \dim A) \) and with Hilbert function \( H \) \cite{22, 23}, and we call it “the postulation Hilbert scheme” \cite{23, §1.1} even though it may be different from the parameter space studied by Gotzmann, Iarrobino and others \cite{12, 20} who study the “same” scheme with the reduced scheme structure (ours may be non-reduced and is equivalent to the Hilbert scheme of constant postulation considered in \cite{34} in the curve case. They are both special cases of the multigraded Hilbert scheme of Haiman and Sturmfels \cite{17}). Again we let \((A), \text{ or } (X)\) where \( X = \text{Proj}(A) \), denote the point of GradAlg(H) which corresponds to \( A \). Note that if \( \text{depth}_m A \geq 1 \) and \( \text{O} \text{Hom}_R(I_X, H^1_{m}(A)) = 0 \), then

\[
\text{GradAlg}(H) \simeq \text{Hilb}^P(\mathbb{P}^n) \quad \text{at} \quad (X),
\]

and hence we have an isomorphism \( \text{O} \text{Hom}(I_X, A) \simeq H^0(N_X) \) of their tangent spaces (cf. \cite{11} for the case \( \text{depth}_m A \geq 2 \), and \cite{23, (9)} for the general case). If \((1.1)\) holds and \( X \) is generically a complete intersection, then \( \text{O} \text{Ext}_A^1(I_X/I_X^2, A) \) is an obstruction space of GradAlg(H) and hence of \( \text{Hilb}^P(\mathbb{P}^n) \) at \((X)\) \cite{23, §1.1}. When we simply write \( \text{Hilb}(\mathbb{P}^n) \), we interpret it as the Hilbert scheme (resp. postulation Hilbert scheme) if \( n-c > 0 \) (resp. \( n-c = 0 \)). By definition \( X \) (resp. \( A \)) is unobstructed if \( \text{Hilb}^P(\mathbb{P}^n) \) (resp. \( \text{Hilb}^H(\mathbb{P}^n) \)) is smooth at \((X)\). Note that we called \( X \) \text{\textit{H-unobstructed}} in \cite{24} if \( A \) was unobstructed.

We say that \( X \) is general in some irreducible subset \( W \subset \text{Hilb}(\mathbb{P}^n) \) if \((X)\) belongs to a sufficiently small open subset \( U \) of \( W \) (so any \((X)\) in \( U \) has all the openness properties that we want to require).

2. Background

In this section we recall some basic results on standard (resp. good) determinantal schemes needed in the sequel, see \cite{3, 10} and \cite{2} for more details. Let

\[
\varphi : F = \bigoplus_{i=1}^t R(b_i) \longrightarrow G := \bigoplus_{j=0}^{t+c-2} R(a_j)
\]

be a graded morphism of free \( R \)-modules and let \( A = (f_{ij})_{i=1,...,t; j=0,...,t+c-2} \), \( \deg f_{ij} = a_j - b_i \), be a \( t \times (t+c-1) \) homogeneous matrix which represents the dual \( \varphi^* := \text{Hom}_R(\varphi, R) \). Let \( I(A) = I_\varphi(A) = I_\varphi(\varphi) \) be the ideal of \( R \) generated by the maximal minors of \( A \). In the following we always suppose

\[
c \geq 2, \quad t \geq 2, \quad b_1 \leq ... \leq b_t \quad \text{and} \quad a_0 \leq a_1 \leq ... \leq a_{t+c-2}.
\]

Recall that a codimension \( c \) subscheme \( X \subset \mathbb{P}^n \) is standard determinantal if \( I_X = I(A) \) for some homogeneous \( t \times (t+c-1) \) matrix \( A \) as above. Moreover \( X \subset \mathbb{P}^n \) is a good determinantal scheme if additionally, \( A \) contains a \( (t-1) \times (t+c-1) \) submatrix (allowing a change of basis if necessary) whose ideal of maximal minors defines a scheme of codimension \( c+1 \). Note that if \( X \) is standard determinantal and a generic complete intersection in \( \mathbb{P}^n \), then \( X \) is good determinantal, and conversely \cite{28}, Thm. 3.4. Without loss of generality we assume that \( A \) is minimal; i.e., \( f_{ij} = 0 \) for all \( i, j \) with \( b_i = a_j \).

Let \( W(b; a) \) (resp. \( W_{s}(b; a) \)) be the stratum in \( \text{Hilb}(\mathbb{P}^n) \) consisting of good (resp. standard) determinantal schemes. By \cite{26}, Cor. 2.5 and see the end of p. 2877, we get
Corollary 2.1. $W(b; a) \neq \emptyset$ if and only if $W_\alpha(b; a) \neq \emptyset$ if and only if $a_{i-1} - b_i > 0$ for $i = 1, \ldots, t$. Moreover, their closures in $\text{Hilb}(\mathbb{P}^n)$ are equal and irreducible.

Let $A := R/I_i(A)$ and $M := \text{coker}(\varphi^*)$. Using the generalized Koszul complexes associated to a codimension $c$ standard determinantal scheme $X$, one knows that the Eagon-Northcott complex yields the following minimal free resolution
\begin{equation}
0 \to \Lambda^{t+c-1}G^* \otimes S_{c-1}(F) \otimes \Lambda^tF \to \Lambda^{t+c-2}G^* \otimes S_{c-2}(F) \otimes \Lambda^tF \to \cdots
\end{equation}
of $A$ and that the Buchsbaum-Rim complex yields a minimal free resolution of $M$;
\begin{equation}
0 \to \Lambda^{t+c-1}G^* \otimes S_{c-2}(F) \otimes \Lambda^tF \to \Lambda^{t+c-2}G^* \otimes S_{c-3}(F) \otimes \Lambda^tF \to \cdots
\end{equation}
See, for instance [3], Thm. 2.20 and [10], Cor. A2.12 and Cor. A2.13. Note that (2.2) show that any standard determinantal scheme is arithmetically Cohen-Macaulay (ACM).

Let $B$ be the matrix obtained deleting the last column of $A$ and let $B$ be the $k$-algebra given by the maximal minors of $B$. Let $Y = \text{Proj}(B)$. The transpose of $B$ induces a map $\phi : F = \oplus_{i=1}^t R(b_i) \to G' := \oplus_{j=0}^{t+c-3} R(a_j)$. Let $M_B$ be the cokernel of $\phi^* = \text{Hom}_R(\phi, R)$ and let $M_A = M$. In this situation we recall that there is an exact sequence
\begin{equation}
0 \to B \to M_B(a_{t+c-2}) \to M_A(a_{t+c-2}) \to 0
\end{equation}
in which $B \to M_B(a_{t+c-2})$ is a regular section given by the last column of $A$. Moreover,
\begin{equation}
0 \to M_B(a_{t+c-2})^* := \text{Hom}_B(M_B(a_{t+c-2}), B) \to B \to A \to 0
\end{equation}
is exact by [28] or [25] (3.1), i.e. we may put $I_{X/Y} := M_B(a_{t+c-2})^*$. Due to (2.3), $M$ is a maximal Cohen-Macaulay $A$-module, and so is $I_{X/Y}$ by (2.5). By [10] we have $K_A(n+1) \simeq S_{c-1}M_A(\ell_c)$, and hence $K_B(n+1) \simeq S_{c-2}M_B(\ell_{c-1})$, where
\begin{equation}
\ell_i := \sum_{j=0}^{t+i-2} a_j - \sum_{k=1}^t b_k \text{ for } 2 \leq i \leq c.
\end{equation}
Hence by successively deleting columns from the right hand side of $A$, and taking maximal minors, one gets a flag of determinantal subschemes
\begin{equation}(\text{X}.i) : X = X_c \subset X_{c-1} \subset \ldots \subset X_2 \subset \mathbb{P}^n
\end{equation}
where each $X_{i+1} \subset X_i$ (with ideal sheaf $\mathcal{I}_{X_{i+1}/X_i} = \mathcal{I}_i$) is of codimension 1, $X_i \subset \mathbb{P}^n$ is of codimension $i$ and where there exist $\mathcal{O}_{X_i}$-modules $\mathcal{M}_i$ fitting into short exact sequences
\begin{equation}
0 \to \mathcal{O}_{X_i}(-a_{t+i-1}) \to \mathcal{M}_i \to \mathcal{M}_{i+1} \to 0 \text{ for } 2 \leq i \leq c-1,
\end{equation}
such that $\mathcal{I}_i(a_{t+i-1})$ is the $\mathcal{O}_{X_i}$-dual of $\mathcal{M}_i$ for $2 \leq i \leq c$, and $\mathcal{M}_2$ is a twist of the canonical module of $X_2$. In this context we let $D_i := R/I_{X_i}$, $I_{D_i} = I_{X_i}$ and $I_i := I_{D_{i+1}}/I_{D_i}$.

Remark 2.2. Let $\alpha$ be a positive integer. If $X$ is general in $W(b; a)$ and $u_{i-\min(\alpha,t),i} = a_{\min(\alpha,t)} - b_i \geq 0$ for $\min(\alpha, t) \leq i \leq t$, then $X_j$, for all $j = 2, \ldots, c$, is non-singular except for a subset of codimension at least $\min(2\alpha - 1, j + 2)$, i.e.
\begin{equation}
codim_{X_j} \text{Sing}(X_j) \geq \min(2\alpha - 1, j + 2).
\end{equation}
As observed in Rem. 2.7 of [26], this follows from the Theorem of [6] by arguing as in [6], Example 2.1. See [35] for a special case. In particular, if \( \alpha \geq 3 \), we get that for each \( i \geq 0 \), the closed embeddings \( X_i \subset \mathbb{P}^n \) and \( X_{i+1} \subset X_i \) are local complete intersections outside some set \( Z_i \) of codimension at least \( \min(4, i + 1) \) in \( X_{i+1} \) (depth\( _Z \mathcal{O}_{X_{i+1}} \geq \min(4, i + 1) \)), cf. next paragraph.

In what follows we always let \( Z \subset X \) (and similarly for \( Z_i \subset X_i \)) be some closed subset such that \( U := X - Z \hookrightarrow \mathbb{P}^n \) (resp. \( U_i := X_i - Z_i \hookrightarrow \mathbb{P}^n \)) is a local complete intersection (l.c.i.). Since the \( 1 \). Fitting ideal of \( \mathcal{M} \) is equal to \( I_{t-1}(\varphi) \), we get that \( \tilde{M} \) is locally free of rank one precisely on \( X - V(I_{t-1}(\varphi)) \) [2], Lem. 1.4.8. Since the set of non locally complete intersection points of \( X \hookrightarrow \mathbb{P}^n \) is exactly \( V(I_{t-1}(\varphi)) \) by e.g. [37], Lem. 1.8, we get that \( U \subset X - V(I_{t-1}(\varphi)) \) and that \( \tilde{M} \) is locally free on \( U \). Indeed \( \mathcal{M}_i \) and \( \mathcal{T}_{X_i}/\mathcal{T}_{X_i}^2 \) are locally free on \( U_i \), as well as on \( U_{i-1} \cap X_i \). Note that since \( V(I_{t-1}(\mathcal{B})) \subset V(I_t(\mathcal{A})) \), we may suppose \( Z_{i-1} \subset X_i \).

Finally notice that there is a close relation between \( M(a_{t+c-2}) \) and the normal module \( N_{X/Y} \) of the quotient \( B \simeq R/I_Y \to A \simeq R/I_X \). If we suppose \( \text{depth}_{I(Z)} B \geq 2 \) where now \( Y - Z \hookrightarrow \mathbb{P}^n \) is an l.c.i., we get by applying \( \text{Hom}_B(I_{X/Y}, -) \) to (2.5), that

\[
(2.10) \quad 0 \longrightarrow B \longrightarrow M_B(a_{t+c-2}) \longrightarrow N_{X/Y}
\]

is exact. Hence we have an injection \( M_A(a_{t+c-2}) \hookrightarrow N_{X/Y} \), which in the case \( \text{depth}_{I(Z)} B \geq 3 \) leads to an isomorphism \( M_A(a_{t+c-2}) \simeq N_{X/Y} \). Indeed, this follows from the more general fact (by letting \( L = N = I_{X/Y} \)) that if \( L \) and \( N \) are finitely generated \( B \)-modules such that \( \text{depth}_{I(Z)} L \geq r + 1 \) and \( N \) is locally free on \( U := X - Y \), then the natural map

\[
(2.11) \quad \text{Ext}^i_B(N, L) \longrightarrow H^i_{\mathcal{O}_Y}(\mathcal{N}, \mathcal{L})
\]

is an isomorphism (resp. an injection) for \( i < r \) (resp. \( i = r \)), and \( H^i_{\mathcal{O}_Y}(\mathcal{N}, \mathcal{L}) \simeq H^{i+1}_{\mathcal{O}_Y}(\mathcal{B}, \mathcal{N}, \mathcal{L}) \) for \( i > 0 \), cf. [13], exp. VI. Note that we interpret \( I(Z) \) as \( \mathfrak{m} \) if \( Z = \emptyset \).

3. THE DIMENSION OF THE DETERMINANTAL LOCUS

In [26] we conjectured the dimension of \( W(b; a) \) in terms of the invariant

\[
(3.1) \quad \lambda_c := \sum_{i,j} \binom{a_i - b_j + n}{n} + \sum_{i,j} \binom{b_j - a_i + n}{n} - \sum_{i,j} \binom{a_i - a_j + n}{n} - \sum_{i,j} \binom{b_j - b_i + n}{n} + 1.
\]

Here the indices belonging to \( a_j \) (resp. \( b_i \)) range over \( 0 \leq j \leq t + c - 2 \) (resp. \( 1 \leq i \leq t \)), \( \binom{a}{n} = 0 \) if \( a < n \) and we always suppose \( W(b; a) \neq \emptyset \) in the following, cf. Corollary 2.1.

**Conjecture 3.1.** Given integers \( a_0 \leq a_1 \leq \cdots \leq a_{t+c-2} \) and \( b_1 \leq \cdots \leq b_t \), we set

\[
\ell_i := \sum_{j=0}^{t+i-2} a_j - \sum_{k=1}^{i} b_k \quad \text{and} \quad h_{i-3} := 2a_{i+i-2} - \ell_i + n, \quad \text{for} \quad i = 3, 4, \ldots, c.
\]

Assume \( a_i - \min([c/2] + 1, t) \geq b_i \) for \( \min([c/2] + 1, t) \leq i \leq t \). Then we have

\[
\dim W(b; a) = \lambda_c + K_3 + K_4 + \cdots + K_c
\]

where \( K_3 = \binom{h_0}{n} \) and \( K_4 = \sum_{j=0}^{t+1} \binom{h_1 + a_j}{n} - \sum_{i=1}^{t} \binom{h_1 + b_i}{n} \) and in general

\[
K_{i+3} = \sum_{r+s+t \geq 0} \sum_{0 \leq i_1 < \cdots < i_r \leq t+i} \sum_{1 \leq j_1 \leq \cdots \leq j_s \leq t} (-1)^{r+t} \binom{h_i + a_{i_1} + \cdots + a_{i_r} + b_{j_1} + \cdots + b_{j_s}}{n}
\]

for \( 0 \leq i \leq c - 3 \).
For the special case where all the entries of $\mathcal{A}$ have the same degree, this means:

**Conjecture 3.2.** Let $W(0; d)$ be the locus of good determinantal schemes in $\mathbb{P}^n$ of codimension $c$ given by the maximal minors of a $t \times (t+c-1)$ matrix with entries homogeneous forms of degree $d$. Then,

$$\dim W(0; d) = t(t+c-1) \binom{d+n}{n} - t^2 - (t+c-1)^2 + 1.$$ 

In [26] we proved that the right hand side in the formula for $\dim W(b; a)$ in the Conjectures is always an upper bound for $\dim W(b; a)$ ([26], Thm. 3.5), and moreover, that the Conjectures hold in the range

$$(3.2) \quad 2 \leq c \leq 5 \quad \text{and} \quad n-c > 0 \quad (\text{supposing } \text{chark} = 0 \text{ if } c = 5),$$

as well as for large classes in the range $c \geq 2$ (without assuming $n > c$), cf. [26], §4.

**Example 3.3** (Counterexample to the Conjectures in the range $n = c \geq 3$).

Let $\mathcal{A}$ be a general $2 \times (c+1)$ matrix of linear entries. The vanishing of all $2 \times 2$ minors defines a reduced scheme $X$ of $c+1$ general points in $\mathbb{P}^c$. The conjectured dimension is $c(c+1) + c - 2$ while the dimension of the postulation Hilbert scheme, $\dim(Hilb^2(\mathbb{P}^c))$ is at most $c(c+1)$. Hence

$$\dim W(0, 0; 1, 1, \ldots, 1) \leq c(c+1).$$

This contradicts both conjectures for every $c \geq 3$.

We have, however, looked at many examples in the range $a_0 > b_t$ where we have used Macaulay 2 to compute necessary invariants (cf. (3.3) below), without finding more counterexamples. The counterexample we have is only for zero dimensional schemes.

Now we recall a few statements from the proof of (3.2) and a variation which we will need in the next section. In the proof we used induction on $c$ by successively deleting columns of the largest possible degree. Hence we computed the dimension of $W(b; a)$, $a = a_0, a_1, \ldots, a_{t+c-2}$ in terms of dimension of $W(b; a')$, where $a' = a_0, a_1, \ldots, a_{t+c-3}$. As in §2, we let $X = \text{Proj}(\mathcal{A})$ belong to $W(b; a)$ and we let $Y = \text{Proj}(\mathcal{B})$, $(Y) \in W(b; a')$, be obtained by deleting the last column of $\mathcal{A}$. We have

**Proposition 3.4.** Let $c \geq 3$, let $(X) \in W(b; a)$ and suppose $\dim W(b; a') \geq \lambda_{c-1} + K_3 + K_4 + \ldots + K_{c-1}$ and $\text{depth}_{I(Z)} B \geq 2$ for a general $Y = \text{Proj}(\mathcal{B}) \in W(b; a')$. If

$$(3.3) \quad \text{hom}_R(I_Y, I_{X/Y}) \leq \sum_{j=0}^{t+c-3} \left( \frac{a_j - a_{t+c-2} + n}{n} \right),$$

then $\dim W(b; a) = \lambda_c + K_3 + K_4 + \ldots + K_c$. We also get equality in (3.3), as well as

$$\dim W(b; a) = \dim W(b; a') + \dim_k M_B(a_{t+c-2})_0 - 1 - \text{hom}_R(I_Y, I_{X/Y}).$$

**Proof.** Indeed the proof of Thm. 4.5 of [26] contains the ideas we need, but since the assumptions of Thm. 4.5 are different, we include a proof. First we remark that we have

$$\lambda_c + K_3 + K_4 + \ldots + K_c \geq \dim W(b; a)$$
by [26], Prop. 3.13 which combined with the assumption on \( \dim W(b; a') \) yields

\[
\lambda_c - \lambda_{c-1} - K_c \geq \dim W(b; a) - \dim W(b; a').
\]

Next by [26], Prop. 4.1 we have the inequality

\[
dim W(b; a) - \dim W(b; a') \geq \dim_k M_B(a_{t+c-2})_0 - 1 - \_\text{hom}_R(I_Y, I_{X/Y}).
\]

Since \( K_c = \_\text{hom}(\text{coker} \varphi, R(a_{t+c-2})) \) by definition (see [26], Prop. 3.12 and (3.14)) we can use (2.3) and (2.4) to get

\[
(3.4) \quad \dim M_B(a_{t+c-2})_0 - 1 = \dim M_A(a_{t+c-2})_0 = \dim F^*(a_{t+c-2})_0 - \dim G^*(a_{t+c-2})_0 + \_\text{hom}(\text{coker} \varphi, R(a_{t+c-2})) =
\]

\[
= \sum_{i=1}^t \left( a_{t+c-2} - b_i + n \right) - \sum_{j=0}^{t+c-2} \left( a_{t+c-2} - a_j + n \right) + K_c.
\]

Now looking at (3.1) and noticing that \( \lambda_{c-1} \) is defined by the analogous expression where \( a_j \) (resp. \( b_i \)) ranges over \( 0 \leq j \leq t+c-3 \) (resp. \( 1 \leq i \leq t \)), it follows after a straightforward computation that

\[
\lambda_c - \lambda_{c-1} = \sum_{i=1}^t \left( a_{t+c-2} - b_i + n \right) - \sum_{j=0}^{t+c-2} \left( a_{t+c-2} - a_j + n \right) - \sum_{j=0}^{t+c-3} \left( a_j - a_{t+c-2} + n \right).
\]

Combining with (3.3), we get

\[
\dim M_B(a_{t+c-2})_0 - 1 - \_\text{hom}_R(I_Y, I_{X/Y}) \geq \lambda_c - \lambda_{c-1} + K_c.
\]

Hence all inequalities of displayed formulas in this proof are equalities and we are done. \( \square \)

**Theorem 3.5.** The Conjectures (and if \( c > 2 \), the final dimension formula of Proposition [3.4] hold provided

\[
2 \leq c \leq 5 \quad \text{and} \quad n - c > 0 \quad \text{(supposing chark = 0 if c = 5)}.
\]

Indeed this is mainly [26], Thm. 4.5, Cor. 4.7, Cor. 4.10, Cor. 4.14 and [11] (\( c = 2 \)) and [25] (\( c = 3 \)). Moreover since the proofs of [26] also show (3.3), we get the final dimension formula of Proposition [3.4]. Moreover we have (valid also for \( n = c \) and chark \( \neq 0 \)):

**Remark 3.6.** Assume \( a_0 > b_t \). Then (3.3) for \( X \) general, and Conjecture 3.1 hold provided \( 3 \leq c \leq 5 \) (resp. \( c > 5 \)) and \( a_{t+c-2} > a_{t-2} \) (resp. \( a_{t+3} > a_{t-2} \)) by [27], Thm 3.2.

### 4. THE CODIMENSION OF THE DETERMINANTAL LOCUS

In this section we consider the problem of when the closure of \( W(b; a) \) is an irreducible component of \( \text{Hilb}(\mathbb{P}_n) \). If it is not a component, we determine its codimension in \( \text{Hilb}(\mathbb{P}_n) \) under certain assumptions. We also examine when \( \text{Hilb}(\mathbb{P}_n) \) is generically smooth along \( W(b; a) \). Moreover we have chosen to introduce the notion “every deformation of \( X \) comes from deforming \( \mathcal{A} \)” because it gives the main reason for why \( \overline{W(b; a)} \) is not always an irreducible component of \( \text{Hilb}(\mathbb{P}_n) \).

In the case the determinantal schemes are of dimension zero or one, then \( \overline{W(b; a)} \) is not necessarily an irreducible component of \( \text{Hilb}(\mathbb{P}_n) \), as the following example shows.
Example 4.1 (\(\overline{W(b,q)}\) not an irreducible component in the range \(0 \leq n-c \leq 1, c \geq 3\)).

Let \(B\) be a general \(2 \times c\) matrix of linear entries and let \(A = [B, v]\) where the entries of the column \(v\) are general polynomials of the same degree 2. The vanishing all \(2 \times 2\) minors of \(A\) defines a determinantal scheme \(X\) of codimension \(c\) in \(\mathbb{P}^n\).

(i) Let \(n = c\). Then \(X = \text{Proj}(A)\) is a reduced scheme of \(2c+1\) points in \(\mathbb{P}^c\) and with \(b\)-vector \((\dim A_i)_{i \geq 0} = (1, c+1, 2c+1, 2c+1, \ldots)\). It follows that \(H^1_{\mathfrak{m}}(A) \simeq H^1(I_X(v)) = 0\) for \(v \geq 2\) and we get \(\varphi \circ \text{Hom}_R(I_X, H^1_{\mathfrak{m}}(A)) = 0\). By (1.1) the postulation Hilbert scheme is isomorphic to the usual Hilbert scheme at \((X)\), whose dimension is \(c(2c+1)\). Moreover since the dimension of \(\overline{W(b,q)}\) is at most the conjectured value \(c^2 + 4c - 2\), and since

\[c^2 + 4c - 2 < c(2c+1)\] for every \(c \geq 3\),

it follows that \(\overline{W(0,0;1,1,\ldots,1,2)}\) is not an irreducible component of \(\text{Hilb}^H(\mathbb{P}^c)\).

(ii) Let \(n = c+1\). Then \(X\) is a smooth connected curve in \(\mathbb{P}^{c+1}\) of degree \(d = 2c+1\) and genus \(g = c\). Since the dimension of \(\overline{W(b,q)}\) is at most the conjectured value, which is \(c^2 + 7c + 2\), and since the dimension of the Hilbert scheme is at least \((n+1)d + (n-3)(1-g) = c^2 + 8c\), it follows that \(\overline{W(0,0;1,1,\ldots,1,2)}\) is not an irreducible component of \(\text{Hilb}^p(\mathbb{P}^{c+1})\) for every \(c \geq 3\).

In what follows we briefly say “\(T\) a local ring” (resp. “\(T\) artinian”) for a local \(k\)-algebra \((T, \mathfrak{m}_T)\) essentially of finite type over \(k = T/\mathfrak{m}_T\) (resp. such that \(\mathfrak{m}_r^r = 0\) for some integer \(r\)). Moreover we say “\(T \to S\) is a small artinian surjection” provided there is a morphism \((T, \mathfrak{m}_T) \to (S, \mathfrak{m}_S)\) of local artinian \(k\)-algebras whose kernel \(a\) satisfies \(a \cdot \mathfrak{m}_T = 0\).

Let \(A = R/I_t(A)\). If \(T\) is a local ring, we denote by \(A_T = (f_{ij,T})\) a matrix of homogeneous polynomials belonging to the graded polynomial algebra \(R_T := R \otimes_k T\), satisfying \(f_{ij,T} \otimes_T k = f_{ij}\) and \(\deg f_{ij,T} = a_j - b_i\) (if \(\deg f_{ij,T} = 0\) we let \(f_{ij,T} = 0\)) for all \(i, j\). Note that all elements from \(T\) are considered to be of degree zero.

Once having such a matrix \(A_T\), we get an induced morphism

\[\varphi_T : F_T := \bigoplus_{i=1}^t R_T(b_i) \to G_T := \bigoplus_{j=0}^{t+c-2} R_T(a_j)\]

and we put \(M_T = \text{coker} \varphi_T\).

Lemma 4.2. If \(X = \text{Proj}(A), A = R/I_t(A)\), is a standard determinantal scheme, then \(A_T := R_T/I_t(A_T)\) and \(M_T\) are (flat) graded deformations of \(A\) and \(M\) respectively for every choice of \(A_T\) as above. In particular \(X_T = \text{Proj}(A_T) \subset \mathbb{P}^n_T := \text{Proj}(R_T)\) is a deformation of \(X \subset \mathbb{P}^n\) to \(T\) with constant Hilbert function.

Proof. Consulting (2.2) and (2.3) we see that the Eagon-Northcott and Buchsbaum-Rim complexes are functorial in the sense that, over \(R_T\), all free modules and all morphisms in these complexes are induced by \(\varphi_T\), i.e. they are determined by \(A_T\). Since these complexes become free resolutions of \(A\) and \(M\) respectively when we tensor with \(k\) over \(T\), it follows that \(A_T\) and \(M_T\) are flat over \(T\) and satisfy \(A_T \otimes_T k = A\) and \(M_T \otimes_T k = M\).

Definition 4.3. Let \(X = \text{Proj}(A), A = R/I_t(A)\), be a standard determinantal scheme. We say “every deformation of \(X\) comes from deforming \(A\)” if for every local ring \(T\) and every graded deformation \(R_T \to A_T\) of \(R \to A\) to \(T\), then \(A_T\) is of the form \(A_T = R_T/I_t(A_T)\) for some \(A_T\) as above. Note that by (1.1) we can in this definition replace “graded deformations of \(R \to A\)” by “deformations of \(X \hookrightarrow \mathbb{P}^n\)” provided \(\dim X \geq 1\).
**Lemma 4.4.** Let \( X = \text{Proj}(A) \), \( A = R/I_i(A) \), be a standard determinantal scheme, \( (X) \in W(k:a) \). If every deformation of \( X \) comes from deforming \( A \), then \( A \) (and hence \( X \) if \( \dim X \geq 1 \)) is unobstructed. Moreover \( W(k:a) \) is an irreducible component of \( \text{Hilb}(\mathbb{P}^n) \).

**Proof.** Let \( T \to S \) be a small artinian surjection and let \( A_S \) be a deformation of \( A \) to \( S \). By assumption, \( A_S = R_S/I_i(A_S) \) for some matrix \( A_S \). Since \( T \to S \) is surjective, we can lift each \( f_{ij,S} \) to a polynomial \( f_{ij,T} \) with coefficients in \( T \) such that \( f_{ij,T} \otimes T S = f_{ij,S} \). By Lemma 4.2 it follows that \( A_T := R_T/I_i(A_T) \) is flat over \( T \). Since \( A_T \otimes T S = A_S \) we get the unobstructedness of \( A \), as well as the unobstructedness of \( X \) in the case \( \dim X \geq 1 \) by (1).

Finally let \( T \) be the local ring of \( \text{Hilb}(\mathbb{P}^n) \) at \( (X) \) and let \( A_T \), or \( \text{Proj}(A_T) \) if \( \dim X \geq 1 \), be the pullback of the universal object of \( \text{Hilb}(\mathbb{P}^n) \) to \( \text{Spec}(T) \). Then there is a matrix \( A_T = (f_{ij,T}) \) such that \( A_T = R_T/I_i(A_T) \) by assumption. We can extend \( f_{ij,T} \) to polynomials \( f_{ij,D} \) with coefficients in \( D \) where \( \text{Spec}(D) \subset \text{Hilb}(\mathbb{P}^n) \) is an open neighborhood of \( (X) \) for which the Eagon-Northcott complex associated to the matrix \( A_D = (f_{ij,D}) \) is exact at any \( (X') \in \text{Spec}(D) \) (cf. [33], Lem. 6.3 or [11], proof of Thm. 1; in our case the existence of \( \text{Spec}(D) \) is quite easy since the Eagon-Northcott complex of the homogeneous coordinate ring of a standard determinantal scheme is always exact). It follows that \( \text{Spec}(D) \subset W(k:a) \), and since \( \text{Spec}(D) \) is open in \( \text{Hilb}(\mathbb{P}^n) \) we are done.

**Remark 4.5.** The arguments of these lemmas, which rely on the fact that we get \( T \)-flat schemes by just parameterizing the polynomials of \( A \) over a local ring \( T \), seem to be known, see e.g. Laksov’s papers [30], [29] where he looks to flat families of determinantal schemes and their singular loci for arbitrary determinantal schemes. Indeed we may expect from Laksov’s papers (or prove by other arguments, as we remember Laksov did in a talk at the university of Oslo in the 70’s) that families of arbitrary determinantal schemes obtained by parameterizing polynomials as above are \( T \)-flat; thus he mainly shows the unobstructedness part of Lemma 4.4. Since we in this paper only look at determinantal schemes defined through maximal minors, our proofs are rather easy. Surprisingly enough the corresponding unobstructedness result of the \( R \)-module \( M \) (of maximal grade \([4]\)) seems less known. Indeed one may prove the unobstructedness of \( M \) as we did for \( A \) in Lemma 4.4 because we from the Buchsbaum-Rim complex may see that every deformation of \( M \) to \( T \) comes from deforming \( A \). We have learned, by distributing a preliminary version of this paper to specialists in deformations of modules, that the unobstructedness of \( M \) was proved in Runar Ile’s PhD thesis, cf. [21], ch. 6 (Lem. 6.1.2 or Cor. 6.1.4).

The following result is a key proposition to our work in this section. Here the morphisms of the \( \text{Ext}^1 \)-groups are induced by the inclusion \( I_{X/Y} \hookrightarrow B \), e.g.

\[
\tau_{X/Y} : \text{oExt}^1_B(I_{Y/I_Y^2}, I_{X/Y}) \to \text{oExt}^1_B(I_{Y/I_Y^2}, B).
\]

**Proposition 4.6.** Let \( X = \text{Proj}(A) \subset Y = \text{Proj}(B) \) be good determinantal schemes defined by the vanishing of the maximal minors of \( A \) and \( B \) respectively where \( B \) is obtained by deleting the last column of \( A \). Let \( Z \subset Y \) be a closed subset such that \( U := Y - Z \hookrightarrow \mathbb{P}^n \) is a local complete intersection (l.c.i.) and suppose

(1) \( \text{depth}_{I(Z)} B \geq 3 \), or \( \text{depth}_{I(Z)} B \geq 2 \) and \( \rho^1 : \text{oExt}^1_B(I_{X/Y}, I_{X/Y}) \to \text{oExt}^1_B(I_{X/Y}, B) \) is injective,
(2) \( \tau_{X/Y} : \text{Ext}^1_B(I_Y/I^2_Y, I_{X/Y}) \to \text{Ext}^1_B(I_Y/I^2_Y, B) \) is injective, and

(3) every deformation of \( Y \) comes from deforming \( \mathcal{B} \).

Then every deformation of \( X \) comes from deforming \( \mathcal{A} \). Moreover

\[
\dim(X) \text{ Hilb}(\mathbb{P}^n) = \dim(Y) \text{ Hilb}(\mathbb{P}^n) + \dim M_B(a_{t+c-2})_0 - 1 - \text{hom}_R(I_Y, I_{X/Y}).
\]

Remark 4.7. If \( \text{depth}_{I(Z)} B \geq 3 \), then \( \text{depth}_{I(Z)} I_{X/Y} \geq 3 \) and it follows from (2.11) that

\[
\text{Ext}^1_B(I_{X/Y}, I_{X/Y}) = \text{Ext}^1_B(I_{X/Y}, B) = 0.
\]

Remark 4.8. Let GradAlg(\( B_2, H_1 \)) be the “postulation” Hilbert-flag scheme, i.e. the representing object of the functor deforming surjections \( (B \to A) \) of graded quotients of \( R \) of positive depth at \( m \), or equivalently flags \( (X \subset Y) \) of closed subschemes of \( \mathbb{P}^n \) with Hilbert functions \( H_Y = H_B = H_2 \) and \( H_X = H_A = H_1 \). In [23], Prop. 4 (iii), we use theorems of Laudal on deformations of a category \( [\mathbb{C}] \) to show that the forgetful morphism

\[
\text{GradAlg}(H_2, H_1) \longrightarrow \text{GradAlg}(H_1)
\]

induced by \( (X \subset Y) \longrightarrow (X) \), is smooth and has fiber dimension \( \text{hom}_R(I_Y, I_{X/Y}) \) at \( (X \subset Y) \) provided \( B \) is unobstructed and (2) of Proposition 4.11 holds. By (1.1) this conclusion holds for the corresponding forgetful map from the Hilbert-flag scheme into the usual Hilbert scheme provided \( X \) and \( Y \) are ACM and \( \dim X \geq 1 \).

Proof. Let \( R_T \to A_T \) be any graded deformation of \( R \to A \) to a local ring \( T \). By the smoothness of the forgetful map of Remark 4.8 there is a graded deformation \( R_T \to B_T \) of \( R \to B \) and a morphism \( B_T \to A_T \). By the assumption (3) there exists a matrix \( B_T \) such that \( B_T = R_T/I_t(B_T) \). By Lemma 1.2 \( B_T \) also defines a deformation \( M_{B_T} \) of \( M_B \).

We will prove that there is a matrix \( \mathcal{A}_T \) such that \( A_T = R_T/I_t(\mathcal{A}_T) \) and such that we get \( B_T \) by deleting the last column of \( \mathcal{A}_T \). Looking at (2.4) and the text before and after (2.4), we see that if we can find a section \( B_T \to M_{B_T}(a_{t+c-2}) \) which reduces to \( B \to M_B(a_{t+c-2}) \) via \( \otimes k \), we can use this section to define a column \( v_T \) which allows us to put \( \mathcal{A}_T := [B_T, v_T] \). Now since we have a deformation \( B_T \to A_T \) of \( B \to A \), it follows that \( I_{X_T/Y_T} := \ker(B_T \to A_T) \) is a deformation of \( I_{X/Y} \simeq M_B(a_{t+c-2})^* \). If we sheafify and restrict to \( U \) we get an isomorphism \( \tilde{I}_{X_T/Y_T}|_U \simeq \tilde{M}_B(a_{t+c-2})^*|_U \) of invertible sheaves. Hence the flat sheaves \( (\tilde{I}_{X_T/Y_T})^* \) and \( \tilde{M}_{B_T}(a_{t+c-2}) \) are also isomorphic on the set \( U_T \) which corresponds to \( U \). Taking global sections, \( H^0(U_T, -) \), of \( B_T \to (\tilde{I}_{X_T/Y_T})^* \), we get a map which fits into a commutative diagram

\[
\begin{array}{ccc}
B_T & \longrightarrow & H^0(U_T, \tilde{M}_{B_T}(a_{t+c-2})) \\
\downarrow & & \downarrow \\
B & \longrightarrow & H^0(U, \tilde{M}_B(a_{t+c-2}))
\end{array}
\]

where the lower isomorphism follows from the fact that \( M_B \) is maximally CM, i.e. from-depth \( I(Z) M_B \) = depth \( I(Z) B \geq 2 \). Note that since an \( M_B \)-regular sequence lifts to an \( M_{B_T} \)-regular sequence, we also have sufficient depth to get the upper isomorphism. Hence we get a section \( B_T \to M_{B_T}(a_{t+c-2}) \) and an induced matrix \( \mathcal{A}_T \), as required.
Let $A' = R_T/I_T(A_T)$. We claim that $A' = A_T$, i.e. that $I_T' = I_{X/Y}$ where $I_T' = \ker(B_T \to A')$. Let $T_r := T/m_r^r$, $B_T := B_T \otimes_T T_r$, $I_{X_T/Y_T} := \ker(B_{T_r} \to A_T \otimes_T T_r)$, $I_{T_r}' = \ker(B_{T_r} \to A' \otimes_T T_r)$ and $S := T_{r-1}$. To prove the claim we first show that $I_{T_r}' = I_{X_T/Y_T}$ for every integer $r > 0$. To see that this follows from the assumption (1), we suppose by induction that $I_S' = I_{X_S/Y_S}$ as ideals of $B_S$. Then $I_{T_r}'$ and $I_{X_{T_r}/Y_{T_r}}$ are two deformations of the same ideal $I_{X_S/Y_S} \hookrightarrow B_S$ to $T_r$ and their difference, as graded $B_T$, modules, corresponds to an element, diff, of $\text{Ext}^1_B(I_{X/Y}, I_{X/Y}) \otimes_k (m_r^{-1} \cdot T_r)$ which via $\rho^1$ maps to a difference, $o_1 - o_2 \in \text{Ext}^1_B(I_{X/Y}, B) \otimes_k (m_r^{-1} \cdot T_r)$ where $o_i$ are the following obstructions. One of them, say $o_1$ (resp. the other $o_2$) is the obstruction of deforming the graded morphism $I_S' \hookrightarrow B_S$ (i.e. the ideal) to a graded morphism between $I_T'$ and $B_T$ (resp. between $I_{X_{T_r}/Y_{T_r}}$ and $B_{T_r}$), cf. [23], Rem. 3 for a similar situation. Since $I_T'$ and $I_{X_{T_r}/Y_{T_r}}$ are ideals in $B_{T_r}$, such graded morphisms exist. Hence $o_i = 0$ for $i = 1, 2$, whence diff = 0 by the injectivity of $\rho^1$, and we conclude that $I_{T_r}' = I_{X_{T_r}/Y_{T_r}}$.

To get the claim let $A'' := B_T/(I_T' + I_{X_{T}/Y_{T}})$. It suffices to show that the natural maps $A' \to A''$ and $A_T \to A''$ are isomorphisms. Note that $A'' \otimes_T T_r \approx A'' \otimes_R R \approx A$ and that we have similar isomorphisms for $A'$ and $A_T$. Notice also that every maximal ideal of $R_T$ lies over $m_T$. Hence we get both isomorphisms by the lemma of Nakayama, Azumaya and Krull if we can show that $A''$ is $T$-flat. But by the proof in the paragraph above the induced maps $A' \otimes_T T_r \to A'' \otimes_T T_r$ are isomorphism for every $r > 0$. It follows that $A'' \otimes_T T_r$ is $T_r$-flat since $A' \otimes_T T_r$ is! Since $A''$ is idealwise separated for $m_T$, we get that $A''$ is $T$-flat by the local criterion of flatness (see Thm. 20.C of [32]).

It remains to prove the dimension formula. Recall that there is a “standard” diagram (whose square is cartesian)

\[
\begin{array}{ccc}
0 & \to & 0 \\
\downarrow & & \downarrow \\
0 & \to & 0 \\
\downarrow & & \downarrow \\
A^1 & \to & 0 \\
\downarrow & \delta & \downarrow \\
0 & \to & 0 \\
\end{array}
\]

which defines the tangent space $A^1$ of the Hilbert flag scheme $\text{GradAlg}(H_2, H_1)$ at $(B \to A)$ and where the morphisms $T_{pr_1}$ and $\delta$ are natural maps (cf. [23], (10) and note that the algebra cohomology group $\text{H}^2(B, A, A) \approx \text{Ext}^1_B(I_{X/Y}, A)$ (cf. [23], §1.1)). Under the assumption (2) the vertical sequence is exact. We claim that $\delta = 0$. To see it, it suffices to prove that $T_{pr_1}$ is surjective. The cartesian diagram is, however, well understood in terms of the deformation theory of the Hilbert flag scheme. Indeed if we take an arbitrary deformation $B_S$ of $B$ to the dual numbers $S := k[t]/(t^2)$, then $T_{pr_1}$ is surjective provided we can prove that there is a deformation $(B_S \to A_S)$ of $(B \to A)$ to $S$. The latter follows from the first part of the proof, or simply, from the assumption (3) because we by (3)
get $B_S = R_S/I_t(B_S)$ for some matrix $B_S$ and we can take $A_S = [B_S, v_S]$ where $v_S$ is any lifting of the last column of $A$ to $S$. Letting $A_S := R_S/I_t(A_S)$ we get the claim.

Since we have $\dim_{(X)} \text{Hilb}(\mathbb{P}^n) = \text{hom}(I_X, A)$ and $\dim_{(Y)} \text{Hilb}(\mathbb{P}^n) = \text{hom}(I_Y, B)$ by Lemma 4.1, we get the dimension formula from the big diagram in which $\delta = 0$ provided we can prove that $\text{hom}(I_X/Y, A) = \dim M_B(a_{t+c-2})_0 - 1$. To see it we apply $\text{Hom}(I_X/Y, -)$ onto $0 \to I_X/Y \to B \to A \to 0$. If we use that $\text{Hom}(I_X/Y, B) \simeq M_B(a_{t+c-2})$, see (2.10), we get the exact sequence

$$0 \to B \to M_B(a_{t+c-2}) \to \text{Hom}(I_X/Y, A) \to \text{Ext}_B^1(I_X/Y, I_X/Y) \to \text{Ext}_B^1(I_X/Y, B),$$

and we conclude by the assumption (1).

Remark 4.9. Suppose $\tau_{X/Y}$ is not injective. Then the vertical sequence in the diagram (4.2) is not exact, and $\delta$ may be non-zero. It is, however, easy to enlarge the diagram (4.2) to a diagram of exact horizontal and vertical sequences by including $\ker \tau_{X/Y}$ and $\text{im} \delta$. From this enlarged diagram it follows that

$$\text{hom}(I_X, A) = \text{hom}(I_X/Y, A) + h^0(N_Y) - \text{hom}(I_Y, I_X/Y) + \dim \ker \tau_{X/Y} - \dim \text{im} \delta$$

since we have $\text{Hom}(I_Y, B) \simeq H^0(Y, N_Y)$ by (2.11) and $\text{depth}_m B \geq 2$. The displayed formula also holds if $\tau_{X/Y}$ is injective.

Theorem 4.10. Suppose either $c = 2$ and $n \geq 2$, or $3 \leq c \leq 4$, $n - c \geq 2$ and $a_{t-\min(3,t)} \geq b_i$ for $\min(3,t) \leq i \leq t$. If $W(\mathbf{b}; \mathbf{a}) \neq \emptyset$, then $W(\mathbf{b}; \mathbf{a})$ is a generically smooth irreducible component of $\text{Hilb}(\mathbb{P}^n)$ of dimension

$$\lambda_c + K_3 + \ldots + K_c.$$

Moreover every deformation of a general $(X) \in W(\mathbf{b}; \mathbf{a})$ comes from deforming $A$.

For $c > 2$ this result is really [26], Thm. 5.1 and Cor. 5.3 except for the final statement. Since, however, the proof of Theorem 4.10 is to apply Proposition 4.6 inductively to the flat $n$ 1, starting with the codimension 2 case where we by Lemma 4.11 know that the final statement holds, the proof of [26] extends to get Theorem 4.10 for $c > 2$. If $c = 2$ we get the other conclusions (and even more) from [11] for $n > 2$ and from works of Gotzmann and others for $n = 2$ as explained in [24], Rem. 22 (i), or see [26], Rem. 4.6 for a direct approach to $\text{dim} W(\mathbf{b}; \mathbf{a}) = \lambda_2$. (We also get all conclusions for $c = 2$ by combining Lemma 4.11 and Lemma 4.4.)

Lemma 4.11. If $X = \text{Proj}(A)$, $A = R/I_t(A)$, is a standard determinantal scheme of codimension 2 in $\mathbb{P}^n$ and $n \geq 2$, then every deformation of $X$ comes from deforming $A$.

Proof. Let $A = (f_{ij})$ be a homogeneous $t \times (t + 1)$ matrix which represents the morphism $\varphi^*$ of (2.1) and let $R_T \to A_T$ be a graded deformation of $R \to A$ to a local ring $T$. To see that $A_T$ is of the form $A_T = R_T/I_t(A_T)$ for some matrix $A_T$ reducing to $A$ via $(-) \otimes_T k$, we consider the canonical module $K_A = \text{Ext}_R^2(A, R)(-n - 1)$. Note that since $c = 2$ we have $K_A(n + 1 - \ell_t) = M$, where $G^* \to F^* \to M \to 0$ is a part of the Buchsbaum-Rim complex, cf. (2.3) and (2.6). Now we observe that $K_{A_T} := \text{Ext}_R^2(A_T, R_T)(-n - 1)$ is a (flat) graded deformation of $K_A$ to $T$ because $\text{Ext}_R^i(A, R) = 0$ for $i \neq 2$ ([7], Proposition (A1)). It follows that $K_{A_T}(n + 1 - \ell_t) = \text{coker}(\varphi_T^*)$ for some matrix $A_T := (f_{ij,T})$, as in (4.1).
Let $A' := R_T/I_t(A_T)$. It suffices to show that $A'$ and $A_T$ are isomorphic as $R_T$ quotients. Looking to the Eagon-Northcott complex associated to $A'$ over $R_T$ and dualizing, i.e. applying $\text{Hom}_{R_T}\left(-, R_T\right)$ to it, we get back the part of the Buchsbaum-Rim complex where $\varphi_T^* \text{ appeared}$ (up to twist). It follows that $K_{A'} \simeq K_{A_T}$ where $K_{A_T} := \text{Ext}_{R_T}^2(A', R_T)(-n - 1)$. Note that the Buchsbaum-Rim complex above is a free resolution of $K_{A_T}(n + 1 - \ell_1)$ over $R_T$ since it is $T$-flat and reduces to a $R$-free resolution via a $(-) \otimes_T k$. Applying $\text{Hom}_{R_T}\left(-, R_T\right)$ we get $A' \simeq \text{Ext}_{R_T}^2(K_{A'}, R_T)(-n - 1)$. Similarly by dualizing twice an $R_T$-free resolution of $A_T$ we show that $A_T \simeq \text{Ext}_{R_T}^2(K_{A_T}, R_T)(-n - 1)$ and we are done. 

Remark 4.12. If we apply Proposition 4.6 successively to the flag (2.7) it is straightforward to generalize Thm. 5.1 of [26] to the zero dimensional case, i.e. we may replace the condition $n \geq 1$ of [26], Thm. 5.1 by $n \geq 0$ provided we in (i) of Thm. 5.1 (and correspondingly in (ii) of Thm. 5.1) replace the depth $\geq 3$ condition by the condition (1) of Proposition 4.6.

There is a variation to Proposition 4.6 that we will use in the case $n = c \left(\dim X = 0\right)$ in which we mainly replace the injectivity assumption in (1) for the $\text{Ext}^1$-groups with the injectivity assumption for the corresponding $\text{Ext}^2$-groups. More precisely let

\begin{equation}
\rho^i : \varrho \text{Ext}^1_B(I_{X/Y}, I_{X/Y}) \rightarrow \varrho \text{Ext}^1_B(I_{X/Y}, B).
\end{equation}

be the map induced by $I_{X/Y} \hookrightarrow B$. Then we have

Proposition 4.13. Let $X = \text{Proj}(A) \subset Y = \text{Proj}(B)$ be good determinantal schemes defined by $A$ and $B$ where $B$ is obtained by deleting the last column of $A$. Let $Z \subset Y$ be a closed subset such that $U := Y - Z \hookrightarrow \mathbb{P}^n$ is a local complete intersection and suppose

(1) $\varrho \text{Ext}^1_B(I_{X/Y}, A) = 0 \ (i.e., \ \rho^1 \ \text{surjective and } \rho^2 \ \text{injective})$ and $\text{depth}_{I(Z)} B = 2$, 
(2) $\tau_{X/Y} : \varrho \text{Ext}^1_B(I_Y/I_Y^2, I_{X/Y}) \hookrightarrow \varrho \text{Ext}^1_B(I_Y/I_Y^2, B)$ is injective, and 
(3) $Y$ is unobstructed (this is weaker than (3) in Proposition 4.6).

Then $A$ is unobstructed and the postulation Hilbert scheme $\text{Hilb}^{\mathbb{P}^n}(\mathbb{P}^n)$ satisfies $\dim_X \text{Hilb}^{\mathbb{P}^n}(\mathbb{P}^n) = \dim_Y \text{Hilb}^{\mathbb{P}^n}(\mathbb{P}^n) + \dim M_S(a_{t+c-2})_0 - 1 - \varrho \text{hom}_{R}(I_Y, I_{X/Y}) + \dim \ker \rho^1$.

Proof. Let $T \rightarrow S$ be a small artinian surjection with kernel $\mathfrak{a}$, and let $R_S \rightarrow A_S$ be any graded deformation of $R \rightarrow A$ to $S$. By Remark 4.8 there is a graded deformation $R_S \rightarrow B_S$ of $R \rightarrow B$ and a morphism $B_S \rightarrow A_S$. By assumption (3) and (1.1) there exists a deformation $R_T \rightarrow B_T$ of $R_S \rightarrow B_S$ to $T$. It is well known that the algebra cohomology group $\varrho \text{H}^2(B, A, A) \otimes_{\mathfrak{a}} \mathfrak{a}$ contains the obstruction of deforming $B_S \rightarrow A_S$ further to $B_T$ and that there is an injection $\varrho \text{H}^2(B, A, A) \hookrightarrow \varrho \text{Ext}^1_B(I_{X/Y}, A)$ ([10], exp. VI, [23], §1.1). The rightmost group vanishes by (1), and it follows that $A$ is unobstructed.

Finally we get the dimension formula from (1.2). Indeed the arguments are almost exactly the same as in the proof of Proposition 4.6 with the variation that (4.3) now implies

$\varrho \text{hom}(I_{X/Y}, A) = \dim M_S(a_{t+c-2})_0 - 1 + \dim \ker \rho^1$.

□

Remark 4.14. We say that “$A$ is unobstructed along any graded deformation of $B$” (call this phrase (*) if for every small artinian surjection $T \rightarrow S$ and for every graded
deformation $B_S \to A_S$ of $B \to A$ to $S$, there exists, for every graded deformation $B_T$ of $B_S$ to $T$, a graded deformation $B_T \to A_T$ reducing to $B_S \to A_S$ via $(-) \otimes_T S$. It is clear from the proof above that $\partial\Ext^1_B(I_{X/Y}, A) = 0$ implies (*) and moreover that we can generalize Proposition 4.13 by replacing the assumption $\partial\Ext^1_B(I_{X/Y}, A) = 0$ by (*).

Now we come to the main results of this paper which are direct consequences of the above propositions. We start with determinant curves whose result we will need in the zero dimensional case. Note that the result below is known ([25], Cor. 10.15 and Rem. 10.9 for $c = 3$, [26], Rem. 5.4 and Cor. 5.7 for $4 \leq c \leq 5$) except for the final statement of (i) and most statements on the codimension in (ii) and (iii). With notations as in Proposition 4.6, we have

**Proposition 4.15.** Let $X = \Proj(A)$, $A = R/I_t(A)$, be general in $W(b; a)$ and suppose $a_{i-\min(3,t)} \geq b_i$ for $\min(3,t) \leq i \leq t$, $\dim X = n - c = 1$ and $3 \leq c \leq 5$ (and $\chark = 0$ if $c = 5$). If $Y = \Proj(B)$ is obtained by deleting the last column of $B$ where $B$ is obtained by deleting the last column of $A$, then the following statements are true:

(i) If $\tau_{X/Y} : \partial\Ext^1_B(I_Y/I_X^2, I_{X/Y}) \to \partial\Ext^1_B(I_Y/I_X^2, B)$ is injective, then $X$ is unobstructed and $W(b; a)$ is a generically smooth irreducible component of $\Hilb^\nu(\PP^n)$ of dimension $\lambda_c + K_3 + \ldots + K_c$. Moreover every deformation of $X$ comes from deforming $A$.

(ii) If $\partial\Ext^1_A(I_X/I_X^2, A) = 0$, then $X$ is unobstructed, $\dim W(b; a) = \lambda_c + K_3 + \ldots + K_c$ and

\[
\codim_{\Hilb^\nu(\PP^n)} W(b; a) = \dim \ker \tau_{X/Y} - \partial\Ext^1_B(I_X/Y, A).
\]

(iii) We always have $\dim W(b; a) = \lambda_c + K_3 + \ldots + K_c$ and

\[
\codim_{\Hilb^\nu(\PP^n)} W(b; a) \leq \dim \ker \tau_{X/Y}.
\]

Moreover if $\partial\Ext^1_B(I_{X/Y}, A) = 0$, then we have equality in the codimension formula if and only if $X$ is unobstructed.

**Proof.** In all cases we use Theorem 3.5 to get $\dim W(b; a) = \lambda_c + K_3 + \ldots + K_c$. (i) Since Theorem 4.10 applies to $W(b; a') \supseteq (Y)$ where $a' = a_0, a_1, \ldots, a_{t+c-3}$, we get (i) from Proposition 4.6, Remark 2.2 and Lemma 4.4.

(ii) The vanishing of the Ext$^1$-group of (ii) implies that $X$ is unobstructed $(X$ is l.c.i. by Remark 2.2), and moreover that $\im \delta \simeq \partial\Ext^1_B(I_{X/Y}, A)$, cf. the diagram (4.12) and continue the horizontal exact sequence as a long exact sequence of algebra cohomology. Since we have $h^0(N_Y) - \dim W(b; a') = 0$ by Theorem 4.10 and $\partial\hom(I_{X/Y}, A) = \dim M_B(a_{t+c-2})_0 - 1$ by (4.13) and Remark 4.7, we conclude by Remark 4.9 and the final dimension formula of Theorem 3.5.

(iii) As in (ii) we get $\partial\hom(I_X, A) - \dim W(b; a) = \dim \ker \tau_{X/Y} - \im \delta$ and hence the inequality of (iii). If the $\partial\Ext^1_B(I_{X/Y}, A)$ vanishes, then $\im \delta = 0$, and since one knows that $X$ is unobstructed if and only if we have equality in $h^0(N_X) \geq \dim (\chi) \Hilb^\nu(\PP^n)$, we conclude easily.

**Remark 4.16** (for the case where the codimension of $X$ in $\PP^n$ is 3, i.e. $c = 3$).

(i) Since $Y$ is l.c.i. ([25], Def. 2.10) for $c = 3$ , we always have $\partial\Ext^1_B(I_Y/I_X^2, B) = 0$ by [11] (or see [19] or [25], Prop. 6.17) and hence we get $\ker \tau_{X/Y} \simeq \partial\Ext^1_B(I_Y/I_X^2, I_{X/Y})$. 

\[
\text{Remark 4.16 (for the case where the codimension of } X \text{ in } \PP^n \text{ is 3, i.e. } c = 3). 
\]

(i) Since $Y$ is l.c.i. ([25], Def. 2.10) for $c = 3$, we always have $\partial\Ext^1_B(I_Y/I_X^2, B) = 0$ by [11] (or see [19] or [25], Prop. 6.17) and hence we get $\ker \tau_{X/Y} \simeq \partial\Ext^1_B(I_Y/I_X^2, I_{X/Y})$. 

\[
\text{Remark 4.16 (for the case where the codimension of } X \text{ in } \PP^n \text{ is 3, i.e. } c = 3). 
\]
(ii) It is shown in [25], Cor. 10.11 (for \( n - c = 1 \)) and Cor. 10.17 (for \( n - c = 0 \)) that \( \_0\text{Ext}^1_B(I_Y/I^2_Y, I_{X/Y}) = 0 \) provided \( a_{t+1} > a_t + a_{t-1} - b_1 \). Indeed the proofs of [25] (or [26], Cor. 5.10 (i)) show \( \_0\text{Ext}^1_R(I_Y, I_{X/Y}) = 0 \) by mainly using the \( R \)-free minimal resolution of \( I_Y \) and the degree of the minimal generators of \( I_{X/Y} \) which we get from (2.2). Hence we can conclude by the injection \( \_0\text{Ext}^1_B(I_Y/I^2_Y, I_{X/Y}) \hookrightarrow \_0\text{Ext}^1_R(I_Y, I_{X/Y}) \). The vanishing of \( \_0\text{Ext}^1_B(I_Y/I^2_Y, I_{X/Y}) \) is, however, much more common than given by the above argument. Indeed examining many examples by Macaulay 2 ([13]) in the range \( a_0 > b_t = b_1 \) we almost always got \( \_0\text{Ext}^1_B(I_Y/I^2_Y, I_{X/Y}) = 0 \) provided \( a_{t+1} > 3 + b_t - n + c \) and \( 0 \leq n - c \leq 1 \).

**Example 4.17** (determinantal curves in \( \mathbb{P}^4 \), i.e. with \( c = 3 \)).

(i) Let \( \mathcal{B} \) be a general \( 2 \times 3 \) matrix of linear entries and let \( \mathcal{A} = [\mathcal{B}, v] \) where the coordinates of the column \( v \) are general polynomials of the same degree \( m \), \( m > 0 \). The vanishing of all \( 2 \times 2 \) minors defines a smooth curve \( X = X_m \) of degree \( 3m + 1 \) and genus \( 3m(m - 1)/2 \) in \( \mathbb{P}^4 \). By Macaulay 2 (mainly),

\[
\_0\text{Ext}^1_B(I_Y/I^2_Y, I_{X_m/Y}) = 0 \quad \text{if and only if} \quad m \neq 2.
\]

Its dimension is \( 1 \) if \( m = 2 \) in which case \( \_0\text{Ext}^1_A(I_{X_m}/I^2_{X_m}, A) = 0 \) and \( \_0\text{Ext}^1_B(I_{X_m/Y}, A) = 0 \). Note that we above only need to use Macaulay 2 for \( m \leq 2 \) because the condition \( a_{t+1} > a_t + a_{t-1} - b_1 \) of **Remark 4.17** (ii) is equivalent to \( m > 2 \). It follows from Proposition 4.15 (i) that \( W(k, a) \) is a generically smooth irreducible component of \( \text{Hilb}^p(\mathbb{P}^4) \) of dimension \( \lambda_3 + K_3 \) for \( m \neq 2 \), and from either (ii) or (iii) that \( X_m \) is unobstructed and \( \text{codim}_{\text{Hilb}(\mathbb{P}^4)} W(k, a) = \_0\text{ext}^1_B(I_Y/I^2_Y, I_{X_m/Y}) = 1 \) for \( m = 2 \). Hence \( \dim_{(X_m)} \text{Hilb}(\mathbb{P}^4) = \lambda_3 + K_3 + 1 \) in this case.

Finally computing \( \lambda_3 \) and \( K_3 \) by their definitions, we get \( \lambda_3 + K_3 = 17 + (m+1)(3m+4)/2 \) for \( m > 1 \) and 21 for \( m = 1 \).

(ii) Let \( \mathcal{A} \) be a general \( 2 \times 4 \) matrix whose columns consist of general polynomials of the same degree, \( 1, 2, 3 \) and \( m, m \geq 3 \) respectively. Put \( \mathcal{A} = [\mathcal{B}, v] \) where the coordinates of the column \( v \) are all of degree \( m \). The vanishing of all \( 2 \times 2 \) minors of \( \mathcal{A} \) defines a smooth curve \( X = X_m \) of degree \( 11m + 6 \) and genus \( (11m^2 + 29m + 8)/2 \) in \( \mathbb{P}^4 \). By **Remark 4.17** we get \( \_0\text{Ext}^1_B(I_Y/I^2_Y, I_{X_m/Y}) = 0 \) for \( m > 5 \), but a Macaulay 2 computation shows this vanishing also for \( 3 \leq m \leq 5 \). It follows from Proposition 4.15 (i) that \( W(k, a) \) is a generically smooth irreducible component of \( \text{Hilb}^p(\mathbb{P}^4) \) of dimension \( \lambda_3 + K_3 = 85 + m(11m - 5)/2 \) for \( m > 3 \), and 126 for \( m = 3 \).

We can also analyze the cases \( m = 1 \) and 2 by using Proposition 4.15 (i). Note that we now delete the column of degree \( 3 \) polynomials to define \( \mathcal{B} \), i.e. we let \( Y \) be defined by the maximal minors of the \( 2 \times 3 \) matrix \( \mathcal{B} \) consisting of linear (resp. degree \( m \)) entries in the first and second (resp. third) column. If \( m = 1 \) (resp. \( m = 2 \)) one verifies that \( \_0\text{Ext}^1_B(I_Y/I^2_Y, I_{X_m/Y}) = 0 \) by Macaulay 2 and we get that \( W(k, a) \) is a generically smooth irreducible component of \( \text{Hilb}^p(\mathbb{P}^3) \) of dimension 66 (resp. 96).

**Remark 4.18.** We have checked the vanishing of \( \_0\text{Ext}^1_A(I_{X_m}/I^2_{X_m}, A) \) for several \( m \geq 1 \) in **Example 4.17** (ii). It seems that this group is always non-zero for every \( m \geq 1 \). This, we think, shows that the results presented here are quite strong because it is hard to
show unobstructedness and to find \( \dim(W_X) \) \( \text{Hilb}^H(\mathbb{P}^n) \) when even the “smallest known obstruction group, \( a \text{Ext}^1_A(I_{X_m}/I_{X_m}^2, A) \),” does not vanish.

Now we consider zero dimensional determinantal schemes \((n - c = 0)\). Indeed Proposition 3.4 with depth \(H_I(Z) = 2\) and Proposition 4.13 are designed to take care of this case. We restrict our attention to a general \(X\) which through Remark 2.2 imply that all depth conditions of the propositions are satisfied. Then our result leads e.g. to the unobstructedness of \(A\) where \(X = \text{Proj}(A)\). In fact for special choices of \(X, A\) may be obstructed after.

First we consider codimension \(c = 3\) determinantal subschemes and schemes with \(c \geq 4\) which we may treat similarly.

**Theorem 4.19.** Let \(X = \text{Proj}(A), A = R/I_t(A), \) be general in \(W(b; a)\) and let \(Y = \text{Proj}(B)\) and \(V = \text{Proj}(C)\) be defined by the vanishing of the maximal minors of \(B\) and \(C\) respectively where \(B\) (resp. \(C\)) is obtained by deleting the last column of \(A\) (resp. \(B\)). Suppose \(\dim(X) = n - c = 0, a_i - b_i\) for \(\min(3, t) \leq i \leq t\) and suppose that (3.3) holds. Moreover suppose

\[
\text{either } c = 3 \text{ or } [4 \leq c \leq 6 \text{ and ker } \tau_{Y/V} = 0],
\]

and suppose char(k) = 0 if \(c = 6\). Then the following statements are true:

(i) If both \(\rho^1 : 0 \text{Ext}^1_B(I_{X/Y}, I_{X/Y}) \to 0 \text{Ext}^1_B(I_{X/Y}, B)\) and \(\tau_{X/Y} : 0 \text{Ext}^1_B(I_Y/I_Y^2, I_{X/Y}) \to 0 \text{Ext}^1_B(I_Y/I_Y^2, B)\) are injective, then \(A\) is unobstructed and \(W(b; a)\) is a generically smooth irreducible component of the postulation Hilbert scheme \(\text{Hilb}^H(\mathbb{P}^c)\) of dimension \(\lambda_c + K_3 + \ldots + K_c\). Moreover every deformation of \(X\) comes from deforming \(A\).

(ii) If \(0 \text{Ext}^1_B(I_{X/Y}, A) = 0\) and \(\ker \tau_{X/Y} = 0\), then \(W(b; a)\) belongs to a unique generically smooth irreducible component \(Q\) of \(\text{Hilb}^H(\mathbb{P}^c)\) of codimension \(\dim \ker \rho^1\). Indeed \(A\) is unobstructed and

\[
\dim Q = \lambda_c + K_3 + \ldots + K_c + \dim \ker \rho^1.
\]

(iii) If \(0 \text{Ext}^1_A(I_X/I_X, A) = 0\), then \(A\) is unobstructed, \(\dim W(b; a) = \lambda_c + K_3 + \ldots + K_c\) and

\[
\text{codim}_{\text{Hilb}^H(\mathbb{P}^c)} W(b; a) = \dim \ker \rho^1 + \dim \ker \tau_{X/Y} - 0 \text{Ext}^1_B(I_{X/Y}, A).
\]

(iv) We always have \(\text{codim}_{\text{Hilb}^H(\mathbb{P}^c)} W(b; a) \leq \dim \ker \rho^1 + \dim \ker \tau_{X/Y}\).

**Proof.** In all cases we use Proposition 3.4 to get \(\dim W(b; a) = \lambda_c + K_3 + \ldots + K_c\) since the Conjectures hold for \(W(b; a') \ni (Y)\) where \(a' = a_0, a_1, \ldots, a_{t+c-3}\) by Theorem 3.5. Moreover if we apply Proposition 4.13 (i) to \(Y \subset V \subset \mathbb{P}^n\), \((Y) \in W(b; a)\) (provided \(c > 3\), if \(c = 3\) we apply Theorem 4.10 to \(W(b; a') \ni (Y)\) ), it follows that every deformation of \(Y\) comes from deforming \(B\).

(i) Using the above statements we easily conclude by Proposition 4.6 and Lemma 4.4.

(ii) Now we use Proposition 4.13 instead of Proposition 4.6. Comparing the dimension formula of Proposition 4.13 with the final one of Proposition 3.4 and using that \(\dim(Y) \text{Hilb}^H(\mathbb{P}^c) = \dim W(b; a')\) by Lemma 4.4, we get all conclusions of (ii).
(iii) The vanishing of the Ext$^1$-group implies that $A$ is unobstructed and that $\im \delta \simeq \Ext^1_B(I_{X/Y}, A)$, cf. (4.12). We have $\hom(I_{X/Y}, A) = \dim M_B(a_{t+c-2}) - 1 + \dim \ker \rho^1$ by (4.3) and $h^0(\mathcal{N}_Y) - \dim W(b; \mathcal{L}) = 0$ by Lemma 4.4. We conclude by Remark 4.9 and the final dimension formula of Proposition 3.3.

(iv) The proof is similar to the last part of (iii), cf. the proof of Proposition 4.15 (iv). $\square$

**Remark 4.20.** (i) Looking to the proofs we see that we don’t need to suppose (3.3) to get the conclusions of (i) and (ii) which don’t involve dimension and codimension formulas.

(ii) Note the overlap in (ii) and (iv) of the theorem.

In [25], Ex. 10.18 we considered the example $A = [B, v]$ where $B$ was a general $2 \times 3$ matrix of linear entries and where the coordinates of the column $v$ are general polynomials of the same degree $m$, $m > 2$. Using Macaulay 2 one may easily check that $\Ext^1_B(I_{X/Y}, I_{X/Y}) = 0$ for $m = 3$. Since $I_{X/Y} = K_B^*(m - 1)$ by (2.5) and (2.6), it follows that $\Ext^1_B(I_{X/Y}, I_{X/Y})$ is independent of $m$, and hence vanishes for every $m \geq 3$. The families of zero dimensional schemes given in [25], Ex. 10.18 are therefore generically smooth of known dimension by Theorem 4.19 (i). More advanced examples are given in the examples below where several aspects of Theorem 4.19 are used. Note that the condition (3.3) in Theorem 4.19 is taken care of by Remark 3.6.

**Example 4.21 (Using Theorem 4.19 (i), mainly, for zero dimensional schemes in $\mathbb{P}^3$).**

Let $A = [B, v]$ be a general $2 \times 4$ matrix with linear (resp. cubic) entries in the first and second (resp. third) column and where the entries of $v$ are polynomials of the same degree $m$, $m \geq 3$. The vanishing of all $2 \times 2$ minors defines a reduced scheme $X =: X_m$ of $7m + 3$ points in $\mathbb{P}^3$. One verifies that $\Ext^1_B(I_Y/I_Y^2, I_{X_m/Y}) = 0$, and $\Ext^1_B(I_{X_m/Y}, I_{X_m/Y}) = 0$ for $m = 3$ by Macaulay 2 mainly and since $I_{X_m/Y} = K_B^*(-m + 1)$ by (2.5) and (2.6), we get the same conclusion for every $m \geq 3$. It follows from Theorem 4.19 (i) that $\overline{W}(b; \mathcal{A})$ is a generically smooth irreducible component of $\Hilb^H(\mathbb{P}^3)$ of dimension $\lambda_3 + \rho_3 = 7m + 25$ (resp. $45$) for $m > 3$ (resp. $m = 3$).

If $m = 1$ or $2$ we delete the column of degree 3 polynomials to define $B$, i.e. we let $Y$ be defined by the maximal minors of the $2 \times 3$ matrix $B$ consisting of linear (resp. degree $m$) entries in the first and second (resp. third) column. If $m = 1$ one verifies (by Macaulay 2) that $\Ext^1_B(I_Y/I_Y^2, I_{X_m/Y}) = 0$ and we get by Theorem 4.19 (i) that $\overline{W}(b; \mathcal{A})$ is a generically smooth irreducible component of $\Hilb^H(\mathbb{P}^3)$ of dimension $\lambda_3 + \rho_3 = 22$. If $m = 2$ one verifies that $\Ext^1_B(I_Y/I_Y^2, I_{X_m/Y}) = 0$ and that $\Ext^1_B(I_{X_m/Y}, I_{X_m/Y}) = 2$. Hence we can not use Theorem 4.19 (i), but we can use Theorem 4.19 (ii)! Such cases are more thoroughly explained in the next example. We verify that $\Ext^1_B(I_{X_m/Y}, B) = 0$, to get $\dim \ker \rho^1 = \Ext^1_B(I_{X_m/Y}, I_{X_m/Y})$, and that $\Ext^1_B(I_{X_m/Y}, A) = 0$. We conclude that $\overline{W}(b; \mathcal{A})$ is contained in a generically smooth irreducible component of $\Hilb^H(\mathbb{P}^3)$ of dimension $\lambda_3 + \rho_3 + \Ext^1_B(I_{X_m/Y}, I_{X_m/Y}) = 37$.

**Example 4.22 (Using Theorem 4.19 (ii), mainly, for zero dimensional schemes in $\mathbb{P}^3$).**

Similar to Example 4.17 (ii) we let $A = [B, v]$ be a general $2 \times 4$ matrix whose columns consist of general polynomials of the same degree, 1, 2, 3 and $m$, $m \geq 3$ respectively. The vanishing of all $2 \times 2$ minors of $A$ defines a reduced scheme $X =: X_m$ of $11m + 6$ points in $\mathbb{P}^3$. This time Macaulay 2 computations show $\Ext^1_B(I_{X_m/Y}, I_{X_m/Y}) = 2$ and
$v\Ext^1_B(I_{X_m/Y}, B) = 0$ for every $m \geq 3$ and every $v \geq 0$ (we only need to check it for $m = 3$ because $I_{X_m/Y} = K_B^*(-m + 2)$ by (2.5) and (2.6)). It follows that

$$\dim \ker \rho^1 = \rho^1(I_{X_m/Y}, I_{X_m/Y}) = 2$$

for every $m \geq 3$, i.e. we can not use Theorem 4.19 (i) at all. We have, however,

$$\Ext^1_B(I_Y/I^2, I_{X_m/Y}) = 0 \text{ for } m > 5 \text{ by Remark } 4.17 \text{ (ii) and } \Ext^1_B(I_Y/I^2, I_{X_m/Y}) = 2$$

(resp. 0) for $m = 3$ (resp. $3 < m \leq 5$) by Macaulay 2. Since $\Ext^2_B(I_{X_m/Y}, I_{X_m/Y}) = 0$ for $m = 3$ and hence for every $m \geq 3$, we get $\Ext^1_B(I_{X_m/Y}, A) = 0$ for $m \geq 3$. We can therefore apply Theorem 4.19 (ii) in this situation except when $m = 3$. In the latter case $\Ext^1_A(I_{X_m/I^2_{X_m}}, A) = 0$ and Theorem 4.19 (iii) applies. Hence Theorem 4.19 applies for every $m \geq 3$, and we get that $W(b; a)$ belongs to a unique generically smooth irreducible component of $\text{Hilb}^H(\mathbb{P}^3)$ of codimension 2 (resp. 4) for $m > 3$ (resp. $m = 3$). Indeed $A$ is unobstructed and

$$\dim W(b; a) = \lambda_3 + K_3 = 11m + 35 \quad \text{for } m > 3 \quad \text{and} \quad 67 \quad \text{for } m = 3.$$

We remark that we have checked a possible vanishing of $\Ext^1_A(I_{X_m/I^2_{X_m}}, A)$ for several $m \geq 3$, and in the range $3 < m \leq 6$ this group is non-zero.

Finally to be complete we consider the cases $m = 1$ and $m = 2$ in which case we will delete the column of degree 3 polynomials to define $B$ and hence $Y$. If $m = 1$ we get by Macaulay 2

$$\dim \ker \rho^1 = \Ext^1_B(I_{X_m/Y}, I_{X_m/Y}) = 2, \quad \Ext^1_B(I_Y/I^2, I_{X_m/Y}) = 0 \text{ and}$$

$\Ext^1_B(I_{X_m/Y}, A) = 0$. We have $\dim W(b; a) = \lambda_3 + K_3 = 35$ and

$$\text{codim}_{\text{Hilb}^H(\mathbb{P}^3)} W(b; a) = \dim \ker \rho^1 = 2$$

by Theorem 4.19 (ii). Moreover if $m = 2$ we get

$$\dim \ker \rho^1 = \Ext^1_B(I_{X_m/Y}, I_{X_m/Y}) = 4, \quad \Ext^1_B(I_Y/I^2, I_{X_m/Y}) = 1, \quad \Ext^1_B(I_{X_m/Y}, A) = 0 \text{ and}$$

$\Ext^1_A(I_{X_m/I^2_{X_m}}, A) = 0$ by Macaulay 2. By Theorem 4.19 (iii) we find $\dim W(b; a) = \lambda_3 + K_3 = 53$ and

$$\text{codim}_{\text{Hilb}^H(\mathbb{P}^3)} W(b; a) = \dim \ker \rho^1 + \dim \tau_{X/Y} = 4 + 1 = 5.$$

Example 4.23 (Using Theorem 4.19 (i) with non-vanishing obstruction groups).

We let $A = [B, v]$ be a general $2 \times 4$ matrix whose columns consist of general polynomials of the same degree, 2, 3, 4, and $m, \geq 4$ respectively. The vanishing of all $2 \times 2$ minors of $A$ defines a reduced scheme $X =: X_m$ of $20m + 16$ points in $\mathbb{P}^3$. This time Macaulay 2 computations show $\Ext^1_B(I_{X_m/Y}, I_{X_m/Y}) = 0$ and $\Ext^1_B(I_Y/I^2, I_{X_m/Y}) = 0$ (resp. 1) for every $m > 4$ (resp. $m = 4$). It follows from Theorem 4.19 (i) that $W(b; a)$ is a generically smooth irreducible component of $\text{Hilb}^H(\mathbb{P}^3)$ of dimension $\lambda_3 + K_3 = 20m + 49$ for $m > 4$. For $m = 4$ we have verified that $\Ext^1_A(I_{X_m/I^2_{X_m}}, A) = 3$ and in this particular case we have not been able to verify whether $A$ is unobstructed or not. But for every $m > 4$, $A$ is unobstructed by Theorem 4.19 (i)! Moreover we have checked a possible vanishing of $\Ext^1_A(I_{X_m/I^2_{X_m}}, A)$ for many $m \geq 3$, and combined with some theoretical arguments (which we don’t take here) we can conclude that this group is always non-zero for every $m \geq 4$. Again, we think, this shows that the results presented here are quite strong because it is really hard to show unobstructedness when even the “smallest known obstruction group, $\Ext^1_A(I_{X_m/I^2_{X_m}}, A)$,” does not vanish.
In the final case $4 \leq c \leq 6$ and $\ker \tau_{Y/V} \neq 0$ where a general $X = \text{Proj}(A) \subset Y = \text{Proj}(B) \subset V = \text{Proj}(C)$ is given by deleting columns as above we can not apply Proposition 4.16 to $X \subset Y$ because there is no reason to expect condition (3) of Proposition 4.13 to be true (that condition is closely related to $\ker \tau_{Y/V} = 0$). But we can still use Proposition 4.13 since condition (3) of Proposition 4.13 is weakened to ”$Y$ unobstructed”. The natural condition for ”$Y$ unobstructed” which also give a formula for $h^0(N_Y) - \dim W(\underline{b}; \underline{a})$ is $\partial \text{Ext}_B^1(I_Y/I_Y^2, B) = 0$, cf. the proof of Proposition 4.15 (ii). We get

**Proposition 4.24.** With notations as above, suppose $4 \leq c \leq 6$ (let $\text{char} = 0$ if $c = 6$), $\dim X = n - c = 0$, $a_{i-3} \geq b_i \text{ for } \min(3, t) \leq i \leq t$ and suppose that (3.3) holds. Then $\dim W(\underline{b}; \underline{a}) = \lambda_c + K_3 + ... + K_c$ and the following statements are true:

(i) If $\partial \text{Ext}_B^1(I_{X/Y}, A) = 0$, $\partial \text{Ext}_B^1(I_Y/I_Y^2, I_{X/Y}) = 0$ and $\partial \text{Ext}_B^1(I_Y/I_Y^2, B) = 0$ then $A$ is unobstructed. Moreover $W(\underline{b}; \underline{a})$ is contained in a unique generically smooth irreducible component of $\text{Hilb}^H(\mathbb{P}^c)$ of codimension $\dim \ker \tau_{Y/V} + \dim \ker \tau_{X/Y}$. Suppose $\partial \text{Ext}_B^1(I_{X/Y}, A) = 0$ and $\partial \text{Ext}_C^1(I_{Y/V}, B) = 0$. Then we have

$$\text{codim}_{\text{Hilb}^H(\mathbb{P}^c)} W(\underline{b}; \underline{a}) = \dim \ker \rho^1 + \dim \ker \tau_{X/Y} + \dim \ker \tau_{Y/V}$$

if and only if $A$ is unobstructed (e.g. $\partial \text{Ext}_A^1(I_X/I_X^2, A) = 0$).

**Proof.** We have $\dim W(\underline{b}; \underline{a}) = \lambda_c + K_3 + ... + K_c$ by Proposition 3.4 since Theorem 3.5 applies to $W(\underline{b}; \underline{a})$ where $\underline{a} = a_0, a_1, \ldots, a_{t+c-3}$.

(i) This follows from Proposition 4.13 and Proposition 4.15 (ii) and by comparing the dimension formula of Proposition 4.13 with the final one of Proposition 3.4.

(ii) Combining Remark 4.9 and the final formula of Proposition 3.4 with (4.3), we get

$$\partial \text{hom}(I_X, A) - \dim W(\underline{b}; \underline{a}) = h^0(N_Y) - \dim W(\underline{b}; \underline{a}) + \dim \ker \rho^1 + \dim \ker \tau_{Y/V} - \text{im} \delta.$$

By the same argument we have $h^0(N_Y) - \dim W(\underline{b}; \underline{a}) \leq \dim \ker \tau_{Y/V}$ and moreover, if $\partial \text{Ext}_C^1(I_{Y/V}, B) = 0$, then equality holds. Hence we get the inequality of (ii), and furthermore, if the two Ext$^1$-groups of (ii) vanish then the inequality of (ii) is an equality if and only if $\dim_{(X)} \text{Hilb}^H(\mathbb{P}^c) = \partial \text{hom}(I_X, A)$ and we are done.

**Example 4.25** (determinantal zero dimensional schemes in $\mathbb{P}^4$, i.e. with $c = 4$).

Let $A = [B, v]$ be a general $2 \times 5$ matrix with linear (resp. quadratic) entries in the first, second and third (resp. fourth) column and let both entries of the column $v$ be of degree $m \geq 2$. Keeping the notations of Proposition 4.24 we get that the vanishing of all $2 \times 2$ minors defines a reduced scheme $X$ of $7m + 2$ points in $\mathbb{P}^4$. One verifies that $\dim \ker \rho^1 = \partial \text{Ext}_B^1(I_{X/Y}, I_{X/Y}) = 3$, $\partial \text{Ext}_B^1(I_{X/Y}, A) = 0$ and that (3.3) holds by Remark 3.6. Note that we have $\dim \ker \tau_{Y/V} = 1$ and $\partial \text{Ext}_C^1(I_{Y/V}, B) = 0$ from Example 4.17 (i).

Suppose $m > 2$. Then $\partial \text{Ext}_B^1(I_Y/I_Y^2, I_{X/Y}) = \partial \text{Ext}_B^1(I_Y/I_Y^2, B) = 0$ for every $m > 2$ and it follows from Proposition 4.24 (i) that $A$ is unobstructed and $W(\underline{b}; \underline{a}) = \lambda_4 + K_3 + K_4 = 7m + 31$. Hence $W(\underline{b}; \underline{a})$ is contained in a unique generically smooth irreducible component of the postulation Hilbert scheme $\text{Hilb}^H(\mathbb{P}^4)$ and,

$$\text{codim}_{\text{Hilb}^H(\mathbb{P}^4)} W(\underline{b}; \underline{a}) = \dim \ker \rho^1 + \dim \ker \tau_{Y/V} = 3 + 1 = 4.$$
Suppose \( m = 2 \). Since \( \dim \ker \tau_{X/Y} = \text{ext}^1_B(I_Y/I_Y^2, I_{X/Y}) = 4 \) and \( \text{ext}^1_A(I_X/I_X^2, A) = 0 \), it follows from Proposition 4.24 (ii) that \( A \) is unobstructed and that \( \dim W(b:a) = \lambda_4 + K_3 + K_4 = 44 \). Hence \( W(b:a) \) is contained in a unique generically smooth irreducible component of \( \text{Hilb}^H(\mathbb{P}^4) \) and,

\[
\text{codim}_{\text{Hilb}^H(\mathbb{P}^4)} W(b:a) = \dim \ker \rho^1 + \dim \ker \tau_{X/Y} + \dim \ker \tau_{Y/V} = 3 + 4 + 1 = 8.
\]

In this case we see that all three kernels of Proposition 4.24 (ii) contribute to the codimension of \( W(b:a) \) in \( \text{Hilb}^H(\mathbb{P}^4) \!\).  

**Remark 4.26.** If we apply Proposition 4.6 successively to the flag (2.7) we get Prop. 10.12 and Thm. 10.13 of [25] in a correct version (the injectivity of \( \rho^1 \), i.e. the assumption (1) of Proposition 4.6 in the case depth\( _I(Z) B = 2 \) lacked in [25]). Indeed in [26], Rem. 6.3 we announced that some results in §10 of [25] were inaccurate, and in the new hypothesis (*) of Rem. 6.3 we increased the depth assumption of the corresponding hypothesis in [25] by 1 to get valid results. The new hypothesis (*) applies to determinantal schemes of positive dimension, i.e. the results of [25], §10 hold in this case. In the zero dimensional case we introduced, in addition to (*) of Rem. 6.3, an assumption (Rem. 6.3 (ii)), which is equivalent to the injectivity of \( \rho^1 \). This assumption makes the results of [25], §10 correct in the zero dimensional case. In [26], Rem. 6.3 (ii) we indicate a proof for this claim, and now Proposition 4.6 provides us with another proof. In [26], Rem. 6.3 (i) and (iii), we claimed that e.g. the unobstructedness of \( A \) also implied \( all \) results of [25], §10, but this is a little inaccurate because the very final result of [25] (Cor. 10.17) uses the injectivity of \( \rho^1 \) to get the dimension formula. E.g. in Example 4.22 for \( m > 3 \) (resp. Example 4.21 with \( m = 2 \)) the formula of Cor. 10.17 gives \( \dim_{(X)} \text{Hilb}^H(\mathbb{P}^3) = \dim W(b:a) \), which should be correct according to Rem. 6.3 (i) (resp. Rem. 6.3 (iii)). The correct dimension is, however, \( \dim_{(X)} \text{Hilb}^H(\mathbb{P}^3) = \dim W(b:a) + \dim \ker \rho^1, \dim \ker \rho^1 = 2 \) in both cases. This observation is a reason for writing this paper, namely to provide detailed proofs in the zero dimensional case for the correction “Rem. 6.3 (ii)” and to present several results related to [26], Rem. 6.3 (i) and (iii) (see Proposition 4.13 Theorem 4.19 Proposition 4.24) where we see that we have to add \( \dim \ker \rho^1 \) to get valid (co)dimension formulas. Note also the obvious misprint in Rem. 6.3, that \( I_i \) should have been \( I_{c-1} \). Thus, letting \( D_i = R/I_{X_i} \) and \( \bar{I}_i = I_{X_{i+1}/X_i} \), the following hypothesis makes all results of [25], §10, true for good determinantal schemes \( X \) with \( \dim X \geq 0 \):

Given \( X \subset \mathbb{P}^n \) a good determinantal scheme of dimension \( n - c \), we will assume that there exists a flag \( X = X_c \subset X_{c-1} \subset \ldots \subset X_2 \subset \mathbb{P}^n \) such that for each \( i < c \), the closed embedding \( X_{i+1} \hookrightarrow X_i \) is l.c.i. outside some set \( Z_i \) of codimension 2 in \( X_{i+1} \) (depth\( _{Z_i} \mathcal{O}_{X_{i+1}} \geq 2 \)). Moreover, we suppose \( X_2 \hookrightarrow \mathbb{P}^n \) is an l.c.i. in codimension \( \leq 1 \) and if \( c = n \) we suppose that \( _0\text{Ext}^1_{D_{c-1}}(I_{c-1}, I_{c-1}) \hookrightarrow _0\text{Ext}^1_{D_{c-1}}(I_{c-1}, D_{c-1}) \) is injective.
