Ideals on Intuitionistic Fuzzy Supra Topological Spaces

Fadhil Abbas
Salzburger Straße 195, Linz, Austria

Abstract
The purpose of this paper is to introduce the notion of ideals on intuitionistic fuzzy supra topological spaces. Also, present the notion of S-compatible with the intuitionistic fuzzy ideal I and investigation some properties of intuitionistic fuzzy supra topological spaces S with the intuitionistic fuzzy ideal I. Moreover, introduce an intuitionistic fuzzy set operator $\Psi_S$ and study its properties.

Keywords: Intuitionistic fuzzy-I-supra topology, Intuitionistic fuzzy s-local function, Intuitionistic fuzzy set operator $\Psi_S$

1. Introduction

Zadeh [1] introduced the notion of fuzzy sets in 1965. Now, they are one of the most serious and possible paths for the advancement of the set theory of introduced by Georg Cantor. Despite the doubts and critical remarks expressed by some of the most influential mathematical logic experts in the second half of the 1960s against fuzzy sets, fuzzy sets were firmly developed as a fruitful field of study as well as a method for evaluating various objects and procedures.

In 1986, Atanassov [2] introduced intuitionistic fuzzy sets. In many applications, the intuitionistic fuzzy sets are important and useful fuzzy sets. Atanassov [3, 4] in 1994 and 1999 proved that the intuitionistic fuzzy sets contain the degree of affiliation and the degree of non-affiliation, and therefore, the intuitionistic fuzzy sets have become more relevant and applicable. In 2001 and 2004, Szmidt and Kacprzyk [5, 6] showed that intuitionistic fuzzy sets are so useful in situations where it seems extremely difficult to define a problem through a membership function.

The idea of intuitionistic fuzzy topology was described by Atanassov [7] in 1988, and the basic idea of intuitionistic fuzzy points was studied by Coker and Demirci [8] in 1995. Kuratowski [9] first proposed the concept of an ideal topological space in 1966, and Vaidyanathaswamy [10] proposed in 1944. In an ideal topological space, they also introduced a local function. In 1990, Jankovic and Hamlett [11] introduced a new topology by introduce the operator in any ideal topological space from the original ideal topological spaces.

Mashhour et al. [12] in 1983 introduced supra topological spaces. The concept of intuitionistic fuzzy supra topological space was introduced by Turanl [13] in 2001. In addition to some features of an ideal supra topological notion obtained by Kandil et al. [14] in 2015.

The purpose of this paper is to introduce the notion of ideals on intuitionistic fuzzy supra topological spaces. Also, present the notion of S is compatible with the intuitionistic fuzzy...
ideal I and investigate some properties of intuitionistic fuzzy supra topological spaces S with intuitionistic fuzzy ideal I. Moreover, introduce an intuitionistic fuzzy set operator \( \Psi_S \) and study its properties.

2. Preliminaries

**Definition 2.1** ([15]). Let \( X \neq \emptyset \), an intuitionistic fuzzy set \( A \) is subject with the form \( A = \{ x, \mu_A(x), \nu_A(x) : x \in X \} \), where \( \mu_A : X \rightarrow [0,1] \) and \( \nu_A : X \rightarrow [0,1] \) define the degree of membership \( \mu_A(x) \) and the degree of non-membership \( \nu_A(x) \) for every \( x \in X \) to the set \( A \), respectively, and \( 0 \leq \mu_A(x) + \nu_A(x) \leq 1 \) for every \( x \in X \).

**Definition 2.2** ([15]). \( 1_\sim = \{ x, 1, 0 : x \in X \} \) and \( 0_\sim = \{ x, 0, 1 : x \in X \} \).

**Definition 2.3** ([16]). Let \( A, B \) be an intuitionistic fuzzy sets, then we define

1. \( A \subseteq B \) if and only if \( \mu_A(x) \leq \mu_B(x) \) and \( \nu_A(x) \geq \nu_B(x) \) for every \( x \in X \).
2. \( A = B \) if and only if \( A \subseteq B \) and \( B \subseteq A \).
3. \( A^c = \{ x, \nu_A(x), \mu_A(x) : x \in X \} \).
4. \( A \cap B = \{ x, \mu_A(x) \land \mu_B(x), \mu_A(x) \lor \mu_B(x) \} \).
5. \( A \cup B = \{ x, \mu_A(x) \lor \mu_B(x), \mu_A(x) \land \mu_B(x) \} \).

**Definition 2.4** ([8]). Let \( X \neq \emptyset \) and let \( x \in X \). If \( \alpha \in (0,1) \) and \( \beta \in [0,1) \) are two fixed real numbers such that \( \alpha + \beta \leq 1 \), then, in the intuitionistic fuzzy set

\[ x(\alpha,\beta) = \{ x, x(\alpha), 1 - x(\beta) : x \in X \} \]

is called an intuitionistic fuzzy point in \( X \), where \( \alpha \) denotes the degree of membership of \( x(\alpha,\beta) \), \( \beta \) is the degree of non-membership of \( x(\alpha,\beta) \), and \( x \in X \) is the support of \( x(\alpha,\beta) \).

**Definition 2.5** ([2]). A subclass \( S \) is called an intuitionistic fuzzy supra topology on \( X \) if \( 0_\sim, 1_\sim \in S \) and \( S \) is closed under arbitrary unions \((X, S)\), which is called an intuitionistic fuzzy supra topology on \( X \), the members of \( S \) are called intuitionistic fuzzy supra open sets. An intuitionistic fuzzy set \( A \) is an intuitionistic fuzzy supra closed if and only if its complement \( A^c \) is fuzzy supra open.

**Definition 2.6** ([2]). Let \( (X, S) \) be an intuitionistic fuzzy supra topological space and let \( A \) be an intuitionistic fuzzy set in \( X \). Then subsequently, the intuitionistic fuzzy supra interior and the intuitionistic fuzzy supra closure of \( A \) in \( (X, S) \) is defined as

\[ \text{Int}^S(A) = \bigcup \{ U : U \subseteq A, U \in S \} \]

and

\[ \text{Cl}^S(A) = \bigcap \{ F : A \subseteq F, F^c \in S \} \]

respectively.

**Corollary 2.1.** From Definition 2.6, \( \text{Int}^S(A) \) is a fuzzy supra open set and \( \text{Cl}^S(A) \) is a fuzzy supra closed set.

**Definition 2.7** ([8]). Let \( A \) and \( B \) be two intuitionistic fuzzy sets in \( X \). A is called quasi-coincident with \( B \) (written \( AqB \)) if and only if, there exists \( x \in X \) such that \( \mu_A(x) > \nu_B(x) \) or \( \nu_A(x) < \nu_B(x) \).

**Definition 2.8** ([8]). Let \( x(\alpha,\beta) \) an intuitionistic fuzzy point and let \( A \) an intuitionistic fuzzy set in \( X \). We say that \( x(\alpha,\beta) \) quasi-coincident with \( A \), denoted by \( x(\alpha,\beta)qA \) if and only if \( \alpha > \nu_A(x) \) or \( \beta < \mu_A(x) \).

**Definition 2.9** ([8]). Let \( x(\alpha,\beta) \) an intuitionistic fuzzy point and let \( A \) an intuitionistic fuzzy set in \( X \). Let \( \alpha \) and \( \beta \) are real numbers between 0 and 1. The intuitionistic fuzzy point \( x(\alpha,\beta) \) is called properly contained in \( A \) if and only if, \( \alpha < \mu_A(x) \) and \( \beta > \nu_A(x) \).

**Definition 2.10** ([8]). Let \( x(\alpha,\beta) \) an intuitionistic fuzzy point . Then, \( x(\alpha,\beta) \in A \) if \( \alpha \leq \mu_A(x) \) and \( \beta \geq \nu_A(x) \).

**Definition 2.11** ([2]). Let \( (X, S) \) be an intuitionistic fuzzy supra topological space and let \( A \subseteq X \). Then, \( A \) is the s-neighborhood of an intuitionistic fuzzy point \( x(\alpha,\beta) \) if there is \( U \in S \) with \( x(\alpha,\beta) \in U \subseteq A(x(\alpha,\beta)qU \subseteq A) \). The collection \( N(x(\alpha,\beta)) \) of all s-neighborhood of \( x(\alpha,\beta) \) is called the s-neighborhood system of \( x(\alpha,\beta) \).

**Definition 2.12** ([2]). Let \( (X, S_1) \) and \( (X, S_2) \) be two intuitionistic fuzzy supra topologies and let \( S_1 \subseteq S_2 \). Then, we say that \( S_2 \) is stronger than \( S_1 \) or \( S_1 \) is weaker than \( S_2 \).

**Definition 2.13** ([2]). Let \( (X, S) \) be an intuitionistic fuzzy supra topological space and let \( \beta \subseteq S \). Then, \( \beta \) is called a base for the intuitionistic fuzzy supra topological space \( S \) if every intuitionistic fuzzy supra open set \( U \in S \) is a union of members of \( \beta \). Equivalently, \( \beta \) is an intuitionistic fuzzy supra-base for \( S \) if for any intuitionistic fuzzy point \( x(\alpha,\beta) \in U \) there exists \( B \in \beta \) with \( x(\alpha,\beta) \in B \subseteq U \).

**Definition 2.14** ([2]). A mapping \( c : P(X) \rightarrow P(X) \) is called an intuitionistic fuzzy supra closure operator if it satisfies
the following axioms:

1. \( c(0_\sim) = 0_\sim \)
2. \( A \subseteq c(A) \) for every \( A \subseteq X \)
3. \( c(A) \cap c(B) \subseteq c(A \cup B) \) for every \( A, B \subseteq X \)
4. \( c(c(A)) = c(A) \) for every \( A \subseteq X \)

**Theorem 2.1.** Let \( X \neq \emptyset \) and let the mapping \( c: P(X) \to P(X) \) be an intuitionistic fuzzy supra closure operator. Then, the collection \( S = \{ A \in P(X) : c(A^c) = A^c \} \) is an intuitionistic fuzzy supra topology on \( X \) induced by the intuitionistic fuzzy supra closure operator \( c \).

**Definition 2.15.** Let \( I \) be a non-empty collection of intuitionistic fuzzy sets of \( X \) is called intuitionistic fuzzy ideal on \( X \) if and only if

1. \( A \in I \) and \( B \subseteq A \), then \( B \in I \)
2. \( A \in I \) and \( B \in I \), then \( A \cup B \in I \)

### 3. Intuitionistic Fuzzy S-Local Function

**Definition 3.1.** Let \((X, S)\) be an intuitionistic fuzzy supra topological space. Then, an intuitionistic fuzzy ideal \( I \) on \( X \) is called an intuitionistic fuzzy ideal supra topological space and is denoted as \((X, S, I)\).

**Definition 3.2.** Let \((X, S, I)\) be an intuitionistic fuzzy ideal supra topological space and let \( A \) be an intuitionistic fuzzy set in \( X \). Then, the intuitionistic fuzzy local function \( A^S(I, S) \) of \( A \) is the union of all intuitionistic fuzzy point \( x_{(\alpha, \beta)} \) such that \( U \in N(x_{(\alpha, \beta)}) \) and \( A^S(I, S) = \cup \{ x_{(\alpha, \beta)} \in X : A \cap U \notin I \} \). We will occasionally write \( A^S \) for \( A^S(I, S) \).

**Example 3.1.** The simplest intuitionistic fuzzy ideal on \( X \) is the set \( \{0_\sim\} \) and \( P(X) \). Obviously, \( I = \{0_\sim\} \Rightarrow A^S = Cl^S(A) \) for any \( A \subseteq X \) and \( I = P(X) \Rightarrow A^S = 0_\sim \).

**Theorem 3.1.** Let \((X, S, I)\) be an intuitionistic fuzzy supra topological space and let \( A, B \subseteq X \). Then,

1. \( 0_\sim^S = 0_\sim \)
2. If \( A \subseteq B \), then \( A^S \subseteq B^S \)
3. If \( I_1 \subseteq I_2 \), then \( A^S(I_2) \subseteq A^S(I_1) \)
4. \( A^S = Cl^S(A^S) \subseteq Cl^S(A) \)
5. \( (A^S)^S \subseteq A^S \)
6. \( A^S \) is an intuitionistic fuzzy supra closed set,
7. \( A^S \cup B^S \subseteq (A \cup B)^S \)
8. \( (A \cap B)^S \subseteq A^S \cap B^S \)
9. If \( E \in I \), then \( (A \cup E)^S = A^S = (A - E)^S \)
10. If \( U \subseteq S \), then \( U \cup A^S = U \cap (U \cap A)^S \subseteq (U \cap A)^S \)
11. If \( E \in I \), then \( E^S = 0_\sim \)
12. \( E \in I \), then \( (1_\sim - E)^S \)

**Proof.** (1) Clear from the definition of intuitionistic fuzzy S-local function.

(2) Since \( A \subseteq B \), let \( x_{(\alpha, \beta)} \in A^S \), then \( A \cap U \notin I \) for every \( U \in N(x_{(\alpha, \beta)}) \). By hypothesis, we obtain \( B \cap U \notin I \), then \( x_{(\alpha, \beta)} \in B \). Therefore, \( A^S \subseteq B^S \).

(3) Clearly, \( I_1 \subseteq I_2 \) implies \( A^S(I_2) \subseteq A^S(I_1) \), as there may be other intuitionistic fuzzy sets that which belong to \( I_2 \) so that for an intuitionistic fuzzy point \( x_{(\alpha, \beta)} \in A^S(I_1) \) but \( x_{(\alpha, \beta)} \notin A^S(I_2) \).

(4) Since \( \{0_\sim\} \subseteq I \) for any intuitionistic fuzzy ideal on \( X \), therefore by (3) and Example 3.1. \( A^S(I) \subseteq A^S(\{0_\sim\}) = Cl^S(A) \), for any intuitionistic fuzzy set \( A \in X \). Suppose, \( x_{(\alpha, \beta)} \in Cl^S(A^S) \) such that for every \( U \in N(x_{(\alpha, \beta)}) \), \( A^S \cup U \notin 0_\sim \) there exists \( x_{2(\alpha, \beta)} \in A^S \cup U \) such that for every \( V \in N(x_{2(\alpha, \beta)}) \), then \( A \cap V \notin I \). Since \( U \cup V \notin N(x_{2(\alpha, \beta)}) \), then \( A \cap (U \cup V) \notin I \), which leads to \( A \cap U \notin I \) for every \( U \in N(x_{2(\alpha, \beta)}) \), therefore \( x_{2(\alpha, \beta)} \in A^S \) and so \( Cl^S(A^S) \subseteq A^S \) while the other inclusion follows directly. Hence, \( A^S = Cl^S(A^S) \subseteq Cl^S(A) \).

(5) From (4), \( (A^S)^S \subseteq Cl^S(A^S) = A^S \).

(6) Clear from (4).

(7) We know that \( A \subseteq A \cup B \) and \( B \subseteq A \cup B \). Then, from (2), \( A^S \subseteq (A \cup B)^S \) and \( B^S \subseteq (A \cup B)^S \). Hence, \( A^S \cup B^S \subseteq (A \cup B)^S \).

(8) We know that \( (A \cap B) \subseteq A \) and \( (A \cap B) \subseteq B \). Then, from (2), \( (A \cap B)^S \subseteq A^S \) and \( (A \cap B)^S \subseteq A^S \). Hence, \( (A \cap B)^S \subseteq A^S \cap B^S \).

(9) Since \( A \subseteq (A \cup E) \), then from (2) \( A^S \subseteq (A \cup E)^S \). Let \( x_{(\alpha, \beta)} \in (A \cup E)^S \). Then, for every \( U \in N(x_{(\alpha, \beta)}) \) such that \( U \cap (A \cup E) \notin I \). This implies that \( U \cap A \notin I \) (if possible suppose that \( U \cap A \in I \). Again, \( U \cap E \subseteq E \) implies \( U \cap E \subseteq I \) and hence \( U \cap (A \cup E) \in I \), contradiction). Hence, \( x_{(\alpha, \beta)} \in A^S \) and \( (A \cup E)^S \subseteq A^S \) then \( (A \cup E)^S = A^S \).

Since \( (A - E) \subseteq A \), then from (2), \( (A - E)^S \subseteq A^S \). For the reverse inclusion, let \( x_{(\alpha, \beta)} \in A^S \). We claim that
$x_{(\alpha, \beta)} \in (A - E)^{S}$, if not, then there is $U \in N(x_{(\alpha, \beta)})$ such that $U \cap (A - E) \notin I$. Given that $E \in I$, then $E \cup (U \cap (A - E)) \notin I$. This implies that $E \cup (U \cap A) \notin I$. So, $U \cap A \notin I$, a contradiction to the fact that $x_{(\alpha, \beta)} \in A^{S}$. Hence, $A^{S} \subseteq (A - E)^{S}$. Then, $A^{S} = (A - E)^{S}$; therefore, $(A \cup E)^{S} = A^{S} = (A - E)^{S}$.

(10) Since $V \cap A \subseteq A$, then from (2), $(V \cap A)^{S} \subseteq A^{S}$. So $V \cap (V \cap A)^{S} \subseteq V \cap A^{S}$.

(11) Clear from the definition of intuitionistic fuzzy S-local function.

(12) Clear from proof (9).

**Theorem 3.2.** Let $(X, S, I)$ be an intuitionistic fuzzy ideal supra topological space and let $A \subseteq X$. If $M \in S$, $M \cap A \in I$, then $M \cap A^{S} = 0_{\omega}$.

**Proof.** Let $x_{(\alpha, \beta)} \in M \cap A^{S}$. Then, $x_{(\alpha, \beta)} \in M$ and $x_{(\alpha, \beta)} \in A^{S}$ implies $U \cap A \notin I$ for every $U \in N(x_{(\alpha, \beta)})$. Since $x_{(\alpha, \beta)} \in M \in S$, then $M \cap A^{S} \notin I$.

**Theorem 3.3.** Let $(X, S, I)$ be an intuitionistic fuzzy ideal supra topological space and let $A \subseteq X$. Then, $(A \cup A^{S})^{S} \subseteq A^{S}$.

**Proof.** Let $x_{(\alpha, \beta)} \notin A^{S}$. Then, there exists $U \in N(x_{(\alpha, \beta)})$ such that $U \cap A \in I \Rightarrow U \cap A^{S} = 0_{\omega}$ (By Theorem 3.2). Hence, $U \cap (A \cup A^{S}) = (U \cap A) \cup (U \cap A^{S}) = U \cap A \in I$. Therefore, $x_{(\alpha, \beta)} \notin (A \cup A^{S})^{S}$. Hence, $(A \cup A^{S})^{S} \subseteq A^{S}$.

**Theorem 3.4.** Let $(X, S, I)$ be an intuitionistic fuzzy ideal supra topological space. Then, the operator $Cl^{S}: P(X) \to P(X)$ defined by $Cl^{S}(A) = A \cup A^{S}$ for any $A \subseteq X$, is an intuitionistic fuzzy supra closure operator and hence it generates an intuitionistic fuzzy supra topology $S^{*}(I) = \{A \in P(X): Cl^{S}(A^{c}) = A^{c}\}$, which is finer than $S$.

**Proof.** (1) By Theorem 3.1.(1), $0^{S}_{\omega} = 0_{\omega}$, we have $Cl^{S}(0_{\omega}) = 0_{\omega}$.

(2) Clear $A \subseteq Cl^{S}$ for every intuitionistic fuzzy set $A$.

(3) Let $A$ and $B$ be two intuitionistic fuzzy sets. Then, $Cl^{S}(A) \cap Cl^{S}(B) = (A \cup A^{S}) \cap (B \cup B^{S}) = (A \cup B) \cup (A^{S} \cup B^{S}) \subseteq (A \cup B) \cup (A \cup B) = Cl^{S}(A \cup B)$ (by Theorem 3.1.(7)). Hence, $Cl^{S}(A) \cup Cl^{S}(B) \subseteq Cl^{S}(A \cup B)$. (4) Let $A$ be any intuitionistic fuzzy set. Since, by (2), $A \subseteq Cl^{S}(A)$, then $Cl^{S}(A) \subseteq Cl^{S}(Cl^{S}(A))$. On the other hand, $Cl^{S}(Cl^{S}(A)) = Cl^{S}(A \cup A^{S}) = (A \cup A^{S}) \cup (A \cup A^{S})^{S} \subseteq A \cup A^{S} \cup A^{S} = Cl^{S}(A)$ (by Theorem 3.3), it follows that $Cl^{S}(Cl^{S}(A)) \subseteq Cl^{S}(A)$. Hence, $Cl^{S}(Cl^{S}(A)) = Cl^{S}(A)$. Consequently, $Cl^{S}(A)$ is an intuitionistic fuzzy supra closure operator. Also, it is also easy to show that the collection $S^{*}(I) = \{A \in P(X): Cl^{S}(A^{c}) = A^{c}\}$ is an intuitionistic fuzzy supra topology on $X$, which is called the intuitionistic fuzzy supra topology induced by the intuitionistic fuzzy supra closure operator.

**Example 3.2.** For any intuitionistic fuzzy ideal on $X$ if $I = \{0_{\omega}\} \Rightarrow Cl^{S}(A) = A \cup A^{S} = A \cup Cl^{S}(A) = Cl^{S}(A)$ for every $A \in P(X)$. So $S^{*}(\{0_{\omega}\}) = S$, and if $I = P(X) \Rightarrow Cl^{S}(A) = A$, because $A^{S} = 0_{\omega}$ for every $A \in P(X)$. So $S^{*}(P(X))$ is an intuitionistic fuzzy discrete supra topology on $X$. Since $\{0_{\omega}\}$ and $P(X)$ are the two extreme intuitionistic fuzzy ideals on $X$, therefore for any intuitionistic fuzzy ideal $I$ on $X$, we have $\{0_{\omega}\} \subseteq I \subseteq P(X)$. So we can conclude by Theorem 3.1.(2) $S^{*}(\{0_{\omega}\}) \subseteq S^{*}(I) \subseteq S^{*}(P(X))$, i.e. $S \subseteq S^{*}(I)$, for any intuitionistic fuzzy ideal $I$ on $X$. In particular, we have for any two intuitionistic fuzzy ideals $I_{1}$ and $I_{2}$ on $X$, $I_{1} \subseteq I_{2} \Rightarrow S^{*}(I_{1}) \subseteq S^{*}(I_{2})$.

**Theorem 3.5.** Let $S_{1}$, $S_{2}$ be two intuitionistic fuzzy supra topologies on $X$. Then, for any intuitionistic fuzzy ideal $I$ on $X$, $S_{1} \subseteq S_{2}$ implies

(1) $A^{S}(S_{2}, I) \subseteq A^{S}(S_{1}, I)$ for every $A \in P(X)$,

(2) $S_{1}^{*}(I) \subseteq S_{2}^{*}(I)$.

**Proof.** (1) Since every $S_{1}$ s-neighborhood of any intuitionistic fuzzy point $x_{(\alpha, \beta)}$ is also an $S_{2}$ s-neighborhood of $x_{(\alpha, \beta)}$. Therefore, $A^{S}(S_{2}, I) \subseteq A^{S}(S_{1}, I)$.

(2) Clearly, $S_{1}^{*}(I) \subseteq S_{2}^{*}(I)$ as $A^{S}(S_{2}, I) \subseteq A^{S}(S_{1}, I)$.

**Theorem 3.6.** Let $(X, S, I)$ be an intuitionistic fuzzy ideal supra topological space. Then, $A$ is an intuitionistic fuzzy $S^{*}$-supra closed if and only if $A^{S} \subseteq A$. Then, $A = Cl^{S}(A^{S}) = Cl^{S}(A)$.

**Proof.** Clear.

**Theorem 3.7.** Let $(X, S, I)$ be an intuitionistic fuzzy ideal supra topological space. Then, the collection $\beta(I, S) = \{U - H: \ U \in S, H \in I\}$ is a base for the intuitionistic fuzzy supra topology $S^{*}(I)$.

**Proof.** Let $U \in S^{*}(I)$ and $x_{(\alpha, \beta)} \in U$. Then, $U^{c}$ is an intuitionistic fuzzy $S^{*}$-supra closed set such that $Cl^{S}(U^{c}) = U^{c}$, and hence $(U^{c})^{S} \subseteq U^{c}$. Then, $x_{(\alpha, \beta)} \notin (U^{c})^{S}$, and so there, exists $V \in N(x_{(\alpha, \beta)})$ such that $V \cap U^{c} \in I$. Putting
\[ H = V \cap U^c, \text{then } x_{(\alpha,\beta)} \notin H, \text{and } H \in I. \text{ Thus, } x_{(\alpha,\beta)} \in V - H = V \cap H^c = V \cap (V \cap H^c) = V \cap (\cap V^c \cap \cup U) = V \cap \cup U \subseteq U. \]

Hence, \( x_{(\alpha,\beta)} \in V - H \subseteq U, \) where \( V - H \in \beta(I,S). \) Hence, \( U \) is the union of the set in \( \beta(I,S). \)

**Theorem 3.8.** Let \( (X, S, I) \) be an intuitionistic fuzzy ideal supra topological space. Then, \( S \subseteq \beta(I,S) \subseteq S^\ast. \)

**Proof.** Let \( U \in S. \) Then, \( U = U - 0_\ast \in \beta(I,S). \) Hence, \( S \subseteq \beta(I,S) \). Now, let \( G \in \beta(I,S) \), then there exists \( U \in S \) and \( H \in I \) such that \( G = U - H. \) Then, \( Cl^S(G^c) = Cl^S(U - H) = (U - H)^c \cup (U - H)^c = (U \cup H) \cup (U \cup H)^c = S. \) But \( H \in I, \) and then by Theorem 3.1.(8), \( (U^c \cup H)^c = (U^c)^c \in S; \) and so, \( Cl^S(U - H) = U^c \cup H \cup (U^c)^c \subseteq U \cup H. \) Hence, \( Cl^S(U - H) \subseteq U \cup H = (U - H)^c, \) but \( (U - H)^c \subseteq Cl^S(U - H)^c. \) Hence, \( Cl^S(U - H)^c = (U - H)^c. \) Therefore, \( U - H \subseteq S(I). \) Hence, \( \beta(I,S) \subseteq S^\ast(I). \) Consequently, \( S \subseteq \beta(I,S) \subseteq S^\ast(I). \)

**Theorem 3.9.** Let \( (X, S, I) \) be an intuitionistic fuzzy ideal supra topological space. Then, if \( I = \{0_\ast\}, \) then \( S = \beta(I,S) = S^\ast(I). \)

**Proof.** It follows from Theorem 3.8.

**Example 3.3.** Let \( T \) be the intuitionistic fuzzy indiscrete supra topology on \( X, \) i.e. \( T = \{0_\ast, 1_\ast\}. \) So \( 1_\ast \) is the only \( s \)-neighborhoods of \( x_{(\alpha,\beta)}. \) Now, \( x_{(\alpha,\beta)} \in A^\ast \) for an intuitionistic fuzzy set \( A \) if and only if for every \( U \in N(x_{(\alpha,\beta)}), \) then \( U \cap A \notin I. \) Therefore, \( A^\ast = 1_\ast \), if \( A \notin I \) and \( A^\ast = 0_\ast \) if \( A \in I. \) This implies that we have \( Cl^S(A) = A \cup A^\ast = 1_\ast \), if \( A \notin I \) and \( Cl^S(A) = A \) if \( A \in I \) for any intuitionistic fuzzy set \( A \) of \( X. \) Hence, \( T^* = \{M: M^* \in I\}. \) Let \( S \cup T^*(I) \) be the supremum intuitionistic fuzzy supra topology of \( S \) and \( T^*(I), \) i.e. the smallest intuitionistic fuzzy supra topology generated by \( S \cup T^*(I). \) Then, we have the following theorem.

**Theorem 3.10.** \( S^\ast(I) = S \cup T^*(I). \)

**Proof.** Follows from the fact that \( \beta \) forms a basis for \( S^\ast(I). \)

\[ x_{(\alpha,\beta)} \in A, \text{there exists } U \in N(x_{(\alpha,\beta)}) \text{ such that } U \cap A \in I, \text{ then } A \in I. \]

**Theorem 4.1.** Let \( (X, S, I) \) be an intuitionistic fuzzy ideal supra topological space, and the following properties are equivalent:

1. \( S \sim I, \)
2. For every intuitionistic fuzzy set \( A \) in \( X, A \cap A^\ast = 0_\ast \) implies that \( A \in I, \)
3. For every intuitionistic fuzzy set \( A \) in \( X, A - A^\ast \in I, \)
4. For every intuitionistic fuzzy set \( A \) in \( X, \text{if } A \text{ contains no non-empty intuitionistic fuzzy subset } B \text{ with } B \subseteq B^\ast, \text{ then } A \in I. \)

**Proof.** (1) \( \Rightarrow \) (2) The proof is obvious.

\( (2) \Rightarrow (3) \) For any intuitionistic fuzzy set \( A \) in \( X, A - A^\ast \subseteq A, \) and \( (A - A^\ast) \cap (A - A^\ast)^\ast \subseteq (A - A^\ast) \cap A^\ast = 0_\ast. \) By (2), we obtain \( A - A^\ast \in I. \)

\( (3) \Rightarrow (4) \) By (3), for every intuitionistic fuzzy set \( A \) in \( X, \)

\( A - \epsilon = \epsilon \cup \epsilon - \epsilon = \epsilon \cup (\epsilon - \epsilon) = \epsilon \cup \epsilon = \epsilon, \text{ and hence } A - A^\ast \in I. \)

\( (4) \Rightarrow (1) \) Let an intuitionistic fuzzy set \( A \) and suppose that for every \( x_{(\alpha,\beta)} \), there exists \( U \in N(x_{(\alpha,\beta)}) \) such that \( U \cap A \in I. \) Then, \( A \cap A^\ast = 0_\ast. \) Suppose that \( A \) contains \( B \) such that \( B \subseteq B^\ast. \) Then, \( B = B \cap B^\ast \subseteq A \cap A^\ast = 0_\ast. \) Therefore, \( A \) contains no non-empty subset \( B \) with \( B \subseteq B^\ast. \) Hence \( A \in I. \)

**Theorem 4.2.** Let \( (X, S, I) \) be an intuitionistic fuzzy ideal supra topological space. If \( S \) is \( S \)-compatible with \( I, \) then the following equivalent properties hold:

1. For every intuitionistic fuzzy set \( A \) in \( X, A \cap A^\ast = 0_\ast \) implies that \( A^\ast = 0_\ast, \)
2. For every intuitionistic fuzzy set \( A \) in \( X, (A - A^\ast)^\ast = 0_\ast. \)

**Proof.** First, we show that (1) holds if \( S \) is \( S \)-compatible with \( I. \) Let \( A \) be any intuitionistic fuzzy set in \( X \) and \( A \cap A^\ast = 0_\ast. \) By Theorem 4.1, \( A \in I; \) then, \( A^\ast = 0_\ast. \)

(1) \( \Rightarrow \) (2) Assume that for every intuitionistic fuzzy set \( A \) in \( X, A \cap A^\ast = 0_\ast. \) Suppose that \( A \) contains \( B \) such that \( B \subseteq B^\ast. \) Then, \( B = B \cap B^\ast \subseteq A \cap A^\ast = 0_\ast. \) Therefore, \( A \) contains no non-empty subset \( B \) with \( B \subseteq B^\ast. \) Hence \( A \in I. \)
then $B \cap B^S = (A - A^S) \cap (A - A^S)^S = (A \cap (A^S)^c) \cap (A \cap (A^S)^c)^S \subseteq \text{Int}((A \ast \text{Scap})(A^S)^c) \cap (A^S)^c \cap (A^S)^c) = 0$. By (1), we have $B^S = 0$. Hence, $(A - A^S)^S = 0$.

(2) $\Rightarrow$ (1) Assume that for every intuitionistic fuzzy set $A$ in $X$, $A \cap A^S = 0$, and let $B = A - A^S$, then $A = B \cup (A \cap A^S) = B \cup 0 = B$, then $A^S = B^* = (A - A^S)^S = 0$.

**Theorem 4.3.** Let $(X, S, I)$ be an intuitionistic fuzzy ideal supra topological space, the following properties are equivalent:

(1) $S \cap I = 0$,

(2) $1^S = 1$.

**Proof.** (1) $\Rightarrow$ (2) Let $S \cap I = 0$. Then $1^S = \text{Int}(1) = 1$.

(2) $\Rightarrow$ (1) $1 = 1^S = \{x_{(a, \beta)} \in X : U \cap 1 = U \notin I, \text{for every } U \in N(x_{(a, \beta)})\}$. Hence $\text{Int}(S) \cap I = 0$.

**5. Intuitionistic Fuzzy Set Operator $\Psi_S$**

**Definition 5.1.** Let $(X, S, I)$ be an intuitionistic fuzzy ideal supra topological space. An operator $\Psi_S : P(X) \to S$ is defined as follows for every intuitionistic fuzzy set $A$ in $X$, $\Psi_S(A) = \{x_{(a, \beta)} \text{ intuitionistic fuzzy point: there exists } M \in N^S(x_{(a, \beta)}) \text{ such that } M - A \in I\}$. We observe that $\Psi_S(A) = 1 - (1 - A)^S$. The behaviors of the operator $\Psi_S$ have been discussed in the following theorem:

**Theorem 5.1.** Let $(X, S, I)$ be an intuitionistic fuzzy ideal supra topological space. Let $A$ and $B$ be two intuitionistic fuzzy set in $X$. Then,

(1) $\Psi_S(A)$ is intuitionistic fuzzy supra open set.

(2) $\text{Int}S(A) \subseteq \Psi_S(A)$.

(3) If $A \subseteq B$, then $\Psi_S(A) \subseteq \Psi_S(B)$.

(4) $\Psi_S(A \cap B) \subseteq \Psi_S(A) \cap \Psi_S(B)$.

(5) $\Psi_S(A) \cup \Psi_S(B) \subseteq \Psi_S(A \cup B)$.

(6) If $U \subseteq S$, then $U \subseteq \Psi_S(U)$.

(7) $\Psi_S(A) \subseteq \Psi_S(\Psi_S(A))$.

(8) $\Psi_S(A) = \Psi_S(\Psi_S(A))$ if and only if $(1 - A)^S = ((1 - A)^S)^S$.

(9) If $(A - B) \cup (B - A) \in I$, then $\Psi_S(A) = \Psi_S(B)$.

(10) If $E \in I$, then $\Psi_S(E) = 1 - 1^S$.

(11) If $E \in I$, then $\Psi_S(A - E) = \Psi_S(A)$.

(12) If $E \in I$, then $\Psi_S(A \cup E) = \Psi_S(A)$.

**Proof.** (1) Since $(1 - A)^S$ is an intuitionistic fuzzy supra closed set, then $1 - (1 - A)^S$ is an intuitionistic fuzzy supra open set. Hence, $\Psi_S(A)$ is an intuitionistic fuzzy supra open set.

(2) From the definition of the $\Psi_S$ operator, $\Psi_S(A) = 1 - (1 - A)^S$. Then, $1 - \text{IntS}(1 - A) \subseteq 1 - (1 - A)^S = \Psi_S(A)$, from Theorem 3.1.(4). Hence, $\text{IntS}(A) \subseteq \Psi_S(A)$.

(3) Let $A \subseteq B$. Then, $(1 - B) \subseteq (1 - A)$. Then subsequently, from Theorem 3.1.(2), $(1 - B)^S \subseteq (1 - A)^S$. Therefore, $\Psi_S(A) \subseteq \Psi_S(B)$.

(4) We have $A \cap B \subseteq A$ and $A \cap B \subseteq B$. Then from (3), $\Psi_S(A \cap B) \subseteq \Psi_S(A) \cap \Psi_S(B)$.

(5) We have $A \subseteq A \cup B$ and $B \subseteq A \cup B$. Then, from (3), $\Psi_S(A) \cup \Psi_S(B) \subseteq \Psi_S(A \cup B)$.

(6) Let $U \subseteq S$. Then, $(1 - U)$ be an intuitionistic fuzzy supra closed set, and hence $\text{IntS}(1 - U) = 1 - U$. Then, $(1 - U)^S \subseteq \text{IntS}(1 - U) = 1 - U$. Hence, $U \subseteq 1 - (1 - U)^S$, and so $U \subseteq \Psi_S(U)$.

(7) From (2), $\Psi_S(A) \subseteq S$, and from (6), $\Psi_S(A) \subseteq \Psi_S(\Psi_S(A))$.

(8) Let $\Psi_S(A) = \Psi_S(\Psi_S(A))$. Then $1 - (1 - A)^S = \Psi_S(1 - (1 - A)^S) = 1 - (1 - (1 - (1 - A)^S)^S) = 1 - 1^S = (1 - A)^S$. Conversely, suppose that $(1 - A)^S = (1 - A)^S$. Then, $1 - (1 - (1 - A)^S) = 1 - (1 - A)^S = (1 - (1 - A)^S)^S$. Therefore, $(1 - A)^S = (1 - A)^S$. Similarly, $1 - (1 - A)^S = 1 - (1 - (1 - A)^S)^S$. Then, $1 - (1 - A)^S = 1 - (1 - A)^S$

(9) Let $(A - B) \cup (B - A) \in I$, and let $A - B = E_1, B - A = E_2$. We observe that $E_1, E_2 \in I$ by heredity, and $B = (A - E_1) \cup E_2$. Thus, $\Psi_S(A) = \Psi_S(A - E_1) = \Psi_S((A - E_1) \cup E_2) = \Psi_S(B)$.

(10) By Theorem 3.1.(9), we obtain if $E \in I$, then $\Psi_S(E) = 1 - 1^S$.

(11) This follows from Theorem 3.1.(9), and $\Psi_S(A - E) = 1 - (1 - (A - E)^S) = 1 - ((1 - A) \cup E)^S = 1 - (1 - A)^S = \Psi_S(A)$.

(12) This follows from Theorem 3.1.(9), and $\Psi_S(A \cup E) = 1 - (1 - (A \cup E)^S) = 1 - ((1 - A) - E)^S = 1 - (1 - A)^S = \Psi_S(A)$.

**Theorem 5.2.** Let $(X, S, I)$ be an intuitionistic fuzzy ideal supra topological space. If $\eta = \{A \in P(X) : A \subseteq \Psi_S(A)\}$. Then, $\eta$ is an intuitionistic fuzzy supra topology for $X$. 

www.ijfis.org
Proof. Let \( \eta = \{ A \in P(X) : A \subseteq \Psi_S(A) \} \). By Theorem 3.1.(1), \( 0^S = 0 \) and \( \Psi_S(1_\sim) = 1_\sim - (1_\sim - 1_\sim)^S = 1_\sim - 0^S = 1_\sim \). Moreover, \( \Psi_S(0_\sim) = 1_\sim - (1_\sim - 0_\sim)^S = 1_\sim - 1_\sim = 0_\sim \). Therefore, we observe that \( 0_\sim \subseteq \Psi_S(0_\sim) \) and \( 1_\sim \subseteq \Psi_S(1_\sim) = 1_\sim \), and thus \( 0_\sim, 1_\sim \in \eta \). Now, if \( \{ A_\alpha : \alpha \in \Delta \} \subseteq \eta \), then \( A_\alpha \subseteq \Psi_S(A_\alpha) \subseteq \Psi_S(\bigcup A_\alpha) \) for every \( \alpha \); and hence, \( \bigcup A_\alpha \subseteq \Psi_S(\bigcup A_\alpha) \). This shows that \( \eta \) is an intuitionistic fuzzy supra topology. \( \Box \)

**Definition 5.2.** An intuitionistic fuzzy ideal \( I \) in a space \((X, S, I)\) is called an \( S \)-codense intuitionistic fuzzy ideal if \( S \cap I = \{ 0_\sim \} \). The following theorem is related to the \( S \)-codense intuitionistic fuzzy ideal.

**Theorem 5.3.** Let \((X, S, I)\) be an intuitionistic fuzzy ideal supra topological space and let \( I \) be \( S \)-codense with \( S \). Then, \( 1_\sim = 1^S_\sim \).

**Proof.** It is obvious. \( \Box \)

**Definition 5.3.** Let \((X, S, I)\) be an intuitionistic fuzzy ideal supra topological space. An intuitionistic fuzzy set \( A \) in \( X \) is called a \( \Psi_S \)-C-intuitionistic fuzzy set if \( A \subseteq \text{Cl}^S(\Psi_S(A)) \). The collection of all \( \Psi_S \)-C-intuitionistic fuzzy sets in \((X, S, I)\) is denoted by \( \Psi_S(X, S) \).

**Theorem 5.4.** Let \((X, S, I)\) be an intuitionistic fuzzy ideal supra topological space. If \( A \in S \), then \( A \in \Psi_S(X, S) \).

**Proof.** From Theorem 5.1.(6) it follows that \( S \subseteq \Psi_S(X, S) \). \( \Box \)

**Theorem 5.5.** Let \( \{ A_\alpha : \alpha \in \Delta \} \) be a collection of non-empty \( \Psi_S \)-C-intuitionistic fuzzy sets in the intuitionistic fuzzy ideal supra topological space \((X, S, I)\); then \( \bigcup_{\alpha \in \Delta} A_\alpha \subseteq \Psi_S(X, S) \).

**Proof.** For each \( \alpha \in \Delta \),

\[
A_\alpha \subseteq \text{Cl}^S(\Psi_S(A_\alpha)) \subseteq \text{Cl}^S(\Psi_S(\bigcup_{\alpha \in \Delta} A_\alpha)).
\]

This implies that \( \bigcup_{\alpha \in \Delta} A_\alpha \subseteq \text{Cl}^S(\Psi_S(\bigcup_{\alpha \in \Delta} A_\alpha)) \). Thus \( \bigcup_{\alpha \in \Delta} A_\alpha \in \Psi_S(X, S) \). \( \Box \)
