ALGEBRAIC INDEPENDENCE AND DIFFERENCE EQUATIONS OVER ELLIPTIC FUNCTION FIELDS

EHUD DE SHALIT

Abstract. For a lattice $\Lambda$ in the complex plane, let $K_\Lambda$ be the field of $\Lambda$-elliptic functions. For two relatively prime integers $p$ (respectively $q$) greater than $1$, consider the endomorphisms $\psi$ (resp. $\phi$) of $K_\Lambda$ given by multiplication by $p$ (resp. $q$) on the elliptic curve $C/\Lambda$. We prove that if $f$ (resp. $g$) is a complex Laurent power series that satisfy linear difference equations over $K_\Lambda$ with respect to $\psi$ (resp. $\phi$) then there is a dichotomy. Either, for some sublattice $N$ of $\Lambda$, one of $f$ or $g$ belongs to the ring $K_\Lambda[z, z^{-1}, \zeta(z, N)]$, where $\zeta(z, N)$ is the Weierstrass zeta function, or $f$ and $g$ are algebraically independent over $K_\Lambda$. This is an elliptic analogue of a recent theorem of Adamczewski, Dreyfus, Hardouin and Wibmer (over the field of rational functions).

1. Introduction

1.1. Background, over fields of rational functions. A $\phi$-field is a field $K$ equipped with an endomorphism $\phi$. The fixed field $C = K^\phi$ of $\phi$ is called the field of constants of $K$. Throughout this paper we shall only consider ground fields which are inversive: $\phi$ is an automorphism of $K$, but for a general extension of $K$ we do not impose this condition. Let $(K, \phi) \subset (F, \phi)$ be an extension of $\phi$-fields (written from now on $K \subset F$), which is also inversive, and with the same field of constants:

$$C = K^\phi = F^\phi.$$ 

Denote by $S_\phi(F/K)$ the collection of all $u \in F$ which satisfy a linear homogenous $\phi$-difference equation

$$a_0\phi^n(u) + a_1\phi^{n-1}(u) + \cdots + a_nu = 0,$$

with coefficients $a_i \in K$. The set $S_\phi(F/K)$ is a $K$-subalgebra of $F$.

Suppose now that $K$ and $F$ are endowed with a second automorphism $\psi$, commuting with $\phi$, and that $\text{tr.deg.}(K/C) \leq 1$. Various results obtained in recent years support the philosophy that if $\phi$ and $\psi$ are sufficiently independent, the $K$-algebras $S_\phi(F/K)$ and $S_\psi(F/K)$ are also “independent” in an appropriate sense.

Here are some classical examples. Let $C$ be an algebraically closed field of characteristic $0$. We consider three classes of examples where

- (2S) $K = C(x)$, $F = C((x^{-1}))$, $\phi f(x) = f(x + h)$, $\psi f(x) = f(x + k)$, $(h, k \in C)$,
- (2Q) $K = C(x)$, $F = C((x))$, $\phi f(x) = f(qx)$, $\psi f(x) = f(px)$ $(p, q \in C^*)$,
- (2M) $K = \bigcup_{s=1}^\infty C(x^{1/s})$, $F = \bigcup_{s=1}^\infty C((x^{1/s}))$ (the field of Puiseux series), $\phi f(x) = f(x^q)$, $\psi f(x) = f(x^p)$ $(p, q \in \mathbb{N})$.

Key words and phrases. Difference equations, elliptic functions, algebraic independence.
Note that $\phi$ and $\psi$ are indeed automorphisms. In all three examples, the assumption that $\phi$ and $\psi$ are “sufficiently independent” is that the group 
$$\Gamma = \langle \phi, \psi \rangle \subset \text{Aut}(K)$$
is free abelian of rank 2. The letters $S,Q$ and $M$ stand for “shifts”, “$q$-difference operators” and “Mahler operators” respectively, and the independence assumption gets translated into the additive independence of $h$ and $k$ in the case (2S), and the multiplicative independence of $p$ and $q$ in the cases (2Q) and (2M). Schäfke and Singer proved in [Sch-Si] the following theorem, confirming the above philosophy.

**Theorem 1.** Assume that $\Gamma$ is free abelian of rank 2. Then in any of the three cases (2S), (2Q) or (2M)
$$S_\phi(F/K) \cap S_\psi(F/K) = K.$$ Some instances of this theorem were known before. The case (2Q) dates back to the work of Bézivin and Boutabaa [Bez-Bou], and the case (2M), originally a conjecture of Loxton and van der Poorten [vdPo], was proved by Adamczewski and Bell in [Ad-Be]. The earlier proofs, however, used a variety of ad-hoc techniques, and only [Sch-Si] gave a unified treatment, revealing the common principles behind these theorems. This new approach enabled the authors to prove a few more theorems of the same nature, dealing with power series satisfying simultaneously a $\phi$-difference equation and a linear ordinary differential equation. See, also, the exposition in [dS-G], where we removed some unnecessary restrictions on the characteristic of the field $C$ and on $|p|$ and $|q|$, in the case (2Q). In addition, this last paper deals for the first time with a case, denoted there (1M1Q), in which $\phi$ is a $q$-difference operator and $\psi$ a $p$-Mahler operator, and the resulting group $\Gamma$ is generalized dihedral rather than abelian. The formulation of the analogous result has to be cast now in the language of difference modules, the classical language of equations being inadequate when $\Gamma$ is non-abelian. Modulo this remark, however, the main result and its proof are very similar, if not identical, to the above three cases.

The next breakthrough occurred in a recent paper by Adamczewski, Hardouin, Dreyfus and Wibmer [A-D-H-W]. Building on an earlier work [A-D-H] dealing with difference-differential systems, these authors obtained a far-reaching strengthening of the above theorem.

**Theorem 2.** Consider any of the three cases (2S), (2Q) or (2M). Let $f \in S_\phi(F/K)$ and $g \in S_\psi(F/K)$. If $f, g \notin K$ then $f$ and $g$ are algebraically independent over $K$.

Letting $f = g$ one recovers Theorem 1. The key new tool which allows to upgrade Theorem 1 to Theorem 2 is the “parametrized” Picard-Vessiot theory, as developed in [H-S, O-W]. We shall elaborate on this theory and summarize its main ingredients in section 3.

1.2. Background, over fields of elliptic functions.

1.2.1. The case (2Ell). In [dS1, dS2] we initiated the study of the same theme over fields of elliptic functions. For a lattice $\Lambda \subset \mathbb{C}$ let $E_\Lambda$ stand for the elliptic curve whose associated Riemann surface is $\mathbb{C}/\Lambda$ and 
$$K_\Lambda = \mathbb{C}(\wp(z, \Lambda), \wp'(z, \Lambda))$$
its function field, the field of $\Lambda$-periodic meromorphic functions on $\mathbb{C}$. Fix $\Lambda_0$ and let 
$$K = \bigcup_{\Lambda \subset \Lambda_0} K_\Lambda.$$
This is the function field of the universal cover of $E_{\Lambda_0}$, and should be compared to the field $K$ in the case (2M), which is the function field of the universal cover of $\mathbb{G}_m$. Let $p, q \in \mathbb{N}$. Multiplication by $p$ or $q$ induces an endomorphism of $E_\Lambda$ for each $\Lambda$, and automorphisms of the field $K$ given by

$$\phi f(z) = f(qz), \quad \psi f(z) = f(pz).$$

For $F$ we take the field of Laurent series $\mathbb{C}((z))$ with the same $\phi$ and $\psi$. Via the Taylor-Maclaurin expansion at 0, $K \subset F$. We label this choice of $(K, F, \phi, \psi)$ by (2Ell).

1.2.2. The ring $S$. To formulate our results we need to introduce a ring slightly larger than $K$, namely the ring

$$S = K[z, z^{-1}, \zeta(z, \Lambda)] \subset F$$

generated over $K$ by $z, z^{-1}$ and the Weierstrass zeta function $\zeta(z, \Lambda)$. Recall that the latter is a primitive of $-\phi(z, \Lambda)$ and satisfies, for $\omega \in \Lambda$,

$$\zeta(z + \omega, \Lambda) - \zeta(z, \Lambda) = \eta(\omega, \Lambda),$$

where the additive homomorphism $\eta(\cdot, \Lambda) : \Lambda \to \mathbb{C}$ is Legendre’s eta function. It is easy to see that the ring $S$ does not depend on which $\Lambda \subset \Lambda_0$ we use: once we adjoin one $\zeta(z, \Lambda)$, they are all in $S$. It is also easy to see that $\phi$ and $\psi$ induce automorphisms of $S$.

1.2.3. Previous results in the case (2Ell). In [dS2], the following analogue of Theorem 1 was proved:

**Theorem 3.** Assume that $2 \leq p, q$ and $(p, q) = 1$. Then in the case (2Ell) we have

$$S_\phi(F/K) \cap S_\psi(F/K) = S.$$  

**Remark.** (i) The reader should note the assumption on $p$ and $q$ being relatively prime integers $\geq 2$. This is stronger than assuming $p$ and $q$ to be only multiplicatively independent. This stronger assumption was needed in only one lemma of [dS2], but so far could not be avoided.

(ii) The case (2Ell) brings up two completely new issues, absent from the rational cases discussed so far. One is the issue of periodicity. The method of [Sch-Si] starts with a formal analysis of the solutions to our $\phi$- and $\psi$-difference equations at common fixed points of $\phi$ and $\psi$. Using estimates on coefficients in Taylor expansions one shows that certain formal power series converge in some open disks around these fixed points. Using the difference equations one writes down a functional equation for these functions, that allows to continue them meromorphically all the way up to a “natural boundary”. While each of the three cases (2S), (2Q) and (2M) has its own peculiarities, and is technically different, the upshot in all three cases is that a certain matrix with meromorphic entries is proved to be globally meromorphic on $\mathbb{P}^1(\mathbb{C})$, hence a matrix with entries in $K = \mathbb{C}(x)$. This matrix is used to descend a certain difference module attached to our system of equations from $K$ to $\mathbb{C}$, and this leads to a proof of Theorem 1.

In the case (2Ell) the analysis of the situation starts along the same lines. However, the matrix of globally meromorphic functions on $\mathbb{C}$ thus produced bears, a priori, no relation to the lattices $\Lambda$. It starts its life as a matrix of formal power series, convergent in some disk $|z| < \varepsilon$, and is then continued meromorphically using a functional equation with respect to $z \mapsto qz$, losing the connection to the lattices. In fact, examples show that this matrix need not be a matrix of elliptic functions.

The Periodicity Theorem of [dS1], and its vast generalization in [dS2], show that just enough of the periodicity can be salvaged to push this approach to an end. A certain generalization of the “baby case” of this theorem, considered in [dS1], will be instrumental in the present work, when we deal with equations of the first order.
(iii) The second new issue in the case (2Ell) has to do with the emergence of certain vector bundles over the elliptic curve $E_\Lambda$, that we associate to our system of difference equations. Luckily, vector bundles over elliptic curves have been fully analyzed in Atiyah’s work [At]. Their classification allows us to understand the $(\phi, \psi)$-difference modules associated to an $f \in S_\phi(F/K) \cap S_\psi(F/K)$. The ensuing structure theorem for elliptic $(\phi, \psi)$-difference modules is the main theorem of [AS2], and Theorem 6 is a corollary of it. The need to include $\zeta(z, \Lambda)$ in $S$ reflects the non-triviality of these vector bundles. Over the field $C(z)$ none of this shows up, essentially because every vector bundle over $G_a$ or $G_m$ is trivial.

1.3. The main results. Our main result is an elliptic analogue of Theorem 2 (Theorem 1.3 of [A-D-H-W]). In fact, both our result and Theorem 2 admit a mild generalization. Let $AS_\psi(F/K)$ be the collection of all $u \in F$ for which there exists an $n \geq 0$ such that $\psi^n(u) \in K(u, \psi(u), \ldots, \psi^{n-1}(u))$.

Clearly $S_\psi(F/K) \subset AS_\psi(F/K)$.

**Theorem 4.** Let $(K, F, \phi, \psi)$ be as in case (2Ell) and assume that $2 \leq p, q$ and $(p, q) = 1$. Let $f \in S_\phi(F/K)$ and $g \in AS_\psi(F/K)$. If $f, g \notin S$, then $f$ and $g$ are algebraically independent over $K$.

The proof follows the strategy of [A-D-H-W]. Theorem 4 will be deduced from the following analogue of Theorem 4.1 there, which concerns a single power series $f \in F$.

**Theorem 5.** Let $(K, F, \phi, \psi)$ be as in case (2Ell) and assume that $2 \leq p, q$ and $(p, q) = 1$. Let $f \in S_\phi(F/K)$ and assume that $f \notin S$. Then $\{f, \psi(f), \psi^2(f), \ldots\}$ are algebraically independent over $K$.

To explain the input from our earlier work, we have to formally introduce the notion of a difference module, to which we already alluded several times. A $\phi$-difference module $(M, \Phi)$ over $K$ (called, in short, a $\phi$-module) is a finite dimensional $K$-vector space $M$ equipped with a $\phi$-linear bijective endomorphism $\Phi$. Its rank $\text{rk}(M)$ is the dimension of $M$ as a $K$-vector space. The set of $\Phi$-fixed points $M^\Phi$ is a $C$-subspace of dimension $\leq \text{rk}(M)$.

Since $\psi$ commutes with $\phi$, the module

$$M^{(\psi)} = (K \otimes_{\psi, K} M, 1 \otimes \Phi)$$

is another $\phi$-module. Our $M$ is called $\psi$-isomonodromic (or $\psi$-integrable) if $M \simeq M^{(\psi)}$.

To any $\phi$-difference equation (1.1) one can attach a $\phi$-module $M$ of rank $n$ whose fixed points $M^\Phi$ correspond to the solutions of the equation in $K$. This is classical, and explained in section 2.2 below. For this reason we shall refer to $M^\Phi$ also as the space of “solutions” of $M$.

To any $\phi$-module $M$ of rank $n$ over $K$ one can associate a difference Galois group $G$, which is a Zariski closed subgroup of $GL_{n, C}$, uniquely determined up to conjugation (and reviewed in section 2.5 below). This linear algebraic group measures the algebraic relations that exist between the solutions of $M$, not over $K$ itself (where there might be none, or too few solutions), but after we have base-changed to a suitable universal extension - the Picard-Vessiot extension - in which a full set of solutions can be found. The larger $G$ is, the fewer such relations exist. The analogy with classical Galois theory, in which the Galois group measures the algebraic relations between the roots of a polynomial in a splitting field, is obvious.

The input, deduced from the main theorem of [AS2], needed in the proof of Theorem 5 is the following. We continue to assume that $2 \leq p, q$ and $(p, q) = 1$.

**Theorem 6.** Assume that $M$ is $\psi$-isomonodromic. Then its difference Galois group $G$ is solvable.
In addition, we shall need a generalization of the “baby” Periodicity Theorem of [dS1], explained in section §1.2.

Except for these two results, the rest of the proof of Theorems 4 and 5 imitates [A-D-H-W]. As this depends on results scattered through many references [A-D-H, A-D-H-W, D-H-R, DV-H-W1, DV-H-W2, O-W], we shall make an effort to collect all the prerequisites in a way that facilitates the reading.

1.4. Outline of the paper. Section 2 will be devoted to generalities on difference equations, difference modules, Picard-Vessiot extensions and the difference Galois group. The standard reference here is [S-vdP], although our language will sometimes be different.

Section 3 will be devoted to the more recent theory of parametrized Picard-Vessiot theory and the parametrized difference Galois group, to be found in the references cited above.

In Section 4 we shall prove the two results that we need as input in the proof of Theorem 5, relying on [dS1, dS2].

Section 5 will start by explaining how to deduce Theorem 4 from Theorem 5. We shall then carry out the proof of Theorem 5, following the program of [A-D-H-W].

2. Review of classical Picard-Vessiot theory

2.1. The ground field. Let $K$ be defined as in section §1.2, in the case (2Ell). We shall need the following facts about it.

**Proposition 7.** (i) $K$ is a C1 field (any homogenous polynomial of degree $d$ in $n > d$ variables has a nontrivial zero in $K$).

(ii) If $G$ is a connected linear algebraic group over $K$ then any $G$-torsor over $K$ is trivial.

(iii) $K$ does not have any non-trivial finite extension $L/K$ to which $\phi$ (or $\psi$) extends as an automorphism.

**Proof.** (i) It is enough to prove the claim for every $K_\Lambda$, where this is Tsen’s theorem: the function field of any curve over an algebraically closed field of characteristic 0 is a C1-field.

(ii) This is Springer’s theorem: a C1-field of characteristic 0 is of cohomological dimension $\leq 1$. By Steinberg’s theorem this implies that every torsor of a connected linear algebraic group over $K$ is trivial. See [SG] ch. III.2.

(iii) (Compare [D-R], Proposition 6). Suppose $L$ is a finite extension of $K$ to which $\phi$ extends as an automorphism. Then, for $\Lambda$ small enough, $L = L_\Lambda K$ where $L_\Lambda$ is an extension of $K_\Lambda$, $[L : K] = [L_\Lambda : K_\Lambda]$. Let $\Lambda' \subset \Lambda$ and $L_{\Lambda'} = L_\Lambda K_{\Lambda'}$. Then for $\Lambda'$ sufficiently small $\psi(L_\Lambda) \subset L_{\Lambda'}$. Replacing $\Lambda$ by $\Lambda'$ we may therefore assume that $\psi(L_\Lambda) \subset L_\Lambda$. Thus $\psi$ extends to an endomorphism of $L_\Lambda$. Let $\pi : Y \to E_\Lambda$ be the covering of complete nonsingular curves corresponding to $L_\Lambda \supset K_\Lambda$ and $\alpha : Y \to Y$ the morphism inducing $\psi$ on $L_\Lambda$. Since $\pi \circ \alpha = [g] \circ \pi$ we get that $\deg(\alpha) = q^2$. By the Riemann-Hurwitz formula

$$2g_Y - 2 = (2g_Y - 2)q^2 + \sum_{x \in Ram(\alpha)} (e_x - 1)$$

where $g_Y \geq 1$ is the genus of $Y$ and $Ram(\alpha)$ the ramification locus of $\alpha$, $e_x$ being the ramification index. This equation can only hold if $g_Y = 1$ (and $\alpha$ is everywhere unramified). In particular, $\pi$ is an isogeny of elliptic curves, hence $L_\Lambda \subset K$ and $L = K$. $\square$
Define
\[ S = K[z, z^{-1}, \zeta(z, \Lambda)] \subset F. \]

If \( \Lambda' \subset \Lambda \) is another lattice then
\[ \varphi(z, \Lambda) - \sum_{\omega \in \Lambda/\Lambda'} \varphi(z + \omega, \Lambda') \]
is a meromorphic \( \Lambda \)-periodic function. Its poles are contained in \( \Lambda \), but at 0 the poles of \( \varphi(z, \Lambda) \) and of \( \varphi(z, \Lambda') \) cancel each other, while the other terms have no pole. It follows that this \( \Lambda \)-periodic function has no poles, hence is a constant. Integrating, we find that
\[ \zeta(z, \Lambda) - \sum_{\omega \in \Lambda/\Lambda'} \zeta(z + \omega, \Lambda') = az + b \]
for some \( a, b \in \mathbb{C} \). On the other hand
\[ \zeta(z + \omega, \Lambda') - \zeta(z, \Lambda') \in K_{\Lambda'} \subset K. \]
It follows that
\[ \zeta(z, \Lambda) - [\Lambda : \Lambda']\zeta(z, \Lambda') \in K[z, z^{-1}]. \]

This shows that the definition of \( S \) does not depend on which \( \Lambda \subset \Lambda_0 \) we use. Since for any rational number \( r = m/n \) \( \zeta(rz, \Lambda) - r\zeta(z, \Lambda) \in K_{n\Lambda} \subset K, \phi \) and \( \psi \) induce automorphisms of \( S \).

**Problem.** Does the field of fractions of \( S \) satisfy Proposition 7?

### 2.2. Difference equations, difference systems and difference modules.

In this subsection and the next ones, the \( \phi \)-field \((K, \phi)\) can be arbitrary. The standard reference is [S-vdP]. As usual, to the difference equation (1.1) we associate the companion matrix
\[
A = \begin{pmatrix}
0 & 1 & 0 & 1 \\
0 & 1 & 0 & 1 \\
\vdots & \ddots & \ddots & \ddots \\
-a_n/a_0 & \cdots & 0 & 1 \\
-a_1/a_0 & \cdots & -a_1/a_0
\end{pmatrix},
\]
and the first order linear system of equations
(2.1)
\[ \phi(Y) = AY \]
for which we seek solutions \( Y = (u_1, \ldots, u_n) \) in \( \phi \)-ring extensions \( L \) of \( K \). Notice that if \( u \) is a solution of (1.1) then \( t^i(u, \phi(u), \ldots, \phi^{i-1}(u)) \) is a solution of (2.1).

From now on we concentrate on first order systems of equations of the form (2.1) with \( A \in GL_n(K) \) arbitrarily given.

With the system (2.1) we associate the \( \phi \)-difference module \( M = (K^n, \Phi) \) where
\[ \Phi(v) = A^{-1}\phi(v). \]
Notice that a solution \( v \in K^n \) to (2.1) is nothing but an element of \( M^\phi \), the fixed points of \( \Phi \) in \( M \). This is a \( C = K^\phi \)-subspace, and the well-known Wronskian Lemma shows that
\[ \dim_C M^\phi \leq \ker M. \]

By abuse of language, we shall refer to \( M^\phi \) also as the space of “solutions” of \( M \).

An equality \( \dim_C M^\phi = \ker M \) holds if and only if a full set of solutions of (2.1) exists in \( K \), if and only if \( M \) is isomorphic to the trivial module \((K^n, \phi)\). In such a case a matrix \( U \in GL_n(K) \) satisfying
\[ \phi(U) = AU \]
For a fundamental matrix of (2.1), its columns form a basis of $M^R$ over $C$.

Given any $\phi$-module, a choice of a basis of $M$ over $K$ shows that it is of the above form. A choice of another basis results in a gauge transformation, replacing $A$ with

$$A' = \phi(P)^{-1}AP$$

for some $P \in GL_n(K)$. Conversely, the systems of equations defined by $A$ and by $A'$ are equivalent if and only if $A$ and $A'$ are gauge equivalent. The transition from a system of equations to a $\phi$-module can therefore be reversed. Thanks to Birkhoff’s cyclicity lemma, the transition from a single linear equation of order $n$ to a system of equations of order one can also be reversed. The three notions are therefore equivalent, and which language one chooses to work with is very much a matter of taste.

### 2.3. Isomonodromy and $(\Phi, \Psi)$-difference modules.

Assume now that the $\phi$-field $K$ is endowed with a second automorphism $\psi$, commuting with $\phi$. If $(M, \Phi)$ is a $\phi$-module over $K$, then

$$M^{(\psi)} = (K \otimes_{\psi, K} M, 1 \otimes \Phi)$$

is another $\phi$-module, called the $\psi$-transform of $M$. If $M = (K^n, \Phi)$ with $\Phi(v) = A^{-1}\phi(v)$ then $M^{(\psi)}$ is likewise given by the matrix $\psi(A)$.

The notion of a $(\phi, \psi)$-difference module is naturally defined. It is a finite dimensional vector space $M$ over $K$ equipped with bijective $\phi$-linear (resp. $\psi$-linear) endomorphisms $\Phi$ (resp. $\Psi$) commuting with each other: $\Phi \circ \Psi = \Psi \circ \Phi$.

**Lemma 8.** For a $\phi$-module $M$ over $K$ of rank $n$, the following are equivalent:

(i) $M^{(\psi)} \simeq M$ as a $\phi$-module.

(ii) $M$ admits a structure of a $(\phi, \psi)$-module extending the given $\phi$-module structure.

(iii) If $A = A_\phi$ is the matrix associated to $M$ in some basis, there exists a matrix $A_\psi \in GL_n(K)$ satisfying the compatibility condition

$$\phi(A_\psi)A_\phi = \psi(A_\phi)A_\psi.$$

The proof is left as an easy exercise. A $\phi$-module satisfying the above conditions is called $\psi$-isomonodromic (or $\psi$-integrable). Property (iii) shows that the definition is symmetric: If $(M, \Phi)$ is $\psi$-isomonodromic and $\Psi$ is the $\psi$-linear operator as in (ii), then $(M, \Psi)$ is $\phi$-isomonodromic as a $\psi$-module. The terminology is derived from the differential set-up, of which the theory of difference equations is a discrete analogue.

### 2.4. Picard-Vessiot theory.

#### 2.4.1. Picard-Vessiot rings and extensions. It is natural to look for an extension of $K$ in which (2.1) attains a full set of solutions, or, equivalently, over which the associated module $M$ is trivialized, after base change. Easy examples show that such an extension might have to have zero divisors. The best we can do is encapsulated in the following definition.

**Definition 9.** (i) A $\phi$-ring is a commutative unital ring $R$ equipped with an endomorphism $\phi$. It is called $\phi$-simple if it does not have any non-zero ideals $I$ invariant under $\phi$, i.e. satisfying $\phi(I) \subset I$.

(ii) A Picard-Vessiot (PV) ring for the $\phi$-module $M$ (associated to $A \in GL_n(K)$ as above) is a simple $\phi$-ring extension $(R, \phi)$ of $(K, \phi)$ over which $M_R = (R \otimes_K M, \phi \otimes \Phi)$ is trivialized (i.e. becomes isomorphic to $(R^n, \phi)$), and such that $R = K[u_{ij}, \det(U)^{-1}]$ if $U = (u_{ij}) \in GL_n(R)$ is a fundamental matrix of (2.1).

Here are the main properties of PV rings.
PV rings exist, are noetherian and (like any \( \phi \)-simple ring) reduced. Furthermore, a PV ring \( R \) is a finite product \( R_1 \times \cdots \times R_6 \) of integral domains, permuted cyclically by \( \phi \).

- Since \( \phi \) was assumed to be an automorphism of \( K \) and \( A \) is invertible, a PV ring \( R \) happens to be **inversive**: \( \phi \) is an automorphism of \( R \).

- The field of constants \( C_R = R^\phi \) is an algebraic extension of \( C = K^\phi \). If \( C \) is algebraically closed, \( C = C_R \).

- The fundamental matrix \( U \in GL_n(R) \) is unique up to \( U \mapsto UV \) with \( V \in GL_n(C_R) \).

- If \( C \) is algebraically closed, any two PV rings for \( M \) are (noncanonically) isomorphic.

- Let \( L = Quot(R) \) be the total ring of fractions of \( R \) (the localization of \( R \) in the \( \phi \)-invariant multiplicative set of non-zero divisors of \( R \)). Thus \( L = L_1 \times \cdots \times L_4 \) is a finite product of fields, which are permuted cyclically by \( \phi \). We have \( L^\phi = C_R \). A \( \phi \)-ring \( L \) of this type is a called a **\( \phi \)-pseudofield**.

Assume from now on that \( C \) is algebraically closed.

**Lemma 10.** Let \( L \) be a \( \phi \)-pseudofield extension of \( K \) which trivializes \( M \) and is generated over \( K \) (as a pseudofield) by the entries \( u_{ij} \) of a fundamental matrix \( U \). Suppose that \( L^\phi = C \). Then \( R = K[u_{ij}, \det(U)^{-1}] \subset L \) is \( \phi \)-simple, hence it is a PV ring for \( M \), and \( L \) is its total ring of fractions.

The last lemma is of great practical value, because it is often much easier to check that \( L^\phi = C \) then to verify directly that \( R \) is \( \phi \)-simple. The \( \phi \)-pseudofield \( L \) is called the PV **extension** associated with \( M \).

- Notation as above, \( L_1 \) is a \( \phi^t \)-PV extension for \( (M, \Phi^t) \) over \( (K, \phi^t) \). Note that the matrix associated to \( (M, \Phi^t) \) is

\[
A_{[t]} = \phi^{-1}(A) \cdots \phi(A) A.
\]

Thus, at the expense of replacing \( \phi \) by a suitable power, we may assume that \( L \) is a field and \( R \) a domain. In the current paper, this will turn out to be always possible.

A PV ring \( R \) for \( (2.3) \) is constructed as follows. Let \( X = (X_{ij}) \) be an \( n \times n \) matrix of indeterminates. Let \( \phi \) act on the ring \( \tilde{R} = K[X_{ij}, \det(X)^{-1}] \) via its given action on \( K \) and the formula

\[
\phi(X) = AX,
\]

i.e. \( \phi(X_{ij}) = \sum_{\nu=1}^n a_{\nu j} X_{\nu j} \). Let \( I \) be a maximal \( \phi \)-invariant ideal in \( \tilde{R} \). Then

\[
R = \tilde{R}/I
\]
is a PV ring for \( (2.4) \), and \( U = X \mod I \) is a fundamental matrix in \( GL_n(R) \). We remark that since \( \tilde{R} \) is noetherian, any \( \phi \)-invariant ideal \( I \) satisfies \( \phi(I) = I \).

The reduced \( K \)-scheme \( W = Spec(R) \) is called the PV **scheme** associated with \( R \). Since the choice of a fundamental matrix \( U \) amounts to a presentation \( R = \tilde{R}/I \) as above, the choice of \( U \) determines a closed embedding

\[
W \hookrightarrow GL_n(K).
\]

In general, the \( K \)-scheme \( W \) might not have any \( K \)-points. We shall see soon (Proposition \( \textbf{11} \)) that if \( K \) satisfies the conclusions of Proposition \( \textbf{6} \) \( W(K) \neq \emptyset \). This will be an important observation in our context.
2.4.2. The map $\tau$. If $h \in GL_n(K) = \text{Hom}_K(K[X_{ij}, \det(X)^{-1}], K)$ we let

$$\tau(h) = \phi \circ h \circ \phi^{-1} \in GL_n(K).$$

If $X_h = h(X)$ is the matrix in $GL_n(K)$ representing the $K$-point $h$, then since $\phi^{-1}(X) = \phi^{-1}(A)^{-1}X$ we have

$$X_{\tau(h)} = \tau(h)(X) = A^{-1}\phi(X_h).$$

If $h \in W(K)$, i.e. $h$ factors through $I$, then since $\phi^{-1}(I) = I$, so does $\tau(h)$. Regarded as a subset of $GL_n(K)$, if $P \in W(K)$ then

$$\tau(P) = A^{-1}\phi(P) \in W(K).$$

The set of $K$-points of the Picard-Vessiot scheme is therefore, if not empty, invariant under $\tau$.

2.5. The difference Galois group of $(M, \Phi)$. We continue to assume that $C = K^\phi$ is algebraically closed. Let $(M, \Phi)$ be a $\phi$-module, $A$ the matrix associated to it in some basis, $R$ a PV ring and $L = \text{Quot}(R)$ the associated PV extension.

Let $B$ be a $C$-algebra, with a trivial $\phi$-action. Writing $-_{B} = B \otimes_C -$ we let

$$G(B) = \text{Aut}_\phi(R_B/K_B) = \text{Aut}_\phi(L_B/K_B)$$

be the group of automorphisms of $R_B$ that fix $K_B$ pointwise and commute with $\phi$. This yields a functor

$$G : \text{Alg}_C \rightarrow \text{Groups}.$$

Then:

- $G$ is representable by a closed subgroup scheme of $GL_{n,C}$. If $\sigma \in G(B)$

  $$\sigma(U) = U \cdot V(\sigma)$$

  with $V(\sigma) \in GL_n(B)$ and $\sigma \mapsto V(\sigma)$ embeds $G$ in $GL_{n,C}$. If $\text{char}(C) = 0$ then $G$ is reduced, but in positive characteristic we must include the possibility of non-reduced $G$.

- If $A$ is replaced by $\phi(P)^{-1}AP$ (change of basis of $M$, $P \in GL_n(K)$) and $U$ is replaced by $P^{-1}U$ then, since $\sigma(P) = P$, we get the same embedding $G \hookrightarrow GL_{n,C}$. If $U$ is replaced by another fundamental matrix for $[2.1]$, necessarily of the form $UT$ with $T \in GL_n(C)$, then $V(\sigma)$ is replaced by $T^{-1}V(\sigma)T$. Thus $G$ is uniquely determined up to conjugation in $GL_n(C)$.

- The coordinate ring of $G$ is given by $C[G] = (R \otimes_K R)^\phi$. Let

  $$Z = (U^{-1} \otimes 1) \cdot (1 \otimes U) \in GL_n(R \otimes_K R),$$

  i.e. $Z_{ij} = \sum_{i=1}^n(U^{-1})_{iv} \otimes U_{vj}$. Then

  $$\phi(Z) = (U^{-1} \otimes 1) \cdot (A^{-1} \otimes 1) \cdot (1 \otimes A) \cdot (1 \otimes U) = Z$$

  so $Z_{ij} \in C[G]$ and $C[G] = C[Z_{ij}, \det Z^{-1}]$. We have

  $$\sigma \in G(B) = \text{Hom}(C[G], B) \leftrightarrow (Z \mapsto V(\sigma))$$

  and $G \hookrightarrow GL_{n,C}$ implies the comultiplication

  $$m^*(Z) = Z \otimes Z,$$

  i.e. $m^*(Z_{ij}) = \sum_{v=1}^n Z_{iv} \otimes Z_{vj}$. 

• Inside $R \otimes_K R$ we have the canonical isomorphism
  
  \[ R \otimes_K K[\mathcal{G}] = R \otimes_C C[\mathcal{G}] \simeq R \otimes_K R \]

  (since $(U \otimes 1) \cdot Z = 1 \otimes U$), which means that $W = \text{Spec}(R)$ is a torsor of $G_K$. We conclude that $W(K) \neq \emptyset$ is a necessary and sufficient condition for $W$ to be the trivial torsor, i.e. to be (noncanonically) isomorphic to $G_K$.

• If $L$ is a field, $\text{tr.deg.} L/K = \dim \mathcal{G}$.

**Proposition 11.** Assume that $\text{char}(C) = 0$ and that $K$ satisfies the conclusions of Proposition 7 for every power of $\phi$. Then $W(K) \neq \emptyset$.

**Proof.** If $\mathcal{G}$ is connected, this follows from part (ii) of Proposition 7. Following Proposition 1.20 in [S-vdP] we explain how part (iii) of the same Proposition allows us to get rid of the assumption that $\mathcal{G}$ is connected. Let

  \[ R = R_1 \times \cdots \times R_t \]

  be the decomposition of $R$ into a product of integral domains, permuted cyclically by $\phi$. Since $K$ does not have any finite extension to which $\phi^t$ extends, it is algebraically closed in the field $L_t = \text{Quot}(R_t)$. This means that $W_t = \text{Spec}(R_t)$ remains irreducible over the algebraic closure $\overline{K}$ of $K$. It follows that one of the $W_t$, say $W_1$, is a torsor of $G_K$. Since $G_K^0$ is connected, $W_1(K) \neq \emptyset$, hence $W(K) \neq \emptyset$. \qed

We continue to assume that $C$ is algebraically closed of characteristic 0.

**Theorem 12.** ([S-vdP] Theorem 1.1.21) (i) Let $H \subset GL_{n,C}$ be a closed subgroup. If in some basis $A \in H(K)$, then we can choose $U \in H(R)$ and $\mathcal{G} \subset H$. For a general fundamental matrix $U \in GL_n(R)$, some conjugate of $\mathcal{G}$ by an element of $GL_n(C)$ will be contained in $H$.

(ii) Assume that the conclusions of Proposition 7 hold. Then conversely, there exists a basis of $M$ with respect to which $A \in \mathcal{G}(K)$. Equivalently, for the original $A$ there exists a $P \in GL_n(K)$ such that $\phi(P)^{-1}AP \in \mathcal{G}(K)$.

(iii) Under the assumptions of (ii) $\mathcal{G}$ is characterized (up to conjugation by $GL_n(C)$) as a minimal element of the set

  \[ \mathcal{H} = \{ H \subset GL_{n,C} | H \text{ closed}, \exists P \in GL_n(K) \text{ s.t. } \phi(P)^{-1}AP \in H(K) \}. \]

Every other element of $\mathcal{H}$ therefore contains a conjugate of $\mathcal{G}$.

(iv) $\mathcal{G}/\mathcal{G}^0$ is cyclic.

**Proof.** (i) Assume $A \in H(K)$, and $H$ is given explicitly as $\text{Spec}(C[X_{ij},\det(X)^{-1}]/N)$ where $N$ is a Hopf ideal. Let $\phi$ act on $K[X_{ij},\det(X)^{-1}]$ via the given action on $K$ and via $\phi(X) = AX$. Then $N_K$ is a $\phi$-ideal because if $f \in N$ then

  \[ \phi(f) = (\alpha \times 1) \circ m^*(f) \]

  where $m^*$ is the comultiplication and $\alpha$ the homomorphism $C[X_{ij},\det(X)^{-1}] \to K$ substituting $A$ for $X$. But

  \[ m^*(f) \in N \otimes_C C[X_{ij},\det(X)^{-1}] + C[X_{ij},\det(X)^{-1}] \otimes_C N \]

  and $\alpha(N) = 0$ since $A \in H(K)$. Thus $\phi(f) \in K \otimes_C N = N_K$.

  Let $I$ be a maximal $\phi$-ideal in $K[X_{ij},\det(X)^{-1}]$ containing $N_K$ and $U = X \mod I$. Then

  \[ W = \text{Spec}(R) = \text{Spec}(K[X_{ij},\det(X)^{-1}]/I) \subset H_K \]
is the PV scheme, and \( U \in H(R) \) (corresponding to the canonical homomorphism
\[
C[X_{ij}, \det(X)^{-1}]/N \to K[X_{ij}, \det(X)^{-1}]/I.
\]
It follows that for \( \sigma \in \Aut_R(R_B/K_B) \) we have \( \sigma(U) \in H(R_B) \), hence
\[
V(\sigma) = U^{-1}\sigma(U) \in H(R_B)^0 = H(B).
\]

Any other fundamental matrix is of the form \( UT \) with \( T \in GL_n(C) \), so \( TGT^{-1} \subset H \).

(ii) Under our assumptions, \( W(K) \) is non-empty. Any \( P \in W(K) \subset GL_n(K) \) satisfies
\[ W = PG_K. \]
Since \( \tau(P) \in W(K) \) as well (see \([2.4.2]\), \( \tau(P)^{-1}P = \phi(P)^{-1}AP \in G(K) \) and there exists a basis of \( M \) for which \( A \in G(K) \).

(iii) By (i) every member of \( \mathcal{H} \) contains \( G \) up to conjugacy. By (ii) every \( G \) (uniquely determined up to conjugacy) belongs to \( \mathcal{H} \). Thus \( G \) is the unique minimal member of \( \mathcal{H} \), up to conjugacy. Note that it is not a-priori clear that all the minimal members of \( \mathcal{H} \) are conjugate, but this follows from the proof.

(iv) See \([S-vdP]\). \( \square \)

2.6. The Galois correspondence. Let \( R \) be a PV ring for \( M \) and \( L \) its total ring of fractions. Let \( G \) be the difference Galois group of \( M \).

We quote the following basic theorem. We say that \( a \in L \) is fixed by \( G \) and write \( a \in L^G \) if for every \( B \in \text{Alg}_C \) the element \( 1 \otimes a \in L_B \) is fixed by \( G(B) \). The set \( L^G \) is a \( \phi \)-sub-pseudofield of \( L \).

**Theorem 13.** (i) For any closed subgroup \( G' \subset G \) let
\[ \mathcal{F}(G') = K' = L^{G'}, \]
a \( \phi \)-sub-pseudofield of \( L \) containing \( K \). For any \( \phi \)-pseudofield \( K \subset K' \subset L \) let \( G(K') = G' \) be the closed subgroup of \( G \) whose \( B \)-points, for \( B \in \text{Alg}_C \) are
\[ G(K')(B) = G'(B) = \Aut_\phi(L_B/K_B). \]
Then \( \mathcal{F} \) is a \( 1 \)-1 correspondence between closed subgroups of \( G \) and \( \phi \)-sub-pseudofields of \( L \) containing \( K \). In particular \( L^G = K \).

(ii) \( G' \) is normal in \( G \) if and only if \( K' \) is a PV extension of some difference \( \phi \)-module \( M' \). In this case the difference Galois group of \( K'/K \) is \( G'/G' \).

(iii) \( G^0 \) corresponds to the algebraic closure of \( K \) in \( L \). If we assume (replacing \( \phi \) by some \( \phi' \)) that \( L \) is a field, then since \( L \) is a finitely generated field extension of \( K \), the algebraic closure of \( K \) in \( L \) is a finite extension. Under Proposition \( 7(ii) \) we conclude that \( K \) must be algebraically closed in \( L \), hence \( G \) must be connected.

2.7. An example. Let \( K \) and \( \phi \) be as in case (Ell). Let \( A \in \text{GL}_2(K) \) be the matrix
\[ A = \begin{pmatrix} q & g_q(z, \Lambda) \\ 0 & 1 \end{pmatrix}, \]
where \( g_q(z, \Lambda) = \zeta(qz, \Lambda) - q\zeta(z, \Lambda) \in K \). The field
\[ E = K(z, \zeta(z, \Lambda)) \]
is a PV extension for the system \( \phi(Y) = AY \), and
\[ U = \begin{pmatrix} z & \zeta(z, \Lambda) \\ 0 & 1 \end{pmatrix}, \]
and
is a fundamental matrix. Note that \( \phi \) induces an automorphism of \( E \). The difference Galois group is

\[
G = \left\{ \left( \begin{array}{cc} \alpha & \beta \\ 0 & 1 \end{array} \right) \mid \alpha, \beta \in \mathbb{C} \right\}
\]

and the unipotent subgroup \((\alpha = 1)\) corresponds, in the Galois correspondence, to \( K(z) \). The field \( K(\zeta(z, \Lambda)) \) is also a \( \phi \)-subfield corresponding to the torus \((\beta = 0)\), but is not a normal extension of \( K \). Note that this field, unlike \( E \), depends on the lattice \( \Lambda \).

3. Review of parametrized Picard-Vessiot theory

3.1. \( \psi \)-linear algebraic groups.

3.1.1. Generalities. In this section \( C \) will be an algebraically closed field of characteristic 0, equipped with an automorphism \( \psi \) (denoted \( \sigma \) in most of the references). For example, if \( K \) is a \((\phi, \psi)\)-field and \( C = K^\psi \) then \( C \) inherits an action of \( \psi \), although this action might well be trivial, as it is in the case \((2\text{Ell})\). We let \( \text{Alg}_C^{\psi} \) denote the category of \( C \)-\( \psi \)-algebras\footnote{It is important, when developing the general formalism, to abandon the requirement that \( \psi \) be invertible on a general \( C \)-\( \psi \)-algebra. Thus while we maintain the assumption that \( \psi \) is an automorphism of \( C \), hence \((C, \psi)\) is “inversive”, we must allow rings in which \( \psi \) is only an endomorphism, perhaps not even injective, in the category \( \text{Alg}_C^{\psi} \).}. All our schemes and \( \psi \)-schemes will be affine. If \( R \in \text{Alg}_C^{\psi} \) we denote by \( \text{Spec}^\psi(R) \) the functor

\[
\text{Spec}^\psi(R) : \text{Alg}_C^{\psi} \rightarrow \text{Sets}
\]

defined by \( \text{Spec}^\psi(R)(S) = \text{Hom}_C^\psi(R, S) \) (homomorphisms of \( C \)-\( \psi \)-algebras). Note that if \( h \in \text{Spec}^\psi(R)(S) \) then \( \psi(h) = \psi \circ h = h \circ \psi \in \text{Spec}^\psi(R)(S) \) as well, so the functor factors through the category of \( \psi \)-sets.

Let \( L \) be a \( \psi \)-field extension of \( C \). A subset \( \{a_1, \ldots, a_n\} \) of \( L \) is called \( \psi \)-algebraically independent over \( C \) if the collection \( \{\psi^i a_j \mid 0 \leq i, 1 \leq j \leq n\} \) is algebraically independent over \( C \). The \( \psi \)-transcendence degree of \( L \) over \( C \), denoted \( \psi \text{tr.deg.}(L/C) \), is the cardinality of a maximal \( \psi \)-algebraically independent set in \( L \). This notion is well defined (any two such maximal sets have the same cardinality).

We refer to appendix A of [DV-H-W1] for an introduction to \( \psi \)-schemes and \( \psi \)-group schemes. A \( \psi \)-algebraic group \( G \) over \( C \) is a \( \psi \)-group scheme that is \( \psi \)-algebraic over \( C \). This means that its coordinate ring \( C\{G\} \) is finitely \( \psi \)-generated over \( C \) : it contains a finite set \( \{u_1, \ldots, u_n\} \) such that \( \psi^i(u_j) \) for \( 0 \leq i \) and \( 1 \leq j \leq n \) generate \( C\{G\} \) as a \( C \)-algebra. It is called \( \psi \)-reduced if \( \psi \) is injective on \( C\{G\} \), perfectly \( \psi \)-reduced if the equation \( u^{e_1} \psi(u)^{e_1} \cdots \psi^{e_m}(u)^{e_m} = 0 \) \((e_i \geq 0)\) forces \( u = 0 \) in \( C\{G\} \), and \( \psi \)-integral if \( C\{G\} \) is an integral domain and \( \psi \) is injective.

If \( G \) is a \( \psi \)-algebraic group over \( C \) its \( \psi \)-dimension is a non-negative integer, defined in Definition A.25 of [DV-H-W1]. If \( G \) is \( \psi \)-integral then

\[
\psi \text{dim}(G) = \text{tr.deg.}(\text{Quot}(C\{G\}))/C).
\]

If \( G \) is a (classical) algebraic group over \( C \) then the functor \( B \mapsto G(B^\psi) \) from \( \text{Alg}_C^{\psi} \) to Groups, where \( B^\psi \) is the \( C \)-algebra \( B \) with the \( \psi \)-structure forgotten, is representable by a \( \psi \)-algebraic group that we denote \([\psi]G\). Suppose \( G \) is exhibited as a closed subgroup of \( GL_{n,C} \), so that

\[
G = \text{Spec}(C[X_{ij}, \det(X)^{-1}]/I)
\]

where \( 1 \leq i, j \leq n \) and \( I \) is a Hopf ideal. Then \( G = [\psi]G = \text{Spec}^\psi C\{G\} \) where \( C\{G\} = C[\psi^k X_{ij}, \det(\psi^k(X)^{-1})]/I_\psi, \quad 0 \leq k < \infty \), the \( \psi^k X_{ij} \) are symbols treated as independent variables,
the $\psi$-action is the obvious one, and $I_\psi$ is the Hopf $\psi$-ideal generated by all $\psi^k(h)$ for $h \in I$. As might be expected,

$$\psi \dim([\psi]G) = \dim(G).$$

As a non-trivial example of a $\psi$-algebraic group, consider the $\psi$-closed subgroup of $[\psi]G_m$ given by the equation

$$X^{e_0}\psi(X)^{e_1}\cdots\psi^{e_m}(X)^{e_m} = 1$$

for some $e_i \in \mathbb{Z}$ (here $G_m = \text{Spec}(C[X, X^{-1}])$).

By Lemma A.40 of [DV-H-W1] any closed $\psi$-subgroup of $[\psi]G_m$ is defined by a (possibly infinite) collection of $\psi$-monomials of the form (3.2). All that we shall need is the following weaker result.

**Lemma 14.** If $G \subseteq [\psi]G_m$ is a proper closed $\psi$-subgroup of the multiplicative group, then there exists a non-trivial $\psi$-monomial of the form (3.2) satisfied by $G$, and $\psi \dim(G) = 0$.

3.1.2. (Classical) Zariski closure. Let $G$ be a (classical) linear algebraic group over $C$ and $G \subseteq [\psi]G$ a $\psi$-closed subgroup. We say that $G$ is Zariski dense in $G$ if for any proper subvariety (or subgroup, since $G$ is a group functor, this will turn out to be the same) $H \subset G$, $G \nsubseteq [\psi]H$. If $G$ is a subgroup of $GL_{n,C}$ given by the Hopf algebra (3.1), and

$$G = \text{Spec}^\psi(C[\psi^k X_{ij}, \det\psi^k(X)^{-1}] / J)$$

for a Hopf $\psi$-ideal $J$, a necessary and sufficient condition for $G$ to be Zariski dense in $G$ is that $J \cap C[X_{ij}, \det(X)^{-1}] = I$, i.e. the "ordinary" equations, not involving $\psi$, in the ideal defining $G$, are just those defining $G$. In such a case $I_\psi \subset J$, because $J$ is a $\psi$-ideal and $I_\psi$ is the smallest $\psi$-ideal containing $I$, but this inclusion might be strict if $G \nsubseteq [\psi]G$.

Conversely, starting with a $\psi$-algebraic group $G$ presented in the above form, and defining

$$J \cap C[X_{ij}, \det(X)^{-1}] =: I$$

one sees that $I$ is Hopf ideal in $C[X_{ij}, \det(X)^{-1}]$ and the algebraic group $G$ that it defines is the (classical) Zariski closure of $G$.

3.1.3. The structure of $\psi$-linear algebraic groups whose Zariski closure is simple. We shall need the following result, which, for simplicity, we only state in the case: $C = C$ and $\psi$ is the identity. It shows that if $G$ is simple, proper $\psi$-subgroups of $[\psi]G$, which are nevertheless Zariski dense in it, are (under a mild technical condition of $\psi$-reducedness) of a very special form. Alternatively, one may start with an arbitrary $\psi$-reduced $\psi$-linear group $G$ and ask (i) that it be properly contained in its (classical) Zariski closure, i.e. $G$ “is not classical”, and (ii) that this Zariski closure be simple.

**Proposition 15** ([DV-H-W2], Proposition A.19 and Theorem A.20). Let $G$ be a simple linear algebraic group over $C$ and $G \subseteq [\psi]G$ a proper, $\psi$-closed, $\psi$-reduced subgroup of $[\psi]G$. Assume that $G$ is Zariski dense in $G$. Then there exists an automorphism $\alpha \in \text{Aut}(G)$ and an integer $m \geq 1$ such that

$$G(B) = \{ g \in G(B) | \psi^m(g) = \alpha(g) \}$$

for every $B \in \text{Alg}_{C}^\psi$. Furthermore, replacing $m$ by a multiple of it we find that there exists an $h \in G(C)$ such that

$$G(B) \subset \{ g \in G(B) | \psi^m(g) = hgh^{-1} \}.$$
3.2. Parametrized Picard-Vessiot extensions. Let \((K, \phi)\) be an inversive \(\phi\)-field, and assume that it is endowed with another automorphism \(\psi\), commuting with \(\phi\). Assume that the field of \(\phi\)-constants \(C = K^\phi\) is algebraically closed of characteristic 0, and note that it inherits a structure of a \(\psi\)-field. Let \((M, \Phi)\) be a \(\phi\)-module of rank \(n\) over \(K\), and let \(A \in GL_n(K)\) be the matrix associated with it in some basis.

**Definition 16.** A \(\psi\)-Picard-Vessiot extension, called also a parametrized Picard-Vessiot (PPV) extension for \((M, \Phi)\) (or the system \(\phi(Y) = AY\)), is a \(\phi\)-pseudofield \(L_\psi\) containing \(K\) which:

(i) carries, in addition, a structure of a (not necessarily inversive) \(\psi\)-field, commuting with \(\phi\),

(ii) trivializes \(M\) after base-change, and if \(U \in GL_n(L_\psi)\) is a fundamental matrix for \(\phi(Y) = AY\),

\[
L_\psi = K(u_{ij})_\psi = K(\psi^k(u_{ij}))
\]

is generated as a total ring (a ring in which every non-zero divisor is invertible) by the elements \(\psi^k(u_{ij})\) for \(1 \leq i, j \leq n\) and \(0 \leq k < \infty\). We shall express this property by saying that \(L_\psi\) is the \(\psi\)-hull (as a total ring) of \((u_{ij})\).

(iii) \(L^\psi_\phi = K^\phi = C\).

Here are the main facts about PPV extensions.

- A PPV extension \(L_\psi\) as above exists ([O-W], Theorem 2.28 and Corollary 2.29). This is tricky! One is inclined to construct inductively (classical) PV extensions for the \(\phi\)-modules

\[
M_d = M \oplus M^{(\psi)} \oplus \ldots \oplus M^{(\psi^d)}
\]

and go to the limit when \(d \to \infty\). The difficulty is in showing that we can get \(L_\psi\) to be a finite product of fields. One should keep track of the number of connected components in this inductive procedure, and prove that it stays bounded.

- Let

\[
R_\psi = K[u_{ij}, \det(U)^{-1}]_\psi = K[\psi^k(u_{ij}), \psi^k(\det U)^{-1}]
\]

be the ring \(\psi\)-hull of \((u_{ij}, \det(U)^{-1})\) inside \(L_\psi\). Then \(R_\psi\) is \(\phi\)-simple and \(L_\psi\) is its total ring of fractions. One calls \(R_\psi\) the PPV ring of \(M\). Since \(U\) is uniquely determined up to right multiplication by \(V \in GL_n(C)\), \(R_\psi\) is uniquely determined as a subring of \(L_\psi\).

- Let \(L = K(u_{ij})\) and \(R = K[u_{ij}, \det(U)^{-1}]\) (inside \(L_\psi\)). Then \(L\) is a (classical) PV extension and \(R\) a PV ring for \(M\).

3.3. The parametrized difference Galois group.

3.3.1. General facts and definitions. Assumptions and notation as above, fix a PPV extension \(L_\psi\) and the PPV ring \(R_\psi \subset L_\psi\). Consider the functor \(G : \text{Alg}_{C}^\psi \rightrightarrows \text{Groups}\) given by

\[
G(B) = \text{Aut}_{\phi, \psi}((R_\psi)_B/K_B) = \text{Aut}_{\phi, \psi}((L_\psi)_B/K_B),
\]

the automorphisms of \((R_\psi)_B = B \otimes_C R_\psi\) that fix \(B \otimes_C K\) pointwise and commute with both \(\phi\) and \(\psi\). Here \(B\) is given the trivial \(\phi\)-action. If \(\sigma \in G(B)\) then

\[
\sigma(U) = UV(\sigma)
\]

with \(V(\sigma) \in GL_n(B)\). Moreover, since \(\sigma\) commutes with \(\psi\), we have for every \(i \geq 0\)

\[
\sigma(\psi^i(U)) = \psi^i(U)\psi^i(V(\sigma)).
\]

Thus the choice of \(U\) determines an embedding \(G \hookrightarrow [\psi]GL_n(C)\).

The main facts about \(G\), mirroring the facts listed for the classical difference Galois group \(G\), are the following (see [O-W], section 2.7).
• $G$ is representable by a $\psi$-linear algebraic group.

• The Hopf $\psi$-algebra $C\{G\}$ of $G$ is $(R_\psi \otimes_K R_\psi)^\phi$.

• The natural map

$$R_\psi \otimes_C C\{G\} = R_\psi \otimes_K K\{G\} \simeq R_\psi \otimes_K R_\psi$$

sending $r \otimes h$ ($r \in R_\psi$, $h \in C\{G\}$) to $r \otimes 1 \cdot h$ is an isomorphism of $K$-$(\phi, \psi)$-algebras. This means that $W_\psi = \text{Spec}^B(R_\psi)$ is a $\psi$-$G_K$-torsor.

• If $L_\psi$ is a field, $\psi \dim(G) = \psi \text{tr.deg.}(L_\psi/K)$.

• The fixed field of a PPV extension under the parametrized Galois group being defined in the same way as the fixed field of a PV extension under the classical Galois group, we have

$$L_\psi^G = K.$$ 

• More generally, there is a 1-1 correspondence between $\psi$-algebraic subgroups of $G$ and intermediate $\phi$-pseudofields of $L_\psi$ stable under $\psi$. Normal $\psi$-subgroups correspond to PPV extensions (of some other $\phi$-modules $M'$).

3.3.2. Relation between $G$ and $G$. Let $L = K(u_{ij}) \subset L_\psi$ be the classical PV extension inside the PPV extension, and $R \subset R_\psi$ the PPV ring. Let $\hat{\mathcal{G}}$ be the classical Galois group. The realization of $\sigma \in G(B)$ as $V(\sigma) \in GL_n(B)$ via its action on $U$, namely

$$\sigma : U \mapsto UV(\sigma)$$

shows that $\sigma$ restricts to an automorphism of $L_B$ over $K$, hence a map of functors

$$G \mapsto [\psi] \hat{\mathcal{G}},$$

which is evidently injective. In general, it need not be an isomorphism, as $\sigma \in [\psi] \hat{\mathcal{G}}(B) = \mathcal{G}(B^\phi)$ “does not know” about the extra automorphism $\psi$, and may not extend to $L_\psi$ so that the extra compatibilities are satisfied. However, since

$$C[\hat{\mathcal{G}}] = (R \otimes_K R)^\phi \hookrightarrow (R_\psi \otimes_K R_\psi)^\phi = C\{G\}$$

is injective, any function from $C[\hat{\mathcal{G}}]$ that vanishes on $G$ is 0. It follows that there does not exist a proper (classical) subgroup $H \subset \hat{\mathcal{G}}$ with $G \subset [\psi]H$, hence

• $G$ is Zariski dense in $\hat{\mathcal{G}}$ ([A-D-H-W], Proposition 2.1.2).

3.3.3. A Galoisian criterion for being $\psi$-isomonodromic. The $\psi$-Galois group $G$ of a difference $\phi$-module $M$ enables us to state a criterion for $M$ to be $\psi$-isomonodromic, i.e. for $M \simeq M^{(\psi)}$.

**Proposition 17** (Theorem 2.55 of [O-W]). The $\phi$-module $M$ is $\psi$-isomonodromic if and only if there exists an $h \in GL_n(C)$ such that

$$\psi(X) = hXh^{-1}$$

holds in $G$ (i.e. for any $B \in \text{Alg}^\psi_C$ and any $\sigma \in G(B) \subset \mathcal{G}(B) \subset GL_n(B)$, $\psi(\sigma) = h\sigma h^{-1}$).

**Proof.** Assume that $M$ is $\psi$-isomonodromic. Then there exists a matrix $A_\psi \in GL_n(K)$, such that with $A_\phi = A$, we have the compatibility relation

$$\phi(A_\psi)A_\phi = \psi(A_\phi)A_\psi.$$ 

Using this relation and the relation $1 = \phi(U)^{-1}A_\phi U$ we see that

$$h = \psi(U)^{-1}A_\psi U.$$
is fixed under $\phi$, hence belongs to $GL_n(L^\psi) = GL_n(C)$. Let $\sigma \in G(B)$ and compute $\sigma(\psi(U))$ in two ways. On the one hand

$$\sigma(\psi(U)) = \sigma(A\psi Uh^{-1}) = A\psi Uh^{-1} \psi(UV)h^{-1}.$$  

On the other hand

$$\sigma(\psi(U)) = \psi(\sigma(U)) = \psi(UV(\sigma)) = A\psi Uh^{-1} \psi(V(\sigma)).$$

Comparing the two expressions we get $\psi(V(\sigma)) = hV(\sigma)h^{-1}$. This string of identities can be reversed. Starting with $h$ as above and defining $A_h = \psi(\sigma)h U h^{-1}$, we see that $A_h$ is fixed by every $\sigma$ in the Galois group, hence lies in $GL_n(K)$, and we get the desired compatibility relation between $A_h$ and $A_\psi$. \qed

**Remark 18.** The last proof can be given a matrix-free version. If $h : M \simeq M^{(\psi)}$ is an isomorphism of $\phi$-modules, then $h$ can be base-changed to $L^\psi$ and then, since it commutes with $\Phi$, induces an isomorphism between the modules of solutions. If $\sigma \in G$ (and not only in $G$) then $\sigma$ induces a commutative diagram

$$\begin{array}{ccc}
M^\phi_{L^\psi} & \xrightarrow{h} & (M^{(\psi)}_{L^\psi})^\phi \\
\downarrow \sigma & & \downarrow \psi(\sigma) \\
M^\phi_{L^\psi} & \xrightarrow{h} & (M^{(\psi)}_{L^\psi})^\phi
\end{array}$$

yielding the relation $\psi(\sigma) = h\sigma h^{-1}$. If we identify, as usual, the spaces of solutions $M^\phi_{L^\psi}$ and $(M^{(\psi)}_{L^\psi})^\phi$ with $C^n$, in the bases given by the columns of $U$ and $\psi(U)$, then $h$ becomes a matrix in $GL_n(C)$ as in the Proposition. Conversely, a descent argument shows that given such a diagram relating the spaces of solutions (after base change to $L^\psi$) yields an isomorphism $M \simeq M^{(\psi)}$ (before the base-change). In fact, this “conceptual proof” is not any different than the “matrix proof” by Ovchinnikov and Wibmer. Unwinding the arguments, one sees that the two proofs are one and the same.

3.4. **Example 2.7 continued.** Suppose we add, in Example 2.7, a second difference operator $\psi f(z) = f(pz)$, as in the case (2Ell). Then the $\phi$-module corresponding to the system $\phi(Y) = AY$ is $\psi$-isomonodromic, and the corresponding system $\psi(Y) = BY$ is given by

$$B = \begin{pmatrix} p & g_p(z, \Lambda) \\ 0 & 1 \end{pmatrix}.$$ 

The compatibility relation

$$\phi(B)A = \psi(A)B$$

is satisfied. The field $E$ is also a PPV extension, being $\psi$-stable. The $\psi$-Galois group $G$ is “classical”, i.e.

$$G = [\psi]G.$$ 

4. **Some preliminary results**

4.1. **Isomonodromy and solvability.** Let $(K, F, \phi, \psi)$ be as in the case (2Ell) and assume that $2 \leq p, q$ and $(p, q) = 1$. Let $M$ be a $\phi$-module over $K$, $A$ the associated matrix (in a fixed basis), $R$ a PV ring for $M$, $L = Quot(R)$ the corresponding PV extension, $U \in GL_n(R)$ a fundamental matrix, and $G \subset GL_{n,C}$ the difference Galois group, its embedding in $GL_{n,C}$ determined by the choice of $U$. The following theorem will be used in the proof of Theorem\[ but has independent interest.

**Theorem (= Theorem\[).** Assume that $M$ is $\psi$-isomonodromic. Then $G$ is solvable.
Proof. By Theorem 12(i), it is enough to show that with respect to a suitable basis of \( M \) the matrix \( A \) is upper triangular. Indeed, if this is the case, take \( H \) to be the Borel subgroup of upper triangular matrices. Since (a conjugate of) \( G \subset H \) and \( H \) is solvable, \( G \) is solvable too.

Endow \( M = (M, \Phi, \Psi) \) with a \((\phi, \psi)\)-module structure. Call \( M \) solvable if there exists a sequence

\[ 0 \subset M_1 \subset \cdots \subset M_n = M \]

of \((\phi, \psi)\)-submodules \( M_i \), \( \text{rk}(M_i) = i \). This would clearly imply that \( A = A_\phi \) is gauge-equivalent to a matrix in upper triangular form.

We show that \( M \) is solvable. By induction, it is enough to show that \( M \) contains a rank-one \((\phi, \psi)\)-submodule. We apply Theorem 35 of [3S2]. Using the notation there, let \((r_1, \ldots, r_k)\) be the type of \( M \), \( r_1 \leq r_2 \leq \cdots \leq r_k \), \( \sum_{i=1}^k r_i = n \). Let \( e_1, \ldots, e_n \) be the basis of \( M \) in which \( A \) has the form prescribed by that theorem. Recall that if we write \( A = (A_{ij}) \) in block-form, \( A_{ij} \in M_{r_i \times r_j}(K) \), then

\[ A_{ij}(z) = U_{ri}(z/p)T_{ij}(z)U_{rj}(z)^{-1}. \]

Then \( T_{ij} \) is a square upper-triangular \( s \times s \) matrix for \( s \leq \min(r_i, r_j) \), with constant (i.e. \( C \)-valued) entries. An analogous description, with a constant matrix \( S \) replacing \( T \), gives the matrix \( B \), associated with \( \Psi \) in the same basis.

Let

\[ i_1 = 1, \; i_2 = r_1 + 1, \ldots, i_k = r_1 + \cdots + r_{k-1} + 1 \]

be the first indices in each of the \( k \) blocks. Let \( M' = \text{Span}_K\{e_1, \ldots, e_{i_k}\} \). Then \( M' \) is a rank \( k \) \((\phi, \psi)\)-submodule of \( M \). Moreover, \( \Phi|_{M'} \) and \( \Psi|_{M'} \) are given in this basis by constant matrices. In other words, \( M' \) descends to \( C \), \( M' = M'_0 \otimes_C K \), where \( M'_0 = C\)-representation of \( \Gamma = \langle \phi, \psi \rangle \simeq \mathbb{Z}^2 \), and \( \Phi \) and \( \Psi \) are extended semilinearly from \( M'_0 \) to \( M' \). Since any two commuting endomorphisms of a \( C \)-vector space have a common eigenvector, \( M' \) has a rank-one \((\phi, \psi)\)-submodule \( M_1 \subset M' \subset M \), which concludes the proof.

Incidentally, note that we have given an affirmative answer to Problem 36 in [3S2].

4.2. A periodicity theorem. In this subsection we generalize Theorem 1.1 of [3S1]. Let \( \mathcal{D} \) be the \( \mathbb{Q} \)-vector space of discretely supported functions \( f : \mathbb{C} \rightarrow \mathbb{Q} \), i.e. functions for which \( \text{supp}(f) = \{z \mid f(z) \neq 0\} \) has no accumulation point in \( \mathbb{C} \). For any lattice \( \Lambda \subset \mathbb{C} \) let \( \mathcal{D}_\Lambda \) be the subspace of \( f \in \mathcal{D} \) which are \( \Lambda \)-periodic. We may identify

\[ \mathcal{D}_\Lambda = \text{Div}(E_\Lambda)_{\mathbb{Q}} \]

with the group of \( \mathbb{Q} \)-divisors on the elliptic curve \( E_\Lambda \).

Given two functions \( f, \bar{f} \in \mathcal{D} \) we say that \( \bar{f} \) is a modification at \( 0 \) of \( f \) if \( \bar{f}(z) = f(z) \) for every \( z \neq 0 \).

Let \( 2 \leq p, q \in \mathbb{N} \) be relatively prime integers: \( (p, q) = 1 \). Consider the operators

\[ \phi f(z) = f(qz), \; \psi f(z) = f(pz) \]

on \( \mathcal{D} \). These operators preserve every \( \mathcal{D}_\Lambda \).
**Proposition 19.** Let \( f \in \mathcal{D} \). Assume that for some \( \Lambda \)-periodic \( f_p, f_q \in \mathcal{D}_\Lambda \) the relations

\[
\begin{align*}
f_q(z) &= f(qz) - f(z) \\
f_p(z) &= \sum_{i=0}^{m} e_{m-i}f(p^{1-i}z)
\end{align*}
\]

\((e_i \in \mathbb{Q}, e_m = 1, e_0 \neq 0)\) hold for all \( z \neq 0 \). Then, after replacing \( \Lambda \) by a sublattice, a suitable modification \( \tilde{f} \) of \( f \) at 0 is \( \Lambda \)-periodic.

Theorem 1.1 of [dS1] concerned the case \( f_p(z) = f(pz) - f(z) \). In this case, or more generally if \( \sum_{i=0}^{m} e_{m-i} = 0 \), we can not forgo the need to modify \( f \) at 0 because if two \( f \)'s agree outside 0, they yield the same \( f_p \) and \( f_q \).

We shall now show how to modify the proof to treat the more general case given here.

Observe first that for some \( r_\nu \in \mathbb{Q} \), \( r_1 = 1 \), we have for every \( z \neq 0 \)

\[
f(z) = \sum_{\nu=1}^{\infty} f_q\left(\frac{z}{q^\nu}\right) = \sum_{\nu=1}^{\infty} r_\nu f_p\left(\frac{z}{p^\nu}\right).
\]

Formally, this is clear for the first sum, and in the second sum one solves recursively for the \( r_\nu \). Since all our functions are discretely supported, for any given \( z \) the infinite sums are actually finite, and the formal identity becomes an equality.

Let \( S_p \subset \mathbb{C}/\Lambda \) and \( S_q \subset \mathbb{C}/\Lambda \) be the supports of \( f_p \) and \( f_q \) (modulo \( \Lambda \)). Let \( \pi_\Lambda : \mathbb{C} \to \mathbb{C}/\Lambda \) be the projection and \( \tilde{S}_p = \pi_\Lambda^{-1}(S_p) \), \( \tilde{S}_q = \pi_\Lambda^{-1}(S_q) \). Let \( \tilde{S} \) be the support of \( f \), and \( S = \pi_\Lambda(\tilde{S}) \). By (4.1) we have

\[
\tilde{S} - \{0\} \subset \bigcup_{\nu=1}^{\infty} p^\nu\tilde{S}_p \cap \bigcup_{\nu=1}^{\infty} q^\nu\tilde{S}_q.
\]

**Lemma 20.** The set \( S \) is finite.

**Proof.** See Lemma 2.3 of [dS1]. It is enough to assume here that \( p \) and \( q \) are multiplicatively independent. \(\square\)

**Lemma 21.** Let \( z \in \tilde{S}_q, z \notin \mathbb{Q}\Lambda \), and let \( n_q(z) \) be the largest \( n \geq 0 \) such that \( q^n z \in \tilde{S}_q \) (it exists since \( S_q \) is finite and the points \( q^n z \) have distinct images modulo \( \Lambda \)). Note that \( n_q(z) = n_q(z + \lambda) \) for \( \lambda \in \Lambda \) so that

\[
n_q = 1 + \max_{z \in \tilde{S}_q, z \notin \mathbb{Q}\Lambda} n_q(z)
\]

exists. Then

\[
f(z + q^{2n_q}\lambda) = f(z)
\]

for every \( z \notin \mathbb{Q}\Lambda \) and \( \lambda \in \Lambda \).

**Proof.** The proof preceding Proposition 2.4 in [dS1] holds, word for word, except that the \( P \) there is our \( q \) here. Thus, away from torsion points of the lattice, \( f \) is \( q^{2n_q}\Lambda \)-periodic. The proof of this Lemma, which relies on the previous one, still assumes only the multiplicative independence of \( p \) and \( q \).

We now treat torsion points \( z \in \mathbb{Q}\Lambda \), for which we have to assume \((p,q) = 1\). We may assume, without loss of generality, that \( f \), hence \( f_p \) and \( f_q \), are supported on \( \mathbb{Q}\Lambda \), because away from \( \mathbb{Q}\Lambda \) we have already proved periodicity, so we may subtract the part of \( f \) supported on non-torsion points from the original \( f \) without affecting the hypotheses. \(\square\)
Since $S$ is finite we may rescale $\Lambda$ and assume that $f$ is supported on $pq\Lambda$. Then $f_p$ is supported on $q\Lambda$ and $f_q$ on $p\Lambda$, as becomes evident from (4.1).

**Lemma 22.** If both $f_p$ and $f_q$ are $N\Lambda$-periodic, then so is a suitable modification of $f$ at 0.

**Proof.** The proof of Proposition 2.2 in [S1] works the same, substituting the relations (4.1) for the relations used there. \[ \square \]

This concludes the proof of Proposition [19]

5. Proof of the main theorems

5.1. Deduction of Theorem 4 from Theorem 5. From now on we let $(K,F,\phi,\psi)$ be as in the case (2Ell), assuming that $2 \leq p,q, (p,q) = 1$.

Assume that Theorem 5 is proven, and let $f$ and $g$ be as in Theorem 4. Let $n$ be the first integer such that $\psi(g) = \psi^n(g,\psi(g),\ldots,\psi^{n-1}(g))$. Clearly all the $\psi^i(g)$, $i \geq n$, also belong there.

If $g$ were algebraic over $K$, so would be all the $\psi^i(g)$, and the field $K(g,\psi(g),\ldots,\psi^{n-1}(g))$ would be a finite extension of $K$ to which $\psi$ extends as an endomorphism. In fact, since $\psi$ is an automorphism of $K$ and $[K(g,\psi(g),\ldots,\psi^{n-1}(g)) : K] < \infty$, it would be an automorphism of $K(g,\psi(g),\ldots,\psi^{n-1}(g))$. By Proposition 7(iii) this is impossible. Hence $g$ is transcendental over $K$.

Suppose $f$ and $g$ were algebraically dependent over $K$. Then this dependence must involve $f$, hence $f$ is algebraic over $K(g,\psi(g),\ldots,\psi^{n-1}(g))$, and so would be all the $\psi^i(f)$. It follows that

$$\text{tr.deg.}(K(f,g,\psi(g),\ldots,\psi^{n-1}(g)) : K) \leq n < \infty.$$ A fortiori, $$\text{tr.deg.}(K(f,\psi(g),\ldots,\psi^{n-1}(g)) : K) < \infty,$$ contradicting the conclusion of Theorem 5.

5.2. First order equations. Consider the difference equation

$$\phi(y) = ay$$

with $a \in K^\times$. The associated $\phi$-module is $M = Ke$ with $\Phi(e) = a^{-1}e$. Let $L_\psi$ be a PPV extension for $M$, and $u \in L_\psi$ a solution: $\phi(u) = au$. Replacing $\phi$ and $\psi$ by some powers $\phi^r$ and $\psi^s$ we may assume that $L_\psi$ is a field. Indeed, let

$$L_\psi = L_1 \times \cdots \times L_r$$

be the decomposition of the $\phi$-pseudofield $L_\psi$ into a product of fields. Then $\phi^r$ is an endomorphism of $L_1$, and some power $\psi^s$ of $\psi$ must also preserve it, and induces an endomorphism of $L_1$. The subfield of $L_1$ generated by (the projection of) $u$ and all its $\psi^s$-transforms is a PPV extension for $M$ as a $\phi^r$-module, which is stable by $\psi^s$.

Assume therefore that $L_\psi$ is a field.

**Proposition 23.** The following are equivalent:

(i) $u$ is $\psi$-algebraic over $K$, i.e. $\text{tr.deg.}(L_\psi : K) < \infty$.

(ii) $u$ satisfies an equation $\psi(u) = \tilde{a}u$ for some $\tilde{a} \in K^\times$. 

(iii) The $\phi$-module $M$ descends to $\mathbb{C}$: there exist $b \in K^\times$ and $c \in \mathbb{C}^\times$ such that

\[ a = c \frac{\phi(b)}{b}. \]

**Corollary 24.** If $\text{ord}_0(a) \neq 0$ then $u$ is $\psi$-transcendental over $K$.

**Proof.** In this case, (iii) can not hold, so (i) can not hold either. \[ \square \]

In [HS1] we proved $(ii) \Rightarrow (iii)$, but we shall not need this step here. Clearly $(ii) \Rightarrow (i)$, and $(iii) \Rightarrow (ii)$ because if (iii) holds we may assume, replacing $u$ by $u/b$, that $a \in \mathbb{C}^\times$. Then

\[ (u^{\phi-1})^{\phi^{-1}} = (u^{\phi-1})^{\psi-1} = a^{\psi-1} = 1, \]

so $\tilde{a} = u^{\psi-1} \in L^\phi = \mathbb{C}$, and (ii) holds. (If we did not assume $a \in \mathbb{C}^\times$ we would only get $\tilde{a} \in K^\times$.) We shall now prove $(i) \Rightarrow (iii)$.

**Proof.** Let $G$ be the $\psi$-Galois group of (5.1). It is a $\psi$-closed subgroup of $[\psi]|G_m$. If $R_\psi = K[u,u^{-1}]_\psi \subset L_\psi$ is the PPV ring then for any $B \in \text{Alg}_C^\psi$ and $\sigma \in G(B)$ we embed $\sigma \mapsto v_\sigma \in B^\times$ where $\sigma(u) = w_\sigma$.

Assume that $u$ is $\psi$-algebraic. Then

\[ \psi \dim(G) = \psi \text{tr.deg.}(L_\psi/K) = 0 < 1 = \psi \dim([\psi]|G_m), \]

so $G$ is a proper closed $\psi$-subgroup of $[\psi]|G_m$. It follows from Lemma 14 that there is a $\psi$-monomial relation

\[ \mu(v_\sigma) = v_\sigma^{e_1} \psi(v_\sigma) \cdots \psi^{e_m}(v_\sigma)^{e_m} = 1 \]

($e_i \in \mathbb{Z}, e_m \neq 0$) that holds for all $\sigma \in G$.

Let $B \in \text{Alg}_C^\psi$ and $\sigma \in G(B)$. Then

\[ \sigma(\mu(u)) = \mu(\sigma(u)) = \mu(\sigma u_\sigma) = \mu(u) \]

so $b' = \mu(u) \in L^\psi_\psi = K$. We conclude that

\[ (5.2) \quad \mu(a) = \mu(u^{\psi-1}) = \mu(u)^{\phi-1} = \phi(b')/b'. \]

Let $\alpha(z) = \text{ord}_p(a)$ and $\beta(z) = \text{ord}_p(b')$. These are the divisors of the elliptic functions $a$ and $b'$, so for some $\Lambda \subset \Lambda_0$ we have $\alpha, \beta \in \mathcal{D}_A$. Furthermore, taking the divisor of the relation (5.2) gives

\[ \sum_{i=0}^{m} e_i \psi^i(\alpha) = \phi(\beta) - \beta. \]

Define

\[ \delta(z) = \sum_{\nu=1}^{\infty} \alpha\left(\frac{z}{q^\nu}\right) (z \neq 0); \quad \delta(0) = 0. \]

Then $\delta \in \mathcal{D}$ and for $z \neq 0$

\[ \begin{align*}
\alpha(z) &= \delta(qz) - \delta(z) \\
\beta(z) &= \sum_{i=0}^{m} e_i \delta(p^i z). 
\end{align*} \]

Applying the Periodicity Theorem 19 to $f_p(z) = \beta(p z)$, $f_q(z) = \alpha(p^m z)$ and $f(z) = \delta(p^m z)$ we conclude:

- After replacing $\Lambda$ by a sublattice, a suitable modification $\tilde{\delta}$ of $\delta$ at 0 is $\Lambda$-periodic.
- We must have $\alpha(0) = 0$. 

The first assertion is the Periodicity Theorem. For the second, if \( z \neq 0 \) we have
\[
\alpha(z) = \delta(qz) - \delta(z) = \tilde{\delta}(qz) - \tilde{\delta}(z).
\]
Let \( \Lambda \) be a periodicity lattice for both \( \alpha \) and \( \tilde{\delta} \). Take \( 0 \neq \lambda \in \Lambda \). Then \( \alpha(\lambda) = \tilde{\delta}(q\lambda) - \tilde{\delta}(\lambda) = 0 \), hence \( \alpha(0) = 0 \).

We may therefore assume that \( \delta(z) \) is already periodic and \( \alpha(z) = \delta(qz) - \delta(z) \) holds everywhere, including at 0. Observe, however, that in the process of modifying \( \delta \) at 0, we might no longer have \( \delta(0) = 0 \).

Let \( \Pi \) be a fundamental parallelopiped for \( \mathbb{C}/\Lambda \) where \( \Lambda \) is a periodicity lattice for \( \alpha, \beta \) and \( \delta \). Then
\[
0 = \sum_{z \in \Pi} \alpha(z) = \sum_{z \in \Pi} \delta(qz) - \sum_{z \in \Pi} \delta(z) = (q^2 - 1) \sum_{z \in \Pi} \delta(z),
\]
so \( \delta \in \text{Div}^0(\mathbb{C}/\Lambda) \). We also have
\[
q^{-1} \sum_{z \in q\Pi} \delta(z) = (q - 1) \sum_{z \in \Pi} \delta(z).
\]
In the last step we used the fact that \( q\Pi \) is the union of \( q^2 \) translates \( \Pi + \lambda \) and that
\[
\sum_{z \in \Pi + \lambda} \delta(z) = \sum_{z \in \Pi} \delta(z)
\]
because \( \delta \) is \( \Lambda \)-periodic and \( \sum_{z \in \Pi} \delta(z) = 0 \).

Let \( \Lambda' = (q - 1)\Lambda \). Let \( \Pi' \) be a fundamental parallelopiped for \( \Lambda' \). Then by the same argument as above
\[
\sum_{z \in q\Pi'} \delta(z) = (q - 1)^2 \sum_{z \in \Pi} \delta(z) = (q - 1) \sum_{z \in \Pi} \alpha(z) \in \Lambda'
\]
because by Abel-Jacobi \( \sum_{z \in \Pi} \alpha(z) \in \Lambda \).

Replacing \( \Lambda \) by \( \Lambda' \) we conclude, again by Abel-Jacobi, that \( \delta \) is the divisor of some \( b \in K_\Lambda \). Let \( c = a/\phi(b)/b \). Then \( c \) is \( \Lambda \)-elliptic and its divisor is
\[
\alpha - \phi(\delta - \delta) = 0.
\]
Thus \( c \) is constant, and the proof is complete. \( \square \)

**Corollary 25** (First order case of Theorem 5). Let \( f \in F \) satisfy the first order, linear homogenous equation
\[
\phi(f) = af
\]
with \( a \in K^\times \). Then either \( f \in S \) or \( \{ f, \psi(f), \psi^2(f), \ldots \} \) are algebraically independent over \( K \).

**Proof.** We may embed \( K(f,\psi) \) in the PPV extension \( L_\psi \).

If \( \{ f, \psi(f), \psi^2(f), \ldots \} \) are not algebraically independent over \( K \) then, according to the last Proposition \( f \) satisfies also a linear homogenous \( \psi \)-difference equation over \( K \).

By Theorem 3 we must have \( f \in S \). \( \square \)

**Remark.** According to [HST], in the order one case, if \( f \) is \( \psi \)-algebraic over \( K \), we can even infer that for some \( m \in \mathbb{Z}, z^m f \in K \).
Generalizing from first order homogenous equations to first order inhomogenous equations is done exactly as in [A-D-H-W], Proposition 4.5. We do not repeat the proof, as it can be duplicated word for word, and will not be needed in the sequel, see the remark below. The only difference is that at the last step in [A-D-H-W], assuming \( f \) was \( \psi \)-algebraic over \( K \), Theorem 1.1 of that paper was invoked to deduce that \( f \in K \). Here we should invoke Theorem 3 instead, so we can only deduce \( f \in S \). We arrive at the following Proposition.

**Proposition 26.** Let \( f \in F \) satisfy the inhomogenous difference equation

\[
\phi(f) = af + b
\]

with \( a, b \in K \). Then either \( f \in S \) or \( \{ f, \psi(f), \psi^2(f), \ldots \} \) are algebraically independent over \( K \).

**Remark.** We shall not need this Proposition. In the last stage of our proof of Theorem 5 we shall deal with the same type of inhomogenous equation, but where \( b \in S \). We shall give full details there.

5.3. **The case of a simple \( G \).**

5.3.1. **Recall of notation and assumptions.** Let

\[
M = (K^n, \Phi), \quad \Phi(v) = A^{-1}\phi(v)
\]

be the rank-\( n \) \( \phi \)-module over \( K \) associated with the system \( \phi(Y) = AY \).

Let \( L \subset L_\psi \) be PV and PPV extensions for \( M \), \( G \) the (classical) difference Galois group and \( G \) the (parametrized) \( \psi \)-Galois group.

Fixing a fundamental matrix \( U \) with entries in \( L \) we get embeddings

\[
G \subset [\psi]G \subset [\psi]\text{GL}_n,\mathbb{C}.
\]

When we base change \( M \) to \( L \) we get the full, \( n \)-dimensional, complex vector space of “solutions” \( V = M_\Phi^L = U\mathbb{C}^n \subset M_L = L^n \).

If instead of \( L \) we use the even larger PPV extension \( L_\psi \) we get the same complex vector space \( V \), as all the solutions already lie in \( L^n \). However, over \( L_\psi \) we get also the solution spaces \( \psi^i(V) \) of all the \( \psi \)-transforms \( M(\psi^i) \), \( i \geq 0 \).

The difference Galois group \( G \) acts on \( V \). If \( \sigma \in G(\mathbb{C}) \) then for \( v \in \mathbb{C}^n \)

\[
\sigma(Uv) = UV(\sigma)v,
\]

so \( \sigma \mapsto V(\sigma) \) is the matrix representation of \( G \) on \( V \) in the basis consisting of the columns of \( U \).

5.3.2. **The simple case.**

**Lemma 27** ([A-D-H-W], Lemma 3.9). Assume that \( L_\psi \) is a field. Then \( G \) is connected and \( G \) is \( \psi \)-integral, hence in particular \( \psi \)-reduced.

The proof relies on Proposition 7. Recall that being \( \psi \)-integral means that the coordinate ring \( \mathbb{C}\{G\} \) is a domain and \( \psi \) is injective on it.

**Proposition 28** ([A-D-H-W], Proposition 4.11). Assume that \( L_\psi \) is a field. If \( G \) is simple, then \( G = [\psi]G \). In particular,

\[
\psi\text{tr.deg.}(L_\psi/K) = \psi\text{dim}(G) = \dim(G) > 0.
\]
Proposition 29. Note first that $G$ is Zariski dense in $G$ (always true) and $\psi$-reduced (by the previous lemma). By Proposition 15 if $G \subset [\psi]G$, there exists an $h \in GL_n(\mathbb{C})$ and an $m \geq 1$ such that

$$\psi^m(X) = hXh^{-1}$$

holds in $G$.

By Proposition 17 $M$ is then $\psi^m$-isomonodromic.

By Theorem 6 $G$ must be solvable, contradicting the assumption that it was simple. This contradiction shows that we must have had $G = [\psi]G$.

Proposition 29 (A-D-H-W, Proposition 4.12). Assume that $L_\psi$ is a field. Then either $G$ is connected and solvable or $\psi$-true. Therefore $\psi$ holds in $G$. Same as in [A-D-H-W]. Connectendness follows from Lemma 27. If $G$ is not solvable then it has a simple quotient $G/N$. The Galois correspondence theorem is used to obtain a PV extension $L' = L^N$ for a $\phi$-module $M'$, whose difference Galois group is $G/N$. The PPV extension of the same $M'$ is a subfield $L'_\psi \subset L_\psi$, and by the previous Proposition $\psi$-true. Then $u \in S^n$.

We prove the following claim, which clearly implies Theorem 6 by induction on $n$. The assumptions on $p$ and $q$ are maintained.

Claim 30. Let $n \geq 1$, $A \in GL_n(K)$ and $u = t(u_1, \ldots, u_n) \in F^n$ a solution of $\phi(Y) = AY$. Assume that all the coordinates $u_i$ are $\psi$-algebraic, i.e. $\trdeg((K(u)_\psi/K) < \infty$ where $K(u)_\psi$ is the field $\psi$-hull of $K(u)$ in $F$. Then $u \in S^n$.

The case $n = 1$ follows from Corollary 25. The following Lemma will be used to reduce the general case to certain inhomogenous first order equations, albeit with coefficients outside $K$.

Lemma 31. Without loss of generality, we may assume:

1. The PPV extension $L_\psi$ is a field, and all its elements are $\psi$-algebraic over $K$. Equivalently, $\psi\dim(G) = 0$.
2. $G$ is solvable, and the matrices $A$ and $U$ are upper triangular.
3. The diagonal elements of $A$ are in $\mathbb{C}^\times$.
4. $K(u)_\psi \subset L_\psi$ and the vector $u$ is the last column of $U$.

Proof. As before, replacing $\phi$ and $\psi$ by some powers $\phi^r$ and $\psi^s$, and $A$ by $A^s$, we may assume, not changing $u$, that the PPV extension $L_\psi$ of $M$ is a field, $K(u)_\psi$ (a priori a subfield of $F$) is embedded as a $(\phi, \psi)$-subfield of $L_\psi$, and that the (classical) difference Galois group $G$ is connected. Let $U$ be a fundamental matrix, with entries in $L_\psi$. The given vector $u$ is some linear combination of its columns.

Let $L^n_\psi$ be the subfield of $L_\psi$ consisting of elements that are $\psi$-algebraic. It is stable under $\phi$ and $\psi$, and also under $G$.

Let $V = M^n_{L_\psi} = U\mathbb{C}^n \subset L^n_\psi$ be the space of solutions, and $V^n = V \cap (L^n_\psi)^n$. Since $V^n$ is fixed by $G$ and $G$ is Zariski dense in $G$, the (classical) Galois group $G$ fixes $V^n$ as well. Let $H$ be the maximal parabolic subgroup of $GL_n(\mathbb{C})$ which is the stabilizer of $V^n$. Since $G \subset H$ we may assume that $A$ and $U$ lie in $H$. After a $\mathbb{C}$-linear change of coordinates we may assume that

$$A = \left( \begin{array}{ccc} A_{11} & A_{12} \\ 0 & A_{22} \end{array} \right), \quad U = \left( \begin{array}{ccc} U_{11} & U_{12} \\ 0 & U_{22} \end{array} \right)$$
in block form \((A_{11} \text{ and } U_{11} \text{ of size } n_1 \times n_1)\), and the first \(n_1\) columns of \(U\) span \(V^a \simeq \mathbb{C}^{n_1}\). Thus \(u\) is a \(\mathbb{C}\)-linear combination of the first \(n_1\) columns of \(U\). Replacing our system of equations by the system \(\phi(Y) = A_{11}Y\) we may assume that \(n = n_1\), \(A = A_{11}\), \(V = V^a\) etc., hence \(L_\psi = L^a_\psi\). This proves (1).

By Proposition 29 the Galois group \(G\) is solvable. By the Lie-Kolchin theorem we may assume that \(G\) is contained in the upper-triangular Borel subgroup of \(GL_{n, \mathbb{C}}\). By Theorem 12 so are \(U\) and \(A\). This proves (2).

Recall that the vector \(u\) is linear combination of the columns of \(U\). If the last non-zero entry of \(u\) is \(u_r\) then we can assume, by a further change of coordinates, not affecting the upper triangular form, that \(u\) is the \(r\)th column of \(U\). Replacing the system of equations by the one correspoding to the upper-left \(r \times r\) block we may assume that \(r = n\), and \(u\) is the last column of \(U\). This is (4).

By induction, we may assume that (3) had been proved for all the diagonal elements of \(A\), but the first one. Since \(u_{11}\) is a solution of \(\phi(y) = a_{11}y\), and is \(\psi\)-algebraic, Proposition 23 shows that there exists a \(b \in K^\times\) such that \(a_{11}/(\phi(b)/b) \in C^\times\). Replacing \(A\) by the gauge-equivalent \(\phi(P)^{-1}AP\), where \(P = \text{diag}.[b, 1, \ldots, 1]\), we get (3). \(\square\)

From now on the proof can be concluded either by the methods of [4S2], or by the Galois theoretic “acrobatics” adapted from [A-D-H-W]. We chose to use the second approach.

Assume therefore that we are in the situation of the Lemma. In particular \(u_i = u_{in}\) is the \(i\)th entry in the last column of the fundamental matrix \(U\). The \(u_i\) lie in \(F\), but also in \(L_\psi\), by our assumption (4) that \(K(u)_\psi \subset L_\psi\).

We may also assume that \(E = \text{Quot}(S)\) is contained in \(L_\psi\). If this is not the case, augment the matrix \(A\) by adding to it along the diagonal a \(2 \times 2\) block as in example 2.7. The fundamental matrix gets augmented by the block

\[
\begin{pmatrix}
    z & \zeta(z, A) \\
    0 & 1
\end{pmatrix},
\]

hence the PPV extension for the augmented system contains \(E\). If we prove the main theorem for the augmented system, we clearly have proved it also for the original one.

By induction we may assume that \(u_2, \ldots, u_n \in S\). We have to show that \(u' = u_1 \in S\).

This \(u' \in F\) satisfies the equation

\[
\phi(u') = au' + b
\]

where \(a = a_{11} \in C^\times\), and \(b = a_{12}u_2 + \cdots + a_{1n}u_n \in S\) (by our induction hypothesis). Let \(v = u_{11}\), so that \(\phi(v) = av\).

Since \((\phi - a)(u') \in S \subset S_\phi(F/K)\) clearly \(u' \in S_\phi(F/K)\). To conclude the proof we shall show, following the ideas of the proof of Proposition 4.5 in [A-D-H-W] that

\(u' \in S_\phi(F/K)\)

as well. Theorem 3 will show then that \(u' \in S\), as desired.

Consider the matrix

\[
U' = \begin{pmatrix} v & u' \\ 0 & 1 \end{pmatrix} \in GL_2(L_\psi).
\]

This is a fundamental matrix for the system

\[
\phi(Y) = \begin{pmatrix} a & b \\ 0 & 1 \end{pmatrix} Y,
\]
regarded as a system of difference equations over \( E \). The field
\[
L'_\psi = E(v, u')_\psi \subset L_\psi
\]
is its PPV extension. Furthermore, the \( \psi \)-Galois group of the last system is
\[
G' = Gal^{\psi}(L'_\psi/E) \subset \left\{ \begin{pmatrix} \alpha & \beta \\ 0 & 1 \end{pmatrix} \in GL_2 \right\}
\]
and its intersection with the unipotent radical (where \( \alpha = 1 \)), denoted \( G'_u \), corresponds via the Galois correspondence to \( E(v)_\psi \) :
\[
G'_u = Gal^{\psi}(L'_\psi/E(v)_\psi).
\]
This is a \( \psi \)-subgroup of \( [\psi]G_u \). By our assumption that \( u' \) is \( \psi \)-algebraic over \( K \), hence clearly over \( E \),
\[
\psi \dim G'_u = \psi \tr \deg (L'_\psi/E(v)_\psi) = 0.
\]
It follows from Corollary A.3 of [DV-H-W1] that there exists an \( 0 \neq L_1 \in \mathbb{C}[\psi] \) such that for any \( B \in \text{Alg}_C \) we have
\[
G'_u(B) \subset \left\{ \begin{pmatrix} 1 & \beta \\ 0 & 1 \end{pmatrix} \in GL_2(B) \mid L_1(\beta) = 0 \right\}.
\]
Observe that
\[
\phi\left( \frac{u'}{v} \right) = \frac{u'}{v} + \frac{b}{av},
\]
and \( b/av \in E(v)_\psi \), so \( L'_\psi/E(v)_\psi \) is a PPV extension for \( \phi(y) = y + (b/av) \), equivalently for the system
\[
\phi(Y) = \begin{pmatrix} 1 \\ \frac{b}{av} \\ 1 \end{pmatrix} Y
\]
over \( E(v)_\psi \). The action of \( \tau \in G'_u(B) \) is given by
\[
\tau\left( \frac{u'}{v} \right) = \frac{u'}{v} + \beta \tau
\]
where \( \beta \tau \in B \) corresponds to the above realization of \( \tau \) as a unipotent \( 2 \times 2 \) matrix. Indeed, if
\[
\tau(U') = U' \begin{pmatrix} 1 & \beta \tau \\ 0 & 1 \end{pmatrix}
\]
then \( \tau(u') = v\beta + u' \) and \( \tau(v) = v \).
It follows that for any \( \tau \in G'_u(B) \)
\[
\tau \left( L_1\left( \frac{u'}{v} \right) \otimes 1 \right) = L_1(\tau(\frac{u'}{v})) \otimes 1 = L_1(\frac{u'}{v} + \beta \tau) \otimes 1 = L_1(\frac{u'}{v}) \otimes 1,
\]
hence \( L_1(u'/v) \in E(v)_\psi \). But
\[
(\nu^\psi - 1)^{\psi - 1} = (\nu^{\psi - 1})^{\psi - 1} = a^{\psi - 1} = 1,
\]
so \( d = v^{\psi - 1} \in \mathbb{C} \) and \( \psi(v) = dv \). \( E(v)_\psi = E(v) \). It follows that there exists a second operator \( \mathcal{L}_2 \in \mathbb{C}[\psi] \), easily derived from \( \mathcal{L}_1 \), such that
\[
\mathcal{L}_2(u') \in E(v).
\]
This \( \mathcal{L}_2(u') \) satisfies the equation
\[
\phi(y) = ay + \mathcal{L}_2(b)
\]
where we have used the fact that $a$ was constant, and where $L_2(b) \in S$. By Lemma 4.7 of [A-D-H-W], with $E$ serving as the base field and the intermediate field, there exists a $g \in E$ with
\[ \phi(g) = ag + L_2(b). \]

We are indebted to Charlotte Hardouin for pointing out the following lemma.

**Lemma 32.** In fact, $g \in S$.

**Proof.** Let $I = \{ s \in S | sg \in S \}$ be the ideal of denominators of $g$. If $s \in I$ then $\phi(s) \in I$ because
\[ \phi(s)g = a^{-1}(\phi(sg) - \phi(s)L_2(b)) \in S. \]
Since $S$ is a simple $\phi$-ring (it is the localization at $z$ of the PV ring $K[z, \zeta(z, \Lambda)]$ associated to the system considered in Example 2.7), we must have $1 \in I$, so $g \in S$.

It follows that $\phi(L_2(u') - g) = a(L_2(u') - g)$. Since also $\phi(v) = av$, the element $d' = (L_2(u') - g)/v$ is fixed by $\phi$, hence lies in $\mathbb{C}$, and
\[ L_2(u') = d'v + g. \]
Since $(\psi - d)d'v = d'((\psi - d)v) = 0$
\[ (\psi - d) \circ L_2(u') = (\psi - d)(g) \in S. \]
As $(\psi - d) \circ L_2 \in \mathbb{C}[\psi]$ and any element of $S$ is annihilated by a non-trivial operator from $K[\psi]$, we deduce that $u' \in S_{\phi}(F/K)$, and the proof is complete.

**Acknowledgements.** The author would like to thank Charlotte Hardouin and Thomas Dreyfus for fruitful discussions regarding this work. He would also like to thank Zev Rosengarten and the participants of the Kazhdan Seminar at the Hebrew University for carefully and critically attending his lectures on the subject.
