The Role of Competency and Succession Program to Retain Millennial Healthcare Workers
Case Study in Indonesian Small Scale Maternity Hospital

Mira Pratiwi, Sandra Dewi, and Hasyim

ABSTRACT

The turnover rates among millennial employees have become serious issue for many industries including healthcare industry. The negative economically outcome due to high turnover rate can vary from direct and indirect, tangible and intangible cost to the organization.

The cause of high turnover rate has been explained in many literatures, which includes leadership as one of the factors. Many studies have been underlining the importance of leadership style in lowering the number of turnover. Albeit some of leadership style may be proven to be effective in certain organization, the shift of millennial characteristic pressed other scholars to analyze if current theories of leadership style may sufficient and fitting to millennial. Therefore, there has been a gap in the literature between leadership style and leadership traits.

The purpose of this research is to study the relation between effective leadership traits for managing millennial and its’ impact to lower millennial healthcare workers turnover intention. Teamwork is an important aspect in millennial setting; therefore, it is used as moderator to imply if teamwork may strengthen the relation between the two previous variables.

The study was held in a small-scale maternity hospital in Malang, Indonesia, with the population of 57 millennial employees. The results of this research effort may help to fill the gap in the literature about the relationship between leadership traits, teamwork, and employee’s turnover for millennial in the workplace; and will hopefully help the organization to understand better the millennial motives to stay, and to bridge understanding between employer and employees.

Keywords: Leadership Traits, Turnover Intention, Teamwork, Millennial Employees, Healthcare Industry.

I. INTRODUCTION

A. Literature Review

Workforce turnover is a normal process within human resource department in many organizations including healthcare sector. However, the rise of turnover can become great concern due to the negative economically impact to the organizations themselves. The direct impact may include recruitment costs, temporary labor costs, employee’s relocation costs, training costs, capitalization of salary leave costs, and induction fees. Indirect impact such as decreased productivity and morale, although cannot be felt directly but can be challenging for the operational functioning and routines of the organization. Additionally, the low morale of the remaining employees may cause further turnover [1].

Researches have estimated the required cost to recruit and train new employees is equal to 50% of the annual employees’ salary due to the loss of productivity during the transition of workers. Based on these findings, many organizations consider the first 6 months of employees’ salaries as investment costs [2].

Therefore, it is prudent for organizations to consider strategies on retaining the current employees. In addition, employee’s retention will maintain good corporate relation for both between employees – organizations, as well as employees – customers.

B. Relational Factors Affecting Turnover Intention

Turnover intention is often described as the predictor of the actual turnover. Researches on turnover intention are expected to give feedback to organizations in maintaining their employees. Previous literatures mention factors such as: high salaries, bonuses, benefits, and career paths may tempt employees to stay within organizations; thus, some studies stated that those factors still cannot trigger the enthusiasm and motivation of employees to stay within organization, in particular their millennial employees. Accordingly, organizations need to take measurement and
investment to maintain their employees in the form of providing training, leadership support, work processes innovation, and career path in order to reduce turnover intention [3].

Leadership behavior has been considered as one of the major contributing factors in reducing turnover intention [4]. When employees feel comfortable with their leaders, employees are more likely to stay within the company, and vice versa [5]. Leaders are expected to be able to create work activities to stimulate good collegial relationships among employees. A good collegial relationship is considered as an important factor for employees to maximize their productivity and efficiency, so as to reduce turnover intention significantly [6].

Beside leadership, teamwork is considered as major contributing factor to retain employees. Due to the bureaucratic system diminution in many organizations, the relationship between coworkers works horizontally instead of vertically, and naturally forced coworkers to work together as team more regularly than before [7]. Teamwork is proven to increase productivity, output quality, balanced quality for employees’ personal and work life, even reducing turnover intention and conflict [8].

C. Justification for the Current Study

Today, the number of millennial employees dominates the total percentage of employees in the organization. In the next 5 years, millennial will dominate more than 60% of the workforce. Organizations face challenges such as: attracting and retaining millennial employees; manage employees with different generations background within workplace; and to manage workforce dynamics that will continue to change [9].

Several studies have found that 60% of millennial employees leave the workplace within three years. So, it is essential for leaders to understand how to cultivate a workplace environment that attracts millennial and influence them to stay long-term. Some literature states the importance of companies and organizations to adapt to millennial characteristic, work and life value, as well as work habit [10], [11]. Organizations that successfully adapt to globalization, new technologies, and horizontal leadership models can improve morale, reduce turnover, and increase sales and profits [12].

Many senior leaders cannot understand their millennial employees motivation; therefore leaders cannot comprehend why their leadership methods ineffective towards the millennial [3]. Experts realize that leaders must gain deeper understanding of the overall social-economic, political background of millennial. By recognizing the approach to facilitate millennial appropriately will support the leadership regeneration in an organization [13].

Some of millennial characteristic and motivation according to some literatures are as follow: solid leadership and teamwork, challenges at work, opportunity to collaborate, flexible and non-traditional working hours, supporting technology, and organizational culture [14], [15].

However, the lack of literatures on effective leadership traits for millennial may limit this research. Leadership theories that are widely used in various organizations such as transformational leadership, servant leadership, and ethical leadership have overlapping characteristics, and may not necessarily incorporate millennial generations motivation, values, and expectations [13].

Furthermore, leadership theories that have been circulating so far have focused on the characteristics of leadership styles. The definition of leadership has always evolved accordingly, hence researchers are welcome to research and explore further on leadership characteristics and attributes that continue to evolve along with the change of generational cohorts, and millennial in particular.

Therefore, this study seeks to address the mentioned literature gap, in particular to examine how health professional perceptions on leadership, teamwork, and turnover intention with its hypothesis as follow:

Hypothesis 1. Leadership has negative effect on turnover intention significantly.

Hypothesis 2. Teamwork has negative effect on turnover intention significantly.

Hypothesis 3. Teamwork moderates significantly the effect of leadership on turnover intention.

II. Method

A. Setting

This study was conducted at small-scale maternity hospital in Malang, Indonesia. The hospital has approximately 25 inpatient beds and offers a variety of specialty services including obstetric and gynecologist, pediatric, internist, fertility care, and dental care. This research takes place from April-May 2020.

B. Sampling and Data Collection Procedures

Data were obtained from millennial employees from all units and departments within the age of 18-30 years old by the time this research is conducted. The study sample included all staff in the above description. Survey data were collected between 25th of April – 5th of May 2020. The questionnaire was given to enumerator with attendee list to ensure most of the respondents participate in the survey. The enumerator would then collect the respondent individually or in a small group of 2 or 3 to fill the questionnaire. The enumerator was allowed to explain carefully the content of the questionnaire, and the respondents were free to ask the enumerator if needed. Respondents were asked to indicate their age, gender, education background, tenure, position, and the unit they assigned on. Nonetheless, the questionnaire is completely anonymous.

C. Measures

A survey was constructed using previously validated scales to access respondents’ perceptions on leadership traits for millennial, teamwork, and turnover intention. Demographic data on age, gender, profession, position and tenure were also collected.

D. Dependent Variables

1. Turnover intention

A three-item turnover intention measure by Mobley [16] was used in this study, which are: (1) Thinking to quit, (2) Intent to search, (3) intent to quit. Items were rated on a Likert-type scale from 1 (strongly disagree) to 5 (strongly
agree), with a middle option, Neither Agree Nor Disagree. The three negative context of turnover intention above have been reverse coded as it made intuitive sense that a low score on the corresponded to a higher intention to leave.

E. Independent Variables

1. Leadership traits

Leadership traits were measured using ten items that found to be ideal and effective for millenial generation [14]. The 10 items include: (1) informal contact, (2) guidance, (3) development of others, (4) absence of hierarchy, (5) empowering, (6) flexibility providing, (7) trust, (8) adaptability, (9) feedback providing, and (10) open for new ideas. Items were rated on a Likert-type scale from 1 (strongly disagree) to 5 (strongly agree), with a middle option, Neither Agree Nor Disagree.

2. Teamwork

Teamwork was measured by Civility, Respect, and Engagement in the Workforce (CREW). Otsutke et al. [17] founded this instrument in 2009. The instrument consists of 8 question that include items such as: (1) Respect, (2) Cooperation, (3) Conflict Resolution, (4) Coworker Personal Interest, (5) Coworker Reliability, (6) Antidiscrimination, (7) Value Differences, (8) Supervisor Diversity Acceptance. Items were rated on a Likert-type scale from 1 (strongly disagree) to 5 (strongly agree), with a middle option, Neither Agree Nor Disagree.

F. Analysis

The analysis was carried out using moderated regression analysis logistic binary using SPSS program. Product Moment Pearson Correlation was used to assess the validity of the questionnaire. Cronbach’s α values were calculated to assess the reliability of the questionnaire for leadership traits, teamwork, and turnover intention variables.

III. RESULT

A. Response Rate and Sample Characteristics

57 out of 60 people responded to this survey, thus make the response rate of 95%. Most study participants were female (94.7%) nurses (21.1%) with healthcare diploma and bachelor degree (64.9%) had tenure of 0-2 years (63.2%), and within age group of 24-26 years old (50.9%).

B. Reliability and Validity Analysis

The Cronbach’s α value for leadership attribute was 0.90, the teamwork scale was 0.86, and turnover intention scale was 0.89 thus prove all indicators in all three variables > 0.60 to be reliable. The Pearson r results are > r table (0.361) thus prove all indicators in all three variables to be valid (Table 1).

C. Regression Model Test

The feasibility of the regression model was tested using Hosmer and Lomeshow's Goodness of Fit Test. The criterion is if the value of sig. > α. Table 2 shows that the value of sig (0.126) > α (0.05). Therefore, the model can predict the value of observation well.

D. Overall Model Test

This test is used to assess the whole model by comparing the value of -2 Log Likelihood in block 0 with the value of -2 Log Likelihood in block 1. The overall test table for this study is declared fit if there is a good decrease of value of -2 Log Likelihood from block 0 to block 1.

E. Nagelkerke R-square

The coefficient of determination is to determine the ability of independent variables representing the dependent variable. The closer the number is to 1, the better the independent variable in representing dependent variables. The coefficient of determination is determined by Nagelkerke R-square value that can be seen in the following table:

F. Hypothesis Test

1. Partial hypothesis test

Partial hypothesis test is used to determine whether there is a partial influence of independent variables on the
dependent variable. The criterion of this test is the value of sig. ≤ α. The results of partial hypothesis test can be seen on following table:

| Variables in the Equation | B     | S.E. | Wald | df | Sig. | Ket   |
|--------------------------|-------|------|------|----|------|-------|
| X                        | -3.687| 1.781| 4.288| 1  | .038 | H1    |
| M                        | -4.560| 2.232| 4.174| 1  | .041 | H2    |
| XM                       | .125  | .058 | 4.579| 1  | .032 | H3    |
| Constant                 | 133.733| 67.803| 3.890| 1  | .049 |       |

Step 1

- a. Variable(s) entered on step 1: X, M, XM.

Source: SPSS Test Result (2020).

The test results indicate the value of Sig. <0.05. This means that there is partially significant influence of leadership traits, teamwork, and the interaction of leadership traits and teamwork on turnover intention.

2. Moderation hypothesis test

The moderation test is used to analyze the outcome of moderating variable on the relations between independent variable and dependent variable. A test criterion is if the value of sig. ≤ α, the moderating variable is able to moderate the effect of the independent variable on the dependent variable.

The result produces sig. (0.032) < α (0.05). This means that teamwork moderates the influence of leadership traits on turnover intention.

However, the Positive B value shown in the table 8 indicates opposite interaction with the previous 2 variables. This result indicates that the interaction of leadership traits and teamwork weakens the effect of leadership traits to turnover intention. In short, this means that the interaction of leadership traits and teamwork increase turnover intention significantly.

IV. DISCUSSION

The survey results supported all hypotheses. In Hypothesis 1, the direct relationships of leadership traits and turnover intention were found to be negatively significant.

R-square value for leadership trait is 0,169 or 16.9%. This means contribution factors of leadership traits on turnover intention is 16.9%, while the remaining 83.1% contribution factors were not discussed in this study.

This finding is consistent with Wiley’s statement (1993), which argues that contributing factors of voluntary turnover are as follow: lack of feedback and career development, job dissatisfaction, unmet job expectations, job stress, and social culture constraint.

Hypothesis test results suggest that leadership trait has significantly negative effect on turnover intention of millennial employees. These results are in accordance with previous studies by Abate et al. [18]; Asiedu et al. [19]; Smith & Nichols [20]; and Wells & Peachey [21].

The result of this study also illuminates several other contributing factors that can affect turnover intention. Nurcahyanto et al. [22] states that leadership has no significant effect on turnover intention, and employees’ desire to leave an organization primarily based on personal motivation to become entrepreneurs. In addition, due to the majority of employees are women (94.7%) contributing factors such as organizational barriers, personal factors, family pressures, and social and cultural restrictions influence the employees’ decision to leave the organizations [23].

In hypothesis 2, the direct relationships of teamwork and turnover intention were found to be negatively significant. These results are in accordance with previous studies by Zaheer et al. [1], Yuniasanti et al. [24], Nelsey & Brownie [25], Rafferty et al. [26], Pinel & Paulin [27], Leiter et al. [6].

Millenial generations are used to work as a team, and they are very open to collaborate with others at work. Therefore, they believe the importance of teamwork to increase their productivity and to build network [12], [15].

R-square value for teamwork is 0.239 or 23.9%. This means contribution factors of leadership traits on turnover intention is 23.9%, while the remaining 76.1% contribution factors were not discussed in this study. This finding is consistent with Houghton et al [8] statements, which argues that beside leadership, teamwork is proven to increase productivity, output quality, better personal and work life quality, as well as to reduce turnover intention and conflict.

For hypothesis 3, the contribution factors of leadership trait, teamwork, interaction between leadership trait and teamwork towards turnover intention is 40.2%. Hypothesis test result of the interaction of leadership traits with teamwork on turnover intention produces a probability of 0.032 < α. Therefore, teamwork moderates the influence of leadership traits on turnover intention.

However, the B value shows opposite interaction between leadership trait, teamwork, and interaction between leadership traits and teamwork on turnover intention. This indicates that the interaction of leadership trait and teamwork will further increase turnover intention.

Analyses of these findings are based on descriptive analysis and interviews with the hospital director and head of HR unit. The absence of gap between senior-juniors, supervisor-subordinate relationship may cause the leadership ineffectiveness within the organization and therefore further increase turnover intention. Due to the camaraderie and solidarity among workers, leaders may feel reluctant to supervise or reprimand subordinates. Consequently, subordinates feel the lack of guidance by superiors. In accordance with Schaeffer [15] and Zanen [14], millenial values the direct support and guidance from superiors. Lack of guidance and supervision can lead to dissatisfaction at work, and consequently increasing workers turnover intention.

Furthermore, based on the interviews with hospital director, there is an assumption that current employee’s turnover may be cause by previous employees persuasion to leave the organization. This assumption is based on the number of employees left the organization has similar educational background and has decided to move to one particular hospital.
V. FINDINGS

The majority of respondents were millennial women aged 24-26 years, had a diploma and bachelor education background in healthcare, with approximate tenure of 0-2 years.

Based on observations on distribution response and interviews with hospital director and head of HR unit, several indicators of leadership variables such as development of others, guidance, and feedback providing considered ineffective. This may be due to the absence of seniority between superiors and subordinates.

Several indicators on teamwork variables are highlighted including anti-discrimination and conflict resolution. This may be due to similar background on age, education, profession, and tenure between leader and subordinate, thus may cause perception of bias, prejudice, and subjectivity.

Statistically, it was found that the leadership trait has significantly negative influence on turnover intention. However, the interaction of leadership trait and teamwork weakens the influence of leadership trait on turnover intention. This situation may be caused by same level collegial relationships thus the boundaries between superiors-subordinates become vague, meanwhile millennial value the support, guidance, feedback, from their leader.

Based on these findings, it was established that leadership competency is essential to lead a group of millennial employees who needed constant feedback and guidance from a much advance and skillful leaders.

VI. CONCLUSION

1. Contributing factors to influence the desire to leave for millennial employees are based on individual factors and organizational factors. Individual factors include age, sex, educational background, family support, work-life balance, and personal motivation. Younger employees with fairly high educational background tend to have the desire to explore their careers elsewhere. Married employees, women especially, have role conflict as wives, mothers, and career women. Work-life balance and family support become important aspects in deciding their intention to leave the organization. In addition, many millennials have the desire to become entrepreneurs lately; this reason may inspire them to leave their organization.

Organizational factors such as guidance, skill development, and career paths influence millennial to stay or leave the organization. Millennial view their leaders as someone who can develop their talents and abilities, hence they expect a leader with abilities far superior to theirs.

2. In this particular healthcare setting, leadership traits that effective to lower millennials’ turnover intention are informal contact and openness to new ideas.

3. Due to similar background on age, education, profession, and tenure between leader and subordinate has proven that the leadership in this particular healthcare setting is not fully effective. Therefore, constant, and continuous training and development is required.

4. Teamwork is proven to lower turnover intention. However, there are factors such antidiscrimination and conflict resolution that still needs immediate attention from the management. The management needs to reevaluate their succession program and employees’ career pathway and need to approach it openly and transparently.

5. The majority of millennial employees in this hospital have similar age, sex, tenure, and education background. This is proven to become obstacle for leadership effectiveness. Therefore, the management need to reevaluate the training and development of their employees based on their characters, interests, and competency.

VII. MANAGERIAL IMPLICATION

Human resource management needs to apply retention program to improve millennial employees’ commitment. This retention program is created in the form of training and development that will be measured and evaluate periodically. The purpose of this retention program is to train and develop employees’ skill and competency both professionally and individually.

Top and human resource management need to plan and apply succession program in the hospital. The current succession program is not based on transparency, therefore may cause bias and prejudice among workers. Millennial are known to be confident on their skill, and they appreciate fair challenge and competition. Therefore, management transparency during the succession process will be much appreciated; reduce bias and prejudice; eliminating antidiscrimination perception; and consequently build better teamwork.

VIII. SUGGESTIONS

1. Management is to provide the hospital with well-equipped technology and proper facility for millennial to enhance their performance and productivity.

2. Management is to form group discussion forum to gain direct and efficient feedback from and to millennial employees.

3. Management is to initiate logbook program for nurses and midwives to measure and evaluate their skill and competency; and to find the right training and development based on the user’s need. This logbook program can be implemented to other units such as pharmacy, medical record, finance, and infrastructure units.

4. Management is to initiate online and offline training and development, and also formal education advancement program for their employees.

5. Management is to introduce position rotation between units for those who are interested in learning other skill outside their competency and expertise.

6. Logbook evaluation can be used as a requirement for career pathway. Furthermore, succession program can be done in a transparent way, such as polling system or internal bidding so employees are given open and fair competition based on their skill and competency evaluation.

IX. LIMITATIONS AND FUTURE RESEARCH

This research has been conducted in accordance with scientific procedures, but still has limitations as follow:
