Abstract—One of the most important places in determining the strategic goal of teaching in the system of secondary vocational education is the social order of state with regard to the younger generation. Discipline "Foreign language" is a mandatory part of the general humanitarian and socio-economic educational cycle included in the training program of middle-level specialists. One of the important tasks in the training of such specialists can be considered the development of foreign language communicative competence for successful implementation in professional activities. Control is the most important condition for effective management in the process of teaching a foreign language and an effective form of feedback for the students of secondary vocational education.

Modern computer technologies allow providing constant control of students’ activity in the process of foreign language teaching. We use LMS Moodle for the organization and control of foreign language teaching. Using LMS Moodle tests as a form of control in teaching a foreign language for students of secondary vocational education is designed to establish the degree of students' realization of the tasks assigned to them in the learning process, to identify the formed level of professional and foreign language communicative competence.

Reasonability of using LMS Moodle tests as a form of control in teaching a foreign language for students of secondary vocational education can be distinguished in the following ways: the teacher can check objectively the knowledge of a large number of students with minimal time; immediate calculation of test results; formation of a sufficiently large number of test option.

Keywords: LMS Moodle tests, control, foreign language, secondary vocational education, students

I. INTRODUCTION

Innovative approaches to the organization and conduct of classes in a foreign language are based on the use of information and communication technologies, involving the restructuring of the content and organizational and methodological forms of education, the development of modern means in information technology support and development of the educational process [1,2]. One of the most important elements of the educational process is the control of students' knowledge, which monitors the dynamics of learning material, assesses the level of knowledge, skills and abilities of students and helps to make the necessary adjustments to the organization of educational activities. For any education system, quality control of students' knowledge is one of the priorities. At present, the solution of such a problem is a necessary condition for the educational process, as "pedagogical tests open promising directions for improving the training quality by the system development of monitoring the training results in the conditions of cooperation between the teacher and the student" [3]. The problem of the methods choice for knowledge quality control is considered relevant in the implementation of the educational program standards. In this regard, the question of how to determine objectively and accurately this quality is raised. It is necessary that the control system is universal and is based not only on the identification of knowledge, skills, future professionals, but also to identify their creative abilities and other personality traits.

Teachers of a foreign language are faced with complex tasks: how to make the process of mastering language material accessible, as well as quickly and control effectively the acquired knowledge. The student’s training quality is checked by the assimilation degree of the required training material in accordance with certain topics and sections of the curriculum. In this case, the teacher is offered an effective tool for monitoring learning outcomes, such as testing [4].

Correctly organized control of knowledge, skills and abilities implements both verification and training functions. The control data is not only the results and evaluation of educational activities in general, but also serves as a form of repetition and consolidation, improvement of previously acquired knowledge. In addition, the control of knowledge performs developmental and educational functions, when as a result of the test; the student trains memory, attention, thinking...
and imagination, learns to reproduce the learned, systematizes and summarizes available knowledge.

The control in educational activity means a certain system of its functioning efficiency check; it has to correspond to the following principles: 1) to have individual character (control of each student’s work); 2) to be systematic, regular; 3) to have various forms; 4) to be comprehensive; 5) to be objective; 6) to have the differentiated approach; 7) to assume unity of requirements [5,6].

It should be noted that a special place is occupied by the works of R. P. Milrud, A. A. Mirolyubova, I. A. Rapoport, which are devoted to the study of testing issues and problems in teaching foreign languages.

Electronic testing has replaced traditional forms of control, which corresponds to the modern concept of modernization and informatization of the Russian educational system. The use of foreign language testing has more advantages compared to other control types of students’ mastering in language material at different levels of education. As an integral part of the class, it provides an opportunity for the student to work in the mode he needs; gradually moving from one level of knowledge accumulation to another. Test exercises allow monitoring the work of each student. When using language tests, the conclusion is made about which lexical and grammatical material will be better assimilated, which in turn provides an opportunity for the teacher to plan and adjust the learning process in accordance with the result of the passed tests and focus on the insufficiently studied material. Thus, it allows applying a differentiated approach in training. The absence of labor-intensive verification of written works makes it possible to conduct testing more often, that is, to be systematic and regular. The testing efficiency allows covering a larger number of students with minimal time compared to the written control work and the time allotted for its verification. Testing allows the students to create a sense of knowledge constant control and thereby activate their independent work during preparation for the test and motivate their work in each class. Testing has multi-functionality and provides an opportunity to test comprehensively the knowledge of the students on the passed language material, to form speech skills, to analyze the characteristic mistakes and the reasons for their occurrence [7,8].

According to recent studies, there is a tendency among young people in Russia to receive secondary vocational education (SVE). One of the urgent tasks is to train middle-level specialists at a sufficiently high level, ready to solve professional problems and be responsible for their implementation. With this in mind, content of secondary vocational education in various specialties was updated to increase the level of SVE graduates, providing intellectual and humanitarian development of personality. The state educational standard of secondary vocational education, which determines the state requirements for the content and level of graduates’ training, was developed and put into effect.

Discipline “Foreign language” is a mandatory part of the general humanitarian and socio-economic educational cycle included in the training program of middle-level specialists. According to the requirements of the federal state educational standard (FSES) of secondary vocational education, graduates must be able to communicate (orally and in writing) in a foreign language on every day and professional topics. Training speech competence (speaking, listening, reading, writing), involves the formation of language competence - mastery of language means (phonetic, spelling, lexical, grammatical).

In Krasnoyarsk State Agrarian University faculty members of the Foreign Language Department are developing actively electronic training courses for SVE students, as well as introducing electronic testing on electronic platform LMS Moodle (full name – Modular Object-Oriented Dynamic Learning Environment)[9-13].

The main tools used in LMS Moodle for monitoring students’ knowledge of a foreign language include "Quiz", "Task", “Forum” and "Chat".

Some variants of test exercises created with the help of the "Quiz" tool and suitable for the discipline "Foreign language" are offered: 1) true/false; 2) select missing words; 3) short answer; 4) multiple choice; 5) drag and drop into text; 6) embedded answers (cloze) questions. Students do test exercises, after which the system automatically gives the result.

II. METHODS AND RESULTS

We consider the skills and abilities that are tested using this tool "Quiz" in LMS Moodle at the example of the discipline "Foreign language" for students of secondary vocational education, the direction 35.02.08 «Electrification of agriculture».

A. Listening comprehension skills

To do this, the creators of the course decided to add audio text to the main text. Modern computer technology allows converting any original text into an audio file. Therefore, the audio equipment with visual support helps students in the initial acquaintance with the content of the new text. For control this skill such tool of "Quiz" can be effectively use, as “Embedded answers (Cloze) questions”. Questions of this type are very flexible and consist of a passage of text that has various answers embedded within it, including short answers, numerical answers and multiple choice. After reading the proposed audio files, students do various exercises, for example, drop the proposed words in the text, insert the missing words and phrases in the text, and choose the right variant. The questions relate directly to the information contained in the audio file, as the teacher should check the students' understanding of the audio material listened. When checking, the teacher can write comments, that is, to carry out feedback [14, 15].

As an example, we can present such exercises for listening comprehension (Fig. 1).

Task 1: Listen to the text and choose the right variant.

Students should listen to the text and choose the right variant of the word expressions.
B. Grammar skills

It is also more expedient to control the students’ knowledge of grammar material by tests. Most often, “Multiple choice questions” are used to test grammar knowledge, in which students need to choose the correct answer from several proposed variants [16].

As an example, we can present such exercises for grammar skills (Fig. 2).

In comparison with usual paper grammar tests, such electronic testing with LMS Moodle has the following advantages: 1) there is an opportunity to work distantly and, as a consequence, to save time; 2) machine testing provides objectivity of evaluation and saves time of the teacher.

C. Vocabulary skills

For control this skill such tool of “Quiz” can be effectively use as “Select missing words”. In LMS Moodle, there is a drop zone with a list of possible meanings after the word, from which the student need to choose the correct translation.

As an example, we can present such exercises for vocabulary skills (Fig. 3).

D. Reading skills

The “Quiz” tool is also used successfully on LMS Moodle as a test of reading skills. We have done exercises for reading on the basis of reference sentences with the help of such element of LMS Moodle as "Drag and drop into text".

As an example, we can present such exercises for reading skills (Fig. 4).

Fig. 1. An example of a listening comprehension exercise

Fig. 2. An example of a grammar exercise

Fig. 3. An example of a vocabulary exercise

Fig. 4. An example of a reading exercise

III. DISCUSSION

The specificity in the use of LMS Moodle tests as a form of control when teaching a foreign language to students of secondary vocational education is as follows:

1. The test is conducted in equal conditions for all subjects: students’ work with the same volume and complexity of the material at a convenient time for them.

2. The test is characterized by a quantitative expression of the task quality, which allows easily and accurately determining the correctness or inaccuracy of actions. In addition, such qualities of tests allow providing objectivity of check, independence of a results assessment from personal judgments of the checking.
3. A clear definition of the forms and content of the tasks and the entire structure of the test makes this type of control economical, so it allows testing the knowledge of a large students group and a significant amount of material for each subject.

LMS Moodle is equipped with a convenient system for generating reports on test results. The settings allow viewing all the necessary information (time spent on passing the test, answers to each question, the number of attempts, etc.) about any attempt of each student. Based on the test results, the teacher can find out how students have mastered the relevant section of the discipline, analyze the quality of test tasks and the percentage of students who have coped with each of them.

IV. CONCLUSIONS

Summing up, we note the reasonability of using LMS Moodle tests as a form of control when teaching a foreign language to students of secondary vocational education [17, 18]. This form of the control process organization makes it more objective, effective and has a number of advantages over traditional methods of control:

- Tests contain tasks to check both theoretical and practical material, which allows diagnosing the assimilation level of the studied material, as well as to assess the effectiveness of forms and methods of training, to carry out, if necessary, the correction of further pedagogical activity.

- The ability to place tests online allows getting an assessment immediately after the completion of the test, which is an effective means to quick check the current level of material assimilation, both the teacher and the students themselves.

- Online version of the gradebook setup allows each student to see their progress in learning the course. At the same time, access is easy to organize in such a way that the student sees only his grades and does not know about the grades of fellow students.
