Abstract

**Background:** Early morning sunlight exposure for infants was a good practice to prevent rickets and alleviate the problem of vitamin D deficiency. Rickets is a major public health problem in many countries of the world. In many rich industrialized countries, the prevalence of rickets in the general population diminished after the introduction of dietary supplementation. But the most cost-effective way of getting vitamin D is simply from sunlight exposure rather than vitamin-D supplementation and advanced treatment. The main objective of this study is to assess the knowledge, attitude and practice of mothers on the effects of sunlight exposure and its associated factors among infants found in Debre Tabor town, North central Ethiopia, 2018.

**Methods:** Community-based cross-sectional study had been conducted among 105 mothers with infants in Debre Tabor city, South Gondar Zone, Amhara, Northcentral Ethiopia, 2018 from October 30 - January 1/2019. To select study participants simple random sampling techniques was employed. Data was entered into Epi info version 7.2.0.1, and exported to SPSS window version 20 for analysis. Binary and Multivariable logistic regression was used to see the association between dependent and independent variables. Odds ratio with 95% confidence interval was computed. P-value < 0.05 was used to declare association.

**Results:** The overall knowledge, practice and attitude of the mothers about sunlight exposure were 61.14%, 59.44%, and 61% respectively, regarding factors associated with knowledge, practice and attitude of mothers about sunlight exposure were highly influenced by good time exposure for sunlight exposure, mother who exposed their infants to sunlight exposure sometimes were 3.2 times less for acquiring knowledge than mothers who expose their infants who warm daily [AOR: *3.2(1.02-6.4)], mothers who had an occupation of daily laborer were 3.4 times less likely to practice sunlight exposure to their infants governmental workers [AOR: *3.4(0.8 2.8)] and mothers who do not believe about the good effect of sunlight exposure had 3.3 times negative attitude towards about sunlight exposure than who thinks well [AOR; **3.3(1.5-8.9)] were significantly associated with knowledge, practice and attitude of mothers about sunlight exposure and the total attitude of the mother’s sunlight exposure was lower than knowledge and practice. Hence; Based on the result the concerned body and health care providers should create awareness about the effect of sunlight exposure through health education.
