Abstract

The purpose of this study was to investigate the influence of electrolyte type, pH, temperature and aging on the viscosity property of okra gum using paracetamol as model drug. Paracetamol (125 mg/5 mL) suspension containing okra gum particles of undersize 180 µm as suspending agent was formulated. Similar suspension of paracetamol was formulated using tragacanth gum as a suspending agent for comparison. Effect of electrolyte type, pH, temperature and aging on the viscosity property of okra gum in paracetamol suspension was evaluated using standard methods. Addition of electrolytes, changes in pH, increase in temperature and increase in storage time were shown to decrease the viscosity of the paracetamol suspension. The effect of temperature and aging on the viscosity of the suspension formulation containing okra gum was more pronounced than on the formulation containing tragacanth gum. Conversely, the effect of alkaline pH and type of electrolyte on the viscosity of the suspension formulation containing tragacanth gum was more pronounced than on the formulation containing okra gum. On the basis of these, formulators and caregivers may consider these factors when designing or using pharmaceutical suspensions containing natural gums such as okra and tragacanth as viscosity enhancing agents.

Keywords: Electrolyte, Temperature, pH, Aging, Okra gum, Viscosity

1 Introduction

Viscosity is termed as resistance to flow\(^1\). Viscosity of a pharmaceutical suspension is of great importance because it affects stability, redispersibility, drug release and pourability of a suspension\(^2\). A good suspension should have adequate viscosity to ensure that the dispersed drug particles remain suspended long enough to maintain stability\(^3\).

A good suspension should also have reasonable viscosity to ensure that drug release process is not impeded. A study by Venkateswarlu, Chnadrasekhar and Ramachandra\(^4\) found out that drug release from flucloxacillin suspension decreased as viscosity increased due to formation of high viscosity regions on the layer surrounding drug particles and in the bulk medium due to reduced diffusion process caused by hydrated polymer chains. The ease with which a suspension pours during withdrawal depends on the viscosity of the suspension; with less viscous pouring more easily than more viscous suspensions\(^5\). Adequate viscosity ensures the caregiver is able to pour the suspension from the packaging container without difficult during administration.

The viscosity of a medium is not constant and factors such as concentration of suspending agent, pH changes, electrolytes (ionic strength), sugars, ageing, temperature and type of agitation have been reported to affect viscosity of a suspension\(^6\). It is important to know how these factors affect viscosity since alteration of viscosity influences other physicochemical properties such as stability, redispersibility, drug release and pourability of a suspension thus affecting performance of the suspension.

Paracetamol is sparingly soluble (14 mg/ mL) in aqueous medium. This means that only 70 mg of the paracetamol powder will dissolve in 5 ml of water. The pediatric paracetamol dose of
125 mg / 5 mL with require that some of the paracetamol powder is suspended in water thus paracetamol is a candidate for formulation as a suspension. It is an indissoluble solid that does not remain suspended for enough time to allow withdrawal of uniform doses. Therefore, to formulate paracetamol suspension, a suspending agent such as okra gum is required to increase the viscosity of the disperse system, reduce settling of the suspended drug particles, maintain uniform dispersion and prevent cake formation.

Okra gum has been used as suspending agent in pharmaceutical suspension formulations. It is not known how electrolytes, temperature, pH and aging can affect the viscosity property of okra gum when used in these formulations. Therefore, the study sought to provide knowledge on the influence of these properties on the viscosity property of okra gum when used in a formulation, an important aspect in the development and use of pharmaceutical suspensions.

2 Materials and methods

2.1 Materials

Okra gum (extracted), Tragacanth gum (Lab Tech Chemicals), Paracetamol powder (A.H.A International Co. Ltd, Batch No. Y142870). All chemical and reagents used were of analytical grade.

2.2 Methods

2.2.1 Collection and Identification of Okra Plant Pods

Okra pods were obtained from Faringada market at Jos, Plateau State in September, 2018. Whole okra plant with pods was taken to a botanist at the College of Forestry, Jos for identification and the herbarium voucher number was FHJ 241.

2.2.2 Extraction and Purification of Okra Gum

The method of Farooq, Malviya and Sharma was adopted. Fresh Okra pods were washed with purified water, sliced, air-dried in the laboratory and weighed. The dried sliced okra was macerated in cold water for 24 hours to extract the mucilage and the dispersion was separated from the chaff using a muslin cloth. The mucilage was centrifuged (Centrifuge, Mistral 1000, UK) at 4500 rpm for ten minutes and then treated severally with 96 % ethanol to precipitate the gum. The gum was air dried, pulverized, weighed and packaged in a well-closed container for subsequent use. The percentage yield of the gum from dried okra was calculated using equation:

\[
\text{Percentage yield} = \frac{\text{Mass of dry okra gum} \times 100 \%}{\text{Mass of dry sliced okra pods}} \\
\ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ ld
2.2.4.3 Effect of pH on viscosity of the paracetamol suspension

The method of Kadiri and Okafor\textsuperscript{11} was adopted. A 1 mL of 0.1 N hydrochloric acid (HCl) was added to the formulated paracetamol suspension and the suspension was made into 50 mL. The viscosity of the suspension was determined using a digital rotational viscometer. The mean of the three determinations was recorded. The same process was repeated using 1 mL of 0.1 N sodium hydroxide (NaOH).

2.2.4.4 Effect of temperature on viscosity of the paracetamol suspension

The method of Kadiri and Okafor\textsuperscript{11} was adopted. A 50 mL of the suspension was transferred into the viscometer cup and after one minute, viscosity was determined using rotor 2 spindle. The suspensions were then stored in a refrigerator (HR 170T) at 4 °C and in a dryer (Gallenkamp drying cabinet, Germany) at 40 °C for twenty-four hours and the viscosity of the suspensions were measured using a digital rotational viscometer. The mean of the three determinations was recorded.

2.2.4.5 Effect of electrolyte type on viscosity of the paracetamol suspension

The method of Kadiri and Okafor\textsuperscript{11} was adopted. A 1 mL of 0.5% w/v sodium chloride, calcium chloride or aluminium chloride was added to 50 mL of the formulated paracetamol suspensions and allowed to stand for twenty-four (24) hours. The viscosity of the suspensions was measured using a digital rotational viscometer. The mean of the three determinations was recorded.

2.2.4.6 Effect of ageing on viscosity of the paracetamol suspension

The method of Kadiri and Okafor\textsuperscript{11} was adopted. A 50 mL of the paracetamol suspension was transferred into the viscometer cup and viscosity was determined using Rotor 2 spindle. The suspension was then stored at room temperature for two months and the viscosity of the suspension was measured using a digital rotational viscometer. The mean of the three determinations was recorded.

3 Results and discussion

3.1 Effect of pH change on viscosity of paracetamol suspension

Table 2 shows the effect of pH on viscosity of paracetamol suspensions formulated using okra gum and tragacanth gum particles of undersize 180 µm. Both alkaline (0.1 N NaOH) and acidic pH (0.1 N HCl) caused a drop in viscosity of the suspensions. The viscosity of the suspension containing okra gum was more affected by acidic pH than alkaline pH. The viscosity dropped by 5.24 % and 3.36 % in acidic pH and alkaline pH respectively. On the other hand, the viscosity of the suspension containing tragacanth gum was more affected by alkaline pH than acidic pH; dropping by 4.90 % and 3.24 % respectively.

The viscosity of the paracetamol suspension containing okra gum, a weak acid, dropped by 5.24 % compared to the viscosity of the paracetamol suspension containing tragacanth gum, a weak base which dropped by 3.24 %. On the other, suspensions containing weakly basic gums are more affected by strong bases such as sodium hydroxide. The viscosity of the paracetamol suspension containing tragacanth gum, a weak base, dropped by 4.90 % compared to the viscosity of the paracetamol suspension containing okra gum, a weak acid which dropped by 3.36 %. These findings augment the findings by Kadiri and Okafor\textsuperscript{11} which found out that the impact of changes in pH on the viscosity of the medium depends on the initial pH and suspensions containing weakly acidic gums are greatly affected by strong acids such as hydrochloric acid.

Table 2: Effect of pH change on Viscosity of Paracetamol Suspension

| Parameter | S1          | S2          |
|-----------|-------------|-------------|
| pH        |             |             |
| Initial   | 6.68 ± 0.02 | 7.40 ± 0.01 |
| After addition of 0.1 N NaOH | 7.08 ± 0.01 | 7.70 ± 0.01 |
| Viscosity in mpa.s |             |             |
| Initial   | 218.00 ± 3.46 | 674.67 ± 8.37 |
| After addition of 0.1 N NaOH | 210.67 ± 0.58 | 641.67 ± 6.81 |
| % change  | ↓3.36       | ↓4.90       |
| pH        |             |             |
| Initial   | 6.68 ± 0.01 | 7.41 ± 0.02 |
| After addition of 0.1 N HCl | 6.25 ± 0.01 | 6.89 ± 0.02 |
| Viscosity in mpa.s |             |             |
| Initial   | 222.67 ± 0.58 | 678.33 ± 6.03 |
| After addition of 0.1 N HCl | 211.00 ± 2.65 | 656.33 ± 8.96 |
| % change  | ↓5.24       | ↓3.24       |

Mean ± SD (n = 3 determinations)

3.2 Effect of temperature on viscosity of paracetamol suspension

Table 3 shows the effect of temperature on viscosity of paracetamol suspensions formulated using okra gum and tragacanth gum particles of undersize 180 µm. Viscosity of the both suspensions decreased with increase in temperature and vice versa. At 4 °C, both suspensions solidified. At 40 °C, the viscosity of the suspensions dropped by 12.96 % and 9.42 % for suspensions containing okra gum and tragacanth gum respectively.
respectively. The drop in viscosity was more in the suspension containing okra gum than in the suspension containing tragacanth gum.

Table 3: Effect of Temperature on Viscosity of Paracetamol Suspension

| Formula | Viscosity in mpa.s | Parameter |
|---------|--------------------|-----------|
|         | 27 °C (Room temp)  | 4 °C      | % change |
| S1      | 235.00±3.464       | Solidified| NA       |
| S2      | 676.00±3.61        | Solidified| NA       |
|         | 27 °C (Room temp)  | 40 °C     | % change |
| S1      | 218.00±3.00        | 190.33±0.58| ↓12.69  |
| S2      | 654.67±3.79        | 593.00±7.00| ↓9.42   |

Mean ± SD (n = 3 determinations)

Viscosity of the paracetamol suspensions decreased with increase in temperature and increased with decrease in temperature augmenting the previous finding by Mudgil et al. Decrease in viscosity with temperature indicated that the heat exerted a viscosity thinning effect on the paracetamol suspensions. This was possible due to loss of water molecules around the suspending agent particles when the temperature increased leading to decreased viscosity of the suspensions. Increase in temperature also reduces frictional force between molecules resulting in decrease in viscosity. Another possible explanation could be that the heat increased the energy and movement of water molecules thereby decreasing intermolecular interactions making the water molecules to lose their ordering around the suspending agent particles and thus affected their conformation consequently resulting in reduced viscosity Venkateswarlu, Chnadrasekhar and Ramachandra.

3.3 Effect of type of electrolyte on viscosity of paracetamol suspension

Table 4 shows the effect of type of electrolyte on viscosity of paracetamol suspensions formulated using okra gum and tragacanth gum particles of undersize 180 µm. Addition of sodium chloride (0.5 % NaCl), calcium chloride (0.5 % CaCl2) and aluminium chloride (0.5 % AlCl3) electrolytes led to decrease in viscosity of the suspensions. There was an inverse relationship between viscosity and the valence of the electrolytes as exhibited by more decrease in viscosity as the valence of the electrolyte increased. AlCl3 was more effective in decreasing viscosity (decreased viscosity by 12.93 %) than CaCl2 (decreased viscosity by 8.02 %) which in turn was more effective than NaCl (decreased viscosity by 6.38 %).

Addition of electrolytes to the paracetamol suspensions decreased their viscosity and the impact increased as the charge on the ion increased from monovalent to trivalent. This is possibly due to electrolytes changing the charge density thus affecting the intermolecular interactions. These findings agrees to early findings by Kadiri and Okafor11 which reported that addition of electrolytes to metronidazole suspension decreased the viscosity.

Table 4: Effect of Electrolyte Type on Viscosity of Paracetamol Suspension

| Parameter | S1         | S2         |
|-----------|------------|------------|
| pH        | Initial    | 6.64 ± 0.01| 7.32 ± 0.02|
|           | After addition of 0.5 % NaCl | 6.58 ± 0.02| 7.33 ± 0.01|
| Viscosity in mpa.s | Initial | 235.00 ± 1.00 | 716.00 ± 436 |
|           | After addition of 0.5 % NaCl | 220.00 ± 0.00 | 652.00 ± 3.61 |
| % change  | ↓6.38      | ↓8.94      |
| pH        | Initial    | 6.64 ± 0.01| 7.31 ± 0.01|
|           | After addition of 0.5 % CaCl2 | 6.62 ± 0.01| 7.30 ± 0.02|
| Viscosity in mpa.s | Initial | 195.33 ± 1.53 | 711.67 ± 13.61 |
|           | After addition of 0.5 % CaCl2 | 179.67 ± 1.15 | 624.33 ± 1.53 |
| % change  | ↓8.02      | ↓12.27     |
| pH        | Initial    | 6.64± 0.01| 7.36 ± 0.02|
|           | After addition of 0.5 % AlCl3 | 6.61± 0.01| 7.36 ± 0.01|
| Viscosity in mpa.s | Initial | 245.00 ± 1.73 | 713.67 ± 2.08 |
|           | After addition of 0.5 % AlCl3 | 213.33 ± 2.08 | 640.67 ± 2.08 |
| % change  | ↓12.93     | ↓10.23     |

Mean ± SD (n = 3 determinations)

However, these findings contradict the findings by 6 which reported that addition of electrolytes such as sodium chloride increased viscosity of guar gum. This could probably mean that electrolytes have different effects on natural gums and it would not be possible to generalize on the effect of electrolytes on natural gums, therefore, treatment of the gums should be on individual basis. Viscosity decreased in the order AlCl3 > CaCl2 > NaCl. This observation agreed with the Schulze-Hardy rule which states that the valence of electrolytes having a charge opposite to that of the hydrophobic particle determines the effectiveness of the electrolyte in aggregating the particles.
Type and concentration of electrolytes present naturally in tap water used for reconstitution of dry suspensions may affect the viscosity the suspension. Decrease in viscosity could possibly be due to slowing down the hydration of gums used as suspending agents causing inadequate viscosity. Therefore, where possible, it is appropriate to use deionized water during reconstitution of dry suspensions to avoid alteration of viscosity.

3.4 Effect of aging on viscosity of paracetamol suspension

Table 5 shows the effect of aging on viscosity of paracetamol suspensions formulated using okra gum and tragacanth gum particles of undersize 180 µm. At day one, the viscosity of the suspensions containing okra gum and tragacanth gum was 244.0 ± 6.25 and 745.65 ± 6.43 respectively. At five (5) weeks, the viscosity had dropped to 210.33 ± 1.15 and 707.33 ± 3.51 respectively indicating a decrease of 13.80 % and 5.14 % respectively. The viscosity of the suspension formulation containing okra gum dropped more than that of the suspension formulation containing tragacanth gum.

Table 5: Effect of Aging on Viscosity of Paracetamol Suspension

| Formula | Viscosity in mpa.s (at RTP) | Day 1 | 5 weeks | % change |
|---------|-----------------------------|-------|---------|----------|
| SI      | 244.00 ± 6.25               | 210.33 ± 1.15 | ↓13.80 |
| S2      | 745.67 ± 6.43               | 707.33  | ↓5.14   |

Mean ± SD (n = 3 determinations)

4 Conclusion

The viscosity property of okra gum in paracetamol suspension was susceptible to type of electrolyte, pH, temperature and aging and thus formulators and caregivers should consider these factors when designing or using pharmaceutical suspensions containing natural gums such as okra and tragacanth as viscosity enhancing agents. The study implies that when reconstituting dry suspensions that have been formulated using natural gums such as okra gum, where possible, it is appropriate to use deionized water, reconstitute and store within the recommended temperature to avoid alteration of viscosity which may affect the performance and bioavailability.
