Abstract

Spray drying is a novel technique for production of dried milk powders to enhance the storage life of milk and making it convenient to reconstitute without much loss of nutrients. A study was conducted to develop a ready to reconstitute milk beverage by using the spray drying technology with optimum physico-chemical and nutritional parameters. Ready to reconstitute milk beverage was prepared by incorporation of 20 per cent level of carrot extract and 1.5 per cent level of cardamom with varying levels of milk fat at 3, 4.5, 1.5 and 0.5 per cent as Control, T1, T2 and T3. Further, the selected treatments and control were subjected to spray drying technology with standardized spray drying parameters and packed in polyethylene bags and stored at room temperature for 120 days during which the physico-chemical properties were studied on day 0, 30, 60, 90 and 120. The mean ± SE values for pH, titrable acidity and solubility index of different treatments of ready to reconstitute milk beverage ranged from 6.68 ± 0.02 to 6.74 ± 0.03, 0.176 ± 0.02 to 0.185 ± 0.04 and 0.67 ± 0.011 to 0.83 ± 0.017 respectively. It was concluded that ready to reconstitute milk beverage can be prepared by using skim milk (0.5 per cent milk fat), carrot extract 20 per cent and cardamom 1.5 per cent with standardized parameters of spray drying technology as input feed rate at 8RPM, inlet temperature at 185.0 °C for set1 and 195.0 °C for set 2, outlet temperature at 102.5 °C for set1 and 95.0 °C for set 2 and with good physico-chemical properties within the prescribed standards.

Keywords: Carrot flavoured milk, Physico-chemical properties, ready-to-reconstitute milk beverage, Spray drying

Introduction

Today there is a demand for ready-to-serve convenience food among consumers. Ready to serve foods are those that are consumed immediately without much cooking/working. Fruit or vegetable beverages such as ready to serve are becoming increasingly popular in comparison to synthetic drinks, because of their taste, flavour and nutritive value. Spray drying is the most suitable technique for producing milk powders and the removal of water which prevents the growth of microorganisms by reducing the water activity and facilitates preservation and storage of milk constituents. (Schuck P. 2002) [12]. It was also used to encapsulate carotene from carrot (Desobry SA et al., 1998) [13].

Carrot is an important root vegetable rich in carotenoids (Sharma KD et al. 2012) [14], vitamin C, calcium, iron and magnesium (Olalude CB et al., 2015) [15]. Carrot root has plenty of antioxidant activity and contain 80% of linoleic acid (Arabshahi DS et al., 2007) [16]. Cardamom acts as flavouring agent in food products with a lot of health properties like antioxidant, blood pressure lowering, fibrinolysis enhancing, diuretic and sedative (Dhulap S et al., 2008) [17]. Nowadays, consumer demand is increasing for low fat foods made with value added ingredients such as carotenoids. Hence the present study has been carried out to enhance the properties of ready to reconstitute milk beverage by using carrot extract and cardamom with increased shelf life by spray drying technology.

Materials and Methods

Cow Milk

High quality fresh milk was obtained from crossbred cows at the Livestock Farm Complex, Veterinary College and Research Institute, Namakkal, Tamil Nadu.
Carrot juice and Cardamom
Good quality fresh carrots and cardamom were purchased from the local market which are utilized for this study.

Skim milk powder and Butter
Good quality Skim milk powder and Butter was obtained from the District Cooperative Milk Producers Union Limited (Aavin), Salem, TamilNadu, India was utilized for this study.

Experimental design
The following three combinations of treatment and control have been prepared for this study.

| Selected treatments | Fat content in milk (%) | Levels of ingredients |
|---------------------|-------------------------|-----------------------|
| Control             | 3.0                     | Carrot extract (%) 20 | Cardamom (%) 1.5 |
| T1                  | 4.5                     | 20                    | 1.5               |
| T2                  | 1.5                     | 20                    | 1.5               |
| T3                  | 0.5                     | 20                    | 1.5               |

Flow chart for the preparation of ready to reconstitute milk beverage

1. Milk ↓ Cream separation
   2. Standardization of varying fat level in milk ↓ Addition of carrot juice and cardamom powder ↓ Filtration ↓ Preheating (70 °C) ↓ Homogenization (First stage - 2500 psi & Second stage - 500 psi) ↓ Pasteurization (72°C for15 seconds) ↓ Loading in the spray dryer ↓ Standardized spray drying parameters setting

Solubility index
Solubility index of ready to reconstitute milk beverage powder was determined as per the procedure in IS: 1479 (part I) 1981 [6].

Titrable acidity
The titrable acidity of ready to reconstitute milk beverage powder was determined as per the procedure in IS: 1479 (part I) 1981 [6].

Sensory evaluation
The sensory evaluation of milk beverage was done by 20 panelists (kajal et al., 2012) [8] who reported that the range of pH of whole milk was 6.6 to 6.8.

Statistical analysis
The data were analyzed by two-way ANOVA in SPSS (version 20.0).

table 1: pH of ready to reconstitute milk beverage during storage

| Storage period (in days) | Treatment |
|--------------------------|-----------|
|                          | 0         | 30        | 60        | 90        | 120       |
| Control                  | 6.71 ± 0.02 | 6.73 ± 0.02 | 6.71 ± 0.03 | 6.72 ± 0.02 | 6.69 ± 0.02 |
| T1                       | 6.68 ± 0.03 | 6.70 ± 0.02 | 6.69 ± 0.03 | 6.71 ± 0.01 | 6.72 ± 0.03 |
| T2                       | 6.73 ± 0.03 | 6.74 ± 0.03 | 6.73 ± 0.02 | 6.69 ± 0.02 | 6.70 ± 0.03 |
| T3                       | 6.69 ± 0.02 | 6.71 ± 0.02 | 6.72 ± 0.02 | 6.70 ± 0.02 | 6.68 ± 0.02 |

Titrable acidity
Titrable acidity of ready to reconstitute milk beverage powder was determined as per the procedure in IS: 1479 (part I) 1981 [6].

Results and Discussion

Physical-chemical parameters

pH
The pH of ready to reconstitute milk beverage powder was determined by mixing 10 g of powder with 10 ml of glass distilled water and dipping the electrode directly into the milk beverage to get the pH value.

Solubility index
Solubility index of ready to reconstitute milk beverage powder was estimated according to IS: SP18 (part XI) 1981 [7].

Results and Discussion

Statistical analysis
The data were analyzed by two-way ANOVA in SPSS (version 20.0).

table 1: Titratable acidity (%) of ready to reconstitute milk beverage during storage

| Storage period (in days) | Treatment |
|--------------------------|-----------|
|                          | 0         | 30        | 60        | 90        | 120       |
| Control                  | 0.185 ± 0.03 | 0.181 ± 0.03 | 0.182 ± 0.02 | 0.185 ± 0.04 | 0.180 ± 0.02 |
| T1                       | 0.179 ± 0.02 | 0.183 ± 0.02 | 0.178 ± 0.01 | 0.181 ± 0.03 | 0.176 ± 0.02 |
| T2                       | 0.184 ± 0.03 | 0.177 ± 0.01 | 0.180 ± 0.02 | 0.184 ± 0.03 | 0.181 ± 0.03 |
| T3                       | 0.185 ± 0.02 | 0.181 ± 0.02 | 0.183 ± 0.03 | 0.180 ± 0.01 | 0.179 ± 0.02 |
Solubility index

Solubility index of ready to reconstitute milk beverage at different storage period in room temperature is presented in table 3. The mean ± SE values for solubility index of different treatments of ready to reconstitute milk beverage ranged from 0.67 ± 0.011 to 0.83 ± 0.017. The statistical analysis revealed that, a significant difference (P<0.05) observed between treatments on a particular period of storage but no significant difference was observed within a treatment during storage period. It could be due to compositional changes of different treatments, particularly higher the level of fat content in the treatment showed higher the value of solubility index and low moisture content of powder had more solubility than higher moisture content powders. Further the results of above treatment are within the standards of FSSAI, (2011) as maximum 1ml. Celestino et al. (1997) reported the solubility index of milk powder ranged from 0.13 to 0.43. Kudo et al. (1990) cited several factors contributing to decreased solubility during storage, such as crystallization of lactose, non-enzymatic browning, higher moisture content and elevated storage temperature of powder.

Table 3: Solubility index (ml) of ready to reconstitute milk beverage during storage

| Treatment | Storage period (in days) |
|-----------|--------------------------|
|           | 0           | 30          | 60          | 90          | 120         |
| Control   | 0.75 ± 0.013 | 0.75 ± 0.002 | 0.76 ± 0.008 | 0.76 ± 0.015 | 0.76 ± 0.015 |
| T1        | 0.81 ± 0.015 | 0.80 ± 0.013 | 0.82 ± 0.011 | 0.83 ± 0.011 | 0.83 ± 0.017 |
| T2        | 0.71 ± 0.015 | 0.69 ± 0.015 | 0.72 ± 0.017 | 0.72 ± 0.011 | 0.73 ± 0.017 |
| T3        | 0.68 ± 0.017 | 0.67 ± 0.011 | 0.67 ± 0.011 | 0.68 ± 0.011 | 0.68 ± 0.011 |

Mean ± (SE) bearing different superscripts in same column differ significantly (P< 0.05)

Conclusion

The present study was observed that, ready to reconstitute milk beverage prepared by using skim milk (0.5 per cent milk fat), carrot extract 20 per cent and cardamom 1.5 per cent with standardized parameters for spray drying technology as input feed rate at 8RPM, inlet temperature on 185.0 °C for set1 and 195.0 °C for set2, outlet temperature on 102.5 °C for set1 and 105.5 °C for set2 showed a good physico-chemical and shelf life qualities of up to 120 days at room temperature.
