Abstract
Consider the Schrödinger operator \( \mathcal{L} = -\Delta + V \) in \( \mathbb{R}^n, n \geq 3 \), where \( V \) is a nonnegative potential satisfying a reverse Hölder condition of the type

\[
\left( \frac{1}{|B|} \int_B V(y)^q \, dy \right)^{1/q} \leq \frac{C}{|B|} \int_B V(y) \, dy, \quad \text{for some } q > n/2.
\]

We define \( \Lambda_{\mathcal{L}}^\alpha, \, 0 < \alpha < 2 \), the class of measurable functions such that

\[
\| \rho(\cdot)^{-\alpha} f(\cdot) \|_{\infty} < \infty \quad \text{and} \quad \sup_{|z| > 0} \left\| \partial_k (y Wy f) \right\|_{L^\infty(\mathbb{R}^n)} \leq C \alpha y^{-k+\alpha/2}, \quad \text{with } k = \left\lceil \alpha/2 \right\rceil + 1, \, y > 0.
\]

We prove that for \( 0 < \alpha \leq 2 - n/q \), \( \Lambda_{\mathcal{L}}^\alpha = \Lambda_{\alpha/2}^W \). As application, we obtain regularity properties of fractional powers (positive and negative) of the operator \( \mathcal{L} \), Schrödinger Riesz transforms, Bessel potentials and multipliers of Laplace transforms type. The proofs of these results need in an essential way the language of semigroups. Parallel results are obtained for the classes defined through the Poisson semigroup, \( P_y f = e^{-y\sqrt{\mathcal{L}}} f \).

Keywords Semigroups · Fractional Laplacian · Lipschitz Hölder Zygmund spaces · Hölder estimates

1 Introduction

Classical Lipschitz spaces on $\mathbb{R}^n$, $\Lambda^\alpha$, $\alpha > 0$, are classes of smooth functions that play an important role in function theory, harmonic analysis and partial differential equations. For $0 < \alpha < 1$, they are defined as the set of functions $\varphi$ such that $|\varphi(x + z) - \varphi(x)| \leq C|z|^\alpha$, $x, z \in \mathbb{R}^n$. If the functions are supposed to be bounded, it is also usual to call them Hölder functions and denote the class by $C^0,\alpha$. For $k \in \mathbb{N}$ and $0 < \beta < 1$, $C^{k,\beta}$, see [15], are defined as the classes of functions such that the derivatives of order less or equal to $k$ are continuous and bounded, while the derivatives of order $k$ belong to $C^0,\beta$. Sometimes these classes are denoted by $C^{k+\beta}$, see [10]. When $\alpha \geq 1$, some definitions of the classes $\Lambda^\alpha$ can be found in the literature, through finite differences, see [9], and also through some integral estimates, see [16,20–22]. Moreover, for $\alpha \notin \mathbb{N}$ such that $\alpha = k + \beta$, $k \in \mathbb{N}$, $0 < \beta < 1$, the classes $\Lambda^\alpha$ and $C^{k,\beta}$ agree.

This paper is doubly motivated by the works of E. Stein and M. Taibleson, [16,20–22], Krylov, [10], and Silvestre, [15]. On the one hand, in [16,20–22] the authors characterized the classes of bounded Lipschitz functions $\Lambda^\alpha$ by integral estimates of the Gauss semigroup, $e^{y\Delta}$, and the Poisson semigroup, $e^{-y\sqrt{-\Delta}}$. On the other hand, in [10] and [15] the authors studied the boundedness of different operators associated to $\Delta$ in the classes $C^{k,\beta}$. Our aim is to analyze the above works in the case of Schrödinger operators $\mathcal{L} = -\Delta + V$, in $\mathbb{R}^n$ with $n \geq 3$, where $V$ is a nonnegative potential satisfying a reverse Hölder inequality, see (2.1).

Namely, our purposes are the following:

- To find the appropriated point-wise definition of Lipschitz classes in the Schrödinger setting for $0 < \alpha < 2$. We shall denote this space by $\Lambda^\alpha_{\mathcal{L}}$.
- To characterize these classes by using either the heat semigroup, $e^{-y\mathcal{L}}$, or the Poisson semigroup, $e^{-y\sqrt{-\mathcal{L}}}$.
- To use these characterizations to prove Hölder estimates of negative and positive powers of the operator $\mathcal{L}$. We shall also show the boundedness of Bessel potentials, Riesz transforms and some multiplier operators associated to $\mathcal{L}$. We remark that we don’t need the point-wise expression of the operators.

Now we present our definitions and results.

Definition 1.1 Let $0 < \alpha < 2$ and $\rho(x)$ the critical radius function, see (2.2). We shall denote by $\Lambda^\alpha_{\mathcal{L}}$ the class of measurable functions such that

$$M^\mathcal{L}_\alpha[f] := \|\rho(\cdot)^{-\alpha}f(\cdot)\|_\infty < \infty \quad \text{and} \quad N_\alpha[f] := \sup_{|z|>0} \frac{\|f(\cdot + z) + f(\cdot - z) - 2f(\cdot)\|_\infty}{|z|^\alpha} < \infty.$$
We endow this space with the norm
\[ \| f \|_{\Lambda_{\alpha}^L} := M_{\alpha}[f] + N_{\alpha}[f]. \]
We shall see that \( \Lambda_{\alpha}^L \) coincides the space defined in [2] for \( 0 < \alpha < 1 \), (1.2), see Remark 3.8.

**Remark 1.2** The set of continuous functions \( \varphi \) such that \( |\varphi(x + z) + \varphi(x - z) - 2\varphi(x)| \leq C|z|, x, z \in \mathbb{R}^n \) was introduced by Zygmund, see [23], and it is usually called Zygmund’s class.

By \( W_y = e^{-yL} \) we will denote the heat semigroup associated to \( L \). From the Feynman-Kac formula, it is well known that
\[ W_y(x, z) \leq (4\pi y)^{-n/2} e^{-\frac{|x-z|^2}{4y}}. \]
Motivated by this estimate, we shall say that a function \( f \) satisfies a **heat size condition** for \( L \) if
\[ \int_{\mathbb{R}^n} e^{-|x|^2/4y} |f(x)| dx < \infty, \]
for every \( y > 0 \), and for every \( \ell \in \mathbb{N} \cup \{ 0 \} \), and every \( x \in \mathbb{R}^n \), \( \lim_{y \to \infty} \partial_y^\ell W_y f(x) = 0 \). When some estimates on the derivatives of the heat semigroup are assumed, the following theorem shows that this **heat size condition** is equivalent to a controlled growth of the function.

**Theorem 1.3** Let \( \alpha > 0 \) and \( f \) be a measurable function. The following are equivalent:

- \( f \) satisfies a **heat size condition** for \( L \) and
\[ \left\| \partial_y^k W_y f \right\|_{L^\infty(\mathbb{R}^n)} \leq C_{\alpha} y^{-k+\alpha/2}, \text{ with } k = [\alpha/2] + 1, y > 0. \]  

- \( f \) satisfies \( M_{\alpha}^L[f] < \infty \) and (1.1).

This theorem leads us to the next definition.

**Definition 1.4** Let \( \alpha > 0 \). We shall denote by \( \Lambda_{\alpha/2}^W \) the set of functions \( f \) which satisfy a **heat size condition** for \( L \) and (1.1). We endow this space with the norm
\[ \| f \|_{\Lambda_{\alpha/2}^W} := S_{\alpha}^W[f] + M_{\alpha}^L[f], \]
being \( S_{\alpha}^W[f] \) the infimum of the constants \( C_{\alpha} \) appearing in (1.1).

Now we state the announced characterization of the Lipschitz classes by using the derivatives of the heat semigroup.

**Theorem 1.5** Let \( 0 < \alpha \leq 2 - \frac{n}{q} \). Then
\[ \Lambda_{\alpha}^L = \Lambda_{\alpha/2}^W, \]
with equivalence of their norms.
Some observations are in order. The restriction in the range $0 < \alpha < 2 - \frac{n}{q}$ is due to the reverse Hölder inequality (2.1) that satisfies the potential $V$. If the potential $V$ satisfies (2.1) for every $q > n/2$, then we get the result for every $0 < \alpha < 2$. This is the case of the Hermite operator, $\mathcal{H} = -\Delta + |x|^2$, see [1]. To prove Theorem 1.5, we compare the spaces $\Lambda^W_{\alpha/2}$ with some parallel spaces $\Lambda^W_{\alpha/2}$ defined for the classical Laplace operator, see Definition 3.1. We believe that these spaces, more general that the classical Lipschitz spaces, are of independent interest. The functions don’t need to be bounded, however a point-wise characterization is also valid as in the classical case, see Theorem 3.6. Once we have this characterization, by using the so called “perturbation formula” for Schrödinger operators, we get a comparison between the classes $\Lambda^W_{\alpha/2}$ and $\Lambda^W_{\alpha/2}$, see Theorem 3.11.

Lipschitz spaces adapted to the operator $L$ have been analyzed by different authors for $0 < \alpha < 1$. In the paper [2] the authors introduced, for $0 < \alpha < 1$, the space of functions which satisfy

$$
\| \rho \cdot^{-\alpha} f \|_\infty < \infty \quad \text{and} \quad \sup_{|z| > 0} \frac{\| f (\cdot - z) - f (\cdot) \|_\infty}{|z|^{\alpha}} < \infty, \quad (1.2)
$$

where $\rho(x)$ is the critical radius function associated to the potential $V$, see (2.2). See also [13]. In the case of the Hermite operator, $\mathcal{H} = -\Delta + |x|^2$, adapted Hölder classes were defined point-wise in [18]. By using the Poisson semigroup some parabolic classes were considered in [19]. Finally, for the Ornstein-Uhlenbeck operator, $\mathcal{O} = -\frac{1}{2} \Delta + x \cdot \nabla$, in [8] some Lipschitz classes were defined by means of its Poisson semigroup, $e^{-y\sqrt{\mathcal{O}}}$, and in [12] a point-wise characterization was obtained for $0 < \alpha < 1$. Our Theorem 1.5 contains as particular cases the results in [2] and [13], when $0 < \alpha < 1$. In the case of Hermite operator, the fact that $\mathcal{H} = -\Delta + |x|^2 = \frac{1}{2} \sum_{i} (A_i A_{-i} + A_{-i} A_i)$ with $A_{\pm i} = \pm \partial_{x_i} + x_i$ can be used to define spaces $C^{k, \beta}_K = \Lambda^K_{H} \Lambda^\beta_{H}$, $k \in \mathbb{N}$, $0 < \beta < 1$. We shall develop the theory of those spaces in a forthcoming paper.

As we said, our third purpose is to study the regularity of the following operators in the Lipschitz spaces previously defined. For more details on the definitions see [17].

- The Bessel potential of order $\beta > 0$,

$$
(Id + L)^{-\beta/2} f (x) = \frac{1}{\Gamma(\beta/2)} \int_0^\infty e^{-t} e^{-tL} f (x) t^{\beta/2} \frac{dt}{t}.
$$

- The fractional integral of order $\beta > 0$.

$$
L^{-\beta/2} f (x) = \frac{1}{\Gamma(\beta/2)} \int_0^\infty e^{-tL} f (x) t^{\beta/2} \frac{dt}{t}.
$$

- The fractional “Laplacian” of order $\beta/2 > 0$

$$
L^{\beta/2} f (x) = \frac{1}{c_\beta} \int_0^\infty (Id - e^{-tL})^{[\beta/2]+1} f (x) \frac{dt}{t^{1+\beta/2}}.
$$
The first order Riesz transforms defined by
\[ R_i = \partial_{x_i} (L^{-1/2}), \quad \text{and} \quad R_i = L^{-1/2} (\partial_{x_i}), \quad i = 1, \ldots, n. \]

The following theorems will be proved in Sect. 4.

**Theorem 1.6** Let \( \alpha, \beta > 0 \) and \( T_\beta \) denote the Bessel potential or the fractional integral of order \( \beta \). Then, \( T_\beta \) satisfies

\[
(i) \quad \| T_\beta f \|_{L^\infty} \leq C \| f \|_{L^\alpha/2}.
(ii) \quad \| T_\beta f \|_{L^\alpha/2} \leq C \| f \|_{L^\alpha/2}.
\]

**Theorem 1.7** (Hölder estimates) Let \( 0 < \beta < \alpha \) and \( f \in L^\alpha/2 \). Then,

\[
\| L^{\alpha/2} f \|_{L^\alpha/2} \leq C \| f \|_{L^\alpha/2}.
\]

**Theorem 1.8**

- For \( 1 < \alpha \leq 2 - n/q \), then \( \| R_i f \|_{L^\alpha/2} \leq C \| f \|_{L^\alpha/2}, \ i = 1, \ldots, n \).
- For \( 0 < \alpha \leq 1 - n/q \), then \( \| R_i f \|_{L^\alpha/2} \leq C \| f \|_{L^\alpha/2}, \ i = 1, \ldots, n \).

**Theorem 1.9** Let \( a \) be a measurable bounded function on \([0, \infty)\) and consider

\[
m(\lambda) = \lambda \int_0^\infty e^{-s\lambda} a(s) ds, \quad \lambda > 0.
\]

Then, for every \( \alpha > 0 \), the multiplier operator of the Laplace transform type \( m(L) \) is bounded from \( L^\alpha/2 \) into itself.

There are some important differences when we want to define Lipschitz spaces through the Poisson semigroup. It can be defined by the following subordination formula

\[
P_y f(x) = e^{-y\sqrt{L}} f(x) = \frac{y}{2\sqrt{\pi}} \int_0^\infty e^{-\frac{\tau^2}{4}} e^{-\tau L} f(x) \frac{d\tau}{\tau^{3/2}}.
\]

Getting inside the Feynman-Kac estimate of the heat kernel we get that the kernel of the Poisson semigroup, \( P_y(x, y) \) satisfies

\[
P_y(x, z) \leq C \frac{y}{(|x - z| + y)^{n+1}}.
\]

Hence, parallel to the heat semigroup case, we shall say that a function \( f \) satisfies a Poisson size condition for \( L \) if

\[
M^P[f] := \int_{\mathbb{R}^n} \frac{|f(x)|}{(1 + |x|)^{n+1}} dx < \infty.
\]
Theorem 1.10 Let \( \alpha > 0 \) and \( f \) be a function satisfying a Poisson size condition for \( \mathcal{L} \) and
\[
\left\| \partial_y^k P_y f \right\|_{L^\infty(\mathbb{R}^n)} \leq C_\alpha y^{-k+\alpha}, \quad \text{with } k = [\alpha] + 1, \ y > 0.
\] (1.4)

Then, \( M^\mathcal{L}_\alpha [f] < \infty \).

Remark 1.11 Observe that if \( f \) is a function such that \( M^\mathcal{L}_\alpha [f] < \infty \) with \( 0 < \alpha < 1 \) (see Lemma 2.5 with \( x = 0 \)) or \( \rho \in L^\infty(\mathbb{R}^n) \), then \( f \) satisfies a Poisson size condition for \( \mathcal{L} \).

The previous theorem drives us to the following definition.

Definition 1.12 Let \( f \) be a function that satisfies \( M^P [f] < \infty \). Given \( \alpha > 0 \), we shall say that \( f \) belongs to the class \( \Lambda^P_\alpha \) if it satisfies (1.4). The linear space can be endowed with the norm
\[
\| f \|_{\Lambda^P_\alpha} := S^P_\alpha [f] + M^\mathcal{L}_\alpha [f],
\]
where \( S^P_\alpha [f] \) is the infimum of the constants \( C_\alpha \) appearing in (1.4).

In [13], the authors proved a characterization of the class \( \Lambda^P_\alpha \) in the case \( 0 < \alpha < 1 \) for functions satisfying the integrability condition
\[
\int_{\mathbb{R}^n} \frac{|f(z)|}{(|z|+1)^{n+\alpha+\epsilon}} dz < \infty.
\]
We can extend the characterization beyond 1. Namely, we have the following result.

Theorem 1.13 Let \( f \) be a function with \( M^P [f] < \infty \). For \( 0 < \alpha \leq 2 - n/q \), the following statements are equivalent:
\[
f \in \Lambda^\alpha_\mathcal{L}, \quad f \in \Lambda^P_\alpha, \quad f \in \Lambda^W_{\alpha/2}.
\]
Moreover, the norms are equivalent.

Since the converse of Theorem 1.10 is not true in general, we have to assume the hypothesis \( M^P [f] < \infty \) in Theorem 1.13. In the case of the Hermite operator, since \( \rho(x) = \frac{1}{1+|x|} \in L^\infty(\mathbb{R}^n) \), that hypothesis is not necessary (see Remark 1.11) and the result holds for \( 0 < \alpha < 2 \). To prove Theorem 1.13 we need to introduce new spaces of functions \( \Lambda^P_\alpha \), see Sect. 5, defined via the classical Poisson semigroup, that are more general than the ones defined by Stein in [16] and we will compare them with the spaces \( \Lambda^P_\alpha \).

In [2], the authors proved that, in the case \( 0 < \alpha < 1 \), the space \( \Lambda^\alpha_\mathcal{L} \) is isometric to the space \( BMO^\alpha_\mathcal{L} \) defined as the set of locally integrable functions such that, for every ball \( B = B(x,R) \), \( R > 0 \)
\[
\int_B |f - f_B| \leq C|B|^{1+\alpha/n}, \quad \text{with } f_B = \frac{1}{|B|} \int_B f,
\]
and \( \int_B |f| \leq C |B|^{1+\alpha/n} \), if \( R \geq \rho(x) \).

Hence, our Theorems 1.5 and 1.13 can be viewed as a sort of Carleson condition characterizations of the space \( BMO_\alpha^\alpha \). In the case of the Poisson semigroup, a complete Carleson characterization has been given in [13] for a more restricted class of functions.

The organization of the paper is the following. In Sect. 2 we collect technical results about the heat kernel of the Schrödinger operators. Also, we analyze the spaces defined by using the heat kernel. We end the section by proving the natural growth at infinity of this class of functions (Proposition 2.9). In Sect. 3, we introduce an auxiliary space of functions defined by using the classical heat Gauss semigroup (Definition 3.1). These spaces are characterized point-wise and also are compared with the classes defined through the heat semigroup associated to \( \mathcal{L} \). These two facts allow us to prove Theorem 1.5. In Sect. 4 we prove Theorems 1.6–1.9, related with applications. Finally, Sect. 5 is devoted to the proofs related with the \( \Lambda_\alpha^p \) spaces.

Along this paper, we will use the variable constant convention, in which \( C \) denotes a constant that may not be the same in each appearance. The constant will be written with subindexes if we need to emphasize the dependence on some parameters.

### 2 Properties of heat Lipschitz spaces associated to \( \mathcal{L} \)

#### 2.1 Technical results

The nonnegative potential \( V \) is assumed to satisfy the following reverse Hölder condition:

\[
\left( \frac{1}{|B|} \int_B V(y)^q \, dy \right)^{1/q} \leq \frac{C}{|B|} \int_B V(y) \, dy, \quad \text{with an exponent } q > n/2,
\]

for every ball \( B \). Consider the critical radius function defined by

\[
\rho(x) = \sup \left\{ r > 0 : \frac{1}{r^{n-2}} \int_{B(x,r)} V(y) \, dy \leq 1 \right\}.
\]

Let \( W_y(x,z) \) be the integral kernel of the semigroup of \( e^{-y\mathcal{L}} \) generated by \( -\mathcal{L} \). That is, for \( f \) satisfying a heat size condition

\[
e^{-y\mathcal{L}} f(x) = \int_{\mathbb{R}^n} W_y(x,z) f(z) \, dz, \quad x \in \mathbb{R}^n.
\]

It is known (see [5,11]) that the integral kernel \( W_\zeta(x,y) \) of the extension of \( e^{-\zeta\mathcal{L}} \) to the holomorphic semigroup \( \{ e^{-\zeta\mathcal{L}} \}_{\zeta \in \Delta_{n/4}} \) satisfies

\[
|W_\zeta(x,z)| \leq C_N e^{-\frac{|x-z|^2}{c_N}} \left( 1 + \frac{\sqrt{\Re\zeta}}{\rho(z)} + \frac{\sqrt{\Re\zeta}}{\rho(x)} \right)^{-N}, \quad x, z \in \mathbb{R}^n,
\]
for $N > 0$ arbitrary.

**Lemma 2.1** Let $k \geq 1$. There exist constants $c, C_k > 0$ such that, for every $M > 0$,

$$|\partial^k_y W_y(x, z)| \leq C_k e^{-\frac{|x-z|^2}{cy}} \left( 1 + \frac{\sqrt{y}}{\rho(z)} + \frac{\sqrt{y}}{\rho(x)} \right)^{-M}.$$  

The case $k = 1$ of this Lemma can be found in [4, Formula (2.7)] and [6].

**Proof** By Cauchy’s integral formula and (2.3) we have

$$|\partial^k_y W_y(x, z)| = k! \left| \frac{1}{2\pi i} \int_{|\zeta-y|=y/10} \frac{W_\zeta(x, z)}{(\zeta-y)^{k+1}} d\zeta \right|$$

$$\leq C_k \frac{1}{y^{k+n/2}} \left( 1 + \frac{\sqrt{y}}{\rho(x)} + \frac{\sqrt{y}}{\rho(z)} \right)^{-N} e^{-\frac{|x-z|^2}{cy}}.$$  

$$\square$$

**Remark 2.2** A consequence of the last lemma is that

$$\int_{\mathbb{R}^n} |\partial^k_y W_y(x, z)| dz \leq \frac{C}{yk}.$$

### 2.2 Controlled growth at infinity. Proof of Theorem 1.3

We shall denote by $\tilde{W}_y$ the Gauss kernel, in other words, the kernel of the classical heat semigroup $e^{\Delta t}$. The following Lemma is inspired in [7], we sketch here the proof for completeness.

**Lemma 2.3** Let $f$ be a measurable function such that there exists $y_0 > 0$ for which

$$\int_{\mathbb{R}^n} e^{-\frac{|z|^2}{y_0}} f(x) dx < \infty.$$  

Then, $\lim_{y \to 0} W_y f(x) = f(x)$, a.e. $x \in \mathbb{R}^n$.

**Proof** Let $|x| \leq A$, $A \in \mathbb{N}$. Given a function $f$ we split

$$f = f \chi_{|z|\leq 2A} + f \chi_{|z|>2A} = f_1 + f_2.$$  

Observe that, for $|z| > 2A$, $|x-z| \geq \frac{|z|}{2}$. Hence, by using (2.3), we get for $y < y_0/(8c)$,

$$W_y(x, z) \leq C e^{-\frac{|x-z|^2}{cy}} \frac{|z|^2}{y_0} \leq C e^{-\frac{|z|^2}{2cy}} e^{-\frac{|z|^2}{y_0}}.$$  

Hence

$$|W_y f_2(x)| \leq C y^{-n/2} e^{-\frac{A^2}{2cy}} \int_{\mathbb{R}^n} |f(z)| e^{-\frac{|z|^2}{y_0}} dz \to 0, \text{ as } y \to 0.$$  

On the other hand, a function $\omega$ is said to be rapidly decaying if for every $N > 0$ there exists a constant $C_N$ with $|\omega(x)| \leq C_N (1 + |x|)^{-N}$. For a rapidly decaying
function $\omega$, we shall denote $\omega_y(x) = y^{-n/2} \omega(y^{-1/2} x)$, $y > 0$, $x \in \mathbb{R}^n$. It is known, see [5, Proposition 2.16], that there exists a nonnegative rapidly decaying function $\omega$ such that

$$|W_y(x, z) - \tilde{W}_y(x - z)| \leq C \left( \frac{\sqrt{y}}{\rho(x)} \right)^{2-n/q} \omega_y(x - z), \text{ for } \sqrt{y} \leq \rho(x). \quad (2.4)$$

Hence, for $\sqrt{y} \leq \rho(x)$,

$$|W_y f_1(x) - \tilde{W}_y f_1(x)| \leq C \left( \frac{\sqrt{y}}{\rho(x)} \right)^{2-n/q} \omega_y f_1(x).$$

By the standard point-wise convergence for $L^1$-functions we have

$$\lim_{y \to 0} \tilde{W}_y f_1(x) = f_1(x), \text{ and } \lim_{y \to 0} \omega_y f_1(x) = f_1(x) \text{ a.e } x \in \mathbb{R}^n.$$ 

Therefore we get

$$\lim_{y \to 0} W_y f_1(x) = f_1(x), \text{ a.e } x \in \mathbb{R}^n \quad \square$$

**Proposition 2.4** Let $\alpha > 0$, $k = \lceil \alpha/2 \rceil + 1$ and $f$ be a function satisfying the heat size condition. Then, $\| \partial^k_y W_y f \|_{L^\infty(\mathbb{R}^n)} \leq C \alpha y^{-k+\alpha/2}$ if, and only if, for $m \geq k$,

$$\| \partial^m_y W_y f \|_{L^\infty(\mathbb{R}^n)} \leq C_m y^{-m+\alpha/2}.$$ 

Moreover, for each $m$, $C_m$ and $C_\alpha$ are comparable.

**Proof** Let $m \geq \lceil \alpha/2 \rceil + 1 = k$. By the semigroup property and Remark 2.2 we have

$$\left| \partial^m_y W_y f(x) \right| = C \left| \partial^{m-k}_y W_{y/2} (\partial^k_y W_y f(x) \big|_{u=y/2}) \right| \leq C_\alpha' \frac{1}{y^{m-k}} y^{-k+\alpha/2} = C_m y^{-m+\alpha/2}.$$ 

For the converse, the fact $|\partial^\ell_y W_y f(x)| \to 0$ as $y \to \infty$, $\ell \in \mathbb{N} \cup \{0\}$, allows us to integrate on $y$ as many times as we need to get $\| \partial^k_y W_y f \|_{L^\infty(\mathbb{R}^n)} \leq C_\alpha y^{-k+\alpha/2} \quad \square$

To prove Theorem 1.3, we need some lemmas and propositions that we present now. The following lemma can be found in [6,14].

**Lemma 2.5** There exist constants $C > 0$ and $k_0 \geq 1$ such that, for all $x, z \in \mathbb{R}^n$,

$$C^{-1} \rho(x) \left( 1 + \frac{|x - z|}{\rho(x)} \right)^{-k_0} \leq \rho(z) \leq C \rho(x) \left( 1 + \frac{|x - z|}{\rho(x)} \right)^{k_0 \frac{1}{1+8x_0}}.$$

In particular, $\rho(x) \sim \rho(z)$ when $z \in B_r(x)$ and $r \leq C \rho(x).$
Lemma 2.6 Let $f$ be a function such that $\rho^\alpha f \in L^\infty(\mathbb{R}^n)$, for some $\alpha > 0$. Then, for every $\ell \in \mathbb{N} \cup \{0\}$ and $M > 0$, $|\partial^\ell_y W_y f(x)| \leq C_\ell \, M_\alpha^\ell f \left( \frac{\rho(x)^\alpha}{y^\ell} \right)(1 + \frac{y^{1/2}}{\rho(x)})^{-M}$, $x \in \mathbb{R}^n$, $y > 0$.

**Proof** By Lemmas 2.1 and 2.5, if $f$ is a function such that $\rho(x)^\alpha f \in L^\infty(\mathbb{R}^n)$, then for every $j$, $i f$ is a function such that $\rho(x)^\alpha f \in L^\infty(\mathbb{R}^n)$, then $f$ satisfies a heat size condition for $\mathcal{L}$.

The following proposition is a direct consequence of Lemma 2.6. Moreover, it corresponds with the “if” part of Theorem 1.3.

**Proposition 2.7** Let $\mathcal{L}$ be a Schrödinger operator with a reverse Hölder class potential and associated function $\rho$. If $\alpha > 0$ and $f$ is a measurable function such that $\rho^\alpha f \in L^\infty(\mathbb{R}^n)$, then $f$ satisfies a heat size condition for $\mathcal{L}$.

**Lemma 2.8** Let $\alpha > 0$ and $k = [\alpha/2] + 1$. Assume that $f$ satisfies the heat size condition and (1.1), then for every $j$, $m \in \mathbb{N} \cup \{0\}$ such that $\frac{m}{2} + j \geq k$, there exists a $C_{m,j} > 0$ such that

$$\left\| \frac{\partial^j_y W_y f}{\rho(\cdot)^m} \right\|_\infty \leq C_{m,j} S_\alpha^W[f] y^{-(\frac{m}{2} + j) + \alpha/2}.$$

**Proof** For $\ell \geq k$, by the semigroup property and Lemma 2.1 we get that

$$\left| \frac{\partial^\ell_y W_y f(x)}{\rho(\cdot)^m} \right| = \left| \frac{C_\ell}{\rho(x)^m} \int_{\mathbb{R}^n} \partial^\ell_{v} - k W_v(x, z)|_{v=y/2} \partial^k_u W_u f(z)|_{u=y/2} dz \right|$$

$$\leq \frac{C_\ell}{\rho(x)^m} \int_{\mathbb{R}^n} \frac{e^{-|x-z|^2/c^2}}{y^{n/2+\ell-k}} \left( \frac{\rho(x)}{y^{1/2}} \right)^m dz$$

If $j < k$, the $y-$derivatives of $W_y f(x)$ tend to zero as $y \to \infty$, we integrate $\ell - j$ times the previous estimate and we get the result.

The following proposition corresponds with the “only if” part of Theorem 1.3.

**Proposition 2.9** Let $\alpha > 0$ and $f$ be a function satisfying the heat size condition for $\mathcal{L}$ and (1.1). Then $\rho^\alpha f \in L^\infty(\mathbb{R}^n)$.
Proof By using Lemma 2.3, for a.e. $x$, we have

$$|f(x)| \leq \sup_{0 < y < \rho(x)^2} |W_y f(x)|$$

$$\leq \sup_{0 < y < \rho(x)^2} |W_y f(x) - W_{\rho(x)^2} f(x)| + |W_{\rho(x)^2} f(x)|$$

$$= I + II.$$

We shall estimate $I$. Let $k = \lceil \alpha/2 \rceil + 1$. If $\alpha$ is not even, by Lemma 2.8 with $j = 1$ and $m = 2(k-1)$ we have that

$$I \leq \rho(x)^{2(k-1)} \sup_{0 < y < \rho(x)^2} \int_y^{\rho(x)^2} \left| \frac{\partial_z W_z f(x)}{\rho(x)^{2(k-1)}} \right| dz$$

$$\leq CS^{W}_\alpha[f] \rho(x)^{2(k-1)} \sup_{0 < y < \rho(x)^2} \int_y^{\rho(x)^2} z^{-k+\alpha/2} dz$$

$$\leq CS^{W}_\alpha[f] \rho(x)^{2(k-1)} \sup_{0 < y < \rho(x)^2} ((\rho(x)^2)^{-(k-1)+\alpha/2} - y^{-(k-1)+\alpha/2})$$

$$\leq CS^{W}_\alpha[f] \rho(x)^{\alpha}.$$

When $\alpha$ is even, we write

$$I = \sup_{0 < y < \rho(x)^2} \left| \int_y^{\rho(x)^2} \partial_z W_z f(x) dz \right|$$

$$= \sup_{0 < y < \rho(x)^2} \left| \int_y^{\rho(x)^2} \left( -\int_z^{\rho(x)^2} \partial^2_{uv} W_{uv} f(x) du + \partial_u W_v f(x) \bigg|_{v=\rho(x)^2} \right) dz \right|.$$ 

By Lemma 2.8 with $j = 2$ and $m = 2(k-2)$, since $k = \alpha/2 + 1$, we get

$$\left| \int_y^{\rho(x)^2} \int_z^{\rho(x)^2} \partial^2_{uv} W_{uv} f(x) du dz \right| = \rho(x)^{2(k-2)} \left| \int_y^{\rho(x)^2} \int_z^{\rho(x)^2} \frac{\partial^2_{uv} W_{uv} f(x)}{\rho(x)^{2(k-2)}} du dz \right|$$

$$\leq CS^{W}_\alpha[f] \rho(x)^{\alpha-2} \int_y^{\rho(x)^2} \int_z^{\rho(x)^2} u^{-1} du dz = CS^{W}_\alpha[f] \rho(x)^{\alpha-2} \int_y^{\rho(x)^2} (\log(\rho(x)^2) - \log z) dz$$

$$= CS^{W}_\alpha[f] \rho(x)^{\alpha-2} \left[ \log(\rho(x)^2) - (\rho(x)^2 - \rho(x)^2)(\rho(x)^2 - y) \right]$$

$$= CS^{W}_\alpha[f] \rho(x)^{\alpha-2} \left[ (\rho(x)^2) - 2 \log \left( \frac{\rho(x)^2}{\rho(x)^2} \right) \right] \leq CS^{W}_\alpha[f] \rho(x)^{\alpha}.$$
For the second summand of $I$, Lemma 2.8 with $j = 1$ and $m = 2(k - 1)$ applies, so

$$
\sup_{0 < y < \rho(x)^2} (\rho(x)^2 - y) |\partial_y W_{\rho} f(x)|_{v = \rho(x)^2} 
= \sup_{0 < y < \rho(x)^2} (\rho(x)^2 - y) \rho(x)^{2(k-1)} \left| \frac{\partial_y W_{\rho} f(x)}{\rho(x)^{2(k-1)}} \right|
\leq CS_{\alpha}^W [f] \sup_{0 < y < \rho(x)^2} (\rho(x)^2 - y) \rho(x)^{\alpha} (\rho(x)^2)^{-1}
\leq CS_{\alpha}^W [f] \rho(x)^{\alpha}.
$$

Regarding $II$, by using Lemma 2.8 with $j = 0$ and $m = 2k$ we have

$$
II = |W_{\rho(x)^2} f(x)| = \left| W_{\rho(x)^2} f(x) \right| \rho(x)^{2k} \leq CS_{\alpha}^W [f] (\rho(x)^2)^{-k+\alpha/2} \rho(x)^{2k}
= CS_{\alpha}^W [f] \rho(x)^{\alpha}.
\Box
$$

## 3 Proof of Theorem 1.5

### 3.1 Some remarks about the classical Lipschitz spaces

In this subsection we define a class of Lipschitz spaces associated to the Laplace operator. It will be an auxiliary class for our results about the spaces adapted to the Schrödinger operator. With respect to the classical definitions, see [16,20–22], the main and crucial difference is that the functions don’t need to be bounded.

**Definition 3.1** Let $\alpha > 0$. We define the spaces $\Lambda_{\alpha/2}^\tilde{W}$ as

$$
\Lambda_{\alpha/2}^\tilde{W} = \left\{ f : (1 + |\cdot|)^{-\alpha} f \in L^\infty(\mathbb{R}^n) \text{ and } \left\| \partial_y^k \tilde{W}_y f \right\|_{L^\infty(\mathbb{R}^n)} \right\}
\leq C_{\alpha} \gamma^{-k+\alpha/2}, \ k = [\alpha/2] + 1.
$$

Parallel to the linear spaces $\Lambda_{\alpha/2}^W$, we can endow this class with the norm

$$
\| f \|_{\Lambda_{\alpha/2}^\tilde{W}} := \tilde{M}_\alpha [f] + \tilde{S}_\alpha [f],
$$

with $\tilde{M}_\alpha [f] = \| (1 + |\cdot|)^{-\alpha} f (\cdot) \|_\infty$ and $\tilde{S}_\alpha [f]$ being the infimum of the constants $C_{\alpha}$ appearing above.
Remark 3.2 Let $f$ be a function such that $\mathcal{M}_\alpha[f] < \infty$. Then, for every $\ell \in \mathbb{N} \cup \{0\}$, $\partial^\ell_y \tilde{W}_y f$ is well defined. Observe that

$$\int_{\mathbb{R}^n} e^{-\frac{|x-z|^2}{cy}} |f(z)| dz \leq C \int_{\mathbb{R}^n} e^{-\frac{|x-z|^2}{cy}} (1 + |z|)^\alpha dz.$$

If $|z| < 2|x|$, the last integral is convergent and bounded by $C(1 + y^{\alpha/2} + |x|^\alpha)$. If $|z| > 2|x|$ then the above integral is less than

$$\int_{\mathbb{R}^n} e^{-\frac{|z|^2}{cy}} (1 + |z|)^\alpha dz \leq C(1 + y^{\alpha/2}).$$

The same arguments can be used for the derivatives $\partial^\ell_y \tilde{W}_y f$, $\ell \in \mathbb{N}$.

Moreover, if $m/2 + \ell \geq [\alpha/2] + 1$, then $\lim_{y \to 0} \partial^m_x \partial^\ell_y \tilde{W}_y f(x) = 0$, for every $x \in \mathbb{R}^n$. Indeed, observe that

$$\left| \partial^m_x \partial^\ell_y \tilde{W}_y f(x) \right| \leq C \int_{\mathbb{R}^n} e^{-\frac{|x-z|^2}{cy}} |f(z)| dz \leq C \int_{\mathbb{R}^n} e^{-\frac{|z|^2}{cy}} (1 + |z|)^\alpha dz.$$

If $|z| < 2|x|$, the last integral is less than $C(1 + y^{\alpha/2} + |x|^\alpha)y^{-m/2-\ell}$. In the case $|z| > 2|x|$ the integral is less than $C(1 + y^{\alpha/2})y^{-m/2-\ell}$.

The following Lemma is parallel to Lemma 2.3 and follows from the ideas in [7]. We sketch the proof for completeness.

Lemma 3.3 Let $f$ be a measurable function such that, for every $y > 0$, $\int_{\mathbb{R}^n} e^{-\frac{|x|^2}{y}} |f(x)| dx < \infty$. Then, $\lim_{y \to 0} \tilde{W}_y f(x) = f(x)$, a.e. $x \in \mathbb{R}^n$. Moreover, $\tilde{W}_y f(x)$ belongs to $C^\infty((0, \infty) \times \mathbb{R}^n)$.

Proof Since

$$\left| \int_{\mathbb{R}^n} \partial^\ell_y \tilde{W}_y (x-z) f(z) dz \right| \leq \frac{C}{y^\ell} \int_{\mathbb{R}^n} e^{-\frac{|x-z|^2}{cy}} |f(z)| dz,$$

we can differentiate $\tilde{W}_y f$ with respect to $y$.

On the other hand, observe that

$$\left| \int_{\mathbb{R}^n} \partial_x \tilde{W}_y (x-z) f(z) dz \right| \leq \frac{C}{y^{\alpha+1}} \int_{\mathbb{R}^n} e^{-\frac{|x|^2}{cy}} |f(z)| dz, \quad y > 0.$$

Given $x \in \mathbb{R}^n$ with $|x| < R$, for some $R > 0$, we have

$$e^{-\frac{|x|^2}{cy}} |f(z)| \leq C \left( \chi_{|x|>2R} e^{-\frac{|z|^2}{cy}} + \chi_{|x|<2R} \right) |f(z)|,$$
Moreover, so we can differentiate \( \tilde{W}_y f \) with respect to \( x_i, i = 1, \ldots, n. \)

**Proposition 3.4** Let \( \alpha > 0 \). A function \( f \in \Lambda_{\alpha/2}^{\tilde{W}} \) if, and only if, for all \( m \geq |\alpha/2| + 1 \), we have \( \| \partial^{m}_{x_i} \partial_{y} \tilde{W}_y f \|_{L^{\infty}(\mathbb{R}^n)} \leq C_m y^{-m+\alpha/2} \) and \( M_{\alpha}[f] < \infty. \)

The proof of this Proposition is parallel to the proof of Proposition 2.4, we leave the details to the reader.

**Lemma 3.5** Let \( \alpha > 0 \) and \( k = |\alpha/2| + 1 \). If \( f \in \Lambda_{\alpha/2}^{\tilde{W}} \), then for every \( j, m \in \mathbb{N} \cup \{0\} \) such that \( \frac{m}{2} + j \geq k \), there exists a \( C_{m,j} > 0 \) such that

\[
\| \partial^{m}_{x_i} \partial_{y} \tilde{W}_y f \|_{\infty} \leq C_{m,j} \tilde{S}_{\alpha}[f] y^{-(m/2+j)+\alpha/2}, \text{ for every } i = 1, \ldots, n.
\]

Moreover, for each \( j, m \), the constant \( C_{m,j} \) is comparable to the constant \( C_{\alpha} \) in Definition 3.1.

**Proof** If \( j \geq k \), by the semigroup property we get that

\[
\left| \partial^{m}_{x_i} \partial_{y} \tilde{W}_y f(x) \right| = C \left| \int_{\mathbb{R}^n} \partial^{m}_{x_i} \partial_{v} \tilde{W}_v(x-z) \big|_{v=y/2} \partial_{u} \tilde{W}_u f(z) \big|_{u=y/2} dz \right|
\]

\[
\leq C_{m,j} \| \partial^{k}_{u} \tilde{W}_u f \|_{u=y/2} \left( \int_{\mathbb{R}^n} e^{-\frac{|x-z|^2}{cy^{n/2}}} dz \right)
\]

\[
\leq C_{m,j} \tilde{S}_{\alpha}[f] y^{-(m/2+j)+\alpha/2}, \quad x \in \mathbb{R}^n.
\]

If \( j < k \), by proceeding as before we get that \( \left| \partial^{m}_{x_i} \partial_{y} \tilde{W}_y f(x) \right| \leq C \tilde{S}_{\alpha}[f] y^{-(m/2+k)+\alpha/2}, \quad x \in \mathbb{R}^n \), and we get the result by integrating the previous estimate \( k - j \) times, since \( \left| \partial^{m}_{x_i} \partial_{y} \tilde{W}_y f(x) \right| \to 0 \) as \( y \to \infty \) as far as \( \frac{m}{2} + k \geq k \), see Remark 3.2.

**Theorem 3.6** Let \( 0 < \alpha < 2 \). Then \( f \in \Lambda_{\alpha/2}^{\tilde{W}} \) if, and only if

\[
N_{\alpha}[f] := \sup_{|z| > 0} \frac{\| f(\cdot+z) + f(\cdot-z) - 2 f(\cdot) \|_{\infty}}{|z|^\alpha} < \infty \text{ and } \tilde{M}_{\alpha}[f] = \| (1 + |\cdot|)^{-\alpha} f \|_{\infty} < \infty.
\]

Moreover,

\[
\| f \|_{\Lambda_{\alpha/2}^{\tilde{W}}} \sim N_{\alpha}[f] + \tilde{M}_{\alpha}[f].
\]

**Proof** Let \( x \in \mathbb{R}^n \) and \( f \in \Lambda_{\alpha/2}^{\tilde{W}} \). We can write, for every \( y > 0, z \in \mathbb{R}^n \),

\[
|f(x+z) + f(x-z) - 2 f(x)| \leq |\tilde{W}_y f(x+z) - f(x+z)| + |\tilde{W}_y f(x-z) - f(x-z)|
\]

\[
+ 2|\tilde{W}_y f(x) - f(x)| + |\tilde{W}_y f(x+z) - \tilde{W}_y f(x) + \tilde{W}_y f(x-z) - \tilde{W}_y f(x)|.
\]
By using Lemma 3.3 we have that

$$|\tilde{W}_y f(x) - f(x)| = \left| \int_0^y \partial_u \tilde{W}_u f(x) du \right| \leq C \tilde{S}_\alpha[f] \int_0^y u^{-1+\alpha/2} du = C \tilde{S}_\alpha[f] y^{\alpha/2}. $$

In a parallel way we handle the two first summands. Regarding the last summand, by using the chain rule and Lemma 3.5 we have that

$$\left| \int_0^1 \partial_u (\tilde{W}_y f(x + \theta z) + \tilde{W}_y f(x - \theta z)) d\theta \right|$$

$$= \left| \int_0^1 (\nabla_u \tilde{W}_y f(u) |_{u=x+\theta z} \cdot z - \nabla_v \tilde{W}_y f(v) |_{v=x-\theta z} \cdot z) d\theta \right|$$

$$= \left| \int_0^1 \int_{-1}^1 \partial_x \nabla_u \tilde{W}_y f(u) |_{u=x+\lambda z} \cdot z \ d\lambda d\theta \right|$$

$$= \left| \int_0^1 \int_{-1}^1 \nabla^2 \tilde{W}_y f(u) |_{u=x+\lambda z} z \cdot \theta z \ d\lambda d\theta \right|$$

$$\leq C \tilde{S}_\alpha[f] y^{-1+\alpha/2} |z|^2,$$

Thus, by choosing $y = |z|^2$ we get what we wanted.

For the converse, we assume that $N_\alpha[f], \tilde{M}_\alpha[f] < \infty$. Since

$$\int_{\mathbb{R}^n} \partial_y \tilde{W}_y(z) f(x + z) dz = \int_{\mathbb{R}^n} \partial_y \tilde{W}_y(-z) f(x - z) dz = \int_{\mathbb{R}^n} \partial_y \tilde{W}_y(z) f(x - z) dz,$$

and

$$\int_{\mathbb{R}^n} \partial_y \tilde{W}_y(z) dz = 0$$

we have

$$|\partial_y \tilde{W}_y f(x)| = \frac{1}{2} \int_{\mathbb{R}^n} \partial_y \tilde{W}_y(z) (f(x - z) + f(x + z) - 2f(x)) dz$$

$$\leq C N_\alpha[f] \int_{\mathbb{R}^n} e^{-\beta |z|^2} \frac{|z|^\alpha}{y^{n+1}} dz \leq C N_\alpha[f] y^{-1+\alpha/2}.$$

The following Proposition shows that in the case $0 < \alpha < 1$ we recover the classical Lipschitz condition.

**Proposition 3.7** Let $0 < \alpha < 1$. If a function $f \in \Lambda^W_{\alpha/2}$ then

$$\sup_{|z|>0} \frac{\|f(\cdot - z) - f(\cdot)\|_\infty}{|z|^\alpha} < \infty.$$

**Proof** We assume that $f \in \Lambda^W_{\alpha/2}$ with $\|f\|_{\Lambda^W_{\alpha/2}} = 1$. Let us take a representative of the function $f$. We want to show that $|f(x + z) - f(x)| \leq C|z|^\alpha, x, z \in \mathbb{R}^n$. 

\[\Box\]
Fix \( x \in \mathbb{R}^n \). Assume first that \(|x| > 1\). In the case \(|z| \geq |x|\), as \( M_\alpha(f) < \infty \), we have that \(|f(x + z) - f(x)| \leq C(1 + |x| + |z|)^\alpha \leq C|z|^\alpha\). In the case \(|z| < |x|\), we choose a nonnegative integer \( k \) such that \(|x| \leq 2^k|z| < 2|x|\). We define

\[
g(t) = f(x + t) - f(x), \quad t \in \mathbb{R}^n.
\]

By hypothesis and Theorem 3.6,

\[
|g(t) - 2g(t/2)| = |f(x + t) + f(x) - 2f(x + t/2)| \leq C|t|^\alpha.
\]

Similarly, \(|2^{j-1}g(t/2j-1) - 2^jg(t/2^j)| \leq C2^{j-1}\left(\frac{|t|}{2^{j-1}}\right)^\alpha\). Therefore, adding up we have

\[
|g(t) - 2^k g(t/2^k)| \leq C \sum_{j=1}^{k} 2^{j-1}(\frac{|t|}{2^{j-1}})^\alpha.
\]

Now we choose \( t = 2^kz \). We have

\[
|g(z)| \leq \frac{|g(2^kz)|}{2^k} + C \frac{1}{2^k} \sum_{j=1}^{k} 2^{j-1}(\frac{2^k|z|}{2^{j-1}})^\alpha
\]

\[
\leq C|z|^\alpha 2^{k(\alpha - 1)} + C2^{k(\alpha - 1)}|z|^\alpha \sum_{j=0}^{k} 2^{j(1 - \alpha)} \leq C|z|^\alpha.
\]

This implies that \(|f(x + z) - f(x)| \leq C|z|^\alpha\).

If \(|x| < 1 < |z|\) we can proceed as in the previous case \(|x| < |z|\). If \(|x| < 1\) and \(|z| < 1\), we choose \( k \) such that \( 1 \leq 2^k|z| < 2\). We observe that in this case \(|g(2^kz)| \leq C\), therefore

\[
|g(z)| \leq C \frac{|g(2^kz)|}{2^k} + C \frac{1}{2^k} \sum_{j=0}^{k} 2^{j-1}(\frac{2^k|z|}{2^{j-1}})^\alpha
\]

\[
\leq C|z| + 2^{k(\alpha - 1)}|z|^\alpha \sum_{j=0}^{k} 2^{j(1 - \alpha)} \leq C|z|^\alpha.
\]

Observe that we have used in an essencial way that \( 0 < \alpha < 1 \). \(\square\)

**Remark 3.8** Observe that Lemma 2.5 for \( x = 0 \), i.e.

\[
\rho(z) \leq C\rho(0) \left(1 + \frac{|z|}{\rho(0)}\right)^\lambda, \text{ for some } 0 < \lambda < 1, \quad (3.1)
\]
implies that if $\rho(\cdot)^{-\alpha} f \in L^\infty(\mathbb{R}^n)$, then $(1 + |\cdot|)^{-\alpha} f \in L^\infty(\mathbb{R}^n)$. Therefore, for $0 < \alpha < 1$, Theorem 3.6 and Proposition 3.7 imply that $\Lambda_{\mathcal{L}}^\alpha$ coincides with the space introduced in [2], see (1.2).

**Proposition 3.9** Let $1 < \alpha < 2$, $f \in \Lambda_{\mathcal{L}}^{W}$ and assume that for a certain $\rho$ associated to a Schrödinger operator $\mathcal{L}$, we have $\rho(\cdot)^{-\alpha} f \in L^\infty(\mathbb{R}^n)$. Then, for every $i = 1, \ldots, n$, $\partial_i f \in \Lambda_{\mathcal{L}}^{W_{\alpha/2}}$ and $\rho(\cdot)^{-(\alpha-1)} \partial_i f \in L^\infty(\mathbb{R}^n)$. Moreover,

$$
\|\partial_i f\|_{\Lambda_{\mathcal{L}}^{W_{\alpha/2}}} \leq C \left( \tilde{S}_\alpha[f] + M_{\alpha}^C[f] \right).
$$

**Proof** We first prove that $\partial_i f$ exists. By Lemma 3.5 we have that $\|\partial_y \partial_i \tilde{W}_y f\|_\infty \leq C \tilde{S}_\alpha[f] y^{-3/2+\alpha/2} = C \tilde{S}_\alpha[f] y^{-1+\alpha/2}$. For every $x \in \mathbb{R}^n$ we can write

$$
\partial_i \tilde{W}_y f(x) = -\int_y^1 \partial_u \partial_i \tilde{W}_u f(x) du + \partial_i \tilde{W}_y f(x)|_{y=1}.
$$

Therefore, for every $0 < y_1 < y_2 < 1$ we have

$$
|\partial_i \tilde{W}_y f(x) - \partial_i \tilde{W}_y f(x)| = \left| \int_{y_1}^{y_2} \partial_u \partial_i \tilde{W}_u f(x) du \right| \\
\leq C |y_2^{\frac{\alpha-1}{\alpha}} - y_1^{\frac{\alpha-1}{\alpha}}| \leq C |y_2 - y_1|^{\frac{\alpha-1}{\alpha}}.
$$

This means that $\{\partial_i \tilde{W}_y f\}_{y>0}$ is a Cauchy sequence in the $L^\infty$ norm (as $y \to 0$). In addition, as $\tilde{W}_y f \to f$ as $y \to 0$ we get that $\partial_i \tilde{W}_y f$ converges uniformly to $\partial_i f$.

On the other hand, since $\rho(\cdot)^{-\alpha} f \in L^\infty(\mathbb{R}^n)$, integration by parts and (3.1) give

$$
|\int_{\mathbb{R}^n} e^{-\frac{|z|^2}{y}} \partial_i f(z) dz| = \left| \int_{\mathbb{R}^n} e^{-\frac{|z|^2}{y}} \frac{2zi}{y} f(z) dz \right| \leq C \int_{\mathbb{R}^n} e^{-\frac{|z|^2}{y_1y_2}} |f(z)| dz < \infty,
$$

for every $y > 0$. Moreover, since $\tilde{W}_y f$ is a convolution, by Remark 3.2 we have

$$
|\partial_y \tilde{W}_y (\partial_i f)(x)| = |\partial_y \partial_i \tilde{W}_y f(x)| \leq C \tilde{S}_\alpha[f] y^{-(3/2)+\alpha/2} = C \tilde{S}_\alpha[f] y^{-1+(\alpha-1)/2}.
$$

Let us see the size condition for the derivative. By proceeding as in the proof of Proposition 2.9, we have

$$
\frac{|\partial_i f(x)|}{\rho(x)^{\alpha-1}} \leq \frac{1}{\rho(x)^{\alpha-1}} \sup_{0 < y < \rho(x)^2} |\tilde{W}_y (\partial_i f)(x)| \\
\leq \frac{1}{\rho(x)^{\alpha-1}} \sup_{0 < y < \rho(x)^2} |(\tilde{W}_y (\partial_i f)(x) - \tilde{W}_{\rho(x)^2} (\partial_i f)(x))| \\
+ \frac{1}{\rho(x)^{\alpha-1}} |\tilde{W}_{\rho(x)^2} (\partial_i f)(x)| \\
= I + II.
$$
\[
I \leq \frac{1}{\rho(x)^{a-1}} \sup_{0 < y < \rho(x)^2} \int_\mathbb{R}^{n} |\partial_\zeta \tilde{W}_\rho(x)(\partial_\zeta f)(x)| dz
\]
\[
\leq C \frac{\tilde{S}_a[f]}{\rho(x)^{a-1}} \sup_{0 < y < \rho(x)^2} \int_\mathbb{R}^{n} (\rho(x)^2)^{-a-1} \left( y^{-1} + \frac{y^{a-1}}{\rho(x)^2} \right) dz
\]
\[
\leq C \frac{\tilde{S}_a[f]}{\rho(x)^{a-1}} \sup_{0 < y < \rho(x)^2} (\rho(x)^a - y^{a-1}) \leq C \tilde{S}_a[f].
\]

On the other hand, integration by parts and Lemma 2.5 give
\[
II = \frac{1}{\rho(x)^{a-1}} \left| \int_\mathbb{R}^{n} \partial_\zeta \tilde{W}_\rho(x)^2 (x-z)f(z) dz \right| \leq C \frac{M_\alpha^L[f]}{\rho(x)^{a-1}} \int_\mathbb{R}^{n} e^{\frac{|x-z|^2}{\rho(x)^2}} \rho(z)^a dz
\]
\[
\leq C \frac{M_\alpha^L[f]}{\rho(x)^{a-1}} \int_\mathbb{R}^{n} e^{\frac{|x-z|^2}{\rho(x)^2}} \rho(z)^a \left( 1 + \frac{|x-z|}{\rho(x)} \right) \lambda \alpha dz.
\]
Performing the change of variable \( \tilde{z} = (x-z)/\rho(x) \) we get \( II \leq C M_\alpha^L[f] \).
Finally, (3.1) allows us to conclude that \( \tilde{M}_{a-1}[\partial_\zeta f] < \infty \) and hence \( \partial_\zeta f \in \Lambda \tilde{W}_{\alpha-1} \).

\[ \square \]

### 3.2 Comparison of Lipschitz spaces. \( \Delta \) versus \( \mathcal{L} \).

Along this section we shall need the following result that can be found in [6,14]. Recall the definition of a rapidly decaying nonnegative function from the proof of Lemma 2.3.

**Lemma 3.10** Let \( \omega \) be a rapidly decaying nonnegative function and consider \( \omega_\gamma(x) = y^{-n/2} \omega(y^{-1/2}x), y > 0, x \in \mathbb{R}^n \). There exists a constant \( C > 0 \) such that
\[
\int_{\mathbb{R}^n} V(z) \omega_\gamma(x-z) dz \leq C \frac{1}{y} \left( \frac{y^{1/2}}{\rho(x)} \right)^{2-\frac{n}{q}}, \text{ whenever } y \leq \rho(x)^2.
\]

**Theorem 3.11** Let \( 0 < \alpha \leq 2 - \frac{n}{q} \), and a function \( f \) such that \( \rho(\cdot)^{-\alpha} f(\cdot) \in L^\infty(\mathbb{R}^n) \). Then, \( \| \partial_t \tilde{W}_t f - \partial_t W_t f \|_\infty \leq C M_\alpha^L[f] t^{-1+\alpha/2} \).

**Proof** Let \( t > 0 \) and \( x \in \mathbb{R}^n \). The existence of the derivatives \( \partial_t \tilde{W}_t f(x) \) and \( \partial_t W_t f(x) \) follows from Lemma 2.6 and Remark 3.2. We analyze first the case \( t \leq \rho(x)^2 \). As a consequence of the Kato-Trotter formula,
\[
\tilde{W}_t(x-y) - W_t(x, y) = \int_0^t \int_{\mathbb{R}^n} \tilde{W}_{t-s}(x-z)V(z) W_s(z, y) dz ds,
\]
\[ \square \]
see [6], we have the following identity:

\[ \partial_t(\tilde{W}_t f - W_t f) = \int_0^{t/2} \frac{\partial}{\partial t} \tilde{W}_{t-s} V W_s f \, ds + \int_{t/2}^t \tilde{W}_{t-s} V \frac{\partial}{\partial s} W_s f \, ds + \tilde{W}_{t/2} V W_{t/2} f \]

\[ = A + B + E. \]

Assume \( t \leq \rho(x)^2 \), then by Lemmas 2.1, 2.5 and 3.10, if \( \omega \) denotes a rapidly decaying function and \( \omega_t(x) = t^{-n/2} \omega(t^{-1/2} x) \), we have

\[ |A| \lesssim \int_0^{t/2} \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} t^{-1} \omega_t(x-z) V(z) |f(y)| \rho(y)^{-\alpha} \rho(x)^{\alpha} \left( 1 + \frac{|x-y|}{\rho(x)} \right)^{\alpha} dy \, dz \, ds \]

\[ \lesssim M_{\alpha}^L[f] \rho(x)^{\alpha} t^{-1} \times \int_0^{t/2} \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \omega_t(x-z) V(z) |f(y)| \rho(y)^{-\alpha} \left( 1 + \frac{|x-z|}{\sqrt{t}} \right)^{\alpha} \left( 1 + \frac{|z-y|}{\sqrt{s}} \right)^{\alpha} dy \, dz \, ds \]

\[ \lesssim M_{\alpha}^L[f] \rho(x)^{\alpha} t^{-1} \left( \frac{\sqrt{t}}{\rho(x)} \right)^{\alpha}, \]

where in the last inequality we use that \( 0 < \alpha \leq 2 - \frac{n}{d} \) and \( t \leq \rho(x)^2 \).

Similarly we proceed for \( B \). Again, by Lemmas 2.1, 2.5 and 3.10, we obtain

\[ |B| \lesssim \int_{t/2}^{t} \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \omega_{t-s}(x-z) V(z) s^{-1} \omega_t(z-y) |f(y)| \rho(y)^{-\alpha} \rho(x)^{\alpha} \left( 1 + \frac{|x-y|}{\rho(x)} \right)^{\alpha} dy \, dz \, ds \]

\[ \lesssim M_{\alpha}^L[f] \rho(x)^{\alpha} t^{-1} \times \int_{t/2}^{t} \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \omega_{t-s}(x-z) V(z) \omega_t(z-y) \left( 1 + \frac{|x-z|}{\sqrt{t-s}} \right)^{\alpha} \left( 1 + \frac{|z-y|}{\sqrt{t}} \right)^{\alpha} dy \, dz \, ds \]

\[ \lesssim M_{\alpha}^L[f] \rho(x)^{\alpha} t^{-1} \int_{t/2}^{t} (t-s)^{-1} \left( \frac{\sqrt{t-s}}{\rho(x)} \right)^{\alpha} ds \]

\[ \lesssim M_{\alpha}^L[f] \rho(x)^{\alpha} t^{-1+\alpha/2}. \]

Similarly, by the same arguments we have

\[ |E| \lesssim \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \tilde{W}_{t/2}(x-z) V(z) W_{t/2}(z, y) |f(y)| \rho(y)^{-\alpha} \rho(x)^{\alpha} \left( 1 + \frac{|x-y|}{\rho(x)} \right)^{\alpha} dy \, dz \]

\[ \lesssim M_{\alpha}^L[f] \rho(x)^{\alpha} \int_{\mathbb{R}^n} \tilde{W}_{t/2}(x-z) V(z) \left( 1 + \frac{|x-z|}{\sqrt{t}} \right)^{\lambda} dz \]

\[ \lesssim M_{\alpha}^L[f] \rho(x)^{\alpha} t^{-1} \left( \frac{\sqrt{t}}{\rho(x)} \right)^{\alpha} \]

\[ \lesssim M_{\alpha}^L[f] t^{-1+\alpha/2}. \]
If $t \geq \rho(x)^2$, then
\[
|\partial_t \tilde{W}_t f(x) - \partial_t W_t f(x)| \lesssim \int_{\mathbb{R}^n} t^{-1} \omega_t(x-y) |f(y)| \rho(x)^{-\alpha} \rho(x)^{\alpha} \left(1 + \frac{|x-y|}{\rho(x)}\right)^{\lambda \alpha} dy
\]
\[
\lesssim M^{\mathcal{L}}_\alpha[f] t^{-1} \left[ \int_{|x-y|<\rho(x)} \omega_t(x-y) \rho(x)^{\alpha} dy + \int_{|x-y|>\rho(x)} \omega_t(x-y) \left(\frac{|x-y|}{\sqrt{t}}\right)^{\alpha/2} dy \right]
\]
\[
\lesssim M^{\mathcal{L}}_\alpha[f] t^{-1} \left(\rho(x)^{\alpha} + t^{\alpha/2}\right) \lesssim M^{\mathcal{L}}_\alpha[f] t^{-1+\alpha/2}.
\]

\[\square\]

### 3.3 Proof of Theorem 1.5

As a consequence of the previous results we have the following theorem.

**Theorem 3.12** For $0 < \alpha \leq 2 - n/q$, a measurable function $f \in \Lambda^{W}_{\alpha/2}$ if, and only if, $f \in \Lambda^{\tilde{W}}_{\alpha/2}$ and $\rho(\cdot)^{-\alpha} f(\cdot) \in L^\infty(\mathbb{R}^n)$.

This result together with Theorem 3.6 is the last step of the proof of Theorem 1.5.

### 4 Applications. Proofs of Theorems 1.6, 1.7, 1.8, and 1.9

**Lemma 4.1** Let $\beta > 0$ and $T_\beta$ be either the operator $(I + \mathcal{L})^{-\beta/2}$ or the operator $\mathcal{L}^{-\beta/2}$. If $f$ is a function such that $\rho(\cdot)^{-\alpha} f \in L^\infty(\mathbb{R}^n)$ for some $\alpha > 0$, then $T_\beta f(x)$ is well-defined and satisfies
\[
M^{\mathcal{L}}_{\alpha+\beta}[T_\beta f] \leq CM^{\mathcal{L}}_\alpha[f].
\]

Moreover if $f \in L^\infty(\mathbb{R}^n)$ then $T_\beta f(x)$ is well defined and
\[
M^{\mathcal{L}}_\beta[T_\beta f] \leq C \|f\|_\infty.
\]

**Proof** If $\rho(\cdot)^{-\alpha} f \in L^\infty(\mathbb{R}^n)$ for some $\alpha > 0$, then by Lemma 2.6 we get
\[
|(I + \mathcal{L})^{-\beta/2} f(x)| = \left| \frac{1}{\Gamma(\beta/2)} \int_0^\infty e^{-t} e^{-t \mathcal{L}} f(x) t^{\beta/2} \frac{dt}{t} \right|
\]\n\[
\leq C M^{\mathcal{E}}_\alpha[f] \int_0^{\rho(x)^2} \rho(x)^{\alpha} t^{\beta/2} \frac{dt}{t}
\]
\[
+ C M^{\mathcal{E}}_\alpha[f] \int_\rho(x)^2^\infty \rho(x)^{\alpha} \left(\frac{\rho(x)^2}{t}\right)^{\beta/2+1} t^{\beta/2} \frac{dt}{t}
\]
\[
= C M^{\mathcal{E}}_\alpha[f] \rho(x)^{\alpha+\beta}, \ x \in \mathbb{R}^n.
\]

The same estimate works for $\mathcal{L}^{-\beta/2} f$. The proof in the second case runs parallel, since Lemma 2.6 has an obvious version for bounded functions.

\[\square\]
Proof of Theorem 1.6  We prove only (i), estimate (ii) can be proved analogously. Let $f \in \Lambda^{W}_{\alpha/2}$. Lemma 2.6 with $\ell = 0$ together with Fubini’s theorem allow us to get 
\[ W_y((I + \mathcal{L})^{-\beta/2} f)(x) = \frac{1}{1(\beta/2)} \int_0^\infty e^{-t} W_y(W_t f)(x) t^{\beta/2} \frac{dt}{t}, \]
Also observe that by the semigroup property and Lemma 2.8 with $j = 1$ and $m$ such that $m + 1 \geq [\alpha/2] + 1$, we have
\[
\int_0^\infty \left| e^{-t} \partial_y W_y(W_t f)(x) t^{\beta/2} \frac{dt}{t} \right| = \int_0^\infty \left| e^{-t} \partial_w W_w f(x)|_{w=y+t} t^{\beta/2} \frac{dt}{t} \right| \leq C S_{\alpha}[f] \int_0^\infty e^{-t} \rho(x)^m (y + t)^{-(m/2+1)+\alpha/2} t^{\beta/2} \frac{dt}{t}.
\]
The last integral can be bounded by a uniform (in a neighborhood of $y$) integrable function (of $t$). This means that we can interchange the derivative with respect to $y$ and the integral with respect to $t$ in the above expression.

Let $\ell = [\alpha/2 + \beta/2] + 1$. By iterating the above arguments and using the hypothesis we have
\[
|\partial_y^\ell W_y((I + \mathcal{L})^{-\beta/2} f(x))| \leq \frac{1}{|\Gamma(\beta/2)|} \int_0^\infty e^{-t} \partial_y^\ell W_y(W_t f)(x) t^{\beta/2} \frac{dt}{t} \leq C S_{\alpha}[f] \int_0^\infty e^{-t} \rho(x)^m (y + t)^{-(m/2+1)+\alpha/2} t^{\beta/2} \frac{dt}{t}
\]
\[
= C S_{\alpha}[f] \int_0^\infty e^{-t} (y + t)^{-\ell + \alpha/2} t^{\beta/2} \frac{dt}{t}
\]
\[
\leq C S_{\alpha}[f] y^{\alpha/2 + \beta/2 - \ell} \int_0^\infty \frac{u^{\beta/2} e^{-yu}}{(1 + u)^{\ell - \alpha/2}} \frac{du}{u}
\]
\[
\leq C S_{\alpha}[f] y^{\alpha/2 + \beta/2 - \ell}.
\]

When $f \in L^\infty(\mathbb{R}^n)$ we apply Lemma 2.1 and we get for $\ell = [\beta/2] + 1$ that
\[
|\partial_y^\ell W_y W_f(x)| \leq C \frac{\|f\|_{L^\infty}}{y}.
\]
Then we can proceed as before.

By using Lemma 4.1 we get the bound of $M_{\alpha + \beta}^{\mathcal{L}}[f]$ and we end the proof of the theorem.

Remark 4.2  In the case $0 < \alpha + \beta < 1$, with $0 < \alpha, \beta < 1$, statement (i) of Theorem 1.6 was obtained in [2] and [13] for the spaces given by (1.2). Moreover, (ii) is also proved for $0 < \beta < 1$ in [2].

Lemma 4.3  Let $0 < \beta < \alpha$ and $f$ be a function in the space $\Lambda^{W}_{\alpha/2}$. Then $\mathcal{L}^{\beta/2} f$ is well defined and
\[
M_{\alpha - \beta}[\mathcal{L}^{\beta/2} f] \leq C_{\alpha, \beta}\|f\|_{\Lambda^{W}_{\alpha/2}}.
\]

Proof  We can write
\[
|\mathcal{L}^{\beta/2} f(x)| = \frac{1}{c_\beta} \left( \int_0^{\rho(x)^2} + \int_{\rho(x)^2}^\infty \right) (I - e^{-t} \mathcal{L})^{[\beta/2] + 1} f(x) \frac{dt}{t^{1+\beta/2}} = |I + II|.
\]
As \( \rho(\cdot)^{-\alpha} f \in L^\infty(\mathbb{R}^n) \), by Lemma 2.6 we have

\[
|I| \leq CM_\alpha^L [f] \int_{\rho(x)^2}^\infty \rho(x)^\alpha \frac{dt}{t^{1+\beta/2}} = CM_\alpha^L [f] \rho(x)^{\alpha-\beta}.
\]

Now we shall estimate \(|I|\). Let \( \ell = [\beta/2] + 1 \), by the semigroup property we have

\[
| (I - e^{-tL})^{\beta/2+1} f (x) | = \left| \int_0^t \cdots \int_0^t \partial_{y_1} \ldots \partial_{y_\ell} W_{y_1 + \ldots + y_\ell} f (x) dy_1 \ldots dy_\ell \right|.
\]

If \( \beta/2 < \alpha/2 < \ell \), then \( k := [\alpha/2] + 1 = \ell \) and

\[
| (I - e^{-tL})^{\ell} f (x) | \leq C S_\alpha^W [f] \int_0^t \cdots \int_0^t \frac{dy_\ell \ldots dy_1}{(y_1 + \ldots + y_\ell)^{\ell-\alpha/2}} \leq C S_\alpha^W [f] t^{\alpha/2}
\]

so \(|I| \leq C S_\alpha^W [f] \int_0^{\rho(x)^2} \frac{dt}{t^{1+\beta/2}} = C S_\alpha^W [f] \rho(x)^{\alpha-\beta}.

Now suppose that \( \ell < \alpha/2 \). Then \( k > \ell \) and by Lemma 2.8 we get, for \( 0 < t \leq \rho(x)^2 \),

\[
| (I - e^{-tL})^{\ell} f (x) | = \left| \int_0^t \cdots \int_0^t \left( - \int_{y_1 + \ldots + y_\ell}^{t} \partial^2_{y} W_{y} f (x) \right) dy_1 \ldots dy_\ell \right|
\]

\[
+ \frac{\partial^\ell_W f (x)}{(\rho(x)^2)^{k-\ell}} (\rho(x)^2)^{k-\ell} \int_0^t \cdots \int_0^t \left( u^{-k+\alpha/2} du \right) dy_1 \ldots dy_\ell
\]

\[
\leq C S_\alpha^W [f] (\rho(x)^2)^{k-\ell} \int_0^t \cdots \int_0^t u^{-k+\alpha/2} du \int_0^t \cdots \int_0^t \left( \rho(x)^2 \right)^{k-\ell} dy_1 \ldots dy_\ell
\]

\[
+ C S_\alpha^W [f] (\ell \rho(x)^2)^{-k+\alpha/2} (\rho(x)^2)^{k-\ell} \ell^\ell.
\]

Therefore, if \( \alpha \) is not even we have, for \( 0 < t \leq \rho(x)^2 \),

\[
| (I - e^{-tL})^{\ell} f (x) |
\]

\[
\leq C S_\alpha^W [f] (\rho(x)^2)^{k-\ell} \int_0^t \cdots \int_0^t (y_1 + \ldots + y_\ell)^{-k+\alpha/2+1} + (\ell \rho(x)^2)^{-k+\alpha/2+1} dy_1 \ldots dy_\ell
\]

\[
+ C S_\alpha^W [f] (\ell \rho(x)^2)^{-k+\alpha/2} \ell^{\ell}
\]

\[
\leq C S_\alpha^W [f] ((\rho(x)^2)^{k-\ell} \ell^{-k+\alpha/2+1} + (\rho(x)^2)^{-k+\alpha/2+1} \ell^{\ell}.
\]
Thus, in this case we get
\[
|I| \leq C \, S^W_\alpha[f] \left( (\rho(x)^2)_{k-\ell-1} \int_{0}^{\rho(x)^2} t^{-k+\alpha/2+\ell+\beta/2} dt + (\rho(x)^2)^{-\ell+\alpha/2} \int_{0}^{\rho(x)^2} t^{\ell+\beta/2-1} dt \right) = C \, S^W_\alpha[f] \rho(x)^{\alpha-\beta}.
\]

If \( \alpha \) is even, then \( k = \alpha/2 + 1 \) and, for \( 0 < t \leq \rho(x)^2 \),
\[
| (Id - e^{-tL})^\ell f(x) | \leq C \, S^W_\alpha[f] (\rho(x)^2)^{\alpha/2-\ell} \int_{0}^{\ell} \ldots \int_{0}^{\ell} (\log(\ell(\rho(x)^2)) - \log(y_1 + \ldots + y_\ell)) dy_1 \ldots dy_\ell + C \, S^W_\alpha[f] (\rho(x)^2)^{\alpha/2-\ell} t^{\ell}.
\]

In order to solve the last integral we can perform the change of variables \( \tilde{y}_1 = y_1, \tilde{y}_2 = y_2, \ldots, \tilde{y}_{\ell-1} = y_{\ell-1}, \tilde{y} = y_1 + \ldots + y_\ell \). Then we proceed as in the proof of Proposition 2.9. Putting together the above computations we get in this case
\[
\left| \int_{0}^{\ell} \frac{(Id - e^{-tL})^\ell f(x)}{t^{1+\beta/2}} dt \right| \leq C \, S^W_\alpha[f] (\rho(x))^{\alpha-\beta}.
\]

\[\square\]

**Proof of Theorem 1.7.** Let \( \ell = [\beta/2] + 1 \) and \( m = \left[ \frac{\alpha-\beta}{2} \right] + 1 \). Then, \( m + \ell = \left[ \frac{\alpha-\beta}{2} \right] + 1 + [\beta/2] + 1 > \alpha/2 - \beta/2 + \beta/2 = \alpha/2 \). As \( m + \ell \in \mathbb{N} \) we get \( m + \ell \geq [\alpha/2] + 1 \).

By using the arguments in the proof of Lemma 4.3 we have
\[
\left| \partial^m_y W_y(L^{\beta/2} f)(x) \right| = \left| C_\beta \int_0^\infty \partial^m_y W_y \left( \int_0^{\ell} \ldots \int_0^{\ell} \partial^\ell_y W_y |_{v=y+s_1+\ldots+s_\ell} f(x) ds_1 \ldots ds_\ell \right) \frac{dt}{t^{1+\beta/2}} \right|
\]
\[
= \left| C_\beta \int_0^\infty \left( \int_0^{\ell} \ldots \int_0^{\ell} \partial^\ell_y W_y |_{v=y+s_1+\ldots+s_\ell} f(x) ds_1 \ldots ds_\ell \right) \frac{dt}{t^{1+\beta/2}} \right|
\]
\[
\leq C_\beta \, S^W_\alpha[f] \int_0^\infty \left( \int_0^{\ell} \ldots \int_0^{\ell} (y + s_1 + \ldots + s_\ell)^{-m+\ell/2} ds_1 \ldots ds_\ell \right) \frac{dt}{t^{1+\beta/2}}
\]
\[
= C_\beta \, S^W_\alpha[f] \int_0^\infty (\ldots) \frac{dt}{t^{1+\beta/2}} + C_\beta \, S^W_\alpha[f] \int_0^\infty (\ldots) \frac{dt}{t^{1+\beta/2}} = C_\beta \, S^W_\alpha[f] (A + B).
\]
Now we shall estimate $A$ and $B$.

\[
A = C\beta y^{-m+\alpha/2} \int_0^y \int_0^{t/y} \ldots \int_0^{t/y} (1 + s_1 + \ldots + s_\ell)^{-(m+\ell)+\alpha/2} \, ds_1 \ldots ds_\ell \frac{dt}{t^{1+\beta/2}}
\]

\[
\leq C\beta y^{-m+\alpha/2} \int_0^y \frac{(1 + t/yt)^{\ell}}{t^{1+\beta/2}} \, dt
= C\beta y^{-m+\alpha/2-\ell} \int_0^y \frac{dt}{t^{1+\beta/2-\ell}} = C\beta y^{-m+(\alpha-\beta)/2}.
\]

On the other hand,

\[
B \leq \int_0^\infty \sum_{j=0}^\ell \frac{C_j}{(y + jt)^{m-\alpha/2}} \frac{dt}{t^{1+\beta/2}} = \sum_{j=0}^\ell \int_y^\infty \frac{C_j}{(y + jt)^{m-\alpha/2}} \frac{dt}{t^{1+\beta/2}}
\]

\[
\leq \sum_{j=0}^\ell C_j y^{-m+(\alpha-\beta)/2}.
\]

The last inequality is obtained by observing that $y \leq y + jt \leq (1 + \ell)t$ inside the integrals together with the discussion about the sign of $m - \alpha/2$. □

**Remark 4.4** The previous result was obtained in [13] for the spaces given by (1.2) when $0 < \alpha < 1$.

**Proof of Theorem 1.8.** Let $0 < \alpha \leq 1 - n/q$ and $f \in \Lambda_{1/2}^W$. By Theorem 1.6 we have that $L^{-1/2} f \in \Lambda_{1/2}^W$ and by Theorem 3.12 this means that $L^{-1/2} f \in \Lambda_{\alpha/2}^W$ and $\rho(\cdot)^{-(\alpha+1)} L^{-1/2} f \in L^\infty(\mathbb{R}^n)$. Therefore, by Proposition 3.9 we get that $R_i f = \partial_{x_i} (L^{-1/2} f) \in \Lambda_{1/2}^W$ and $\rho(\cdot)^{-\alpha} R_i f \in L^\infty(\mathbb{R}^n)$. Thus, Theorem 3.12 gives the second statement of the theorem.

Suppose now $1 < \alpha \leq 2 - n/q$ and $f \in \Lambda_{\alpha/2}^W$. By Theorem 3.12 this means that $f \in \Lambda_{\alpha/2}^W$ and $\rho(\cdot)^{-\alpha} f \in L^\infty(\mathbb{R}^n)$. Then, Proposition 3.9 gives that $\partial_{x_i} f \in \Lambda_{\alpha/2}^W$ and $\rho(\cdot)^{-(\alpha-1)} \partial_{x_i} f \in L^\infty(\mathbb{R}^n)$. Again, by Theorem 3.12 this means that $\partial_{x_i} f \in \Lambda_{\alpha/2}^W$ and by Theorem 1.6 we get that $R_i f = L^{-1/2}(\partial_{x_i} f) \in \Lambda_{1/2}^W$. □

**Remark 4.5** Theorem 1.8 was known in the case $0 < \alpha < 1$ for the spaces given by (1.2), see [3].

**Proof Theorem 1.9.** Lemmas 2.6 and 2.8 guaranty the integrability of $\partial_s (W_s f(x))$ as a function of $s$. Then, we can write
\[ m(\mathcal{L}) f(x) = \int_0^\infty (-\partial_s(W_s f(x)))a(s)ds = \left( \int_0^{\rho(x)^2} + \int_{\rho(x)^2}^\infty \right) (-\partial_s(W_s f(x)))a(s)ds = I + II. \]

By using Lemma 2.6, we get

\[ |II| \leq C\|a\|_\infty M^L_\alpha [f] \rho(x)^\alpha \int_0^\infty \frac{1}{s} \left( 1 + \frac{s}{\rho(x)^2} \right)^{-M} ds \]
\[ = C\|a\|_\infty M^L_\alpha [f] \rho(x)^\alpha \int_1^\infty \frac{1}{u(1+u)^M} du \leq C\|a\|_\infty M^L_\alpha [f] \rho(x)^\alpha. \]

Now we estimate \( I \). Let \( k = [\alpha/2] + 1 \). If \( \alpha \) is not even, by Lemma 2.8 we get

\[ |I| \leq (\rho(x))^{2(k-1)} \int_0^{\rho(x)^2} |\partial_s W_s f(x)| (\rho(x))^{2(k-1)} a(s)ds \leq C\|a\|_\infty S^W_\alpha [f] (\rho(x))^{2(k-1)} \int_0^{\rho(x)^2} s^{-k+\alpha/2} ds \]
\[ = C\|a\|_\infty S^W_\alpha [f] \rho(x)^\alpha. \]

If \( \alpha \) is even, by Lemma 2.8 we have

\[ |I| = \left| \int_0^{\rho(x)^2} \left( \int_s^{\rho(x)^2} \frac{\partial_u^2 W_u f(x)}{(\rho(x))^{2(k-2)}} du \right)(\rho(x))^{2(k-2)} a(s)ds \right| \]
\[ \leq C\|a\|_\infty S^W_\alpha [f] \int_0^{\rho(x)^2} \left( \int_s^{\rho(x)^2} u^{-1} du \right) (\rho(x))^{\alpha-2} + (\rho(x))^\alpha ds \]
\[ = C\|a\|_\infty S^W_\alpha [f] \int_0^{\rho(x)^2} \left( \log(\rho(x)^2) - \log s \right)(\rho(x))^{\alpha-2} ds + (\rho(x))^\alpha \]
\[ = C\|a\|_\infty S^W_\alpha [f] \rho(x)^\alpha. \]

Up to now, we have shown that \( M^L_\alpha [m(\mathcal{L}) f] \leq C\|f\|_{A^W_{\alpha/2}}. \)

Now we want to see that \( \|\partial_u^k W_y m(\mathcal{L}) f\|_\infty \leq C y^{-k+\alpha/2} \). Fubini’s Theorem together with Lemmas 2.8 and 2.6 allow us to interchange integral with derivatives and kernels. Then,

\[ |\partial_u^k W_y m(\mathcal{L}) f(x)| = \left| \int_0^\infty \partial_u^{k+1} W_y f(x) \bigg|_{u=y^+} a(s)ds \right| \leq C\|a\|_\infty S^W_\alpha [f] \int_0^\infty \frac{ds}{(y+s)^{k+1-\alpha/2}} \]
\[ = C\|a\|_\infty S^W_\alpha [f] y^{-(k+1)+\alpha/2} \int_0^\infty \frac{dr}{(1+r)^{k+1-\alpha/2}} = C\|a\|_\infty S^W_\alpha [f] y^{-k+\alpha/2}. \]

\[ \square \]

**Remark 4.6** In the case \( 0 < \alpha < 1 \), the previous result was obtained in [13] for the spaces given by (1.2).
5 Lipschitz spaces via the Poisson Semigroup

The Poisson semigroup of the operator \( \mathcal{L} \) was defined in (1.3). The following result was proved in [13].

Lemma 5.1 Given \( k \in \mathbb{N} \), for any \( N > 0 \) there exists a constant \( C = C_{N,k} \) such that

\[
\begin{align*}
(a) \quad & P_y(x, z) \leq C \frac{y}{(|x| + y)^{2k+2}} \left( 1 + \frac{|x|^2 + y^2}{\rho(x)} \right)^{-N}; \\
(b) \quad & |\partial^k_y P_y(x, z)| \leq C \frac{1}{(|z| + y)^{2k+2}} \left( 1 + \frac{|x|^2 + y^2}{\rho(x)} \right)^{-N}.
\end{align*}
\]

As a consequence, we have the following proposition.

Proposition 5.2 Let \( f \) be a function such that \( M^P[f] = \int_{\mathbb{R}^n} \frac{|f(x)|}{(1 + |x|)^{n+1}} dx < \infty \). Then, \( \lim_{y \to 0} \partial^k_y P_y f(x) = 0 \), for every \( \ell \in \mathbb{N} \cup \{0\}, x \in \mathbb{R}^n \), and \( \lim_{y \to 0} P_y f(x) = f(x) \), a.e. \( x \in \mathbb{R}^n \).

Proof The convergence to 0 of the Poisson semigroup and its derivatives follows directly from the previous Lemma. It remains to prove that \( \lim_{y \to 0} P_y f(x) = f(x) \), a.e. \( x \in \mathbb{R}^n \).

By Lemma 5.1 we have that, for \( y < 1 \),

\[
\begin{align*}
\int_{|x-z|>2|x|} |P_y(x, z)| f(z) dz & \leq \int_{|x-z|>2|x|} \frac{y}{(|x-z| + y)^{n+1}} |f(z)| dz \\
& \leq C \int_{|z|<1} \frac{y}{(2|x| + y)^{n+1}} |f(z)| dz + C \int_{|z|>1} \frac{y}{(\frac{|z|}{2} + 1)^{n+1}} |f(z)| dz \\
& \leq Cy \int_{|z|<1} |f(z)| dz + Cy \int_{|z|>1} \frac{1}{(|z| + 1)^{n+1}} |f(z)| dz \to 0, \text{ as } y \to 0. \quad (5.1)
\end{align*}
\]

To manipulate the other integral, we proceed as in the proof of Lemma 2.3. We compare the Poisson kernel with the kernel of the classical Poisson semigroup, \( e^{-y\sqrt{-\Delta}} \), that we will denote by \( \tilde{P}_y \).

By using (2.4) we have that

\[
\begin{align*}
\left| \int_{|x-z|<2|x|} (P_y(x, z) - \tilde{P}_y(x-z)) f(z) dz \right| & \leq C \int_0^\infty ye^{-\frac{y^2}{4\tau}} \int_{|x-z|<2|x|} |W_\tau(x, z) - \tilde{W}_\tau(x-z)||f(z)| dz \frac{d\tau}{\tau^{3/2}} \\
& \leq C \int_{\rho(x)^2} ye^{-\frac{y^2}{4\tau}} \int_{|x-z|<2|x|} \left( \frac{\sqrt{\tau}}{\rho(x)} \right)^{2-n/q} \omega_\tau(x-z) |f(z)| dz \frac{d\tau}{\tau^{3/2}} \\
& \quad + Cy \int_{\rho(x)^2} \frac{d\tau}{\tau^{3/2}} \int_{|x-z|<2|x|} |f(z)| dz \\
& \leq C \int_0^\infty ye^{-\frac{y^2}{4\tau}} \int_{|x-z|<2|x|} \left( \frac{\sqrt{\tau}}{\rho(x)} \right)^{2-n/q} \omega_\tau(x-z) |f(z)| dz \frac{d\tau}{\tau^{3/2}} \\
& \quad + Cy \int_{\rho(x)^2} \frac{d\tau}{\tau^{3/2}} \int_{|x-z|<2|x|} |f(z)| dz.
\end{align*}
\]

\[ \text{Springer} \]
\[
\begin{aligned}
\leq \frac{C(x)}{\rho(x)} \int_0^{\rho(x)^2} \frac{y}{\tau^{1/2}} e^{-\frac{\tau}{4}} \left( \sqrt{\tau} \right)^{\epsilon} d\tau + \frac{C(x) y}{\rho(x)} \\
\leq \frac{C(x) y^{\epsilon}}{\rho(x)^{\epsilon}} + \frac{C(x) y}{\rho(x)} \rightarrow 0, \text{ as } y \rightarrow 0,
\end{aligned}
\]

where \(0 < \epsilon < 1\).

Finally, by the point-wise convergence of the classical Poisson semigroup to \(L^1\) functions, we deduce the result. \(\square\)

Parallel to the heat semigroup case, in order to prove Theorem 1.10, we shall need this lemma.

**Lemma 5.3** Let \(\alpha > 0\) and \(k = \lceil \alpha \rceil + 1\). Assume that \(f \in \Lambda^P_{\alpha}\), then for every \(j, m \in \mathbb{N} \cup \{0\}\) such that \(m + j \geq k\), there exists a \(C_{m,j} > 0\) such that

\[
\left\| \frac{\partial_j P_y f}{\rho(\cdot)^m} \right\|_{\infty} \leq C_{m,j} S^P_{\alpha} \left[ f \right] y^{-(m+j)+\alpha}.
\]

**Proof** For \(\ell > k\), by the semigroup property and Lemma 5.1 we get that

\[
\left| \frac{\partial^\ell_y P_y f(x)}{\rho(x)^m} \right| = \frac{C_{\ell}}{\rho(x)^m} \int_{\mathbb{R}^n} \left| \partial_{v}^{\ell-k} P_y f(x, z) |_{v=y/2} \partial_{u}^{k} P_y f(z) |_{u=y/2} dz \right|
\]

\[
\leq \frac{C_{\ell} \left\| \partial_{u}^k P_y f |_{u=y/2} \right\|_{\infty}}{\rho(x)^m} \int_{\mathbb{R}^n} \frac{1}{(|x-z|^2 + y^2)^{n+\ell-k} y} \left( \frac{\rho(x)}{y} \right)^m dz
\]

\[
\leq C_{\ell} S^P_{\alpha} \left[ f \right] y^{-(m+\ell)+\alpha}, \quad x \in \mathbb{R}^\mathbb{N}.
\]

If \(j \leq k\), since the \(y\)-derivatives of \(P_y f(x)\) tend to zero as \(y \rightarrow \infty\), we integrate \(\ell - j\) times the previous estimate and we get the result. \(\square\)

**Proof of Theorem 1.10.** By using Proposition 5.2 we have

\[
\left| f(x) \right| \leq \sup_{0<y<\rho(x)} \left| P_y f(x) \right|
\]

\[
\leq \sup_{0<y<\rho(x)} \left| P_y f(x) - P_{\rho(x)} f(x) \right| + \left| P_{\rho(x)} f(x) \right|
\]

\[
= I + II.
\]

Let \(k = \lceil \alpha \rceil + 1\). By using Lemma 5.3 with \(j = 0\) and \(m = k\) we have

\[
II = \left| P_{\rho(x)} f(x) \right| = \left| \frac{P_{\rho(x)} f(x)}{\rho(x)^k} \right| \rho(x)^k \leq C S^P_{\alpha} \left[ f \right] (\rho(x))^{-k+\alpha} \rho(x)^k = C S^P_{\alpha} \left[ f \right] \rho(x)^\alpha.
\]
Now we shall estimate \( I \). If \( \alpha \) is not integer, by Lemma 5.3 with \( j = 1 \) and \( m = k - 1 \) we have that

\[
I \leq \rho(x)^{k-1} \sup_{0 < y < \rho(x)} \int_{y}^{\rho(x)} \left| \partial_z P_z f(x) \right| dz \leq C S_{\alpha}^P[f] \rho(x)^{k-1} \sup_{0 < y < \rho(x)} \int_{y}^{\rho(x)} z^{-k+\alpha} dz
\]

\[
\leq C S_{\alpha}^P[f] \rho(x)^{k-1} \sup_{0 < y < \rho(x)} ((\rho(x))^{-(k-1)+\alpha} - y^{-(k-1)+\alpha}) \leq C S_{\alpha}^P[f] \rho(\alpha)^\alpha.
\]

When \( \alpha \) is an integer, we write

\[
I = \sup_{0 < y < \rho(x)} \int_{y}^{\rho(x)} \left| \partial_z P_z f(x) \right| dz.
\]

By Lemma 5.3 with \( j = 2 \) and \( m = k - 2 \), since \( k = \alpha + 1 \), we get

\[
\left| \int_{y}^{\rho(x)} \int_{z}^{\rho(x)} \partial^2_{u,v} f(x) dudz \right| = \rho(x)^{k-2} \left| \int_{y}^{\rho(x)} \int_{z}^{\rho(x)} \frac{\partial^2_{u,v} f(x)}{\rho(x)^{k-2}} dudz \right|
\]

\[
\leq C S_{\alpha}^P[f] \rho(x)^{\alpha-1} \int_{y}^{\rho(x)} \int_{z}^{\rho(x)} u^{-1} dudz = C S_{\alpha}^P[f] \rho(x)^{\alpha-1} \int_{y}^{\rho(x)} (\log(\rho(x)) - \log z) dz
\]

\[
= C S_{\alpha}^P[f] \rho(x)^{\alpha-1} \left[ \log(\rho(x)) (\rho(x) - y) - (\rho(x) \log(\rho(x)) - \rho(x) - y \log y + y) \right]
\]

\[
= C S_{\alpha}^P[f] \rho(x)^{\alpha-1} \left[ y \log \left( \frac{y}{\rho(x)} \right) + \rho(x) - y \right] \leq C S_{\alpha}^P[f] \rho(\alpha)^\alpha.
\]

For the second summand of \( I \), Lemma 5.3, with \( j = 1 \) and \( m = k - 1 \) applies, so

\[
\sup_{0 < y < \rho(x)} \left( \rho(x) - y \right) \left| \partial_{v} P_{v} f(x) \right|_{v = \rho(x)} = \sup_{0 < y < \rho(x)} \left( \rho(x) - y \right) \rho(x)^{k-1} \left| \frac{\partial_{v} P_{v} f(x) \left|_{v = \rho(x)} \right|}{\rho(x)^{k-1}} \right|
\]

\[
\leq C S_{\alpha}^P[f] \sup_{0 < y < \rho(x)} \left( \rho(x) - y \right) \rho(x)^{\alpha} \left( \rho(x)^{-1} \right) \leq C S_{\alpha}^P[f] \rho(x)^{\alpha}.
\]

\[\square\]

To prove Theorem 1.13, we need to define an auxiliary class of Lipschitz functions by means of the classical Poisson semigroup, \( \tilde{P}_y = e^{-y\sqrt{-A}} \). Again, the crucial difference between this class and the one defined by Stein in [16] is that the functions don’t need to be bounded.

We define \( \Lambda_{\alpha}^P \) as the collection of functions satisfying \( M^P[f] < \infty \) and

\[
\left\| \partial^k_y \tilde{P}_y f \right\|_{L^\infty(\mathbb{R}^n)} \leq C_{\alpha} y^{-k+\alpha}, \text{ with } k = [\alpha] + 1, \ y > 0.
\]

We denote by \( S_{\alpha}^P[f] \) as the infimum of the constants \( C_{\alpha} \) above.

\[\heartsuit\] Springer
Remark 5.4 Observe that the space $\Lambda_\alpha^\tilde{P}$ is well defined, because if $f$ is a function such that $M_\alpha^P[f] < \infty$, then

\[(i) \ |\partial_{x_i}^m \partial_y^\ell \tilde{P}_y f(x)| \rightarrow 0 \text{ as } y \rightarrow \infty \text{ as far as } m + \ell \geq k \geq 1. \text{ Indeed,}\]

\[
|\partial_{x_i}^m \partial_y^\ell \tilde{P}_y f(x)| \leq C \int_{|x-z|<|x|} \frac{|f(z)|}{(|x-z|+y)^{n+k}} \, dz + C \int_{|x-z|>|x|} \frac{|f(z)|}{(|z|+y)^{n+k}} \, dz
\]

\[
\leq C \frac{1}{y^{n+k}} \int_{|x-z|<|x|} |f(z)| \, dz + C \int_{|x-z|>|x|} \frac{|f(z)|}{(|z|+y)^{n+k}} \, dz.
\]

Both summands tend to zero, the second one by dominated convergence.

\[(ii) \ \lim_{y \to 0} \tilde{P}_y f(x) = f(x) \text{ a.e. } x \in \mathbb{R}^n. \text{ This can be proved as we did in (5.1) and by using the a.e. convergence of the classical Poisson semigroup for } L^1 \text{ functions.}\]

Moreover, we can prove the following results analogously as we did for the heat semigroup.

Proposition 5.5 Let $\alpha > 0$, $k = [\alpha] + 1$ and $f$ be a function satisfying $M_\alpha^P[f] < \infty$. Then, $\|\partial_y^k \tilde{P}_y f\|_{L^\infty(\mathbb{R}^n)} \leq C_k y^{-k+\alpha}$ if, and only if, for $m \geq k$, $\|\partial_{x_i}^m \tilde{P}_y f\|_{L^\infty(\mathbb{R}^n)} \leq C_m y^{-m+\alpha}$.

Theorem 5.6 Let $\alpha > 0$ and $f$ a function such that $M_\alpha^P[f] < \infty$. If $f \in \Lambda_\alpha^W$, then $f \in \Lambda_\alpha^P$. Moreover, $S_\alpha^P[f] \leq C S_\alpha^W[f]$.

Proof Let $k = [\alpha/2] + 1$ and $f \in \Lambda_\alpha^W$, then $[\alpha] + 1 = [\alpha/2 + \alpha/2] + 1 \leq [\alpha/2] + [\alpha/2] + 2 = 2k$. By Proposition 5.5 it is enough to prove that $\|\partial_{y_i}^{2k} P_y f\|_\infty \leq C y^{-(2k)+\alpha}$.

Since $\partial_{y_i}^2 \left(\frac{ye^{-\frac{1}{\sqrt{\tau}}}}{\sqrt[3]{2\pi}}\right) = \partial_{y_i} \left(\frac{ye^{-\frac{1}{\sqrt{\tau}}}}{\sqrt[3]{2\pi}}\right)$, $k$-times integration by parts give

\[
|\partial_{y_i}^{2k} P_y f(x)| = \left| \frac{1}{2\sqrt{\pi}} \int_0^\infty \partial_y^{2k} \left(\frac{ye^{-\frac{1}{\sqrt{\tau}}}}{\sqrt[3]{2\pi}}\right) e^{-\tau \mathcal{L} f(x)} \, d\tau \right| = \left| \frac{1}{2\sqrt{\pi}} \int_0^\infty \partial_{\tau}^{2k} \left(\frac{ye^{-\frac{1}{\sqrt{\tau}}}}{\sqrt[3]{2\pi}}\right) e^{-\tau \mathcal{L} f(x)} \, d\tau \right|
\]

\[
= \left| \frac{1}{2\sqrt{\pi}} \int_0^\infty (-1)^k \partial_{\tau}^{2k} e^{-\tau \mathcal{L} f(x)} \, d\tau \right| \leq C S_\alpha^W[f] \int_0^\infty \frac{ye^{-\frac{1}{\sqrt{\tau}}}}{\sqrt[3]{2\pi}} \tau^{-k+\alpha/2} \, d\tau
\]

\[
\leq C S_\alpha^W[f] \left( \frac{1}{y^2} \int_0^\infty \frac{ye^{-\frac{1}{\sqrt{\tau}}}}{\sqrt[3]{2\pi}} \tau^{-k+\alpha/2} \, d\tau + \int_{y^2}^\infty \tau^{-k+\alpha/2} \, d\tau \right)
\]

\[
\leq C S_\alpha^W[f] y^{-2k+\alpha}.
\]

The following Lemma is parallel to Lemma 3.5. We leave the details of the proof to the interested reader.

Lemma 5.7 Let $\alpha > 0$ and $k = [\alpha] + 1$. If $f \in \Lambda_\alpha^\tilde{P}$, then for every $j, m \in \mathbb{N} \cup \{0\}$ such that $m + j \geq k$, there exists a $C_{m,j} > 0$ such that

\[
\left\| \partial_{x_i}^m \partial_{y_j}^\ell \tilde{P}_y f \right\|_\infty \leq C S_\alpha^\tilde{P}[f] y^{-(m+j)+\alpha}, \text{ for every } i = 1, \ldots, n.
\]
Theorem 5.8 Let $0 < \alpha < 2$. Then $f \in \Lambda^\text{\text{\check{P}}}_a$, if and only if $M^P[f] < \infty$ and

$$N_\alpha[f] = \sup_{|z| > 0} \frac{\|f(\cdot + z) + f(\cdot - z) - 2f(\cdot)\|_{\infty}}{|z|^\alpha} < \infty.$$  

Proof Let $x \in \mathbb{R}^n$. We can write, for every $y > 0$, $z \in \mathbb{R}^n$,

$$|f(x + z) + f(x - z) - 2f(x)| \leq |\tilde{P}_y f(x + z) - f(x + z) + \tilde{P}_y f(x - z) - f(x - z) - 2(\tilde{P}_y f(x) - f(x))| + |\tilde{P}_y f(x + z) - \tilde{P}_y f(x) + \tilde{P}_y f(x - z) - \tilde{P}_y f(x)|$$

$$= A + B.$$  

By using Lemma 5.7 we can proceed as in the proof of Theorem 3.6. We have

$$B = |\tilde{P}_y f(x + z) - \tilde{P}_y f(x) + \tilde{P}_y f(x - z) - \tilde{P}_y f(x)| \leq C S^\tilde{P}_\alpha[f]y^{-2+\alpha}|z|^2,$$

If $0 < \alpha < 1$, by using Remark 5.4 we have that

$$|\tilde{P}_y f(x) - f(x)| = \left|\int_0^y \partial_u \tilde{P}_u f(x)du\right| \leq C S^\tilde{P}_\alpha[f]\int_0^y u^{-1+\alpha}du = C S^\tilde{P}_\alpha[f]y^\alpha,$$

and the same for the other two summands of $A$.

If $1 < \alpha < 2$, by proceeding as in the proof of Theorem 3.6, by Lemma 5.7 we have that

$$A = \left|\int_0^y \partial_u \tilde{P}_u f(x + z) + \partial_u \tilde{P}_u f(x - z) - 2\partial_u \tilde{P}_u f(x)du\right|$$

$$= \left|\int_0^y \int_0^1 (\nabla_w \partial_u \tilde{P}_u f(w)|_{w=x+\theta z} \cdot z - \nabla_v \partial_u \tilde{P}_u f(v)|_{v=x-\theta z} \cdot z)d\theta du\right|$$

$$\leq C S^\tilde{P}_\alpha[f]\int_0^y u^{-2+\alpha}du|z| \leq C S^\tilde{P}_\alpha[f]y^{-1+\alpha}|z|.$$  

Thus, by choosing $y = |z|$ in each case we get what we wanted.

For $\alpha = 1$, by using that $\partial_u \tilde{P}_u f(x) = -\int_u^1 \partial_w \tilde{P}_w f(x)dw + \partial_y \tilde{P}_y f(x)$, we have

$$|A| \leq C S^\tilde{P}_1[f]\int_0^y \int_u^y w^{-1}dwdu + \left|\int_0^y \left(\partial_y \tilde{P}_y f(x + z) + \partial_y \tilde{P}_y f(x - z) - 2\partial_y \tilde{P}_y f(x)\right)du\right|$$

$$= A_1 + A_2.$$  

Observe that $A_1 \leq C S^\tilde{P}_1[f]|z|$. Regarding $A_2$, we proceed as in the case $1 < \alpha < 2$ and we have

$$A_2 \leq \left|\int_0^1 (\nabla_z \partial_y \tilde{P}_y f(\tilde{x})|_{\tilde{x}=x+\theta z} \cdot z - \nabla_z \partial_y \tilde{P}_y f(\tilde{z})|_{\tilde{z}=x-\theta z} \cdot z)d\theta\right| \leq C S^\tilde{P}_1[f]|z|.$$  

When $y = |z|$ we get what we wanted.

\(\square\) Springer
For the converse we proceed as in Theorem 3.6.

\begin{proof}

\textbf{Theorem 5.9} Let \(0 < \alpha \leq 2 - \frac{n}{q}\) and \(f\) be a function such that \(M^P[f] < \infty\). If \(\rho(\cdot)^{-\alpha}f(\cdot) \in L^\infty(\mathbb{R}^n)\), then

\[
\|\partial_y^2 P_y f - \partial_y^2 \tilde{P}_y f\|_\infty \leq CM_\alpha^L[f]y^{-2+\alpha}.
\]

\end{proof}

\textbf{Proof} By subordination formula, integration by parts and and Theorem 3.11 we have that

\[
|\partial_y^2 P_y f(x) - \partial_y^2 \tilde{P}_y f(x)| = \left| \frac{1}{2\sqrt{\pi}} \int_0^\infty \partial_y^2 \left( \frac{ye^{-\frac{y^2}{4\tau}}}{\tau^{3/2}} \right) (W_\tau f - \tilde{W}_\tau f) d\tau \right|
\]

\[
= \left| \frac{1}{2\sqrt{\pi}} \int_0^\infty \partial_\tau \left( \frac{ye^{-\frac{y^2}{4\tau}}}{\tau^{3/2}} \right) (W_\tau f - \tilde{W}_\tau f) d\tau \right|
\]

\[
\leq \frac{1}{2\sqrt{\pi}} \int_0^\infty \frac{ye^{-\frac{y^2}{4\tau}}}{\tau^{3/2}} |\partial_\tau (W_\tau f - \tilde{W}_\tau f)| d\tau
\]

\[
\leq CM_\alpha^L[f] \int_0^\infty \frac{ye^{-\frac{y^2}{4\tau}}}{\tau^{3/2}} \tau^{-1+\alpha/2} d\tau
\]

\[
\leq CM_\alpha^L[f] \left( \frac{1}{y^2} \int_0^{y^2} \frac{y^3}{\tau^{3/2}} e^{-\frac{y^2}{4\tau}} \tau^{-1+\alpha/2} d\tau + \int_{y^2}^\infty \tau^{-1+\alpha/2} d\tau \right)
\]

\[
\leq CM_\alpha^L[f]y^{-2+\alpha}.
\]

\end{proof}

A consequence of the previous theorem is the following.

\textbf{Theorem 5.10} Let \(0 < \alpha \leq 2 - \frac{n}{q}\) and \(f\) be a function such that \(M^P[f] < \infty\) and \(\rho(\cdot)^{-\alpha}f(\cdot) \in L^\infty(\mathbb{R}^n)\). Then, \(f \in \Lambda_\alpha^P\) if and only if \(f \in \Lambda_\alpha^{\tilde{P}}\).

Finally it is easy to see that Theorems 3.6, 5.6, 5.10 and 5.8 have as a consequence that Theorem 1.13 is true.

**Acknowledgements** The authors are highly indebted to the referees for the very careful reading of the manuscript. The precise comments and remarks greatly helped the authors to improve the manuscript and in particular the proofs of Lemma 2.6 and Theorem 3.11.
