General
Flash column chromatography (FCC) was carried out with a Büchi system (Pump Manager C-615 and Fraction Collector C-660) using Normasil 60 silica gel (0.040–0.063 mm; VWR). Thin-layer chromatography (TLC) analysis was carried out using TLC silica gel 60 F254 (aluminium sheets, Merck), and plates were visualized with UV light or by treatment with permanganate solution followed by heating. Optical rotations were measured with a JASCO P-2000 digital polarimeter with a Na-D lamp (10 cm cell length). Concentrations (c) are given in gram per 100 mL. Infrared (IR) spectra were recorded as neat samples with a Nicolet 5700 FTIR spectrometer with an ATR Smart Orbit Diamond adapter (Thermo Electron Corporation). NMR spectra were recorded with a Varian INOVA-300 spectrometer (1H, 299.95 MHz, and 13C, 75.42 MHz) and a Varian VNMRS-600 instrument (1H, 599.75 MHz, and 13C, 150.81 MHz) in CDCl3 using tetramethylsilane as the internal standard. Data are presented as follows: chemical shift (in ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, dd = doublet of doublets, ddd = doublet of doublet of doublets, td = triplet of doublets, dt = doublet of triplets, m =multiplet, bs = broad singlet), coupling constants (J/Hz) and integration. HRMS analysis was carried out with an Orbitrap Velos Pro spectrometer (Thermo Fisher Scientific). All solvents used were dried and distilled according to conventional methods.

2,3-Dihydroisoxazoles 5a, 5b and benzoylated isoxazolidine-4,5-diols 6a, 6b were prepared using already published procedures [1,2].

(±)-2-Benzyl-3-phenylisoxazolidin-4-yl benzoate (7a)
A round-bottom reaction flask was charged with isoxazolidinyl dibenzoate 6a (350 mg, 0.73 mmol), sealed with a rubber septum, evacuated, and filled with argon. Anhydrous CH2Cl2 was added (0.7 mL) followed by Et3SiH (350 µL, 2.19 mmol), and the resulting solution was cooled in an ice-water bath (0 °C). TMSOTf (270 µL, 1.49 mmol) was added dropwise to the stirred solution. After stirring at 0 °C for 5 min, the cooling bath was removed, and the mixture was further stirred at room temperature for 2 h. After this time, TLC showed that the reaction was complete (hexanes/ethyl acetate, 9:1). The reaction mixture was cooled in an ice-water bath and the reaction was quenched by addition of sat. aq NaHCO3 solution (5 mL). Afterwards, the mixture was diluted with water (5 mL) and extracted with CH2Cl2 (2 × 5 mL). The combined organic layers were washed with water (10 mL), dried with MgSO4 and evaporated in vacuo.
