INTRODUCTION

Plastic and reconstructive surgery is a unique field that is not limited to a specific demographic group or anatomic part. The poor understanding and misconception about plastic surgeons’ scope of practice has been well-established among the public, especially in Saudi Arabia; but the question is, do healthcare physicians share the same misconception? This study aims to answer this question.

Methods: This study was conducted between September 11, 2021 and November 1, 2021. This is a cross-sectional, survey-based study utilizing a self-structured questionnaire targeting physicians in Saudi Arabia.

Results: A total of 261 medical and surgical physicians participated in this study. Nearly 45% of them demonstrated a poor understanding of plastic surgery and its scope of practice, whereas only 16.1% were sufficiently knowledgeable. Male physicians were more likely to understand the field of plastic surgery when compared with female physicians. More than 80% of the physicians knew that cosmetic operations are done by plastic surgeons, whereas 50% or less knew that reconstructive operations are conducted by plastic surgeons.

Conclusion: This study shows that 44.1% of the participating physicians demonstrate poor knowledge regarding plastic surgery as a field, in addition to a lack of understanding about the scope of practice of plastic surgeons. We recommend enhancing promotional efforts that raise awareness about the nature of plastic surgery as a specialty among healthcare physicians. (Plast Reconstr Surg Glob Open 2022;10:e4104; doi: 10.1097/GOX.0000000000004104; Published online 28 February 2022.)

Current literature lacks studies exploring medical and surgical physicians’ perception of plastic surgery as a field, as well as estimating their knowledge about plastic surgeons’ scope of practice. Hence, this study aims to fill this gap by conducting a nationwide study among physicians in Saudi Arabia, utilizing a self-structured questionnaire based on previously published studies.1–12

**METHODOLOGY**

In this cross-sectional study, the authors structured a self-administered questionnaire based on available literature with similar objectives.1–12 The questionnaire was revised by three academic plastic surgeons to ensure the objectivity of the questions. The single inclusion criterion was being a physician in either a surgical or a medical specialty during the period the study. Any responses from plastic surgeons have been excluded to prevent any biases in the result.

Apart from the demographic questions, the questionnaire was based on 33 items to assess general knowledge about plastic surgery. 27 of which were clinical scenarios of common plastic surgery procedures. The questionnaire was composed of two sections covering the following aspects: questions that assess general knowledge about plastic surgery and questions in the form of common clinical scenarios managed by plastic surgeons to assess the scope of understanding.

All physicians have been notified that no identifiers will be required. Data were kept safe with authorized access only. The electronic survey (see figure, Supplemental Digital Content 1, which shows the plastic surgery assessment questions, http://links.lww.com/PRSGO/B921) was distributed to physicians affiliated with major universities in Saudi Arabia (King Abdulaziz University, King Saud bin Abdulaziz University for Health Sciences, and King Saud University) by 29 data collectors. Data collection took place between September 11, 2021, and November 1, 2021.

The data were analyzed using Statistical Packages for Software Sciences version 26 (IBM Corporation, Armonk, N.Y.). The overall knowledge of physicians regarding plastic surgery was assessed by a 33-item questionnaire. The total knowledge score was obtained by adding all 33 items, and a score ranging from 0 to 33 was generated where a higher score indicated deeper understanding of the role of plastic surgeons. By using 50% and 75% as cutoff points to determine the level of knowledge, participants were classified as having poor knowledge if they scored below 50%, whereas participants who scored 50%–75% were considered as having moderate knowledge, and participants who scored above 75% were considered to have a good knowledge level.

For the descriptive analysis, mean ± SD was used for metric variables, whereas numbers and percentages were given for categorical variables. Multiple response patterns were allowed for each clinical scenario; therefore, a total (frequency distribution) was calculated for each specialty. The frequency distribution per “plastic surgeon” was identified as the primary variable of interest. As for comparison, the Mann–Whitney U-test and Kruskal–Wallis H-test were applied. Normality test was conducted using the Shapiro–Wilk test. Values were considered significant with a confidence level of 95% ($P < 0.05$).

**RESULTS**

In total, 261 physicians agreed to participate in the study. The most common age group was 30 years old or younger (60.2%), with more than half being females (51%). Surgeons constituted 31.4%, whereas internal medicine physicians constituted 19.2%. Furthermore, the vast majority (93.1%) were of Saudi nationality, with nearly 60% having less than 5 years of practice. The prevalence of physicians who underwent a plastic surgery procedure was 18%, and the prevalence of physicians who frequently managed a patient after a plastic surgery procedure was 17.6%. Further sociodemographic characteristics of the physicians are detailed in Table 1.

In the section containing questions about clinical scenarios, some physicians chose a “plastic surgeon” to perform skin grafting (85.4%), burn deformities (83.5%), liposuction (83.5%), breast reduction or enhancement surgery (83.1%), electrical burns (80.8%), abdominoplasty (77.4%), cuts over the face (77%), deformities of leprosy (74.3%), surgery for facial wrinkles (72%), nonhealing wounds over legs (58.6%), botox (58.2%), cleft lip and palate (51.7%), sex change surgery (50.6%), totally amputated thumb (49.8%), congenital anomalies of ear and nose (48.3%), and tendon injuries of hands (46.4%). On the other hand, some participants chose a “general surgeon” to manage diabetic foot wounds (65.9%) and bedsores (46%), whereas 66.3% and 52.9% thought that it should be a dermatologist who performs vitiligo surgery and hair transplantation. Furthermore, 67.4% and 63.6% of the physicians chose “oral and maxillofacial surgeon” to perform trismus release and jaw and face fractures, respectively. In addition, some indicated that an ENT surgeon should perform rhinoplasties (46.4%); also, some chose orthopedic surgeons for the treatment of hand fractures (62.8%), ophthalmologists for eyelid tears and injuries (52.5%), neurosurgeons for injury to the nerves of the hands and legs (49.8%), and urologists for hypospadias (53.3%). Further details are presented in Table 2.
Table 1. Physicians’ Basic Demographic Characteristics (n = 261)

| Study Variables                  | N (%)  |
|----------------------------------|--------|
| **Age group, y**                 |        |
| <3                               | 148 (56.7%) |
| 5–10                            | 56 (21.5%) |
| >10                             | 57 (21.8%) |
| **Years of practice, y**         |        |
| <5                               | 157 (60.2%) |
| 5–10                            | 104 (39.8%) |
| **Gender**                       |        |
| Male                             | 128 (49.0%) |
| Female                           | 133 (51.0%) |
| **Specialty**                    |        |
| Surgical specialty               | 82 (31.4%) |
| Internal medicine specialty      | 50 (19.2%) |
| Pediatric medicine specialty     | 22 (8.4%) |
| **Nationality**                  |        |
| Saudi                            | 243 (93.1%) |
| Non-Saudi                        | 18 (06.9%) |
| **Have you ever had to manage a patient who has** |        |
| **Yes**                          | 47 (18.0%) |
| **No**                           | 214 (82.0%) |
| **I do not know**                | 24 (9.2%) |

Only around 30% believed that 6 years of training after an MBBS/MD degree is the required duration of training to be a plastic surgeon. Moreover, 53.6% understood the meaning of “plastic surgery,” and 77.8% were confident that “a surgeon who performs procedures to restore the form and function of patients” was the correct definition of a plastic surgeon. When asked who is best qualified to perform surgery to improve appearance, 33.7% chose plastic surgeons, and 30.3% chose cosmetic surgeons. In addition, 49.4% were aware of the scope of plastic surgery. Based on the above 33-item questionnaire, the total mean knowledge score was 17.4 (SD 6.98) of 33. Poor, moderate, and good knowledge accounted for 44.1%, 39.8%, and 16.1%, respectively. Further details are presented in Table 3. The total knowledge scores are depicted in Figure 1.

Furthermore, when measuring the differences in the physicians’ knowledge score in relation to their sociodemographic characteristics, it was found that the knowledge score of males (Z = −2.712; P = 0.007) and those who indicated media (Z = −2.188; P = 0.029), professional training (Z = −2.725; P = 0.006), personal background (Z = −2.934; P = 0.003), and discussion with acquaintances (Z = −2.030; P = 0.042) as their sources of information regarding plastic surgery was significantly higher than their counterparts. Further details are presented in Table 4.

Moreover, it was shown that the most common source of information regarding plastic surgery was professional training (55.6%), followed by personal background (44.8%) and media (28.7%). Further details are depicted in Figure 2.

**DISCUSSION**

This study aims to investigate physicians’ perception of plastic surgery and their depth of understanding regarding the scope of this field. This study is the first in the literature to be conducted among this cohort locally. The data will assist stakeholders to educate medical staff about the scope of plastic surgeons, to improve the dynamics in hospitals and to prevent delay of care to patients.

We have found that nearly 45% (N = 115) of the physicians have a poor overall knowledge of plastic surgery and its scope of practice, whereas only 16.1% (N = 42) were sufficiently knowledgeable regarding the field of plastic surgery.

**Table 2. Percentages of Physicians Choosing the Surgical Specialties in Each Clinical Scenario**

| Clinical Scenario                  | PS (%) | ENT (%) | ORTHO (%) | OMS (%) | OPTH (%) | GS (%) | NS (%) | DERMA (%) | PEDIA (%) | URO (%) |
|------------------------------------|--------|---------|-----------|---------|----------|--------|--------|-----------|-----------|--------|
| Skin grafting                      | 85.4   | 0.40    | 0.80      | 0.80    | 0.80     | 5.7    | 1.1    | 4.6       | 0.40      | 0      |

| Rhinoplast                         | 43.3   | 46.4    | 1.1       | 5.0     | 0.40     | 0.40   | 0      | 3.1       | 0.40      | 0      |
| Hair transplantation               | 42.1   | 1.1     | 0         | 0       | 0.40     | 1.9    | 0.80   | 52.9      | 0.80      | 0      |
| Eyelid tear and injury             | 33.0   | 2.7     | 1.5       | 2.3     | 52.5     | 2.7    | 1.1    | 3.1       | 0.80      | 0.40   |
| Fracture of hand                   | 25.7   | 0.40    | 62.8      | 1.1     | 0.80     | 6.9    | 0.80   | 1.1       | 0.40      | 0      |
| Vittigo                           | 24.9   | 3.4     | 0.40      | 0       | 0.80     | 1.1    | 2.7    | 66.3      | 0.40      | 0      |
| Digital foot wound                 | 19.9   | 0.40    | 3.1       | 0.80    | 1.1      | 65.9   | 0.40   | 8.4       | 0.80      | 0      |
| Hypoplasia                        | 14.2   | 0.40    | 0.80      | 0.40    | 1.5      | 4.6    | 0.80   | 1.1       | 1.1       | 5.3    |
| Trismus release                    | 13.4   | 4.6     | 2.3       | 67.4    | 1.1      | 2.7    | 4.6    | 3.1       | 0.40      | 0.40   |
| Fracture of the jaw and face       | 12.3   | 3.1     | 14.2      | 65.6    | 0.80     | 5.0    | 0.40   | 0.40      | 0         | 0.40   |
surgery. This conclusion parallels previously published studies, as Tanna et al,1 Kim et al,7 Panse et al,8 and Dunkin et al9 have affirmed that more education and awareness are needed among physicians regarding the scope of plastic surgery practice. Interestingly, this study shows that a male physician is more likely to understand the scope of plastic surgery practice and have an accurate perception regarding plastic surgery. In contrast, Tanna et al 1 reported that female physicians were more likely to have a deeper understanding of the scope of plastic surgery practice, concluding that they are unable to provide a rational explanation behind this finding. 7 We cannot explain the reason behind the disparity.

When it comes to the clinical scenarios, around 80% of the participating physicians knew that cosmetic operations are done by a plastic surgeon; however, when it comes to reconstructive operations, such as clef/lip and palate, hand injuries, and facial fractures, around 50% knew that a plastic surgeon treats those reconstructive cases. This result goes in line with previously published studies.1,5-9 This, in large part, could be due to the lack of knowledge about the scope of practice of plastic surgeons. Medical and surgical physicians may lack accurate understanding of the pivotal role that plastic surgeons play in reconstructive operations.

### Table 1.

**Table 3. Assessment of the Physicians' Knowledge about Plastic Surgery (n = 261)**

| Statement                                                                 | N (%)          |
|----------------------------------------------------------------------------|----------------|
| 1. What's the training required to be a plastic surgeon?                  |                |
| 3 y training in general surgery after MBBS/MD followed by 3 y training in PS* | 69 (26.4%)     |
| 6 y training after MBBS/MD degree*                                        | 78 (29.9%)     |
| Both of the above*                                                        | 56 (21.5%)     |
| Do not know                                                               | 58 (22.2%)     |
| 2. Do you feel plastic surgery and cosmetic surgery are the same?         |                |
| Yes                                                                       | 29 (11.1%)     |
| No                                                                        | 59 (22.6%)     |
| Cosmetic surgery is a part of plastic surgery*                            | 156 (59.8%)    |
| Do not know                                                               | 17 (06.5%)     |
| 3. Why do you think plastic surgery is called "plastic" surgery?          |                |
| It involves the use of plastic in surgery                                 | 15 (05.7%)     |
| After the surgery, the face looks shiny like plastic                      | 18 (06.9%)     |
| Because it means reshaping in Greek*                                      | 140 (53.6%)    |
| Do not know                                                               | 86 (33.0%)     |
| Other reason                                                              | 02 (08.0%)     |
| 4. Which of the following accurately defines a plastic surgeon?            |                |
| A surgeon that performs procedures to restore the form and function of the patients* | 203 (77.8%)    |
| A surgeon that seeks money performing procedures to enhance the appearance of the patients* | 33 (12.6%)     |
| 5. In your opinion, who is best qualified to perform surgery to improve your appearance? | |
| A cosmetic surgeon*                                                      | 79 (30.3%)     |
| A plastic surgeon                                                        | 88 (33.7%)     |
| They are equally qualified                                                 | 94 (36.0%)     |
| 6. Do you think you know what the scope profession of a plastic surgeon is about? | |
| Yes*                                                                      | 129 (49.4%)    |
| No                                                                        | 132 (50.6%)    |
| Total knowledge score (mean ± SD)                                         | 17.4 ± 6.98    |

*C, Correct answer.

PS, plastic surgery.

§Significant at P < 0.05 level.
Comparing the perception of plastic surgeons with studies investigating the perception of other surgeons, namely the perception of OMF surgeons, it has been well-established that more awareness and education are needed. Interestingly, a plastic surgeon was mostly preferred for the OMF surgeons’ cosmetic operations. Moreover, it has been well-proven that the medical and dental professionals were more aware of OMF surgeon’s scope of practice when compared with the public. The previously mentioned finding is, unfortunately, not true when it comes to perception of plastic surgery. Furthermore, Domanski et al. have investigated the perceptions otolaryngologists among primary care residents, and they found that the residents were not aware of otolaryngologists’ scope of expertise. The previous findings show that plastic surgery is not the only specialty that lacks awareness in the scope of expertise.

The authors believe that the responsibility of educating fellow practitioners falls on the shoulders of stakeholders and, in part, plastic surgeons. Furthermore, the authors recommend that hospital administrators promote educational activities towards improving the accurate referral to plastic surgeons when it comes to reconstructive operations. Moreover, the Saudi Scientific Association of Plastic Surgery and Burns must promote the scope of plastic surgeons’ practice, as well as try to correct the misconceptions present among treating physicians. This could be done by regular educational campaigns as well as by increasing the society publications tackling this significant topic. Furthermore, increasing specialty awareness activities of the Saudi Scientific Association of Plastic Surgery and Burns on social media accounts is highly recommended by the authors.

There are a few limitations in our study that must be addressed. First, the descriptive cross-sectional nature and the probability of bias. Second, our study only included physicians affiliated with the major universities in the kingdom, further research that includes a larger pool of physicians is recommended. Third, the basis on which judged the physician’s depth of knowledge was arbitrarily constructed. Fourth, given the granularity of specialty descriptions in our survey, there may be an underestimation of the plastic surgeons’ scope of practice. Finally, involving specialists with overlapping areas of expertise may bias the result, namely dermatologists, ENT surgeons, and orthopedics. Despite the previously mentioned limitations, the authors believe that this study is of high value when it comes to estimating the knowledge of physicians regarding plastic surgery as a specialty.

**CONCLUSIONS**

The results of our study showed that 44.1% of physicians demonstrated a poor understanding regarding plastic surgery and its scope of practice. This is alarming, as it could delay patients from proper management. Enhancing the perception of plastic surgery among physicians is needed, and this could be done by educational activities as well as peer-teaching from the plastic surgeons themselves.
