ABSTRACT

The current investigational work was designed to evaluate inhibitory effect of ethanol extract of Nymphaea nauchali against experimentally induced ulcers in albino wistar rats. The aerial parts of Nymphaea nauchali were dried under shade, powdered and defatted with petroleum ether and then marc left over was subjected to ethanol extraction using soxhlet apparatus. Antulcer activity of ethanol extract was determined against ethanol induced and aspirin induced ulcers in experimental animal models. The total number of ulcers formed, ulcer index, percentage inhibition, ulcerated area, protected area, pH and Total acidity were parameters in the study. The ethanol extract of Nymphaea nauchali have significantly reduced the total number of ulcers formed, ulcer index, ulcerated area and total acidity in therapeutic groups compare to vehicle control and there by significantly increased percentage inhibition of ulcers and protected area which was evident by significant rise in pH of gastric content. The effect of extracts was dose dependent and results were comparable to that of standard drug omeprazole. The results obtained from the present work suggest that the ethanol extract of Nymphaea nauchali possess significant anti-ulcer potentials against experimentally induced ulcers in albino rats.

Keywords: Nymphaea nauchali, Anti-ulcer activity, Ethanol, Aspirin, Ulcer index, pH, total acidity, Percentage inhibition and percentage of protected area.

INTRODUCTION

Peptic ulcer which includes both gastric and duodenal ulcers is one of the most prevalent gastrointestinal tract diseases that affect a wide range of people worldwide. Due to its high morbidity and mortality rates, peptic ulcer disease has been one of the leading causes of gastrointestinal surgery over a century. The pathophysiology of peptic ulcer disease was attributed to the imbalance between the offensive factors (e.g. acid, pepsin, Helicobacter infection) and the defensive ones (e.g. bicarbonate, mucin, prostaglandins, nitric oxide and growth factors). The use of non-steroidal anti-inflammatory drugs (NSAIDs), irregular diet, emotional stress, excessive alcohol use and smoking are all the principal etiological factors associated with the peptic ulcer. Nowadays, the drug treatment of ulcer is commonly focused on the suppression of acid secretion and the enhancement of gastric protection. However, more and more clinical evaluation on the drug treatment showed that tolerance was developed and also incidence of relapses as well as side effects were increased, which made the efficacy of the treatment be arguable. Many of the existed medicines have limitations, especially when they were used against the ulcers with complex etiologies.

The aim of treating peptic ulcer disease is to relieve pain, heal the ulcer and prevent ulcer recurrence. Currently, efforts are on research of a suitable treatment from natural product sources. A large number of species and herbs have been evaluated by various researchers for their anti-ulcer effects to achieve a favourable outcome. A wide range of drug is currently available for the treatment of gastric ulcer which includes proton pump inhibitor, H2 blocker, antacid, and anti-cholinergic. The most common adverse effect of these drugs are hypergastrinemia, hypersensitivity, gynecomastia, impotence, arrhythmia and blood dyscaris such as thrombocytopenia and enteric infection (Clostridium difficile). Hence till now there is no truly satisfactory medicine for the management of peptic ulcer and plant drugs are proven as effective and safe drugs for the management ulcers. About 600 commercial preparations with claimed liver protecting activity are available all over the world. About 100 Indian medicinal plants belonging to 40 families are used for herbal formulation.

Nymphaea nauchali also known as Nymphaea stellata belongs to family Nymphaeaceae is an important and well-known medicinal plant, widely used in the Ayurveda and Siddha systems of medicines for the
treatment of diabetes, inflammation, ulcers, liver disorders, urinary disorders, menorrhagia, blenorrhagia, menstruation problem, as an aphrodisiac, and as a bitter tonic.8,9 Though Nymphaea nauchali widely used for the management of peptic ulcer in traditional and folklore medicine but doesn’t have the scientific evidence for the same10. Hence the present study was designed to assess the antiulcer activity of the Nymphaea nauchali against animal models of ulcer with the objective to provide establish the scientific rationale.

MATERIALS AND METHODS

Preparation of ethanol extract

The areal parts of Nymphaea nauchali have been collected from surroundings of Bangalore and authenticated. The authenticated plant material was dried under shade and dried plant material was pulverized into powder and sieved through No. 22 mesh. About 350 g (appx.) of coarse powder was subjected to successive solvent extraction using petroleum ether, benzene, chloroform and ethanol in soxhlet apparatus.11

Preliminary phytochemical investigation of ethanol extract of Nymphaea nauchali

The preliminary phytochemical investigation for the ethanol extract of Nymphaea nauchali had been conducted as per procedure prescribed by Khandelwa12.

Drugs and chemicals

All the chemical and reagents used in the present study were of analytical grade and procured from following sources. The inducing agents eethanol and aspirin were obtained from Sigma-aldrich chemicals Pvt. Ltd., Bangalore and Tween80 was obtained from Nice chemicals Bangalore. All the other solvents and chemicals used for extraction and physiochemical investigation were as of analytical grade purchased from S.D fine chemicals Pvt. Ltd. Bangalore.

Animals

Albino wistar rats of either sex (150-200g) will acclimatized for seven days under standard husbandry conditions, i.e.; room temperature of 25 ± 1°C; relative humidity 45-55% and a 12:12h light/ dark cycle. The animals had to free access to standard rat pellet, with water supplied ad libitum under strict hygienic conditions. Animals were habituated to laboratory conditions for 48 hours prior for experimental protocol to minimize if any of non-specific stress. All the protocols and the experiments were conducted in strict compliance according to ethical principles of CPCSEA, Newdelhi and the protocol was approved by the Institutional Animal Ethics Committee, East West College of Pharmacy, Bangalore (Ref No.: EWCP/CPCSEA/IAEC/I/2018/09).

Evaluation of antiulcer activity of ethanol extract

The ethanol extract of Nymphaea nauchali was evaluated against stress and aspirin induced ulcers and study design in both studies consisting of six groups of six animals in each group as follows.

| Groups   | Treatment                                                                 |
|----------|----------------------------------------------------------------------------|
| Group I: | Treated with Normal Saline (2ml/kg)                                        |
| Group II: | Induced with ulcers and treated with 2% tween 20                           |
| Group III: | Induced with ulcers + Treated with omeprazole (10 mg/kg, p.o.)            |
| Group IV: | Induced with ulcers + Treated with ethanol extract of Nymphaea nauchali (100 mg/kg p.o) |
| Group V: | Induced with ulcers + Treated with ethanol extract of Nymphaea nauchali (200 mg/kg p.o) |
| Group VI: | Induced with ulcers + Treated with ethanol extract of Nymphaea nauchali (400 mg/kg p.o) |

Evaluation of anti-ulcer activity against aspirin ulcers

All the experimental animals were kept for overnight fasting and gastric ulcers were by administering cold absolute aspirin (150 mg/kg p.o). All the extract (EENN) and standard drug omeprazole were administered orally prior to the administration of aspirin. One hour later, the animals were sacrificed by cervical dislocation and the stomachs were removed. Gastric acid was collected and its pH and total acidity was determined. Stomachs were opened along the greater curvature and gently rinsed with water for subsequent scanning. The number of ulcers was scored and percentage of protection and ulcer index were calculated13,14,15.

Evaluation of anti-ulcer activity against stress ulcers

After 12 hour of fasting, EENN and standard drug omeprazole were administered to respective group of experimental rats orally. One hour after treatment, all the rats received 1ml of 99.5% ethanol to induce gastric ulcer. One hour later, the animals were sacrificed by cervical dislocation and the stomachs were removed. Gastric acid was collected and its pH and total acidity was determined. Stomachs were opened along the greater curvature and gently rinsed with water for subsequent scanning. The number of ulcers was scored and percentage of protection and ulcer index were calculated and pH were estimated13,16.

Statistical Analysis

The data obtained from the present investigation were analyzed by ANOVA followed by post hoc Dunnet’s t-test with the help of Graphpad prism® software. All the values were shown as mean ± standard error of mean (S.E.M.).

RESULTS AND DISCUSSION

Preliminary phytochemical study

The percentage yield of the EENN was found to be 9.15 % w/w. The preliminary phytochemical investigation of the ethanol extract of Nymphaea nauchali reveals the presence of alkaloids, glycosides, poly phenols, flavonoids, tannins, steroids, and carbohydrates in the plant.

Evaluation of antiulcer activity

The etiological factors that causes ulcer in human being are several which includes alcohol, stress, chronic use of anti-inflammatory drugs and continuous alcohol ingestion, spicy food among others. In most of the cases, the exact causative factor of ulcer is unknown but it is generally accepted that it is the result of an imbalance between aggressive factors and defensive factors that maintenance mucosal integrity through the several endogenous mechanisms. Peptic ulcer is leading cause of mortality and morbidity in developing countries, characterized by imbalance between aggressive gastric luminal factor and defensive mucosal barrier. This disease is mainly associated with increase in gastric acid secretion. Numerous factors like diet, smoking, drugs like aspirin and infection are responsible for augmentation of ulcers. Still, no therapeutic intervention has been found successful. So, in the present study efforts has been made to review and to explore various animal models to find out a suitable medication for the treatment of peptic ulcer.

Nymphaea nauchali are employed in the treatment and management of the ulcers in folklore medicine but still no complete curative treatment is available. So this review has been designed to explore the effects of Nymphaea nauchali extracts for the treatment of peptic ulcer against various ulcer models like pyloric ligation; ethanol and aspirin induced ulcer models.

In the present study, oral administration of ethanol extract Nymphaea nauchali at 200mg/kg and 400mg/kg significantly inhibited gastric ulcer formation in both selected ulcer models when compared control and effect was comparable to standard omeprazole.

Aspirin is commonly used for inducing ulcer in experimental rats’ due to its intense gastric mucosal damage. Studies suggest that the Aspirin damage to the gastrointestinal mucosa starts with micro vascular injury, namely disruption of the vascular endothelium resulting in increased vascular permeability, edema formation and epithelial lifting. Aspirin is an NSAID its abuse will induce gastric ulceration by inhibition of gastric cyclooxygenase resulting in the formation of prostacyclin, which is predominant prostanoid produced in the gastric mucosa. The ulcers produced can be prevented by exogenous PGE_2 and PGI_2 The alcohol is another agent produces irritation in stomach develops ulcers. in the stomach due to free radical nature.

The ethanol extract of Nymphaea nauchali was tested using aspirin and ethanol induced ulcer in albino wistar rats model. The results are as follows.

Antiulcer activity against aspirin induced ulcers

Administration of aspirin has shown significant (P<0.001) no of ulcers and ulcer index in vehicle control animals in the present study compare to normal animals which have shown no ulcers and ulcer index. Administration of Standard drug omeprazole and EENN at medium and high dose have significantly (P<0.01) reduced number of ulcers formed and ulcer index when compare to vehicle control. Due to the reduction in number of ulcers and ulcer index, percentage of protection was significantly increased in therapeutic groups treated with standard drug and EENN [Table No.:1]

| Group V: EENN (200mg/kg) | 2.333***±0.2108 | 17.08***±1.173 | 63.161***               | 41.48***±0.6586               | 58.52**                     | 3.548***±0.06877 | 48.99***±1.292 |
| Group VI: EENN (400mg/kg) | 1.667***±0.3333 | 4.468***±0.4937 | 73.678***              | 25.10***±1.318                | 74.9***                     | 3.932***±0.1771 | 40.87***±0.6475 |

Values are mean ± S.E.M, n=6 symbols represent statistical significance.; ns p>0.05, * p<0.05, ** p<0.01, ***p<0.001 vs ulcer control.; ns p>0.05, + p<0.05, ++ p<0.01, +++p<0.001 normal control vs Normal control.
The formation of significant ulcerated area was observed and total acidity was significantly increased in vehicle control animals due to the administration of aspirin. But there was significant (P<0.001) decrease in ulcerated area and total acidity found in omeprazole and EENN (200mg/kg and 400mg/kg) treated animals compared to control vehicle group. Hence the percentage of protected area was significantly increased in animals treated with omeprazole and EENN (Table No.:1).

**Anti-ulcer activity against ethanol induced ulcers**

In the present study of ethanol induced ulcer model, control animals have shown significant (P<0.001) no of ulcers and ulcer index compared to normal animals which have shown no ulcers and ulcer index. Administration of Standard drug omeprazole and EENN at medium and high dose have significantly (P<0.001) reduced number of ulcers formed and ulcer index when compared to vehicle control. Due to the reduction in number of ulcers and ulcer index, percentage of protection was significantly increased in therapeutic groups treated with standard drug and EENN. Effect of EENN at 100mg/kg was not significant [Table No.:2].

The significant increase in formation of ulcerated area and total acidity were observed in vehicle control animals due to stress. But there was significant (P<0.001) decrease in ulcerated area and total acidity found in omeprazole and EENN (200mg/kg and 400mg/kg) treated animals compared to vehicle control group. Hence the percentage of protected area was significantly increased in animals treated with omeprazole and EENN [Table No.:2].

In the present study, significant decrease in gastric ulcer, ulcer index, ulcerated area and total acidity was observed in pretreated ethanol extract compared to vehicle control group. In the present study we also found that there is significant rise percentage inhibition of ulcer formation, protected area and pH of gastric content. The antiulcer potentials of plant extracts were almost similar to standard drug omeprazole used in the present study.

The other ulcerogenic agents alcohol and aspirin used in the present study directly irritate GIT mucosa and acts as free radical results in the formation of peptic ulcers. Hence the drugs those possess antioxidants can be good approaches for the treatment of ulcers due to the presence flavonoids and phenolic compounds. In this regard, the study can be performed to evaluate the antioxidant properties of the plant to determine the possible mechanism.

**CONCLUSION**

The present study was undertaken for the investigation of antiulcer activity of ethanol extracts of *Nymphaea nauchali* against stress and aspirin induced ulcers in animal model. From the results obtained from the study, it can be concluded that ethanol extract of the plant exhibited a strong gastroprotective activity against experimentally induced ulcers. However further investigation required establishing the clear mechanism of action of the extract and also to isolate individual phytoconstituents present in *Nymphaea nauchali* that may be responsible for these beneficial therapeutic effects.

**Acknowledgements:** The authors of manuscript are thankful to The Principal and management of East West College of Pharmacy, Bangalore for providing facilities to conduct this research work.
