Supplemental information

A Mendelian randomization-based exploration of red blood cell distribution width and mean corpuscular volume with risk of hemorrhagic strokes

Jundong Liu, Elizabeth L Chou, Kui Kai Lau, Peter Yat Ming Woo, Tsz Kin Wan, Ruixuan Huang, and Kei Hang Katie Chan
Supplemental Information

Table of Contents

Supplemental tables
Table S1. Univariable Mendelian randomization estimates
Table S2. Multivariable Mendelian randomization estimates
Table S3. Mediation analysis statistics
Table S4. Overlap bias between mean corpuscular volume and diastolic blood pressure
Table S5. Univariable Mendelian randomization data
Table S6. Multivariable Mendelian randomization data
Table S7. Mendelian randomization data for exposure and mediator
Table S8. Mendelian randomization data for exposure, mediator, and outcome

Supplemental Figures
Figure S1. Leave-one-out between mean corpuscular volume and intracerebral hemorrhage.

Figure S2. Leave-one-out analysis between mean corpuscular volume and subarachnoid hemorrhage.

Figure S3. Leave-one-out analysis between mean corpuscular volume and nontraumatic intracranial hemorrhage.

Figure S4. Leave-one-out analysis between mean corpuscular volume and cerebral aneurysm, aneurysm operations, and subarachnoid hemorrhage.

Figure S5. Leave-one-out between red blood cell distribution width and intracerebral hemorrhage.

Figure S6. Leave-one-out analysis between red blood cell distribution width and subarachnoid hemorrhage.

Figure S7. Leave-one-out analysis between red blood cell distribution width and nontraumatic intracranial hemorrhage.
**Figure S8.** Leave-one-out analysis between red blood cell distribution width and cerebral aneurysm, aneurysm operations, and subarachnoid hemorrhage.

**Figure S9.** Funnel plot between mean corpuscular volume and outcomes.

**Figure S10.** Funnel plot between red blood cell distribution width and outcomes.
Figure S1. Leave-one-out between mean corpuscular volume and intracerebral hemorrhage. MR, Mendelian randomization.
Figure S2. Leave-one-out analysis between mean corpuscular volume and subarachnoid hemorrhage. MR, Mendelian randomization.
Figure S3. Leave-one-out analysis between mean corpuscular volume and nontraumatic intracranial hemorrhage. MR, Mendelian randomization.
Figure S4. Leave-one-out analysis between mean corpuscular volume and cerebral aneurysm, aneurysm operations, and subarachnoid hemorrhage.
Figure S5. Leave-one-out between red blood cell distribution width and intracerebral hemorrhage. MR, Mendelian randomization.
Figure S6. Leave-one-out analysis between red blood cell distribution width and subarachnoid hemorrhage. MR, Mendelian randomization.
Figure S7. Leave-one-out analysis between red blood cell distribution width and nontraumatic intracranial hemorrhage. MR, Mendelian randomization.
Figure S8. Leave-one-out analysis between red blood cell distribution width and cerebral aneurysm, aneurysm operations, and subarachnoid hemorrhage.
Figure S9. Funnel plot between mean corpuscular volume and outcomes. (A) MCV and intracerebral hemorrhage; (B) MCV and subarachnoid hemorrhage; (C) MCV and nontraumatic intracranial hemorrhage; (D) MCV and cerebral aneurysm, aneurysm operations, and SAH. MCV, mean corpuscular volume and outcomes.
Figure S10. Funnel plot between red blood cell distribution width and outcomes. (A) RCDW and intracerebral hemorrhage; (B) RCDW and subarachnoid hemorrhage; (C) RCDW and nontraumatic intracranial hemorrhage; (D) RCDW and cerebral aneurysm, aneurysm operations, and SAH. RCDW, red blood cell distribution width.
