Experimental Section

General information

Tetrahydrofuran was distilled from sodium benzophenone ketyl in an atmosphere of nitrogen. 1,3-Dicyclohexylcarbodiimde (DCC) was purchased from Suzhou Highfine Biotech Co., Ltd. (China). 4-Dimethylaminopyridine (DMAP) and (R)-2-octanol were obtained from J & K Scientific Ltd. (China). All other chemicals were purchased from Sinopharm Group Chemical Reagent Co., Ltd. (China) and used as received without further purification.

FTIR spectroscopy was performed on a Nicolet 6700 spectrometer at 2 cm⁻¹ resolution by averaging over 32 scans. The ¹H NMR spectrum was taken on a Varian NMR (400 MHz) spectrometer in DMSO-d₆ solutions using tetramethylsilane (TMS) as an internal standard at room temperature. Elemental analysis was measured on an EA-1106 instrument. UV-Vis absorption spectra were recorded on an Agilent Cary 5000 UV-Vis-NIR spectrophotometer. Photoluminescence spectra were obtained on a F-2500 FL spectrophotometer. Fluorescence quantum yields (Φ_F) were determined by a comparative method and using quinine sulfate in 0.1 M H₂SO₄ (Φ_F = 54.6%) as the standard.[1] The absorbance of the solutions was maintained at 0.04–0.06 to avoid the internal filter effect. Differential scanning calorimetry (DSC) measurements were conducted on a TA-Q200 under nitrogen at 5.0 °C min⁻¹. Circular dichroism spectra were recorded in a 0.01-mm quartz cell on an AVIV-410 spectropolarimeter. For the crystalline structure of 1TC8*, all measurements were made on a Bruker APEX-II CCD X-ray diffractometer by using graphite monochromated Mo Ka (λ =0.071073 nm) at 273 K. The structure was solved in the space group P2₁2₁2₁ by direct methods and refined on F² using full matrix least-squares methods with SHELXTL version 2008.

Synthesis

(S)-4-(Octan-2-yloxy)phenol (1) and 4-[(4-methoxyphenyl)ethynyl]benzoic acid (2) shown in Scheme 1 were prepared according to the modified methods reported in our previous work.[2,3]
Synthesis of (S)-4-(octan-2-yloxy)phenyl 4-((4-methoxyphenyl)ethynyl)benzoate (1TC8*). 1.2 g (5.4 mmol) of 1 and 1.63 g (6.5 mmol) of 2 were added into a 500-mL round-bottom flask. Then, 200 mL of distilled tetrahydrofuran was injected under N₂ to dissolve the solid, followed by the addition of 1.3 g (6.5 mmol) of DCC and appropriate DMAP. The reaction mixture was stirred at 0°C for 3 h and room temperature for another 24 h under N₂. After filtration and solvent evaporation, the crude product was purified by a silica gel column using ethyl acetate/petroleum ether (1 : 20) as eluent and recrystallization from acetone/methanol. A white solid of 1TC8* was obtained in 30.0% (0.75 g).

FT-IR (KBr pellet): 3071 cm⁻¹ (C-H of the phenyl, stretching), 2956 cm⁻¹ (νasC-H₃), 2866 cm⁻¹ (νsC-H₃), 2923 cm⁻¹ (νasC-H₂), 2854 cm⁻¹ (νsC-H₂), 2206 cm⁻¹ (νC=C), 1730 cm⁻¹ (νC=O), 1599 cm⁻¹, 1509 cm⁻¹, 1468 cm⁻¹ (νPh).

¹H-NMR (400 MHz, DMSO-d₆, TMS, 25°C): δ = 0.86 (t, 3H, J = 6.8 Hz; CH₃CH₂), 1.22-1.69 [m, 13H; -CH₂CH₂CH₂CH₂CH₂CH(CH₃)-], 3.81 (s, 3H; -OCH₃), 4.39-4.47 (m, 1H; -CH₂CH₂), 6.98 (d, 2H, J = 8.8 Hz; 2,6-PhHOCH₃), 7.02 (d, 2H, J = 8.6 Hz; 3,5-PhHOCO), 7.19 (d, 2H, J = 8.8 Hz; 2,6-PhHOCO), 7.57 (d, 2H, J = 8.8 Hz; 3,5-PhHOCO), 7.73 (d, 2H, J = 8.4 Hz; 3,5-COOHCC), 8.13 (d, 2H, J = 8.4 Hz; 2,6-COOHCC). Elemental analysis calcd for C₃₀H₃₂O₄ (%): C, 78.30; H, 6.94. Found: C, 78.92; H, 7.06.
