ABSTRACT

French auxilliaries and clitics have been analysed in the flame of U.C.G. (Unification Categorial Grammar). Concatenation of a functor sign and an adjacent argument sign is the basic operation of the model; unification allows (a) to verify if constraints on concatenation are respected; (b) to produce a flow of information between the functor sign and the argument sign.

The rules of the grammar and the design structure of the sign allows to express: (a) the concatenation between French auxilliaries (être and avoir) and the participle verb form within a single pattern, (b) transitions between clitics in a systematic way. Two complex questions of French syntax are thus covered in a fairly simple way.

The UCG Model

U(nification), C(ategorial), G(rammar) is a new grammatical model proposed by an Edinburgh team headed by Ewan Klein in [CALDER 86] and [ZEEVAT 86]. UCG is a feature grammar incorporating some basic insights from GPSG [GAZDAR 85] and HPSG [POLLARD 84]. Functional application applies in UCG as in categorial grammars; it allows for concatenation of a functor with an adjacent argument. Unification is a basic operation which allows (a) to verify if constraints on concatenation are respected; (b) to produce a flow of information between functor and argument. This information together with some defined aspects of the information carried by the functor, will be finally inscribed in the resulting concatenated sign.

The Sign

A UCG sign has the following format:

(1)  

sign --> category:semantics:order:phonology  
category --> head:features:catlist  
features --> [feat,clo,agree,class]  
catlist --> nil  
catlist --> catlist/active  
active --> order:semantics --> index:predicat:arglist  
arglist --> agr1, ..., argn

order --> pre | post  
phonology --> <lexical_item>

In graph notation, a UCG sign can be represented (in a slightly simplified form, relevant to this paper) as in figure 1.

In this figure the leaves of vertical branches columns (i) through (viii) - denote the values of the corresponding labels in its upper portion.

We have:

(i) to (vi) Simple categories: sent*:nil, noun*:nil.
(ii) Features on (i) (see below)
(iii) values for the CL(itics) label are: prod (dialogue pronouns, for me, te, nous, vous); protob (third person object pronouns: le, la, les); prota (third person dative pronouns: lui, leur); se, en and y, (for se, en and y pronouns respectively); n is a barrier symbol (see below).
(iv and v) values for morphological aspects of the sign:
(iv) categorizes signs in lex(ical) and pron(ominal) ones,
(v) in masc(ulin) and fem(inin), in sing(ular) and pl(ural), and introduces values for the 3 persons.
(vi) the subcatlist: the label C will denote the typical variable for it.
(vii) the index sort system (which is not exhibited here) allows selection on semantic features while a special field (pr_res) contains information (agreement, class and COR) for the pronoun resolution component.
COR(eference) is intended to prepare the semantic representation for pronoun resolution. The corresponding values are: obl(igatory), for bound anaphora as in se; ind(ependent), for NP nominals of indicative sentences and dep(endent) for NP nominals of subjunctive ones (the algorithm for pronoun resolution will not be presented here, but the semantic representation specified by the proposed grammar is intended to carry all the required relevant information).
(viii) post and pre are the values for order; they are essential for handling word order and for the application of the grammar rules.

In the unification process and in the generation of the subsequent flow of information, the labels Class, Ge, Nb and Pe denote variables for the corresponding ones, Clo the variable for clitic placement value and O, the variable for order values.

The two following are the French UCG signs for aime and Marie:
(2) (a) $^1$ aime

sent[fin,v,(_:sg:p3),_] :nil
-nil[np[nom,n,(_:sg:p3),_] :nil:X:pre:_
-nil[np[acc,m,_] :nil:Y:post:_and(e,at(e,now),aimer(e,X,Y))]
-O :aime

(b) Marie

Head[Feat,Clo,Ag,Class]
:C/(Head'[Feat,_,Ag,Class]
:C/(np[or(nom,acc),Clo,(fem:sg:p3),lex]
:nil:marie:Ord:_)
:Sem
:Ord
:)
:Sem
:O
:marie

Categories

Categories are defined by

(3) (a) A simple category is a category.
(b) If H:C is a category and Si is a sign, H:(C/Si)
is a category.

Rules

[ZEEVAT 86] describes 2 grammar rules based on
functional application.

(4) FA (Forward Application)

Functor :

HF
:CF/(HA:CA:SA:pre:_)
:SF
:OF
:W1

Argument :

HA:CA:SA:pre:W1

-> HF:CF:SF:OF:[W1,W2]

(5) BA (Backward Application)

Argument :

HA:CA:SA:post:W1

Functor :

HF
:CF/(HA:CA:SA:post:_)
:SF
:OF
:W2

-> HF:CF:SF:OF:[W1,W2]

We added two rules to these, inspired by
functional composition as described in [STEEDMAN 86].

(6) FC (Forward Composition)

Functor :

HF
:CF/(HA:CA:SA:pre:_)
:SF
:OF
:W1

Argument :

HA:CA/(np[Fe,_,Ag," lex]
ilil:X:_:):SA:pre:W2

-> HF
:CF/(np[Fe,n,Ag," lex]
ilil:X:pre:_)
:SF
:OF
:[W1,W2]

FC is basically designed to deal with np-gaps.

(7) BC (Backward Composition)

Argument :

HA:CA/(np*Feats:Nilil:X:O:_:):SA:post:W1

Functor :

HF
:CF/(HA:CA:SA:post:_)
:SF
:SO
:W2

-> HF
:CF/(np*Feats:Nilil:X:O:_)n
:SF
:OF
:[W1,W2]

BC is designed to deal with free-order of np-
arguments of verbs

Forward application must be interpreted as
follows:

---

1 where PROLOG conventions are respected: lower
case = constant, upper case = variable, _ = anonymous
variable
If a sign of string $W_1$ and category HF:CF/(HA:CA) unifies with a sign of string $W_2$ and category HA:CA, $W_1$ concatenates with $W_2$; the resulting sign, with string $[W_1,W_2]$, is of category HF:CF, where HF:CF is the category inherited from the functor as resulting from unification with its argument, and stripping HA:CA.

Mutatis mutandis, analogous interpretations must be given to (5) through (7).

By definition (3) HA:CA in HF:CF/(HA:CA) of (4) must be a sign; it is the active part of the functor. The final concatenated sign is obtained by stripping the active part of the functor as instantiated by the argument.

Example

For example: (8) is the instantiation by BA of (2b) as the functor with respect to (2a) as the argument of the rule; (9) is the resulting sign, obtained from (8) by stripping; (10) represents the sign of the whole sentence *Pierre aime Marie* :

(8) 

$\text{Marie} \text{sent}'[^{\text{fin}},m,(^{\text{sg,p3}},\text{Class})]$ :nil/np$[^{\text{nom,n}},(\text{Ge}1:^{\text{sg,p3}},\text{Class1})]$ :nil/np$[^{\text{acc,m}},(\text{fem}^{\text{sg,p3}},\text{lex})]$ :nil/np$[^{\text{pre}},_\text{marie}]$

(9) 

$aime \text{Marie}$

$\text{sent}'[^{\text{fin}},m,(^{\text{sg,p3}},\text{Class})]$ :nil/np$[^{\text{nom,n}},(\text{Ge}1:^{\text{sg,p3}},\text{Class1})]$ :nil/np$[^{\text{pre}},_\text{marie}]$

(10) 

$\text{Pierre aime Marie}$

$\text{sent}'[^{\text{fin},n,(^{\text{sg,p3}},\text{Class})}]$ :nil/np$[^{\text{nom,n}},(\text{Ge}1:^{\text{sg,p3}},\text{Class1})]$ :nil/np$[^{\text{pre}},_\text{marie}]$

Semantics

The semantics of UCG incorporates the basic insights of Kamp's DRT [KAMP 81] but the introduction of indexes greatly increases the expressive power of semantic representations (cf. [ZEEVAT 86]).

To resume:

The whole model is based on:

* one unique operation: concatenation between adjacent constituents.
* one unique process to control the flow of information and to verify conditions: unification.

* similar ways to combine a functor and its argument to give a resulting sign.

The French sentence

simple verbs

They accept left-placed arguments (as clitics) and right-placed ones (as lexical ones).

composed verbal forms

No argument can be inserted between the auxiliary and the participle form.

Whereas in English only one auxiliary is used to construct perfect tenses, French uses *avoir* and *être* depending on the main verb. Furthermore, *être* is also used for passive constructions.

The most important problem, however, is due to the agreement of the past participle with the subject of the main verb when used with *être*, but with the object -only if it precedes the auxiliary- when used with *avoir*.

However, we succeeded to maintain a single lexical entry for a verb, allowing for the different order of arguments. This is made possible by the introduction of forward and backward composition rules.

AUXILIARIES

The following are the main features allowing a correct treatment of auxiliaries in a French UCG grammar.

Features as presented in Figure 1 column (ii): PSPA for past participles of verbs using *avoir* as auxiliary, PSPE for verbs used with *être*, PAS for passive participle. They allow for the distinction between finite and non-finite forms and between participles used with *avoir* or *être*.

Values for the CL label: *v* value denotes the fact that the verb is "virgin" i.e. has not consumed any of its arguments.

Values for GE, NB, PERS allow for correct agreement of the past participle and between auxiliary and subject.

A unique format for perfect tenses with *avoir* and *être* and for passive constructs with *être* was designed as follows:

(12) auxiliary general design

$\text{sent}'[^{\text{fin},v,Ag,Class}]$ :C/sent$[^{\text{FEAT},v,Ag,Class}]$:C Sem:pre: _

AUXILIARIES

The following are the main features allowing a correct treatment of auxiliaries in a French UCG grammar.

Features as presented in Figure 1 column (ii): PSPA for past participles of verbs using *avoir* as auxiliary, PSPE for verbs used with *être*, PAS for passive participle. They allow for the distinction between finite and non-finite forms and between participles used with *avoir* or *être*.

Values for the CL label: *v* value denotes the fact that the verb is "virgin" i.e. has not consumed any of its arguments.

Values for GE, NB, PERS allow for correct agreement of the past participle and between auxiliary and subject.

A unique format for perfect tenses with *avoir* and *être* and for passive constructs with *être* was designed as follows:

(12) auxiliary general design

$\text{sent}'[^{\text{fin},v,Ag,Class}]$ :C/sent$[^{\text{FEAT},v,Ag,Class}]$:C Sem:pre: _

AUXILIARIES

The following are the main features allowing a correct treatment of auxiliaries in a French UCG grammar.

Features as presented in Figure 1 column (ii): PSPA for past participles of verbs using *avoir* as auxiliary, PSPE for verbs used with *être*, PAS for passive participle. They allow for the distinction between finite and non-finite forms and between participles used with *avoir* or *être*.

Values for the CL label: *v* value denotes the fact that the verb is "virgin" i.e. has not consumed any of its arguments.

Values for GE, NB, PERS allow for correct agreement of the past participle and between auxiliary and subject.

A unique format for perfect tenses with *avoir* and *être* and for passive constructs with *être* was designed as follows:

(12) auxiliary general design

$\text{sent}'[^{\text{fin},v,Ag,Class}]$ :C/sent$[^{\text{FEAT},v,Ag,Class}]$:C Sem:pre: _
tense, free word order, and constrained word order due to clitics.

Standard lexical entries present word order as for non-clitic arguments, and semantics as for the infinitive.

A morphological component allows for a dynamic transformation of these entries according to tense gender and person.

Thus, typical entries look like:

\[(13) \text{regarder} \]

\[
\begin{align*}
\text{sent}'[\text{fin},v,\text{Ag}_\text{p}] & :\text{nil}/\text{np}'[\text{nom},n,\text{Ag}_\text{p}] :\text{nil}:X:\text{pre} : _ \\
\text{np}'[\text{acc},m,_] & :\text{nil}:Y:\text{post} : _ \\
\text{regarder}(e,X,Y) & :O \\
\text{regarder} &
\end{align*}
\]

When analysing (morphologically) the passive participle (13) is transformed (by a special passive lexical_rule) into:

\[(14) \text{regardée} \]

\[
\begin{align*}
\text{sent}'[\text{pas},v,(\text{fem:sg:Pe}),_] & :\text{nil}/\text{np}'[\text{nom},n,(\text{fem:sg:Pe}),_] :\text{nil}:Y:\text{pre} : _ \\
\text{np}'[\text{par},m,_] & :\text{nil}:X:\text{post} : _ \\
\text{regarder}(e,X,Y) & :O \\
\text{regardée} &
\end{align*}
\]

\[\text{to be combined with an auxiliary as}\]

\[(15) \text{être} \]

\[
\begin{align*}
\text{sent}'[\text{fin},v,(\text{Ge:sg:p3}),_] & :\text{nil}/\text{np}'[\text{nom},n,(\text{Ge:sg:p3}),_] :\text{nil}:X:\text{pre} : _ \\
\text{np}'[\text{par},m,_] & :\text{nil}:Y:\text{post} : _ \\
\text{être}(e,X,Y) & :O \\
\text{est} &
\end{align*}
\]

\[\text{yielding}\]

\[(16) \text{est regardée} \]

\[
\begin{align*}
\text{sent}'[\text{fin},v,(\text{fem:sg:p3}),_] & :\text{nil}/\text{np}'[\text{nom},n,(\text{fem:sg:p3}),_] :\text{nil}:Y:\text{pre} : _ \\
\text{np}'[\text{par},m,_] & :\text{nil}:X:\text{post} : _ \\
\text{est}(e,X,Y) & :O \\
\text{est,regardée} &
\end{align*}
\]

This can then correctly be combined with the subject Marie (2b) respecting the agreement auxiliary-subject and subject-participle (because it is used with être)

**CLITICS**

Beside the fact that clitics in French are always placed before the verb or verb-auxiliary unit (as it was said before) there are also restrictions concerning placement between them.

It is thus necessary to specify (17 a) and to exclude (17 b), among others.

\[(17) (a) \text{Marie lui[a]} \text{a donné un livre[ec]} \\
(b) \text{Marie a lui[a] donné un livre[ec]} \]

The main problem with French clitics is that arguments combine in a different order with the verb according to (a) whether they are clitic or not and (b) whether they are first/second person or third person.

\[(18) (a) \text{Marie donne un livre[ec] à Pierre[ec]} \\
(b) \text{Marie lui[ec] donne un livre[ec]} \\
(c) \text{Marie le[ec] lui[ec] donne} \\
(d) \text{Marie me[ec] le[ec] donne} \]

The core of conditions on clitic ordering in French can be found in (19). These transitions are valid for argumental clitics and non-argumental ones (for example, VP modifiers, as y in Il y a apporté un livre), but the present paper is only intended to cover the argumental ones.

\[(19) 1 \rightarrow \text{pro[acc]} \text{pro[dat]} \text{pro[aux]} \text{pro[aux]} \text{y} \text{m[acc]} \text{m[dat]} \text{m[acc]} \text{m[dat]} \]

2 where G = grammatical, * = non grammatical, $\varnothing$ = impossible (because an argument of a verb cannot be consumed twice)

The complex information of the matrice are included in a uniform way in the clitics lexical entries.

The basic template for clitic is:

\[
\text{Head}'[\text{Feat},\text{Clo2},A,\text{Class}] :C / (\text{Head}'[\text{Feat},\text{Clo1},A,\text{Class}] :C/\text{np}'[\_,\_,\_,\text{pro}] :\text{nil}:\text{pro}(X):_: _) :S \\
\text{pre} \\
\text{S} \\
\text{O} \\
\text{String}
\]

where the relation between Clo2 and Clo1 constains the matrice information relevant for each clitic.

**IMPLEMENTATION**

The UCG French grammar has been implemented at the Laboratoires de Marcoussis (France) on a VAX 780 in C-PROLOG using PIMPLE, a PROLOG implementation of a PATR-II like tool for development of unification grammars, implemented by the Centre for Cognitive Science of Edinburgh University.

Some more examples with auxiliaries and clitics

Entries for the sentence Marie la lui a donnée:

\[
\begin{align*}
\text{(a) Marie lui[a]} & \text{a donné un livre[ec]} \\
\text{(b) Marie a lui[a] donné un livre[ec]} \\
\text{The main problem with French clitics is that arguments combine in a different order with the verb according to (a) whether they are clitic or not and (b) whether they are first/second person or third person.}
\end{align*}
\]
Entries for the sentence Marie lui est donnée:

(24) est

sent'[fin,v,(fem:sg:Pe),Class] :C/sent'[or(pas,pspe),v,Ag,Class]:C:Sem:pre:_
:Sem
:O
:est

(25) donnée

sent'[pas,v,(fem:sg:Pe),Class] :nil/np[nom,n,Ag,Class]:nil:X:pre:_
/np[acc,n,Ag,Class]:nil:Y:pre:_
/np[dat,m,Class]:nil:Z:post
:donner(e,unknown,Z,Y)
:O
:donnée

est with donnée by FA yielding:

sent'[fin,v,(fem:sg:Pe),Class] :nil/np[nom,n,Ag,Class]:nil:X:pre:_
/np[acc,n,(fem:sg:Pe),Class]:nil:Y:pre:_
/np[dat,m,Class]:nil:Z:post
:donner(e,unknown,Z,Y)
:O
:donnée

lui with [est,donnée] by FA yielding:

sent'[fin,v,(fem:sg:Pe),Class] :nil/np[nom,n,Ag,Class]:nil:X:pre:_
/np[acc,n,Ag,Class]:nil:Y:pre:_
/np[dat,m,Class]:nil:Z:post
:donner(e,unknown,pro(Z),Y)
:O
:[lui,[est,donnée]]
Marie with \(lui, est, donnée\)) by FA yielding:

\[
\text{sent}[(\text{fin,v,}(\text{fem:sg:Pe}),_)] \\
:\text{nil} \\
:\text{donner}(e, \text{unknown}, \text{pro(Z)}, \text{marie}) \\
:\text{O} \\
[:\text{Marie,}\text{lui,}\text{est, donnée}]]
\]
