On the existence and uniqueness of weak solutions to time-fractional elliptic equations with time dependent variable coefficients

H.T. Tuan

November 11, 2020

Abstract

This paper is devoted to discuss on the existence and uniqueness of weak solutions to time-fractional elliptic equations having time dependent variable coefficients. To obtain the main result, our strategy is to combine Galerkin method, a basic inequality for fractional derivative of convex Lyapunov candidate functions, the Yoshida approximation sequence and the weak compactness argument.

Keywords and phrases: Time fractional derivatives, Existence and uniqueness, Weak solution, Elliptic equations, Variable coefficients

1 Introduction

Diffusion equations with fractional-order derivatives in time (which is called as time-fractional diffusion equations) have been introduced in Physics by Nigmatullin [N86] to describe super slow diffusion process in a porous medium with the structure type of fractal geometry (Koch’s tree). Then, by the probabilistic point of view, in the paper [MK2000], Metzler and Klafter have pointed out that a time-fractional diffusion equation generates a non-Markovian diffusion process with a long memory. After that, Roman and Alemany [RA94] have considered continuous-time random walks on fractals and observed that the average probability density of random walks on fractals obeys a diffusion equation with a fractional time derivative asymptotically. Another context where such systems appear is the modelling of evolution processes in materials with memory, see e.g., [P93, C99].
The existence of solutions to time-fractional partial differential equations has been studied by many authors. In [EK04], using Fourier transform, the authors have obtained a fundamental solution for time-fractional elliptic equations with smooth coefficient. Combining Galerkin method and the Yoshida approximation sequence, in [Z09], the author has proposed a way to prove existence of certain weak solutions to abstract evolutionary integro-differential equations in Hilbert spaces. By virtue of the operator theory in functional analysis and the eigenfunction expansion method for symmetry elliptic operators, in [SY11], Sakamoto and Yamamoto have proved the existence and uniqueness of the weak solution for a fractional diffusion-wave equation. Based on a definition of the Caputo derivative on a finite interval in fractional Sobolev spaces, Gorenflo, Luchko and Yamamoto [GLY15] have investigated solutions (in the distribution sense) to time-fractional diffusion equations from the operator theoretic viewpoint. In the recent work, by a classical variational approach, K.V. Bockstal [B20] has established the existence of a unique weak solution to a class of fractional diffusion equations with Caputo derivative.

However, to the best of our knowledge, the development of this theory is still in its infancy and requires further researches. The main difficulty which one have to face is the meaning of the initial condition of solutions and the correctness of the formulation of weak solutions. In this paper, we focus on an initial-boundary value problem with the zero initial condition for time-fractional elliptic equations having time dependent variable coefficients which can not apply Fourier transformation to solve them. To overcome the aforementioned obstacles, our strategy is to use Galerkin method, a basic inequality for fractional derivative of convex Lyapunov candidate functions, the Yoshida approximation sequence and the weak compactness argument.

The paper is organized as follows. In section 2, we recall some preliminary results on fractional calculus. Then, we give the setting of the problem and propose a clear definition of a weak solution to a time fractional elliptic equation with time dependent variable coefficients. The main result of the paper is Theorem 8 on the existence and uniqueness of weak solutions introduced in section 3.

To conclude the introduction, we will introduce some notations used throughout the rest of the article. Denote by \( \mathbb{N} \) the set of natural numbers and by \( \mathbb{R} \) the set of real numbers. For any natural \( d \in \mathbb{N} \), let \( \mathbb{R}^d \) be the \( d \)-dimensional Euclidean space. For an open subset \( \Omega \) of \( \mathbb{R}^d \), let \( C_c^\infty(\Omega) \) denote the space of infinitely differentiable functions \( f : \Omega \to \mathbb{R} \) with the compact support in \( \Omega \), \( L^p(\Omega) \), \( p \in \mathbb{N} \), be the set of measurable functions \( f : \Omega \to \mathbb{R} \) such that

\[
\int_\Omega |f(x)|^p \, dx < \infty,
\]

\( H^1(\Omega) \) be the Sobolev space containing all locally integrable functions \( f : \Omega \to \mathbb{R} \) such that \( f \) and its weak derivatives belong to \( L^2(\Omega) \), \( H_0^1(\Omega) \) be the closure of \( C_c^\infty(\Omega) \) in \( H^1(\Omega) \), and \( H^{-1}(\Omega) \) be the dual space of \( H_0^1(\Omega) \). Fix \( T > 0 \), denote
by $W_1^1([0,T]; \mathbb{R})$ the space of functions $f : [0,T]; \mathbb{R}$ such that $f$ and its weak derivative belong to the space $L^1([0,T]; \mathbb{R})$ and $W_2^2([0,T]; H^{-1}(\Omega))$ by the space of functions $f : [0,T] \to H^{-1}(\Omega)$ such that $f$ and the weak derivative belong to the space $L^2([0,T]; H^{-1}(\Omega))$.

2 Fractional calculus

We briefly recall an abstract framework of fractional calculus.

Let $\alpha \in (0,1], [0,T] \subset \mathbb{R}$ and $x : [0,T] \to \mathbb{R}$ be a measurable function such that $\int_0^T |x(\tau)| \, d\tau < \infty$. The right-handed Riemann–Liouville integral operator of order $\alpha$ is defined by

$$(I_{0+}^\alpha x)(t) := \frac{1}{\Gamma(\alpha)} \int_0^t (t - \tau)^{\alpha - 1} x(\tau) \, d\tau,$$

where $\Gamma(\cdot)$ is the Gamma function. The left-handed Riemann–Liouville integral operator of order $\alpha$ is defined by

$$(I_{T-}^\alpha x)(t) := \frac{1}{\Gamma(\alpha)} \int_t^T (\tau - t)^{\alpha - 1} x(\tau) \, d\tau.$$

We have the following result on the relation between the right-handed and left-handed Riemann–Liouville integral operators.

Theorem 2.1 (The Hardy–Littlewood form of fractional integration by parts). If $p > 1$, $q > 1$, $0 < \alpha < 1$, $\frac{1}{p} + \frac{1}{q} - 1 \leq \alpha$, and $f \in L^p([0,T]; \mathbb{R})$, $g \in L^q([0,T]; \mathbb{R})$,

then

$$\int_0^T (I_{0+}^\alpha f(t))g(t)dt = \int_0^T f(t)I_{T-}^\alpha g(t)dt.$$

Proof. See [LY37]. \hfill \Box

The right-handed Riemann–Liouville fractional derivative $RLD_{0+}^\alpha x$ of $x$ on $[0,T]$ is defined by

$$RLD_{0+}^\alpha x(t) := (D I_{0+}^{1-\alpha} x)(t) \text{ for almost } t \in [0,T],$$

where $D = \frac{d}{dt}$ is the usual derivative. The left-handed Riemann–Liouville fractional derivative $RLD_{T-}^\alpha x$ of $x$ on $[0,T]$ is defined by

$$RLD_{T-}^\alpha x(t) := -(D I_{T-}^{1-\alpha} x)(t) \text{ for almost } t \in [0,T].$$
Theorem 2.2. The formula
\[ \int_0^T f(t) RL D^\alpha_{0+} g(t) dt = \int_0^T g(t) RL D^\alpha_{T-} f(t) dt \]
is valid for \(0 < \alpha < 1\), \(f \in I^p_{\alpha+}(L^p)\), \(g \in I^q_{\alpha+}(L^q)\) and \(\frac{1}{p} + \frac{1}{q} - 1 \leq \alpha\).

Proof. See [SKM93, Corollary 2, pp. 46]. □

The right-handed Caputo fractional derivative of \(x\) on \([0, T]\) is defined by
\[ C D^\alpha_{0+} x(t) = RL D^\alpha_{0+} (x(t) - x(0)) \quad \text{for almost } t \in [0, T] \]
and the left-handed Caputo fractional derivative of \(x\) on \([0, T]\) is defined by
\[ C D^\alpha_{T-} x(t) = RL D^\alpha_{T-} (x(t) - x(T)) \quad \text{for almost } t \in [0, T]. \]

We have a sufficient condition for the existence of fractional derivative.

Theorem 2.3. Let \(f \in AC([0, T]; \mathbb{R})\), \(\alpha \in (0, 1)\), then \(RL D^\alpha_{0+} f\) and \(RL D^\alpha_{T-} f\) exist almost everywhere. Moreover, \(RL D^\alpha_{0+} f, RL D^\alpha_{T-} f \in L^r([0, T]; \mathbb{R}), 1 \leq r \leq \frac{1}{1 - \alpha}\), and
\[
RL D^\alpha_{0+} f(t) = \frac{1}{\Gamma(1 - \alpha)} \left[ f(0) t^\alpha + \int_0^t \frac{f'(\tau)}{(t - \tau)^\alpha} d\tau \right],
\]
\[
RL D^\alpha_{T-} f(t) = \frac{1}{\Gamma(1 - \alpha)} \left[ f(T) \frac{t^{1 - \alpha}}{(T - t)^\alpha} - \int_t^T \frac{f'(\tau)}{(\tau - t)^\alpha} d\tau \right].
\]

Proof. See [SKM93] Lemma 2.2, pp. 35–36. □

Definition 2.4. Let \(u \in L^1([0, T]; H^1_0(\Omega))\). We define the weak Riemann–Liouville fractional derivative of the order \(\alpha\) of \(u\), \(RL D^\alpha_{0+} u(t)\), as below
\[
\int_0^T \varphi(t) RL D^\alpha_{0+} u(t) dt = \int_0^T RL D^\alpha_{T-} \varphi(t) u(t) dt
\]
for all \(\varphi \in C^\infty_c((0, T); \mathbb{R})\).
3 Weak solutions to time-fractional elliptic equations

Let \( \Omega \) be a bounded domain in \( \mathbb{R}^d \) with the boundary \( \partial \Omega \in C^1 \), \( T > 0 \) and \( \alpha \in (0, 1) \). Denote \( \Omega_T = (0, T] \times \Omega \). We consider the equation of the order \( \alpha \)
\[
\frac{\partial^\alpha u(t, x)}{\partial t^\alpha} - \sum_{i,j=1}^{d} \partial_{x_i} (a_{ij}(t, x) \partial_{x_j} u(t, x)) + \sum_{j=1}^{d} b_j(t, x) \partial_{x_j} u(t, x) + c(t, x) u(t, x) = f(t)
\]
for \((t, x) \in \Omega_T\), where \( \frac{\partial^\alpha u(t, \cdot)}{\partial t^\alpha} \) is the weak Riemann–Liouville fractional derivative of the order \( \alpha \) of \( u \) with respect to the time variable \( t \) and
\( a_{ij}, b_j, c \in L^\infty(\Omega_T; \mathbb{R}) \) for all \( 1 \leq i, j \leq d \);
\( a_{ij} = a_{ji} \) for all \( 1 \leq i, j \leq d \);
\( \exists \theta > 0 \) such that \( \sum_{i,j=1}^{d} a_{ij}(t, x) \xi_i \xi_j \geq \theta \| \xi \|^2 \) for a.e. \( t \in (0, T), x \in \Omega \) and for all \( \xi \in \mathbb{R}^d \);
\( f \in L^\infty([0, T]; H^{-1}(\Omega)) \).

Assume that
\[
u(t, x) = 0 \quad \text{on} \quad [0, T] \times \partial \Omega.
\]

Denote
\[
a(u, v; t) := \int_{\Omega} \sum_{1 \leq i, j \leq d} a_{ij} \partial_{x_i} u \partial_{x_j} v + \sum_{1 \leq j \leq d} b_j \partial_{x_j} uv + cuv
\]
for all \( u, v \in H^1_0(\Omega) \) and \( u(t) := [u(t)](x) \) for all \( t \in [0, T], x \in \Omega \).

**Definition 3.1** (Weak solution). A function \( u : [0, T] \to H^1_0(\Omega) \) is a weak solution to the problem (1) with the condition (2) if
(i) \( u \in L^2([0, T]; H^1_0(\Omega)) \) and \( RL D^\alpha_{0+} u \in L^2([0, T]; H^{-1}(\Omega)) \);
(ii) for all \( v \in H^1_0(\Omega) \)
\[
\langle RL D^\alpha_{0+} u(t), v \rangle_{H^{-1} \times H^1_0} + a(u(t), v; t) = \langle f(t), v \rangle_{H^{-1} \times H^1_0}
\]
for a.e. \( t \in (0, T) \), where \( \langle \cdot, \cdot \rangle_{H^{-1} \times H^1_0} \) is the duality pairing between \( H^{-1}(\Omega) \) and \( H^1_0(\Omega) \).
3.1 Galerkin approximation solution

Let \( \{e_j\}_{j=1}^\infty \) be smooth functions which constitutes an orthonormal basis of \( L^2(\Omega) \) and a basis of \( H^1_0(\Omega) \) such that

(i) \(-\Delta e_k = \lambda_k e_k, k \in \mathbb{N};\)

(ii) \( \int_\Omega e_j e_j = \begin{cases} \mathbf{1}, & i = j \\ 0, & i \neq j \end{cases} \quad \text{and} \quad \int_\Omega D e_i D e_j = \begin{cases} \lambda_i, & i = j \\ 0, & i \neq j \end{cases} \)

For the existence of these functions, see [E98, p. 335]. Fix \( N \in \mathbb{N} \). Let \( E_N = \text{span}\{e_1, \ldots, e_N\} \) and \( P_N \) be the project map from \( L^2(\Omega) \) to \( E_N \) defined by

\[
P_N u = \sum_{i=1}^N c_i e_i \text{ with } u \in L^2(\Omega) \text{ has the form } u = \sum_{i=1}^\infty c_i e_i \text{ in which } c_i = \int_\Omega u e_i \, dx, \quad i \in \mathbb{N}.
\]

In this section, using Galerkin method, we will construct approximation solutions to the problem (1)–(2) in \( E_N \).

Let the function \( u_N : [0, T] \to E_N \) having the form

\[
u(t) = \sum_{i=1}^N c^i(t) e_i, \quad t \in [0, T], \tag{3}
\]

here \( c^i(\cdot), 1 \leq i \leq N \), is continuous and has the Riemann–Liouville fractional derivative of the order \( \alpha \) on \( [0, T] \). Assume that

\[
(R^t D_0^\alpha) u_N, v)_{L^2} + a(u_N(t), v; t) = (f(t), v)_{H^{-1} \times H^1_0} \tag{4}
\]

for a.e. \( t \in (0, T) \) and \( u_N(0) = 0. \tag{5} \)

We obtain the following result.

**Proposition 3.2.** For any \( N \in \mathbb{N} \), there exists a unique solution to the problem (4)–(5) having the form (3).

**Proof.** Consider the function \( u_N : [0, T] \to E_N \) having the form

\[
u(t) = \sum_{i=1}^N c^i(t) e_i, \quad t \in [0, T],
\]

where \( c^i(\cdot), 1 \leq i \leq N \), is continuous and has the Riemann–Liouville fractional derivative of the order \( \alpha \) on \( [0, T] \). To \( u_N(\cdot) \) is a solution to (4)–(5) then \( c^i(\cdot), 1 \leq i \leq N \), have to satisfy the following condition

\[
\left( \sum_{i=1}^N R^t D_0^\alpha c^i(t) e_i, e_j \right)_{L^2} + a \left( \sum_{i=1}^N c^i(t) e_i, e_j; t \right) = (f(t), e_j)_{H^{-1} \times H^1_0} = f^j(t) \tag{6}
\]
for $1 \leq j \leq N$ and almost every $t \in (0, T]$. Moreover,

$$c^j(0) = 0, \quad 1 \leq j \leq N. \quad (7)$$

Put $\overline{c}(t) = (c^1(t), \ldots, c^N(t))^T$, $A(t) = (a(e_i, e_j; t))_{1 \leq i, j \leq N}$, and

$$\overline{f}(t) = (f^1(t), \ldots, f^N(t))^T.$$ Then the system (6)–(7) is rewritten in the form

$$RLD_0^\alpha \overline{c}(t) + A(t) \overline{c}(t) = C D_0^\alpha \overline{c}(t) + A(t) \overline{c}(t) = \overline{f}(t), \quad t \in (0, T], \quad (8)$$

$$\overline{c}(0) = 0. \quad (9)$$

Hence, the system (8)–(9) has a solution on $[0, T]$ if and only if the following integral equation has a continuous solution

$$\overline{c}(t) = -\frac{1}{\Gamma(\alpha)} \int_0^t (t-\tau)^{\alpha-1} A(\tau) \overline{c}(\tau)d\tau + \frac{1}{\Gamma(\alpha)} \int_0^t (t-\tau)^{\alpha-1} \overline{f}(\tau)d\tau, \quad t \in [0, T]. \quad (10)$$

On the space $C([0, T]; \mathbb{R}^N)$, we establish an operator as

$$T_0\varphi(t) = -\frac{1}{\Gamma(\alpha)} \int_0^t (t-\tau)^{\alpha-1} A(\tau)\varphi(\tau)d\tau + \frac{1}{\Gamma(\alpha)} \int_0^t (t-\tau)^{\alpha-1} \overline{f}(\tau)d\tau, \quad t \in [0, T].$$

For any $\gamma > 0$, define a norm $\| \cdot \|_{\gamma}$ on $C([0, T]; \mathbb{R}^N)$ by

$$\|\varphi\|_{\gamma} := \max_{t \in [0, T]} \frac{\|\varphi(t)\|}{\exp(\gamma t)}.$$

It is obvious that $(C([0, T]; \mathbb{R}^N), \| \cdot \|_{\gamma})$ is a Banach space. On the other hand, for any $\varphi, \tilde{\varphi} \in C([0, T]; \mathbb{R}^N)$ and $t \in [0, T]$, we have

$$\frac{\|T_0\varphi(t) - T_0\tilde{\varphi}(t)\|}{\exp(\gamma t)} \leq \frac{\esssup_{t \in [0, T]} \|A(t)\|}{\gamma t^{\alpha}} \int_0^t \frac{\exp(-\gamma(t-\tau)) \|\varphi(\tau) - \tilde{\varphi}(\tau)\|}{(t-\tau)^{1-\alpha} \exp(\gamma \tau)}d\tau \leq \frac{\esssup_{t \in [0, T]} \|A(t)\|}{\gamma t^{\alpha}} \int_0^t u^{\alpha-1} \exp(-u)du \|\varphi - \tilde{\varphi}\|_{\gamma} \leq \frac{\esssup_{t \in [0, T]} \|A(t)\|}{\gamma t^{\alpha}} \|\varphi - \tilde{\varphi}\|_{\gamma}.$$ Hence, for $\gamma > 0$ large enough, the operator $T_0$ is contractive in $(C([0, T]; \mathbb{R}^N), \| \cdot \|_{\gamma})$ and has a unique fixed point which is also the solution to the system (10). The proof is complete.

We now give some estimate of the Galerkin approximation solution.

**Proposition 3.3.** For any $N \in \mathbb{N}$, there exists a positive constant $C$, depending on $\Omega$, $T$ and the coefficients of the equation (11), such that

$$\|u_N\|_{L^2([0,T]; L^2(\Omega))} + \|u_N\|_{L^2([0,T]; H^1_0(\Omega))} + \|RLD_0^\alpha u_N\|_{L^2([0,T]; H^{-1}(\Omega))} \leq C\|f\|_{L^\infty([0,T]; H^{-1}(\Omega))}.$$
Proof. First, using \cite[Theorem 2]{118}, we have
\begin{align*}
\langle RL_0^\alpha \mathbf{u}_N(t), \mathbf{u}_N(t) \rangle_{H^{-1} \times H_0^1} &= \langle C_0^\alpha \mathbf{u}_N(t), \mathbf{u}_N(t) \rangle_{H^{-1} \times H_0^1} \\
&= \left( \sum_{i=1}^{N} C_0^\alpha c_i(t)e_i, \sum_{i=1}^{N} c_i(t)e_i \right)_{L^2} \\
&= \sum_{i=1}^{N} c_i(t)C_0^\alpha c_i(t) \\
&\geq \frac{1}{2} \sum_{i=1}^{N} C_0^\alpha (c_i(t))^2 \\
&= \frac{1}{2} C_0^\alpha \| \mathbf{u}_N(t) \|_{L^2(\Omega)}^2.
\end{align*}

On the other hand, by \cite[Theorem 3, p. 300]{198}, there exist $\beta > 0$ and $\nu \geq 0$ such that
\begin{align*}
\beta \| \mathbf{u}_N(t) \|_{H_0^1}^2 &\leq a(\mathbf{u}_N(t), \mathbf{u}_N(t); t) + \nu \| \mathbf{u}_N(t) \|_{L^2}^2 \quad \text{for almost every } t \in (0, T).
\end{align*}

Moreover, from the assumption of $f$ and the Cauchy inequality
\begin{align*}
\langle f(t), \mathbf{u}_N(t) \rangle_{H^{-1} \times H_0^1} &\leq \| f(t) \|_{H^{-1}(\Omega)} \| \mathbf{u}_N(t) \|_{H_0^1(\Omega)} \\
&\leq \frac{1}{4 \beta} \| f(t) \|_{H^{-1}(\Omega)}^2 + \beta \| \mathbf{u}_N(t) \|_{H_0^1(\Omega)}^2.
\end{align*}

Thus, for almost every $t \in (0, T),
\begin{align*}
C_0^\alpha &\| \mathbf{u}_N(t) \|_{L^2(\Omega)}^2 \leq 2 \nu \| \mathbf{u}_N(t) \|_{L^2(\Omega)}^2 + \frac{1}{2 \beta} \| f(t) \|_{H^{-1}(\Omega)}^2.
\end{align*}

Put $v(t) := \| \mathbf{u}_N(t) \|_{L^2(\Omega)}^2$, $h(t) := \frac{1}{2 \beta} \| f(t) \|_{H^{-1}(\Omega)}^2$, and use the comparison principle for solutions to fractional differential equation and the variation of constants formula for solutions to the equations (see \cite[Lemma 3.1]{17}), we obtain the estimate
\begin{align*}
v(t) &\leq \int_{0}^{t} (t - \tau)^{\alpha - 1} E_{\alpha, \alpha}(2 \nu(\tau - \tau)^{\alpha}) h(\tau) d\tau \quad \text{for a.a. } t \in [0, T].
\end{align*}

This implies that
\begin{align*}
\| \mathbf{u}_N(t) \|_{L^2(\Omega)}^2 &\leq \frac{T^{\alpha} E_{\alpha, \alpha + 1}(2 \nu T^{\alpha}) \| f \|_{L^2(0, T; H^{-1}(\Omega))}^2}{2 \beta} \quad \text{for a.a. } t \in [0, T]. \quad (11)
\end{align*}

Next, by the similar arguments as above, we see that
\begin{align*}
C_0^\alpha &\| \mathbf{u}_N(t) \|_{L^2(\Omega)}^2 + \beta \| \mathbf{u}_N(t) \|_{H_0^1(\Omega)}^2 \leq \frac{1}{\beta} \| f(t) \|_{H^{-1}(\Omega)}^2 + 2 \nu \| \mathbf{u}_N(t) \|_{L^2(\Omega)}^2.
\end{align*}
Furthermore,
\[ C \frac{d}{dt} \| u_N(t) \|^2_{L^2(\Omega)} = \frac{RL D_0^\alpha}{d} \| u_N(t) \|^2_{L^2(\Omega)}, \]

\[ \int_0^T \beta \| u_N(t) \|^2_{L^2(\Omega)} \leq \frac{T \| f \|^2_{L^\infty([0,T];H^{-1}(\Omega))}}{\beta} + 2\nu \int_0^T \| u_N(t) \|^2_{L^2(\Omega)} dt, \]

Thus,
\[ \beta \| u_N \|^2_{L^2([0,T];H_0^1(\Omega))} \leq \frac{T \| f \|^2_{L^\infty([0,T];H^{-1}(\Omega))}}{\beta} + 2\nu \int_0^T \| u_N(t) \|^2_{L^2(\Omega)} dt. \]

This combines with (11) implies that there is a constant \( C_1 \) such that
\[ \| u_N \|^2_{L^2([0,T];H_0^1(\Omega))} \leq C_1 \| f \|^2_{L^\infty([0,T];H^{-1}(\Omega))}. \]

Finally, fix any \( v \in H_0^1(\Omega) \) with \( \| v \|_{H_0^1} \leq 1 \), and write \( v = v_0 + v_1 \), where \( v_1 \in \text{span}\{e_1, \ldots, e_N\} \) and \( (e_i, v_0) = 0, \ 1 \leq i \leq N \). Using the estimate concerning the bilinear operator \( a(\cdot, \cdot) \) and the facts that \( (RL D_0^\alpha u_N(t), v_1)_{L^2} = (RL D_0^\alpha u_N(t), v)_{H^{-1} \times H_0^1} \) and \( \| v_1 \|_{H_0^1(\Omega)} \leq \| v \|_{H_0^1(\Omega)} \leq 1 \), we obtain
\[ |(RL D_0^\alpha u_N(t), v)^{H^{-1} \times H_0^1}| \leq |a(u_N(t), v_1)| + f(t, v_1)^{H^{-1} \times H_0^1} \leq C_2 \| u_N(t) \|_{H_0^1(\Omega)} \| v \|_{H_0^1(\Omega)} + \| f(t) \|_{H^{-1}(\Omega)} \| v \|_{H_0^1(\Omega)}. \]

Hence,
\[ \| RL D_0^\alpha u_N(t) \|_{H^{-1}(\Omega)} \leq C_2 \| u_N(t) \|_{H_0^1(\Omega)} + \| f(t) \|_{H^{-1}(\Omega)} \]

which together with (13) and the estimate (12) implies
\[ \| RL D_0^\alpha u_N \|^2_{L^2([0,T];H^{-1}(\Omega))} \leq C_3 \| f \|^2_{L^\infty([0,T];H^{-1}(\Omega))}. \]

From (11), (12) and (13), the proof is complete.

### 3.2 Existence and uniqueness of weak solutions

We now in a position to state the main result of the paper.

**Theorem 3.4.** Consider the problem (1)–(2). Suppose that assumptions (a1)–(a4) hold. Then, this problem has a unique weak solution.
Proof. First, we prove the system (11)–(12) has at least one weak solution. From (12) and (13), by the Banach–Aloaglu theorem, there exist a sequence \( \{n_k\}_{k=1}^\infty \) such that

\[
\mathbf{u}_{n_k} \rightharpoonup u \text{ in } L_0^2([0, T]; H_0^1(\Omega)),
\]
(14)

\[
RL D_{0+}^\alpha \mathbf{u}_{n_k} \rightharpoonup v \text{ in } L^2([0, T]; H^{-1}(\Omega)).
\]
(15)

Let \( \varphi \in C_c^\infty((0, T); \mathbb{R}) \) and \( \psi \in H_0^1(\Omega) \) be arbitrary. Then,

\[
\int_0^T \langle v(t), \phi(t) \psi \rangle_{H^{-1} \times H_0^1} dt = \lim_{k \to \infty} \int_0^T \langle RL D_{0+}^\alpha \mathbf{u}_{n_k}(t), \phi(t) \psi \rangle_{H^{-1} \times H_0^1} dt
\]

\[
= \lim_{k \to \infty} \int_0^T \phi(t) \langle RL D_{0+}^\alpha \mathbf{u}_{n_k}(t), \psi \rangle_{H^{-1} \times H_0^1} dt
\]

\[
= \lim_{k \to \infty} \int_0^T RL D_{0+}^\alpha \phi(t) \langle \mathbf{u}_{n_k}(t), \psi \rangle_{H^{-1} \times H_0^1} dt
\]

\[
= \int_0^T RL D_{0+}^\alpha \phi(t) \langle \mathbf{u}(t), \psi \rangle_{H^{-1} \times H_0^1} dt
\]

\[
= \int_0^T \langle RL D_{0+}^\alpha \mathbf{u}(t), \varphi(t) \psi \rangle_{H^{-1} \times H_0^1} dt
\]

\[
= \int_0^T \varphi(t) \langle RL D_{0+}^\alpha \mathbf{u}(t), \psi \rangle_{H^{-1} \times H_0^1} dt,
\]

which implies

\[
v(t) = RL D_{0+}^\alpha \mathbf{u}(t).
\]
(16)

Fix \( N, M \in \mathbb{N} \) and \( N > M \). For any \( \varphi \in C_c^\infty((0, T]; \mathbb{R}) \) and \( w \in E_M \), we see that

\[
\int_0^T \langle RL D_{0+}^\alpha \mathbf{u}_N(t), \varphi(t) w \rangle_{H^{-1} \times H_0^1} dt = \int_0^T \varphi(t) \langle RL D_{0+}^\alpha \mathbf{u}_N(t), w \rangle_{H^{-1} \times H_0^1}
\]

\[
\to \int_0^T \varphi(t) \langle RL D_{0+}^\alpha \mathbf{u}(t), w \rangle_{H^{-1} \times H_0^1},
\]

\[
\int_0^T a(\mathbf{u}_N(t), \varphi(t)w; t) dt = \int_0^T \varphi(t) a(\mathbf{u}_N(t), w; t) dt
\]

\[
\to \int_0^T \varphi(t) a(\mathbf{u}(t), w; t) dt,
\]

and

\[
\int_0^T \langle f(t), \varphi(t) w \rangle_{H^{-1} \times H_0^1} dt = \int_0^T \varphi(t) \langle f(t), w \rangle_{H^{-1} \times H_0^1} dt.
\]

Thus,

\[
\langle RL D_{0+}^\alpha \mathbf{u}(t), w \rangle_{H^{-1} \times H_0^1} + a(\mathbf{u}(t), w; t) = \langle f(t), w \rangle_{H^{-1} \times H_0^1}.
\]
(17)
By virtue of \( [Z09, \text{Lemma 2.1}] \), there exists a unique weak solution to the problem \( [1-2] \).

Next, we give a proof for the uniqueness of weak solutions to \( [1-2] \). Suppose that \( u_1, u_2 \) are two weak solution to this system. Define \( u := u_1 - u_2 \). Then, \( u \) satisfies

\[
\langle (k * u)'(t), v \rangle_{H^{-1} \times H^1_0} + a(u(t), v; t) = 0, \quad v \in H^1_0(\Omega), \quad a.a. \ t \in (0, T).
\]

Let \( v = u(t) \), then for almost every \( t \in (0, T) \)

\[
\langle RL D_{0+}^a u(t), u(t) \rangle_{H^{-1} \times H^1_0} + a(u(t), u(t); t) = \langle (k * u)'(t), u(t) \rangle_{H^{-1} \times H^1_0} - a(u(t), u(t); t) = 0,
\]

where \( k(t) = \frac{1}{(1+t)^{\alpha}} \) for \( t > 0 \). Motivated by Rico Zacher \([VZ08, \text{pp. 291–292}]\), we will approximate the operator \( \frac{d}{dt}(k * u) \) by the sequences \( \{ \frac{d}{dt}(k_n * u) \}_n \), where \( k_n(t) := n s(t) = n E_a(-n t^\alpha) \) (note that by using Laplace transform, we see that \( s(\cdot) \) is the unique solution to the equation \( s(t) + n(l * s)(t) = 1, \ t > 0, \) where \( l(t) = \frac{t^{-\alpha}}{\Gamma(1-\alpha)}, \ t > 0 \), see \([KTT20, p. 3]\)). We rewrite the equation \( [18] \) as below

\[
\langle (k_n * u)'(t), u(t) \rangle_{H^{-1} \times H^1_0} + a(u(t), u(t); t) = h_n(t), \quad a.a. \ t \in (0, T)
\]

with

\[
h_n(t) := \langle (k_n * u)'(t) - (k * u)'(t), u(t) \rangle_{H^{-1} \times H^1_0}, \quad a.a. \ t \in (0, T).
\]

By virtue of \([Z09, \text{Lemma 2.1}]\),

\[
\frac{1}{2} \frac{d}{dt}(k_n * \| u(\cdot) \|^2_{L^2(\Omega)})(t) \leq \langle \frac{d}{dt}(k_n * u)(t), u(t) \rangle_{L^2(\Omega)}, \quad a.a. \ t \in (0, T).
\]

On the other hand, there exists \( d \geq 0 \) such that

\[
a(u(t), u(t); t) \geq -\nu \| u(t) \|^2_{L^2(\Omega)}.
\]

Hence, from \([19]\), we have

\[
\frac{d}{dt}(k_n * \| u(\cdot) \|^2_{L^2(\Omega)})(t) \leq 2\nu \| u(t) \|^2_{L^2(\Omega)} + 2h_n(t), \quad a.a. \ t \in (0, T).
\]

This together with the positivity of \( l \) implies that

\[
l * \frac{d}{dt}(k_n * \| u(\cdot) \|^2_{L^2(\Omega)}) \leq 2\nu (l * \| u(\cdot) \|^2_{L^2(\Omega)})(t) + 2l * h_n(t), \quad a.a. \ t \in (0, T).
\]

We will show that

\[
\lim_{n \to \infty} h_n = 0 \text{ in } L^1([0, T]; \mathbb{R}). \tag{20}
\]

11
From the facts that $u \in L^2([0, T]; H^{-1}(\Omega))$, $\frac{d}{dt}[k*u] \in L^2([0, T]; H^{-1}(\Omega))$, [VZ08] Proposition 2.1, p. 293 and [VZ08] Example 2.1, p. 294, we have

$$k * \|u(\cdot)\|^2_{H^{-1}(\Omega)} \in W^1_2([0, T]; \mathbb{R}).$$

This implies that $u \in D(B_2)$, $\|u(\cdot)\|^2_{H^{-1}(\Omega)} \in D(B_1)$, where

$$B_1(u) = \frac{d}{dt}[k*u], \quad B_2(u) = \{u \in L^1(0, T) : k*u \in W^1_2([0, T]; \mathbb{R})\},$$

and

$$B_1(u) = \frac{d}{dt}[k*u], \quad B_2(u) = \{u \in L^1(0, T) : k*u \in W^1_2([0, T]; H^{-1}(\Omega))\}.$$ 

Hence, by using [VZ08] Estimate (18), p. 292, we obtain

$$\lim_{n \to \infty} \int_0^T \left\| \frac{d}{dt}[(k - k_n) * u](t) \right\|^2_{H^{-1}(\Omega)} dt = 0.$$  \hspace{1cm} \text{(21)}$$

By (21) and the Holder inequality, the following estimates hold

$$\lim_{n \to \infty} \int_0^T |h_n(t)| dt = \lim_{n \to \infty} \int_0^T \left\| \frac{d}{dt}[(k - k_n) * u](t) \right\|_{H^{-1}(\Omega)} dt$$

$$\leq \lim_{n \to \infty} \int_0^T \left\| \frac{d}{dt}[(k - k_n) * u](t) \right\|_{H^{-1}(\Omega)} \|u(t)\|_{H^1_0(\Omega)} dt$$

$$\leq \lim_{n \to \infty} \left\| \frac{d}{dt}[(k - k_n) * u](\cdot) \right\|_{L^2([0, T]; H^{-1}(\Omega))} \|u\|_{L^2([0, T]; H^1_0(\Omega))}$$

$$= 0,$$

which shows that $\lim_{n \to \infty} h_n = 0$ in $L^1([0, T])$. Notice that

$$(l * k)(t) = \frac{1}{\Gamma(\alpha)\Gamma(1 - \alpha)} \int_0^t s^{\alpha-1}(t-s)^{-\alpha} ds$$

$$= \frac{1}{\Gamma(\alpha)\Gamma(1 - \alpha)} \int_0^1 u^{-\alpha}(1-u)^{\alpha-1} du$$

$$= \frac{1}{\Gamma(\alpha)\Gamma(1 - \alpha)} B(\alpha, 1 - \alpha)$$

$$= 1, \forall t > 0,$$

$$l * \frac{d}{dt}(k_n * \|u(\cdot)\|^2_{L^2(\Omega)}) = \frac{d}{dt}(k_n * l * \|u(\cdot)\|^2_{L^2(\Omega)}) - \frac{d}{dt}(k * l * \|u(\cdot)\|^2_{L^2(\Omega)}) = \|u(\cdot)\|^2_{L^2(\Omega)}$$
in $L^1([0,T];\mathbb{R})$ as $n \to \infty$ (see [VZ08, Estimate (19), p. 292]) and $l_n \to 0$ in $L^1([0,T];\mathbb{R})$ as $n \to \infty$, we obtain

$$
\|u(t)\|^2_{L^2(\Omega)} \leq 2\nu(l \ast \|u(\cdot)\|^2_{L^2(\Omega)})(t), \quad a.a. \quad t \in (0,T).
$$

(22)

From (22), using a Gronwall type inequality as in [H81, Lemma 7.1.1, p. 188], then $\|u(t)\|^2_{L^2(\Omega)} = 0$ a.e. in $(0,T)$, that is, $u_1 = u_2$. The proof is complete. \(\Box\)

**Remark 3.5.** The key point in the proof of the uniqueness of weak solution to the problem (1)–(2) is to show that $h_n \to 0$ in $L^1([0,T])$ as $n \to \infty$. The approach proposed in [Z09] can not apply directly to this situation because the operator $B = \frac{d}{dt}(k \ast u)$ with domain $D(B) = \{u \in L^2([0,T];H^1_0(\Omega)) : \frac{d}{dt}k \ast u \in L^2([0,T];H^{-1}(\Omega))\}$ is not m-accretive.
