New synthesis of tetraoxaspirododecane-diamines and tetraoxazaspirobicycloalkanes†

Nataliya N. Makhmudiyarova, Kamil R. Shangaraev, Lilya U. Dzhemileva,* Tatjana V. Tyumkina, Ekaterina S. Mescheryakova, Vladimir A. D’yakonov, Askhat G. Ibragimov and Usein M. Dzhemilev

An efficient method for the synthesis of new spiro-tetraoxadodecanediamines and tetraoxazaspirobicycloalkanes has been developed by reactions of primary arylamines with gem-dihydroperoxides and \( \alpha,\omega \)-dialdehydes (glyoxal, pentanedial) catalyzed by lanthanide catalysts. A potential pathway for formation of tetraoxaspirododecane-diamines and tetraoxazaspirobicycloalkanes has been proposed that involves generation of intermediate tetraoxaspiroalkanediols under the reaction conditions. The structures of the crystalline products have been confirmed by XRD. It was shown that the synthesized tetraoxazaspirobicycloalkanes exhibit high cytotoxic activity against Jurkat, K562, and U937 tumor cultures and Fibroblasts.

Presence of a heteroatom at \( \alpha \)-position relative to the peroxide group in such compounds as artemisinin, artemether, Du-1301, OZ277, veruculogen and fumitremorgin, and in bicyclic and acyclic \( \alpha \)-amino endoperoxides accounts for antimalarial and antimicrobial activities of these compounds. The data available on heteroatom-containing peroxides with high antimalarial activity suggest that tetraoxaspiropolyalkanediamines could be useful for the development of antimalarial agents.

Result and discussion

During preliminary experiments it has been shown that the reaction of 1,1-dihydroperoxycyclohexane 1 with an equimolar amount of glyoxal 2 and \( p \)-chloroaniline 3a in selected conditions (~20 °C, THF, 6 h) catalyzed by 5 mol% of Sm(NO\(_3\))\(_3\)-bis(4-chlorophenyl) formamide (70%) and cyclohexane-1,12-tetraoxaspiro[5,6]dodecane-9,10-diamine 4a in 87% yield (Scheme 1). The Sm(NO\(_3\))\(_3\)-6H\(_2\)O catalyst has been selected due to its activity in the syntheses of pentaoxacanes, hexaoxazadispiroalkanes, and hexaoxazadispiroalkanes.

In an absence of the catalyst, the aforesaid reaction proceeds with the formation, along with the target product 4a (10%), of \( N,N’ \)-bis(4-chlorophenyl)formamide (70%) and cyclohexanone (10%). Whether the reaction is conducted in presence of other lanthanide catalysts, the yield of \( N,N’ \)-bis(4-chlorophenyl)-7,8,11,12-tetraoxaspiro[5,6]dodecane-9,10-diamine 4a decreases in the following order: La(NO\(_3\))\(_3\)-6H\(_2\)O (80%) > TbCl\(_3\)-6H\(_2\)O (73%) > Ho(NO\(_3\))\(_3\)-5H\(_2\)O (60%) > DyCl\(_3\)-6H\(_2\)O (51%) > NdCl\(_3\)-6H\(_2\)O (50%).

In selected conditions [5 mol% Sm(NO\(_3\))\(_3\)-6H\(_2\)O, 20 °C, 6 h], arylamines (\( m,p \)-fluoroanilines, \( p \)-bromoaniline) 3b–e enter the...
reaction with glyoxal 2 and 1,1-dihydroperoxycyclohexane 1 to result in formation of corresponding \(N,N'\)-bis(aryl)-7,8,11,12-tetraoxaspiro[5.6]dodecane-9,10-diamines 4b–d in 84–90% yields (Scheme 1). In the experiments, choice of the solvent has been stipulated by the fact that both the reactants and the target products are highly soluble in THF.

Structures of \(N,N'\)-bis(aryl)-7,8,11,12-tetraoxaspiro[5.6]dodecane-9,10-diamines 4a–e have been established using \(^1\text{H}\) and \(^{13}\text{C}\) NMR spectrometry methods, MALDI TOF/TOF mass spectrometry and X-ray diffraction (Fig. 1). In \(^1\text{H}\) NMR spectra, the signals for methine hydrogens atoms localized between the N and O atoms in the seven-membered rings resonate in a region between 4.60–4.75 ppm and emerge as a broadened singlet due to slow, in the NMR time scale, conformational flexibility of the ring, whereas methylene protons of the spiroalkane and alkane moieties occur as two multiplets in the regions between 1.40–1.70 ppm and 2.40–2.70 ppm. Aromatic protons resonate in a low-field region between 6.80–7.40 ppm. The mass spectrum of the heterocycles 4a–e displays the corresponding molecular ion peaks, accordingly.

Crystals for the compounds 4a, b, d, e (Fig. 1) have been obtained from a solvent mixture of hexane and Et\(_2\)O in 10 : 1 ratio, at room temperature. In the corresponding structures, a spiro-conjugated tetraoxepane ring adopts a twist boat conformation, similarly to the tetraoxepane derivative described in the literature.\(^6\) Chiral centers at atoms C9 and C10 adopt S configuration in the compounds 4a, 4d, and 4e and R configuration in the compound 4b. N-aryl substituents are anti-oriented relative to each other, whereupon the torsion angle N20–C10–C9–N13 constitutes 73.1(3), 79.4(2), 68.7(4) and 74.3(8) for the compounds 4a, 4b, 4d, and 4e, respectively. The cyclohexane moiety in all compounds 4a, b, d, e adopts a chair conformation. In all molecules, the nitrogen atoms adopt a planar configuration (wherein the sum of angles at the
nitrogen atom is \( \approx 360^\circ \), due to conjugation between the \( \pi \)-system of the aromatic substituent and an unshared pair of electrons at the nitrogen atom. The lengths of peroxide bonds are provided within a range of 1.458 to 1.468 Å.

In order to expand the scope of applicability of the method developed hereby, we have conducted a reaction of pentane-1,5-dial 5 with \textit{gem}-bis-hydroperoxides and primary amines. In conditions determined for the cyclocondensation of glyoxal 2 (5 mol% \( \text{Sm(NO}_3\text{)}_3 \cdot 6\text{H}_2\text{O}, 20^\circ\text{C}, 6 \text{~h} \)), the pentane-1,5-dial 5 enters the reaction with \textit{gem}-bis-hydroperoxides and primary amines to give tetraoxazaspirobicycloalkanes (Scheme 3). In the reaction, the 1,1-dihydroperoxycycloalkane compounds based on cyclohexane 1, cyclopentane 6, 4-methylcyclohexane 7, cyclooctane 8, dodecane 9 and adamantane 10 have been utilized as primary amines. The results obtained in selected cyclocondensation conditions [pentane-1,5-dial : \textit{gem}-bis-hydroperoxide : amine : \( \text{Sm(NO}_3\text{)}_3 \cdot 6\text{H}_2\text{O} = 1 : 1 : 1 : 0.05 \) (mol/mol); THF; 20 \(^\circ\)C] indicate that the method thus developed is an efficient tool for the selective synthesis of bicyclic tetraoxazaspirobicycloalkanes 11–16 (71–83%) (Scheme 2).

Crystals for the compound 12b (Fig. 2) have been obtained from a solvent mixture of hexane and Et\(_2\)O in 10 : 1 ratio, at room temperature.

According to the X-ray diffraction data, a tetraoxazacane ring adopts a boat chair conformation, whereas cyclohexane and pyran rings adopt the chair conformation. Bond lengths of the peroxide bonds O001–O003 and O002–O004 constitute 1.4692 (14) and 1.4612 (14) Å, respectively. The nitrogen atom N006 in the compound 12b adopts a planar conformation similarly to that occurring in the compounds 4a, b, d, e (with the sum of angles at the nitrogen, \( \sum \text{N006} = 359.7^\circ \)).

As can be viewed from the figure, in a crystal phase the diperoxide moiety in the bicyclic structure adopts the chair conformation, while in solution a multicomponent conformational equilibrium exists, which is typical of both triperoxide\(^{20}\) and azadiperoxide\(^{18,19}\) compounds. Thus, in the \(^{13}\)C NMR spectra of the synthesized compounds 11–16, three signals with similar chemical shifts can be observed in a region between 85.92–86.87 ppm for each said compound, instead of individual signals characteristic of the bridgehead tertiary carbon atoms. At the same time, the methine protons also exhibit signals split into components with different intensity in the matching region 5.36–5.83 ppm of the \(^1\)H NMR spectra. By the way of an example, for the compound 12a, the integrated intensity ratio for signals at 5.83 ppm, 5.68 ppm, and 5.37 ppm constitutes 1 : 8 : 1, which correlates with the carbon signals at 85.92 ppm, 86.87 ppm, and 86.75 ppm, respectively, according to the data obtained by heteronuclear 2D HSQC spectroscopy. In order to assign signals in the NMR spectra and by using quantum chemical method B3LYP/6-31G(d,p), six stable conformers have been identified on a potential energy surface of the bicyclic tetraoxazaspirocycloalkane molecule 12a having the spirohexane substituent in the chair conformation.\(^{22}\) The most energetically favorable conformers are shown in Fig. 3 as preferred candidates for the structures observed in the NMR spectra.

According to the calculated data, the global minimum corresponds to a conformer A that occurs in the crystal phase. Slightly higher in energy conformational states of the spiroaminodiperoxide moiety are the twist chair (B) and the chair (C). For the conformation B, a conformation B’ of similar energy may exist, due to a lack of symmetry upon rigid fixation of rotational position of the N-substituent and the spiro moiety. Symmetry violation is also possible in an event of \textit{ortho-} or \textit{meta-}
substitutions in the aromatic ring, which can cause doubling of the observed set of signals. Additionally, any changes in the bicyclic cage lead to a sharp increase in energy up to 28 kcal mol\(^{-1}\) and higher (ESI,† conformers D and E); therefore, these changes are unlikely.

Presumably, the scheme of formation of spiro-tetraoxepanes includes the initial formation of tetraoxaspirocycloalkanediols, which then undergo condensation with primary amines to give the target products. This assumption was verified by conducting the synthesis of tetraoxaspirocycloalkanediols 18–20 by the reaction of 1,1-dihydroperoxycycloalkanes 1, 6, and 7 with glyoxal 2 in the presence of 5 mol% of the Sn(NO\(_3\))\(_2\)-6H\(_2\)O catalyst (Scheme 3). Without a catalyst, the yield of diols 17–19 did not exceed 10%.

According to X-ray diffraction data for compounds 19 (Fig. 4), in the crystalline state, the tetraoxepane and cyclohexane moieties exist in the chair conformation. Like in structure 4b, the chiral centers at the C005 and C008 carbon atoms have the R configuration.

Cytotoxicity of azaperoxide based compounds is well known,\(^{2,13,14,19,20a,21}\) so screened the representative compounds for their cytotoxicity activity against Jurkat, K562, U937 Fibroblasts cell lines and results are summarized in Table 1.

It was found that the synthesized spiro-tetraoxadecanediamines 4a, f and tetraoxazaspirobicycloalkanes 11a, e, 12b, c, 14g, 15a exhibit a cytotoxic effect on all selected tumor cell lines in a wide range from 11.49 to >500 \(\mu\)M. The most potent cytotoxic activity was shown by peroxides 11e, 12c and 12b synthesized by the reaction of 1,1-dihydroperoxycyclopentane 6 or 1,1-dihydroperoxycyclohexane 1 and fluorine(bromine)arylamines. The replacement of bromine or fluorine atoms with chlorine atom in the phenyl substituent of the studied peroxides 11a, 14g and 15a leads to a significant decrease in their cytotoxicity, with a pronounced selective effect on myelocytic (K562) and mononcic (U937) cell cultures, in comparison with the cytotoxicity of the studied compounds to lymphocytes of the Jurkat line. At the same time, spiro-tetraoxadecanediamines with two fluororomatic substituents 4b or chloroaromatic 4a fragments showed less cytotoxicity compared to tetraoxazaspirobicycloalkanes 11a, e, 12b, c, 14g, 15a.

The synthesized compounds have a selectivity index (SI) with respect to all tumor cells from 4 to 10 (SI = IC\(_{50}\) Fibroblasts/IC\(_{50}\) cancer cells).

## Conclusions

Hence, a versatile method has been developed for the synthesis of new spiro-tetraoxepanediamines and tetraoxazaspirobicycloalkanes by the reactions of primary arylamines with gem-dihydroperoxides and \(\alpha,\omega\)-dialdehydes in presence of lanthanide catalysts. The method thus developed markedly expands structural diversity of nitrogen-containing cyclic diperoxide derivatives and, in most cases, allows synthesizing these compounds with higher yields (up to 95%) and selectivity. In addition, it was shown that the synthesized spiro-tetraoxepanediamines and tetraoxazaspirobicycloalkanes exhibit high cytotoxic activity against Jurkat, K562, U937 tumor cultures and Fibroblasts.

## Experimental section

### General remarks

All reactions were performed at room temperature in air in round-bottom flasks equipped with a magnetic stir bar. The NMR spectra were recorded on a Bruker Avance 500 spectrometer at 500.17 MHz for \(^1\)H and 125.78 MHz for \(^13\)C according to standard Bruker procedures. CDCl\(_3\) was used as the solvent, and tetramethylsilane, as the internal standard. The mixing time for the NOESY experiments was 0.3 s. Mass spectra were recorded on a Bruker Autoflex III MALDI TOF/TOF instrument with \(\alpha\)-cyano-4-hydroxycinnamic acid as a matrix. Samples were prepared by the dried droplet method. The C, H, and N were quantified by a Carlo Erba 1108 analyzer. The oxygen content was determined on a Carlo Erba 1108 analyzer. The progress of reactions was monitored by TLC on Sorbfil (PTSKh-AF-A) plates, with a 5 : 1 hexane : EtOAc mixture as the eluent and visualization with \(I_2\) vapor. For column chromatography, silica gel MACHEREY-NAGEL (0.063–0.2 mm) was used.

All calculations were carried out using a program Gaussian 09. Geometric parameter optimization, vibrational frequency analysis, and calculation of entropy and thermodynamic corrections to the total energy of the compounds were carried out on the B3LYP functional\(^{18}\) using the 6-31G(d,p) basis set. No limitation was imposed on the changes in the geometric parameters of the subsystems studied. Thermodynamic parameters were determined at 298 K. The minima were confirmed through the calculation of the force constant (Hessian) matrix and the analysis of the resulting frequencies.
All minima were verified to have no negative frequencies. Visualization of quantum chemical data was carried out with the programs ChemCraft.  

The X-ray diffraction measurements for compounds 4a, 4b, 4d, 4e, 12b, 19 were performed on an XCalibur Gemini Eos automated four-circle diffractometer (graphite monochromator, MoKα radiation, λ = 0.71073 Å, ω-scan mode, 2θ_{max} = 62°) at ambient temperature (293–298 K). Collected data were processed using the program CrystAlisPro.  

Structures determinations were carried out with the OLEX2 program.  

The structures were solved by direct methods and refined by the full-matrix least-squares method in the anisotropic approximation for non-hydrogen atoms. All hydrogen atoms are generated using the proper HFIX command and refined isotropically using the riding model. The calculations were performed using the SHELX program package. The molecular plots were drawn using Mercury.  

The synthesis of the gem-dihydroperoxides 1, 6–10 was as reported in the literature. THF was freshly distilled over LiAlH₄. Glyoxal was used as aqueous solution (40%).

Cell culturing

Human cancer cell line HeLa was obtained from the HPA Culture Collections (UK). Cells (Jurkat, K562, U937, Fibroblasts) were purchased from Russian Cell Culture Collection (Institute of Cytology of the Russian Academy of Sciences) and cultured according to standard protocols and sterile technique. The cell lines were shown to be free of viral contamination and mycoplasma. Cells were maintained in RPMI 1640 (Jurkat, K562, U937, Fibroblast) (Gibco) supplemented with 4% FBS (Sigma) and 100 units per ml penicillin–streptomycin (Sigma). All types of cells were grown in an atmosphere of 5% CO₂ at 37 °C. The cells were subcultured at 2–3 days intervals. Cells were then seeded in 24 well plates at 5 × 10⁴ cells per well and incubated overnight. Jurkat, K562, U937, Fibroblast cells were subcultured at 2 day intervals with a seeding density of 1 × 10⁵ cells per 24 well plates in RPMI with 10% FBS.

Cytotoxicity assay

Viability (live/dead) assessment was performed by staining cells with 7-AAD (7-aminoactinomycin D) (Biolegend). After treatment cells were harvested, washed 1–2 times with phosphate-buffered saline (PBS) and centrifuged at 400g for 5 min. Cell pellets were resuspended in 200 μL of flow cytometry staining buffer (PBS without Ca²⁺ and Mg²⁺, 2.5% FBS) and stained with 5 μL of 7-AAD staining solution for 15 min at room temperature in the dark. Samples were acquired on NovoCyte TM 2000 Flow Cytometry System (ACEA) equipped with 488 nm argon laser. Detection of 7-AAD emission was collected through a 675/30 nm filter in the FL4 channel.

Cyclocondensation reactions of primary amines with gem-dihydroperoxides and α,ω-dialdehydes (glyoxal, pentanediol) catalyzed by Sm(NO₃)₂·6H₂O

General procedure: a Schlenk vessel mounted on a magnetic stirrer was charged at ~20 °C with tetrahydrofuran (5 ml), α,ω-dialdehydes (glyoxal, pentanediol) (10 mmol), and specified gem-dihydroperoxides (10 mmol).  

Then Sm(NO₃)₂·6H₂O (0.062 g, 5 mol% relative to 1,1,3-peroxybis(1-hydroperoxycycloalkane)) was added. The reaction mixture was stirred at ~20 °C for 1 h, after which primary amines (20 mmol) were added, and the reaction mixture was stirred at ~20 °C for 6 h more. After completion of the reaction H₂O (5 ml) and CH₂Cl₂ (5 ml) were added. The organic layer was separated, dried (anhydrous MgSO₄) and concentrated to isolate products stable during storage at room temperature. Products of the reaction were purified by column chromatography on SiO₂ using 10 : 1 PE : Et₂O as the eluent. The progress of reactions was monitored by TLC, with a 5 : 1 hexane : EtOAc mixture as the eluent, visualization was performed with I₂ vapor.

N⁹,N¹⁰-bis(4-Chlorophenyl)-7,8,11,12-tetraoxaspiro[5.6]dodecane-9,10-diamine 4a

White crystals; 0.34 g (85% yield), mp 120–122 °C.  

1H NMR (400 MHz, CDCl₃, δ 25 °C): δ = 1.28–1.48 (m, 2H, CH₂), 1.69 (br.s, 4H, 2CH₂), 1.77–1.89 (m, 4H, 2CH₂), 5.57 (br.s, 2H, 2CH), 7.13–7.15 (m, 4H, CH), 7.18–7.21 (m, 4H, CH).  

13C NMR (100 MHz, CDCl₃, δ 25 °C): δ = 122.6 (conformer A), 22.8 (conformers B+C), 25.1, 31.2 (conformer A), 31.4 (conformers B+C), 85.1, 115.8, 116.3, 124.7, 128.6, 145.1. MALDI TOF/TOF, m/z: 424 [M – H]⁺. Anal. calcd for C₂₀H₂₂Cl₂N₂O₄: C, 56.48; H, 5.63; N, 7.11%.

N⁹,N¹⁰-bis(2-Fluorophenyl)-7,8,11,12-tetraoxaspiro[5.6]dodecane-9,10-diamine 4b

White crystals; 0.33 g (85% yield), mp 134–136 °C.  

1H NMR (400 MHz, CDCl₃, δ 25 °C): δ = 1.28–1.36 (m, 2H, CH₂), 1.43–1.45 (m, 4H, 2CH₂), 1.60–1.61 (m, 4H, 2CH₂), 5.70 (br.s, 2H, 2CH), 6.87–6.89 (m, 2H, CH₂), 7.02–7.10 (m, 4H, CH), 7.18–7.24 (m, 2H, CH).  

13C NMR (100 MHz, CDCl₃, δ 25 °C): δ = 22.6, 25.1, 29.7, 89.7, 111.5, 114.5, 115.2 (J = 19), 120.3 (J = 12), 124.7, 145.4, 161.4 (J = 192). MALDI TOF/TOF, m/z: 391 [M – H]⁺. Anal. calcd for C₂₀H₂₂F₂N₂O₄: C, 56.48; H, 5.65; N, 7.14%.

N⁹,N¹⁰-bis(3-Fluorophenyl)-7,8,11,12-tetraoxaspiro[5.6]dodecane-9,10-diamine 4c

White crystals; 0.34 g (85% yield), mp 138–140 °C.  

1H NMR (400 MHz, CDCl₃, δ 25 °C): δ = 1.30–1.46 (m, 2H, CH₂), 1.61 (br.s, 4H, 2CH₂), 1.77–1.84 (m, 4H, 2CH₂), 5.62 (br.s, 2H, 2CH), 6.58–6.68 (m, 6H, CH), 7.18–7.25 (m, 2H, CH).  

13C NMR (100 MHz, CDCl₃, δ 25 °C): δ = 22.6 (conformer A), 22.7 (conformers B+C), 25.0 (conformer A), 25.2 (conformers B+C), 31.2 (conformer A), 31.6 (conformers B+C), 88.2, 102.5 (J = 7), 111.1, 112.1, 107.2 (J = 17), 130.7 (J = 8), 145.6, 163.8 (J = 195). 11-(3-Fluorophenyl)-2,3,5,6-tetraoxa-11-azaspiro[bicyclo[5.3.1]undecane-4,1'-cyclohexane] 12c

Brown oil; 0.24 g (75% yield), Rf 0.81 (PE/ Et2O = 10/1). 1H NMR (500.17 MHz, CDCl3, 25 °C): δ = 1.31–1.46 (m, 4H, CH2, 2CH2), 1.48–1.62 (m, 5H, 2CH2, CH2), 1.72–1.99 (m, 4H, 2CH2), 2.14–2.19 (m, 1H, CH3), 2.22–2.25 (m, 2H, CH2), 3.57–3.59 (m, 2H, 2CH, conformer A), 5.69 (brs, 2H, 2CH, conformer A), 5.85–5.86 (m, 2H, 2CH, conformer B), 6.59–6.68 (m, 1H, CH), 6.89–6.98 (m, 2H, CH), 7.15–7.25 (m, 1H, CH). 13C NMR (125.78 MHz, CDCl3, 25 °C): δ: 14.2 (conformer B+C), 14.6 (conformer A), 21.0 (conformers B+C), 22.0 (conformer A), 22.5 (conformer B), 22.7 (conformer A), 22.8 (conformer C), 25.0 (conformer C), 25.3 (conformer B), 25.4 (conformer A), 26.4 (conformer C), 27.0 (conformer B), 85.6 (conformer B), 86.7 (conformer C), 86.9 (conformer A), 104.8 (J = 17, conformer C), 105.3 (J = 20, conformer B), 105.9 (J = 20, conformer A), 107.2 (J = 17 conformer A), 107.8 (J = 17, conformers B+C), 108.8 (conformers B+C), 109.5 (conformer A), 113.3 (conformers B+C), 114.0 (conformer A), 129.7 (J = 8, conformers A), 129.9 (J = 7, conformer B), 130.4 (J = 8, conformer C), 151.3 (J = 8, conformers B+C), 151.8 (J = 8, conformer A), 163.3 (J = 194). MALDI TOF/TOF, m/z: 322 [M – H]+. Anal. calcd. for C19H26ClNO4: C, 62.04; H, 7.12; N, 3.81%. Found: C, 62.02; H, 7.10; N, 3.79%.

11-(2-Chlorophenyl)-2,3,5,6-tetraoxa-11-azaspiro[bicyclo[5.3.1]undecane-4,1'-cyclohexane] 13f

Orange oil; 0.27 g (78% yield), Rf 0.76 (PE/ Et2O = 10/1). 1H NMR (500.17 MHz, CDCl3, 25 °C): δ = 0.97 (d, 3H, J = 10 Hz, CH3, conformer A), 1.04 (d, 3H, J = 10 Hz, CH3, conformer B+C), 1.58–1.59 and 2.21–2.28 (m, 2H, CH2), 1.89–1.92 and 2.14–2.19 (m, 4H, 2CH2), 1.59–1.61 and 3.09–3.11 (m, 4H, CH2), 1.23–1.73 (m, 4H, 2CH2), 1.98–2.03 (m, 1H, CH), 5.03–5.52 (m, 2H, 2CH), 6.69–6.78 (m, 2H, 2CH), 6.97–7.40 (m, 2H, 2CH). 13C NMR (125.78 MHz, CDCl3, 25 °C): δ = 14.2 (conformer C), 15.0 (conformer A), 16.6 (conformer B), 21.6 (conformer B), 21.0 (conformers B+C), 25.9 and 26.0 and 26.7 (conformers A+B+C), 30.9 and 31.2 (conformer B+C), 31.0 (conformers A), 31.4 (conformers B+C), 31.5 (conformer A), 31.7 and 31.9 (conformers B+C), 31.7 (conformer A), 34.8, 89.7 (conformer A), 89.6 and 89.8 and 89.9 (conformer A+B+C), 109.6, 113.7 (conformers B+C), 115.9 (conformer A), 119.0 (conformer A), 119.3 and 119.4 (conformers B+C), 127.4 and 127.6 and 127.8 (conformers B+C), 127.6 (conformers A), 129.2 (conformers B+C), 129.4 (conformers A), 130.2 (conformers B+C), 130.5 (conformer A), 143.0 (conformer B+C), 147.1 (conformer A), MALDI TOF/TOF, m/z: 322 [M – H]+. Anal. calcd. for C19H26ClNO4: C, 61.10; H, 6.84; N, 3.96%. Found: C, 61.08; H, 6.82; N, 3.94%.

11-(2-Chlorophenyl)-2,3,5,6-tetraoxa-11-azaspiro[bicyclo[5.3.1]undecane-4,1'-cyclooctadecane] 15a

Orange crystal; 0.33 g (79% yield), Rf 0.78 (PE/ Et2O = 10/1), mp 82–84 °C. 1H NMR (500.17 MHz, CDCl3, 25 °C): δ = 1.27–1.36 (m, 12H, 6CH2), 1.70–1.75 (m, 2H, CH2), 1.27–1.98 (m, 4H, 2CH2), 2.15–2.20 and 1.98–2.20 (m, 4H, 2CH2), 2.15–2.41 (m, 2H, 2CH2), 5.35–5.36 (m, 2H, 2CH, conformer B), 5.66 (s, 2H, 2CH, conformer A), 5.82 (s, 2H, 2CH, conformer C), 7.03–7.08 (m, 1H, CH), 7.15–7.21 (m, 2H, CH2), 6.87–6.94 (m, 1H, CH). 13C NMR (125.78 MHz, CDCl3, 25 °C): δ = 14.2 (conformer A), 16.1 (conformer B+C), 22.0 (conformers A), 22.3 (conformer B+C), 24.7 (conformer A), 25.1 (conformer B+C), 25.7, 31.0 (conformer B+C), 31.4 (conformers A), 85.8 (conformer B), 86.7 (conformer C), 86.7 (conformer A), 113.3, 112.5 (conformer A), 113.2 (conformer B), 114.7, 117.9 (conformers A), 118.2 (conformers B+C), 129.7 (conformers B+C), 130.3 (conformers A), 143.3 (conformers B+C), 143.6 (conformers A), 147.4 (conformers B+C), 148.1 (conformers A). MALDI TOF/TOF, m/z: 366 [M – H]+. Anal. calcd. for C33H38ClNO8: C, 65.16; H, 8.08; N, 3.30%. Found: C, 65.12; H, 8.06; N, 3.28%.
Brown oil; 0.28 g (72% yield), Rf 0.80 (PE/EtO = 10/1). 1H NMR (400 MHz, CDCl₃, 25 °C): δ = 1.66–1.74 (m, 2H, CH₂-Ad), 1.77 (m, 1H, CH-Ad, conformer A), 1.82–1.86 (m, 8H, CH₂-Ad), 1.95–2.01 (m, 4H, CH₂-Ad, conformer A), 2.04–2.06 (m, 4H, CH₂-Ad), 2.10–2.17 (m, 4H, 2CH₂), 2.19–2.28 (m, 2H, CH₃), 2.31 (br.s, 2H, CH₂-Ad), 2.39 (br.s, 1H, CH-Ad, conformer A), 5.48–5.49 (m, 2H, 2CH, conformer B), 5.68 (s, 2H, 2CH, conformer A), 5.81 (s, 2H, 2CH, conformer C), 6.77–6.84 (m, 1H, CH), 6.89–6.95 (m, 1H, CH), 7.02–7.13 (m, 1H, CH), 7.15–7.23 (m, 1H, CH). 13C NMR (100 MHz, CDCl₃, 25 °C): δ = 14.6 (conformer A), 16.3 (conformer B+C), 26.5, 27.1 (conformer B+C), 27.2 (conformer A), 30.3, 33.1 (conformer A), 33.6 (conformer B+C), 34.2 (conformer B+C), 34.4 (conformer A), 37.4 (conformer B+C), 37.4 (conformer A), 84.8 (conformer B), 86.1 (conformer C), 86.9 (conformer A), 110.9 (conformer B), 111.5 (conformer A), 112.6 (conformer C), 116.6 (conformers B+C), 116.9 (conformer A), 118.8 (conformers A), 119.1 (conformers B+C), 120.5 (conformer A), 121.4 (conformers B+C), 129.7, 151.3. MALDI TOF/TOF, m/z: 390 [M – H]⁻. Anal. calcld for C₁₁H₁₆O₆: C, 49.09; H, 7.32%. Found: C, 49.07; H, 7.30%.

**Crystal structure determination and refinement**

The crystallographic data, coordinates of atoms, and geometric parameters for compounds 4a, 4b, 4d, 4e, 12b are monoclinic, space group P2₁/c, a = 18.9061(6), b = 11.4711(4) and c = 8.7831(3) Å, β = 99.1343(3)°, V = 1880.66(11) Å³, d_calc = 1.386 g cm⁻³, Z = 4, μ = 0.110 mm⁻¹, 2θ_max = 58.30°, 9078 reflections were measured, from which 4395 were independent. The refinement converged to R = 0.0544, wR₂ = 0.1617, GOF = 1.030.

**Crystal data for 4a.** Crystals of C₁₁H₂₂Br₂N₂O₄ (M = 392.40) are monoclinic, space group P2₁/c, a = 10.5362(9), b = 9.4705(6) and c = 20.3165(17) Å, β = 99.4628(8)°, V = 1999.73(11) Å³, d_calc = 1.413 g cm⁻³, Z = 4, μ = 0.354 mm⁻¹, 2θ_max = 58.56°, 13 245 reflections were measured, from which 4644 were independent. The refinement converged to R = 0.0608, wR₂ = 0.1916, GOF = 0.987.

**Crystal data for 4d.** Crystals of C₁₀H₁₆N₂O₂ (M = 425.30) are monoclinic, space group P2₁/n, a = 12.9687(13), b = 10.0294(8) and c = 14.5182(15) Å, β = 100.068(10)°, V = 1859.3(3) Å³, d_calc = 1.402 g cm⁻³, Z = 4, μ = 0.111 mm⁻¹, 2θ_max = 58.23°, 9607 reflections were measured, from which 4798 were independent. The refinement converged to R = 0.0749, wR₂ = 0.1777, GOF = 0.986.

**Crystal data for 12b.** Crystals of C₁₁H₁₈F₂NO₄ (M = 514.20) are monoclinic, space group P2₁/n, a = 10.6640(6), b = 9.4362(6) and c = 20.7558(11) Å, β = 97.997(5)°, V = 2068.3(2) Å³, d_calc = 1.651 g cm⁻³, Z = 4, μ = 3.948 mm⁻¹, 2θ_max = 58.35°, 9582 reflections were measured, from which 4798 were independent. The refinement converged to R = 0.0749, wR₂ = 0.1777, GOF = 0.986.

**Crystal data for 19.** Crystals of C₆H₁₄O₆ (M = 206.19) are orthorhombic, space group Pbcₐ, a = 6.5986(6), b = 9.8591(8)
and $c = 29.604(2)$ Å, $\alpha = 90^\circ$, $\beta = 90^\circ$, $\gamma = 90^\circ$, $V = 1925.9(3)$ Å$^3$, $d_{\text{calc}} = 1.422$ g cm$^{-3}$, $Z = 8$, $\mu = 0.123$ mm$^{-1}$, $2\theta_{\text{max}} = 58.10^\circ$, 4693 reflections were measured, from which 1905 were independent. The refinement converged to $R_1 = 0.0953$, $wR_2 = 0.2238$, GOF = 0.980.

**Conflicts of interest**

There are no conflicts to declare.

**Acknowledgements**

This work was financially supported by the Russian Science Foundation (RSF projects 18-73-00014). The structural studies of the synthesized compounds were performed with the use of Collective Usage Center “Agidel” at the Institute of Petrochemistry and Catalysis of RAS. The anticancer activity studies of the synthesized compounds were performed in laboratory of molecular design and biological screening of candidate substances for the pharmaceutical industry at the Institute of Petrochemistry and Catalysis of RAS.
