Abstract

We study the supersymmetric Wilson loop as introduced by Caron-Huot, which attaches to lightlike polygons certain edge and vertex operators, whose shape is determined by supersymmetry constraints. We state explicit formulas for the vertex operators to all orders in the Grassmann expansion, thus filling a gap in the literature. This is achieved by deriving a recursion formula out of the supersymmetry constraints.

I. INTRODUCTION

Gluon scattering amplitudes have been known to be dual to Wilson loops along lightlike polygons. While first shown at strong coupling (Ref. 1) through the famous AdS/CFT duality introduced in Ref. 2, this result has later been verified at weak coupling (Refs. 3 and 4). For a review, consult Ref. 5.

Recently, a similar duality (at weak coupling) between the full superamplitude of $\mathcal{N} = 4$ super Yang-Mills theory and a supersymmetric extension of the Wilson loop has been claimed, of which two variants appeared almost simultaneously. The first approach by Mason and Skinner (Ref. 6) originates in momentum twistor space and translates into the integral over a superconnection in spacetime. The second is due to Caron-Huot (Ref. 7) and attaches to lightlike polygons certain edge and vertex operators, whose shape is determined by supersymmetry constraints. At the classical level, both approaches are identical only on-shell (Ref. 8). Belitsky showed in Ref. 9 that the conjectured duality with superamplitudes indeed holds, however only upon subtracting an anomalous contribution from the super Wilson loop.

The operators in the Caron-Huot approach depend on momentum supertwistors. While the edge operators are wellknown, explicit formulas for the vertex operators have been available in the literature only up to fourth order in the Grassmann expansion. The aim of this article is to fill this gap. We state explicit formulas for the vertex operators up to maximum order. This is achieved by deriving a recursion formula out of the supersymmetry constraints.

To fix notation, we let $W_n$ denote the super Wilson loop and $E_i$ and $V_{i,i+1}$ the edge and vertex operators, respectively, which depend on the (odd) momentum supertwistors $\eta_i^A$ and $\eta_{i+1}^A$. At zeroth order, the ordinary Wilson loop should be recovered, thus leading to the ansatz $E_i = p_i \cdot A + \mathcal{O}(\eta)$ and $V_{i,i+1} = 1 + \mathcal{O}(\eta)$. The supersymmetry constraints are such that $Q_A^\alpha W_n = 0$ is to vanish, where the $Q_A^\alpha = q_A^\alpha + c_0 \sum_i \lambda_i^\alpha \frac{\partial}{\partial \eta_i^A}$ act on the fields as well as the momentum supertwistors. This is achieved if the edges and vertices transform by an infinitesimal super gauge transformation

$$Q_A^\alpha E_i = \frac{1}{g} (\partial_i - ig [E_i, \cdot]) X_{iA}^\alpha$$  \hspace{1cm} (1a)

$$Q_A^\alpha V_{i,i+1} = i X_{i+1A}^\alpha V_{i,i+1} - i V_{i,i+1} X_{iA}^\alpha$$ \hspace{1cm} (1b)
Here, and in the following, we adopt the conventions of Ref. 10.

II. EDGE OPERATORS

The edge operators are computed as sketched in Ref. 7. One finds the following solution of (1a), making use of the Euler-Lagrange equations.

\[ \mathcal{E}_i = \frac{1}{2} \lambda_{i\beta} \tilde{\lambda}_{i\beta} A^{\beta\gamma} + \frac{i}{c_0} \tilde{\lambda}_{i\beta} \tilde{\psi}_{i\beta} A_i^A - \frac{i\sqrt{2}}{2c_0} \tilde{\lambda}_{i\beta} \lambda_{(i-1)\gamma} D^{\beta\gamma} \tilde{\phi}_{AB} \eta_i^A \eta_i^B \]

\[ + \frac{1}{3c_0^2} \varepsilon_{ABCD} \frac{\lambda_{(i-1)\xi} \lambda_{(i-1)\gamma} D^{\beta\gamma} \psi_{i\xi} A^{i\beta}}{\langle i, i - 1 \rangle^2} \eta_i^B \eta_i^C \eta_i^D \]

\[ + \frac{i}{24c_0^2} \varepsilon_{ABCD} \frac{\lambda_{(i-1)\gamma} \lambda_{(i-1)\xi} \tilde{\lambda}_{i\beta} D^{\beta\gamma} F^{\gamma\xi}}{\langle i, i - 1 \rangle^3} \eta_i^A \eta_i^B \eta_i^C \eta_i^D \]

with

\[ X_{iA}^\alpha := g_{i\alpha} \frac{\lambda_{i\alpha}}{c_0 \langle i, i - 1 \rangle} \left( -2i\sqrt{2} \tilde{\phi}_{iA} \eta_i^B + \varepsilon_{ABCD} \frac{2\lambda_{(i-1)\gamma} \psi_{i\gamma} A^{i\beta}}{c_0 \langle i, i - 1 \rangle} \eta_i^B \eta_i^C \eta_i^D \right) \]

\[ + \frac{i}{3c_0^2} \varepsilon_{ABCD} \frac{\lambda_{(i-1)\gamma} \lambda_{(i-1)\xi} \tilde{\lambda}_{i\beta} D^{\beta\gamma} F^{\gamma\xi}}{\langle i, i - 1 \rangle^3} \eta_i^B \eta_i^C \eta_i^D \]

III. A RECURSION FORMULA

We expand

\[ V_{i,i+1} = \sum_{k=0}^{4} \sum_{\ell=0}^{4} V_{A_1...A_k B_1...B_l} \eta_i^{A_1} \ldots \eta_i^{A_k} \eta_{i+1}^{B_1} \ldots \eta_{i+1}^{B_l} \]

and, similarly, denote the coefficients of \( X_{iA}^\alpha \) by

\[ X_{iA}^\alpha = X_{iA}^{\alpha(1)} + X_{iA}^{\alpha(2)} + X_{iA}^{\alpha(3)} = X_{iAA_1}^{\alpha(1)} \eta_i^{A_1} + X_{iAA_1A_2}^{\alpha(2)} \eta_i^{A_1} \eta_i^{A_2} + X_{iAA_1A_2A_3}^{\alpha(3)} \eta_i^{A_1} \eta_i^{A_2} \eta_i^{A_3} \]

Let \( V_0 = 1 \) (i.e. \( V_{i,i+1} = 1 + \mathcal{O}(\eta) \)) and require that \( V_{i,i+1} \) only depends on the generators \( \eta_i \) and \( \eta_{i+1} \). Then (1b) with \( X_{iA}^\alpha \) as above has the following unique solution: All coefficients \( V_{B_1,...,B_d} = 0 \) for \( d > 0 \) (i.e. all "pure \( \eta_{i+1} \)-terms") vanish and the remaining coefficients are
successively determined by the following recursion formula.

\[
V_{A_1 \ldots A_k B_1 \ldots B_l} = \frac{(-1)^{d+1} \lambda_{i+1}^{(i+1)\alpha}}{(k + 1) c_0 \langle i + 1, i \rangle} \left(-q_A^\alpha (V_{A_1 \ldots A_k B_1 \ldots B_l}) + i X^{\alpha(1)}_{(i+1), AB} V_{A_1 \ldots A_k B_1 \ldots B_{l-1}} + i X^{\alpha(2)}_{(i+1), AB \ldots B_{l-1}} V_{A_1 \ldots A_k B_1 \ldots B_{l-2}} + i X^{\alpha(3)}_{(i+1), AB \ldots B_{l-2} B_{l-1}} V_{A_1 \ldots A_k B_1 \ldots B_{l-3}} \right)
\]

where \( d = k + l \).

**Proof.** For calculations, it is easier to work with an expansion where the generators \( \eta_i \) and \( \eta_{i+1} \) can stand in any order:

\[
V_{i,i+1} = \sum_{d=0}^8 C^{j_1 \ldots j_d}_{B_1 \ldots B_d} \eta_{j_1} \ldots \eta_{j_d}, \quad V_{A_1 \ldots A_k B_1 \ldots B_l} = \binom{k + l}{k} C^{i \ldots i+1 \ldots i+1}_{A_1 \ldots A_k B_1 \ldots B_l}
\]

with \( j_i \in \{i, i+1\} \). Now, applying from the left a fixed \( \frac{\partial}{\partial \eta_k} \) in the \( C \)-expansion kills the corresponding \( \eta \) terms which can occur at every position, thus giving a symmetry factor of \( d \) and a sign such that

\[
Q_A^\alpha (V_{i,i+1}) = \sum_{d=0}^8 \left( q_A^\alpha (C^{j_1 \ldots j_d}_{B_1 \ldots B_d}) + c_0 (d + 1) (-1)^{j_1 \ldots j_d} C^{k_{j_1} \ldots j_d}_{AB_1 \ldots B_d} \eta_{B_1} \ldots \eta_{B_d} \right)
\]

(11) is equivalent to the recursion formula

\[
c_0 (d + 1) (-1)^{j_1 \ldots j_d} C^{k_{j_1} \ldots j_d}_{AB_1 \ldots B_d} \eta_{B_1} \ldots \eta_{B_d} = -q_A^\alpha (C^{j_1 \ldots j_d}_{B_1 \ldots B_d}) \eta_{j_1} \ldots \eta_{j_d} + i \sum_{k+l=d} (X^{\alpha}_{i+1 A} | \eta_k V_{i,i+1} | \eta_l - V_{i,i+1} | \eta_k X^{\alpha}_{i A} | \eta_l)
\]

By induction, one shows that the coefficients are of parity \( |C^{j_1 \ldots j_d}_{B_1 \ldots B_d}| \equiv_2 d \). Also by induction, we see that all coefficients \( C^{i+1,i+1}_{B_1 \ldots B_d} = 0 \) vanish: In the recursion formula so far established, we consider the case \( j_1 = \ldots j_d = i+1 \) and multiply both sides with \( \lambda_{i\alpha} \). Then only the left hand side with \( k = i+1 \) remains and

\[
C^{i+1,i+1 \ldots i+1}_{AB_1 \ldots B_d} \eta_{i+1} \ldots \eta_{i+1} = \frac{(-1)^{d+1} \lambda_{i\alpha}}{(i + 1) c_0 (d + 1)} \left(-q_A^\alpha (C^{i+1,i+1}_{B_1 \ldots B_d}) \eta_{i+1} \ldots \eta_{i+1} \right)
\]

since \( \lambda_{i\alpha} X^{\alpha}_{i+1 A} = 0 \) and \( X^{\alpha}_{i A} = \mathcal{O}(\eta_i) \). For \( d = 0 \), the right hand side \( \sim q_A^\alpha (1) = 0 \) vanishes and thus \( C^{i+1}_{B_1 \ldots B_d} = 0 \). Take this as induction basis and assume that \( C^{i+1,i+1}_{B_1 \ldots B_d} = 0 \). The same recursion formula then implies that \( C^{i+1,i+1 \ldots i+1}_{AB_1 \ldots B_d} = 0 \).
Now, by multiplying both sides of the recursion formula with $\lambda_{(i+1)\alpha}$, only the left hand side with $k = i$ remains, and we yield

$$C_{AB_1...B_d}^{ij_1...j_d} \eta_{j_1}^{B_1} \cdots \eta_{j_d}^{B_d} = \frac{(-1)^{d+1} \lambda_{(i+1)\alpha}}{(i+1, i) c_0 (d+1)} \left( - q_0^\alpha (C_{AB_1...B_d}^{ij_1...j_d}) \eta_{j_1}^{B_1} \cdots \eta_{j_d}^{B_d} + (i X_{i+1}^\alpha V_{i,i+1} - i V_{i,i+1} X_{i,i}^\alpha) \right)$$

Writing the second term on the right hand side in the $C$-expansion and then translating everything back to the original expansion (2) using

$$C_{AB_1...B_d}^{ij_1...j_d} \eta_{j_1}^{B_1} \cdots \eta_{j_d}^{B_d} | \eta^{k \eta_{k+1}} \rangle = \frac{k+1}{d+1} V_{A_1...A_k B_1...B_l} \eta_{1}^{A_1} \cdots \eta_{k}^{A_k} B_1 \cdots B_l \eta_{k+1} \cdots \eta_{l+1}$$

the statement is finally obtained. \(\square\)

IV. VERTEX OPERATORS

By the recursion formula of the previous section, the coefficients of the vertex operators in the expansion (2) can be explicitly calculated. Up to order three, the result reads

$$V_{i,i+1} = 1 - \frac{\sqrt{2} g_{i+}^i}{c_0^2 i_+} \phi_{A_1 A_2} \eta_i^{A_1} \eta_i^{A_2} + \frac{2 \sqrt{2} g_{i+}^i}{c_0^2 i_+} \phi_{A_1 B_1} \eta_i^{A_1} \eta_{i+1}^{B_1} + \frac{2 g i_+ (-i_- \lambda_{(i+1)\gamma} + i_+ \lambda_{(i-1)\gamma}) \psi \gamma C}{3 c_0^3} \varepsilon_{A_1 A_2 A_3} \eta_i^{A_1} \eta_i^{A_2} \eta_i^{A_3}$$

$$+ \frac{2 g \lambda_{(i+1)\gamma} \psi \gamma C}{c_0^2 i_+^2} \varepsilon_{A_1 A_2 B_1 C} \eta_i^{A_1} \eta_i^{A_2} \eta_{i+1}^{B_1} - \frac{2 g \lambda \psi \gamma C}{c_0^2 i_+} \varepsilon_{A_1 B_1 B_2 C} \eta_i^{A_1} \eta_{i+1}^{B_1} \eta_{i+1}^{B_2}$$

$$+ O(\eta^4)$$

with $i_- := \langle i, i-1 \rangle$, $i_+ := \langle i+1, i \rangle$ and $i_{\pm} := \langle i+1, i-1 \rangle$.
Fourth Order

The (non-vanishing) fourth order coefficients \(^{2}\) of \(V_{i,i+1}\) are as follows.

\[
V_{A_1A_2A_3A_4} = \left( \frac{g i^\pm \left( i^2 \lambda_{i+1} \lambda_{i+1} - i_- \lambda_{i+1} \lambda_{i+1} \gamma + i_+ \lambda_{i+1} \lambda_{i+1} \gamma + i^2 \lambda_{i-1} \lambda_{i-1} \gamma \right) }{12c_0^3 i_- t_+^3} + \frac{g^2 i^\pm \phi_{CD} \phi^{CD}}{12c_0^4 i_- t_+^2} \right) \varepsilon_{A_1A_2A_3A_4}
\]

\[
V_{A_1A_2A_3B_1} = \frac{g \lambda_{i+1} \lambda_{i+1} \gamma F^{\beta\gamma}}{3c_0^3 i_-^3} \varepsilon_{A_1A_2A_3B_1} - \frac{4g^2 i^\pm}{c_0^4 i_- t_+^2} \phi_{A_1B_1} \phi_{A_2B_3}
\]

\[
V_{A_1A_2B_1B_2} = \frac{g \lambda_{i+1} \lambda_{i+1} \gamma F^{\beta\gamma}}{2c_0^3 i_-^3} \varepsilon_{A_1A_2B_1B_2} - \frac{g^2}{c_0^4 i_-^2} \left[ \phi_{A_1A_2}, \phi_{B_1B_2} \right] - \frac{4g^2}{c_0^4 i_- t_+^2} \phi_{A_1B_1} \phi_{A_2B_2}
\]

\[
V_{A_1B_1B_2B_3} = -\frac{g \lambda_{i+1} \lambda_{i+1} \gamma F^{\beta\gamma}}{3c_0^3 i_-^3} \varepsilon_{A_1B_1B_2B_3}
\]

Fifth Order

\[
V_{A_1A_2A_3B_1} = \frac{i \sqrt{2} g^2 i^\pm}{3c_0^5 i_-^2 t_+^3} \left( 4(i_- \lambda_{i+1} \gamma - i_+ \lambda_{i-1} \gamma) \varepsilon_{A_2A_3A_4} \phi_{A_1B_1} \psi^{\gamma C} \right.
\]

\[
-6i_- \lambda_{i+1} \gamma \psi^{\gamma C} \varepsilon_{A_1A_2B_1B_3} \phi_{A_3A_4} \left. \right)
\]

\[
V_{A_1A_2A_3B_1B_2} = \frac{i \sqrt{2} g^2 \lambda_{i+1} \beta}{3c_0^5 t_+^3} \left( \varepsilon_{A_2A_3B_1B_2} \phi_{A_1C}, \psi^{\beta C} \right) + \varepsilon_{A_1A_2A_3} \phi_{B_1B_2}, \psi^{\beta C} \]

\[
- \varepsilon_{A_1B_1B_2C} \phi_{A_2A_3}, \psi^{\beta C} - 4 \varepsilon_{A_1A_2B_1C} \phi^{\beta C} \phi_{A_3B_2}
\]

\[
-8 \varepsilon_{A_2A_3B_1C} \phi_{A_1B_2}, \psi^{\beta C} \]

\[
+ \frac{2i \sqrt{2} g^2 i^\pm \lambda_{i+1} \gamma}{c_0^5 i_-^2 t_+^3} \varepsilon_{A_1B_1B_2C} \psi^{\gamma C} \phi_{A_2A_3}
\]

\[
V_{A_1A_2B_1B_2B_3} = \frac{2i \sqrt{2} g^2 \lambda_{i+1} \gamma}{3c_0^5 t_+^3} \left( -\phi_{A_1C}, \psi^{\gamma C} \right) \varepsilon_{A_2B_1B_2B_3} + 3 \phi_{A_1B_1}, \psi^{\gamma C} \varepsilon_{A_2B_2B_3C}
\]

where \([X,Y]_+ := XY + YX\) denotes the anticommutator.
Sixth Order

\[
V_{A_1 A_2 A_3 A_4 B_1 B_2} = -\frac{\sqrt{2} g^2 \lambda_{(i+1)\alpha} \lambda_{(i+1)\beta}}{24 c_0^3 i_+} \varepsilon_{A_1 A_2 A_3 A_4} \left[ \phi_{B_1 B_2}, F^{\beta \alpha} \right] + \frac{\sqrt{2} g^2 \lambda_{(i+1)\alpha} \lambda_{(i+1)\beta}}{6 c_0^3 i_+} \varepsilon_{A_1 A_2 A_3 B_1} \left( F^{\beta \alpha} \phi_{A_4 B_2} + 3 \phi_{A_4 B_2} F^{\beta \alpha} \right) - \frac{\sqrt{2} g^2 i_+^2 \lambda_{1} \lambda_{(i+1)\gamma} F^{\beta \gamma} \phi_{A_1 A_2} \varepsilon_{A_2 A_3 B_1} + \frac{\sqrt{2} g^3 i_+^2}{2 c_0^3 i_+} \left( 2 \left[ \phi_{A_1 A_2}, \phi_{B_1 B_2} \right] \phi_{A_3 A_4} + 8 \phi_{A_2 B_1} \phi_{A_3 B_2} \phi_{A_4 B_4} \right) + \frac{g^2}{3 c_0^3 i_+^2} \left( \varepsilon_{A_2 A_3 A_4 C} \varepsilon_{A_1 B_1 B_2 D} \left( i^2_+ \lambda_{(i+1)\gamma} \lambda_{(i+1)\delta} \right) + \varepsilon_{A_1 B_1 B_2 C} \varepsilon_{A_2 A_3 A_4 D} \left( i^2_+ \lambda_{(i+1)\gamma} \lambda_{(i+1)\delta} + 4 i_+ i_+ \lambda_{1} \lambda_{(i+1)\delta} \right) \right)
\]

\[
\psi^C, \psi^D
\]

and

\[

$$+ \frac{g^2\lambda_i\gamma_{\lambda_i\lambda_{(i+1)}}\lambda_{(i+1)^{\alpha}}}{8c_0^2\bar{\lambda}_i^2} \varepsilon_{A_1A_2B_1B_2} \varepsilon_{A_3A_4B_3B_4} F^\gamma_\beta F^{\epsilon\alpha}$$

*The General Structure*

From the above formulas for $V_{i,i+1}$, we see that higher order terms factor into terms with the structure of lower order terms:

$$V_{i,i+1} \sim \sum \prod \left(1 + \bar{\phi} \cdot \eta^2 + \frac{1}{\sqrt{g}} \bar{\psi} \cdot \eta^3 + \frac{1}{g} F \cdot \eta^4\right)$$

It is understood that this is not an equation but only a similarity which helps memorise the types of terms occurring.

**ACKNOWLEDGEMENTS**

I would like to thank Jan Plefka, Johannes Henn and Konstantin Wiegandt for interesting discussions.
