Footnotes Table 4

Abbreviations: HDU, high dependency unit; ICU, intensive care unit; SD, standard deviation; VTE, venous thromboembolism

a Length of stay begins with admission time and ends with discharge time, days

b Acute kidney injury was identified as an increase in serum creatinine by ≥0.3mg/dL (≥26.5 mol/L) within 48 hours or an increase in serum creatinine to ≥1.5 times baseline within the prior 7 days compared with the preceding 1 year of data in acute care medical records. Acute kidney injury is calculated only for patients with record of baseline kidney function data available and without a
diagnosis of end-stage kidney disease.
