BLOWUP OF $H^1$ SOLUTIONS FOR A CLASS OF THE FOCUSING INHOMOGENEOUS NONLINEAR SCHRÖDINGER EQUATION

VAN DUONG DINH

ABSTRACT. We consider a class of focusing inhomogeneous nonlinear Schrödinger equation

$$i\partial_t u + \Delta u + |x|^{-b}|u|^{\alpha} u = 0, \quad u(0) = u_0 \in H^1(\mathbb{R}^d),$$

with $0 < b < \min\{2, d\}$ and $\alpha_* \leq \alpha < \alpha^*$ where $\alpha_* = \frac{4-b}{2}$ and $\alpha^* = \frac{4-b}{2}$ if $d \geq 3$ and $\alpha^* = \infty$ if $d = 1, 2$. In the mass-critical case $\alpha = \alpha_*$, we prove that if $u_0$ has negative energy and satisfies either $xu_0 \in L^2$ or $u_0$ is radial with $d \geq 2$, then the corresponding solution blows up in finite time. Moreover, when $d = 1$, we prove that if the initial data (not necessarily radial) has negative energy, then the corresponding solution blows up in finite time. In the mass and energy intercritical case $\alpha_* < \alpha < \alpha^*$, we prove the finite time blowup for radial negative energy initial data as well as the finite time blowup below ground state for radial initial data in dimensions $d \geq 2$. This result extends the one of Farah in [9] where the blowup below ground state was proved for data in the virial space $H^1 \cap L^4(|x|^2dx)$ with $d \geq 1$.

1. INTRODUCTION

In this paper, we consider the Cauchy problem for the inhomogeneous nonlinear Schrödinger equation

$$\begin{cases}
    i\partial_t u + \Delta u + \mu|x|^{-b}|u|^{\alpha} u = 0, \\
    u(0) = u_0,
\end{cases} \quad (\text{INLS})$$

where $u : \mathbb{R} \times \mathbb{R}^d \to \mathbb{C}$, $u_0 : \mathbb{R}^d \to \mathbb{C}$, $\mu = \pm 1$ and $\alpha, b > 0$. The parameters $\mu = 1$ (resp. $\mu = -1$) corresponds to the focusing (resp. defocusing) case. The case $b = 0$ is the well-known nonlinear Schrödinger equation which has been studied extensively over the last three decades. The inhomogeneous nonlinear Schrödinger equation arises naturally in nonlinear optics for the propagation of laser beams, and it is of a form

$$i\partial_t u + \Delta u + K(x)|u|^{\alpha} u = 0. \quad (1.1)$$

The (INLS) is a particular case of (1.1) with $K(x) = |x|^{-b}$. The equation (1.1) has been attracted a lot of interest in a past several years. Bergé in [1] studied formally the stability condition for soliton solutions of (1.1). Towers-Malomed in [28] observed by means of variational approximation and direct simulations that a certain type of time-dependent nonlinear medium gives rise to completely stable beams. Merle in [21] and Raphaël-Szeftel in [24] studied (1.1) for $k_1 < K(x) < k_2$ with $k_1, k_2 > 0$. Fibich-Wang in [12] investigated (1.1) with $K(x) := K(|x|)$ where $\epsilon > 0$ is small and $K \in C^2(\mathbb{R}^d) \cap L^\infty(\mathbb{R}^d)$. The case $K(x) = |x|^b$ with $b > 0$ is studied by many authors (see e.g. [4, 19, 31] and references therein).

In order to recall known results for the (INLS), let us give some facts for this equation. We first note that the (INLS) is invariant under the scaling,

$$u_\lambda(t, x) := \lambda^{\frac{2-b}{2}} u(\lambda^2 t, \lambda x), \quad \lambda > 0.$$
An easy computation shows
\[ \|u_\lambda(0)\|_{H^\gamma} = \lambda^{\gamma + \frac{2-\beta}{d}} \|u_0\|_{H^\gamma}. \]
Thus, the critical Sobolev exponent is given by
\[ \gamma_\epsilon := \frac{d}{2} - \frac{2 - b}{\alpha}. \] (1.2)
Moreover, the (INLS) has the following conserved quantities:
\[ M(u(t)) := \int |u(t, x)|^2 dx = M(u_0), \] (1.3)
\[ E(u(t)) := \int \frac{1}{2} |\nabla u(t, x)|^2 - \frac{\mu}{\alpha + 2} |x|^{-b}|u(t, x)|^{\alpha + 2} dx = E(u_0). \] (1.4)

The well-posedness for the (INLS) was first studied by Genoud-Stuart in [13, Appendix] (see also [14]) by using the argument of Cazenave [3]. Note that the existence of $H^1$ solutions to (INLS) is shown by the energy method which does not use Strichartz estimates. More precisely, Genoud-Stuart showed that the focusing (INLS) with $0 < b < \min\{2, d\}$ is well posed in $H^1$:
- locally if $0 < \alpha < \alpha^*$,
- globally for any initial data if $0 < \alpha < \alpha^*$,
- globally for small initial data if $\alpha^* \leq \alpha < \alpha^*$,
where $\alpha^*$ and $\alpha^*$ are defined by
\[ \alpha_* := \frac{4 - 2b}{d}, \quad \alpha^* := \begin{cases} \frac{4 - 2b}{d - 2} & \text{if } d \geq 3, \\ \infty & \text{if } d = 1, 2. \end{cases} \] (1.5)

In the case $\alpha = \alpha_*$ ($L^2$-critical), Genoud in [16] showed that the focusing (INLS) with $0 < b < \min\{2, d\}$ is globally well-posed in $H^1$ assuming $u_0 \in H^1$ and
\[ \|u_0\|_{L^2} < \|Q\|_{L^2}, \]
where $Q$ is the unique nonnegative, radially symmetric, decreasing solution of the ground state equation
\[ \Delta Q - Q + |x|^{-b}|Q|^{\frac{4}{d-2}}Q = 0. \] (1.6)

Also, Combet-Genoud in [6] established the classification of minimal mass blow-up solutions for the focusing $L^2$-critical (INLS).

In the case $\alpha_* < \alpha < \alpha^*$, Farah in [9] showed that the focusing (INLS) with $0 < b < \min\{2, d\}$ is globally well-posed in $H^1, d \geq 1$ assuming $u_0 \in H^1$ and
\[ E(u_0)^{\gamma_\epsilon} M(u_0)^{1-\gamma_\epsilon} < E(Q)^{\gamma_\epsilon} M(Q)^{1-\gamma_\epsilon}, \] (1.7)
\[ \|\nabla u_0\|_{L^2} \|u_0\|_{L^2}^{1-\gamma_\epsilon} < \|\nabla Q\|_{L^2} \|Q\|_{L^2}^{1-\gamma_\epsilon}, \]
where $Q$ is the unique nonnegative, radially symmetric, decreasing solution of the ground state equation
\[ \Delta Q - Q + |x|^{-b}|Q|^\alpha Q = 0. \] (1.8)

He also proved that if $u_0 \in H^1 \cap L^2(|x|^2 dx) =: \Sigma$ satisfies (1.7) and
\[ \|\nabla u_0\|_{L^2} \|u_0\|_{L^2}^{1-\gamma_\epsilon} > \|\nabla Q\|_{L^2} \|Q\|_{L^2}^{1-\gamma_\epsilon}, \] (1.9)
then the blow-up in $H^1$ must occur. Afterwards, Farah-Guzman in [10, 11] proved that the above global solution is scattering under the radial condition of the initial data. Note that the existence and uniqueness of solutions $Q$ to the elliptic equations (1.6) and (1.8) were proved by Toland [27], Yanagida [30] and Genoud [15] (see also Genoud-Stuart [13]).
Guzman in [18] used Strichartz estimates and the contraction mapping argument to establish the local well-posedness as well as the small data global well-posedness for the (INLS) in Sobolev space. Recently, the author in [7] improved the local well-posedness in $H^1$ of Guzman by extending the validity of $b$ in the two and three dimensional spatial spaces. Note that the results of Guzman [18] and Dinh [7] about the local well-posedness of (INLS) in $H^1$ are a bit weaker than the one of Genoud-Stuart [13]. More precisely, they do not treat the case $d = 1$, and there is a restriction on the validity of $b$ when $d = 2$ or $3$. However, the local well-posedness proved in [18, 7] provides more information on the solutions, for instance, one knows that the global solutions to the defocusing (INLS) satisfy $u \in L^p_{\text{loc}}(\mathbb{R}, W^{1,q})$ for any Schrödinger admissible pair $(p, q)$. This property plays an important role in proving the scattering for the (INLS). Note also that the author in [7] pointed out that one cannot expect a similar local well-posedness result for (INLS) in $H^1$ as in [18, 7] holds in the one dimensional case by using Strichartz estimates.

In [7], the author used the so-called pseudo-conformal conservation law to show the decaying property of global solutions to the defocusing (INLS) by assuming the initial data in $\Sigma$ (see before (1.9)). In particular, he showed that in the case $\alpha \in [\alpha_*, \alpha^*)$, global solutions have the same decay as the solutions of the linear Schrödinger equation, that is for $2 \leq q \leq \infty$ when $d \geq 3$ or $2 \leq q < \infty$ when $d = 2$ or $2 \leq q \leq \infty$ when $d = 1$,

$$
\|u(t)\|_{L^q(\mathbb{R}^d)} \lesssim |t|^{-d(\frac{1}{2} - \frac{1}{q})}, \quad \forall t \neq 0.
$$

This allows the author proved the scattering in $\Sigma$ for a certain class of the defocusing (INLS). Later, the author in [8] made use of the classical Morawetz inequality and an argument of [29] to derive the decay of global solutions to the defocusing (INLS) with the initial data in $H^1$. Using the decaying property, he was able to show the energy scattering for a class of the defocusing (INLS). We refer the reader to [7, 8] for more details.

The main purpose of this paper is to show the finite time blowup for the focusing (INLS). Thanks to the well-posedness of Genoud-Stuart [13], we only expect blowup in $H^1$ when $\alpha_* \leq \alpha < \alpha_*$ which correspond to the mass-critical and the mass and energy intercritical cases. Note that the local well-posedness for the energy-critical (INLS), i.e. $\alpha = \alpha^*$ is still an open problem.

Our first result is the following finite time blowup for the (INLS) in the mass-critical case $\alpha = \alpha_*$.  

**Theorem 1.1.** Let $0 < b < \min\{2, d\}$ and $u_0 \in H^1$. Then the corresponding solution to the focusing mass-critical (INLS) blows up in finite time if one of the following conditions holds true:

1. $d \geq 2$, $E(u_0) < 0$ and $xu_0 \in L^2$,
2. $d \geq 2$, $E(u_0) < 0$ and $u_0$ is radial,
3. $d = 1$ and $E(u_0) < 0$.

**Remark 1.2.**

1. This theorem extends the well-known finite time blowup for the focusing mass-critical nonlinear Schrödinger equation (i.e. $b = 0$ in (INLS)) [22, 23] to the focusing mass-critical (INLS).
2. The condition $E(u_0) < 0$ is a sufficient condition for the finite time blowup but it is not necessary. In fact, one can show (see Remark 4.2) that for any $E > 0$, there exists $u_0 \in H^1$ satisfying $E(u_0) = E$ and the corresponding solution blows up in finite time.

We now consider the intercritical (i.e. mass-supercritical and energy-subcritical) case $\alpha_* < \alpha < \alpha^*$. Our next result is the following blowup for the intercritical (INLS).

**Theorem 1.3.** Let

$$
d \geq 3, \quad 0 < b < 2, \quad \alpha_* < \alpha < \alpha^*,
$$

or

$$
d = 2, \quad 0 < b < 2, \quad \alpha_* < \alpha \leq 4.
$$
Let \( u_0 \in H^1 \) be radial and satisfy either \( E(u_0) < 0 \) or, if \( E(u_0) \geq 0 \), we suppose that
\[
E(u_0)M(u_0)^\sigma < E(Q)M(Q)^\sigma,
\]
and
\[
\|\nabla u_0\|_{L^2}^d\|u_0\|_{L^2}^\sigma > \|\nabla Q\|_{L^2}^d\|Q\|_{L^2}^\sigma,
\]
where
\[
\sigma := \frac{1 - \gamma_c}{\gamma_c} = \frac{2(2 - b) - (d - 2)\alpha}{d\alpha - 2(2 - b)},
\]
and \( Q \) is the unique solution the ground state equation (1.8). Then the corresponding solution to the focusing intercritical (INLS) blows up in finite time. Moreover, if \( u_0 \) satisfies (1.10) and (1.11), then the corresponding solution satisfies
\[
\|\nabla u(t)\|_{L^2}^d\|u(t)\|_{L^2}^\sigma > \|\nabla Q\|_{L^2}^d\|Q\|_{L^2}^\sigma,
\]
for any \( t \) in the existence time.

**Remark 1.4.**

1. The restriction \( \alpha \leq 4 \) when \( d = 2 \) is technical due to the Young inequality (see Lemma 3.4).
2. It was proved in [9] that if the initial data \( u_0 \) satisfies (1.10) and \( \|\nabla u_0\|_{L^2}^d\|u_0\|_{L^2}^\sigma < \|\nabla Q\|_{L^2}^d\|Q\|_{L^2}^\sigma \), then the corresponding solution exists globally in time.

This paper is organized as follows. In Section 2, we recall the sharp Gagliardo-Nirenberg inequality related to the focusing (INLS) due to Farah [9]. In Section 3, we derive the standard virial identity and localized virial estimates for the focusing (INLS). We will give the proof of Theorem 1.1 in Section 4. Finally, the proof of Theorem 1.3 will be given in Section 5.

### 2. Sharp Gagliardo-Nirenberg Inequality

In this section, we recall the sharp Gagliardo-Nirenberg inequality related to the focusing (INLS) due to Farah [9].

**Theorem 2.1** (Sharp Gagliardo-Nirenberg inequality [9]). Let \( d \geq 1, 0 < b < \min\{2, d\} \) and \( 0 < \alpha < \alpha^* \). Then the Gagliardo-Nirenberg inequality
\[
\int |x|^{-b}|u(x)|^{\alpha + 2} \, dx \leq C_{\text{GN}} \|u\|_{L^2}^{4 - 2b - (d - 2)\alpha} \|\nabla u\|_{L^2}^{d\alpha + 2b}, \quad (2.1)
\]
holds true, and the sharp constant \( C_{\text{GN}} \) is attended by a function \( Q \), i.e.
\[
C_{\text{GN}} = \int |x|^{-b}|Q(x)|^{\alpha + 2} \, dx \div \left[ \|Q\|_{L^2}^{\frac{4 - 2b - (d - 2)\alpha}{d\alpha + 2b}} \|\nabla Q\|_{L^2}^{d\alpha + 2b} \right], \quad (2.2)
\]
where \( Q \) is the unique non-negative, radially symmetric, decreasing solution to the elliptic equation
\[
\Delta Q - Q + |x|^{-b}|Q|^\alpha Q = 0. \quad (2.3)
\]

**Remark 2.2.**

1. In [9], Farah proved this result for \( \alpha_* < \alpha < \alpha^* \). However, the proof and so the result are still valid for \( 0 < \alpha \leq \alpha_* \).
2. We also have the following Pohozaev identities:
\[
\|Q\|_{L^2}^2 = \frac{4 - 2b - (d - 2)\alpha}{d\alpha + 2b} \|\nabla Q\|_{L^2}^2 = \frac{4 - 2b - (d - 2)\alpha}{2(\alpha + 2)} \int |x|^{-b}|Q(x)|^{\alpha + 2} \, dx. \quad (2.4)
\]
In particular,
\[ C_{GN} = \frac{2(\alpha + 2)}{4 - 2b - (d - 2)\alpha} \left[ \frac{4 - 2b - (d - 2)\alpha}{d\alpha + 2b} \right]^{\frac{d\alpha + 2b}{\alpha}} \frac{1}{\|Q\|_{L^2}^2}. \]  

(2.5)

3. Virial identities

In this section, we derive virial identities and virial estimates related to the focusing (INLS).

Given a real valued function \( u \), we define the virial potential by
\[ V_u(t) := \int a(x)|u(t, x)|^2 dx. \]  

(3.1)

By a direct computation, we have the following result (see e.g. [26, Lemma 5.3].)

**Lemma 3.1** ([26]). If \( u \) is a smooth-in-time and Schwartz-in-space solution to
\[ i\partial_t u + \Delta u = N(u), \]
with \( N(u) \) satisfying \( \text{Im}(N(u)) = 0 \), then we have
\[ \frac{d}{dt} V_u(t) = 2 \int_{\mathbb{R}^d} \nabla a(x) \cdot \text{Im}(\overline{u}(t, x)\nabla u(t, x)) dx, \]  

(3.2)

and
\[ \frac{d^2}{dt^2} V_u(t) = -\int \Delta^2 a(x)|u(t, x)|^2 dx + 4 \sum_{j,k=1}^d \frac{d}{dt}^{2} a(x) \text{Re}(\partial_k u(t, x)\partial_j u(t, x)) dx 
+ 2 \int \nabla a(x) \cdot \{N(u), u\}_p(t, x) dx, \]  

(3.3)

where \( \{f, g\}_p := \text{Re}(f\nabla g - g\nabla f) \) is the momentum bracket.

We note that if \( N(u) = -|x|^{-b}u^a u \), then
\[ \{N(u), u\}_p = \frac{\alpha}{\alpha + 2} \nabla(|x|^{-b}|u|^{a+2}) + \frac{2}{\alpha + 2} \nabla(|x|^{-b})|u|^{a+2}. \]

Using this fact, we immediately have the following result.

**Corollary 3.2.** If \( u \) is a smooth-in-time and Schwartz-in-space solution to the focusing (INLS), then we have
\[ \frac{d^2}{dt^2} V_u(t) = -\int \Delta^2 a(x)|u(t, x)|^2 dx + 4 \sum_{j,k=1}^d \frac{d}{dt}^{2} a(x) \text{Re}(\partial_k u(t, x)\partial_j u(t, x)) dx 
- \frac{2\alpha}{\alpha + 2} \int \Delta a(x)|x|^{-b}|u(t, x)|^{a+2} dx + \frac{4}{\alpha + 2} \int \nabla a(x) \cdot \nabla(|x|^{-b})|u(t, x)|^{a+2} dx. \]  

(3.4)

A direct consequence of Corollary 3.2 is the following standard virial identity for the (INLS).

**Lemma 3.3.** Let \( u_0 \in H^1 \) be such that \( |x|u_0 \in L^2 \) and \( u : I \times \mathbb{R}^d \to \mathbb{C} \) the corresponding solution to the focusing (INLS). Then, \( |x|u \in C(I, L^2) \). Moreover, for any \( t \in I \),
\[ \frac{d^2}{dt^2}\|xu(t)\|_{L^2}^2 = 8\|\nabla u(t)\|_{L^2}^2 - \frac{4(\alpha + 2b)}{\alpha + 2} \int |x|^{-b}|u(t, x)|^{a+2} dx. \]  

(3.5)

**Proof.** The first claim follows from the standard approximation argument, we omit the proof and refer the reader to [3, Proposition 6.5.1] for more details. The identity (3.5) follows from Corollary 3.2 by taking \( a(x) = |x|^2 \). \( \square \)
In order to prove the blowup for the focusing (INLS) with radial data, we need localized virial estimates. To do so, we introduce a function \( \theta : [0, \infty) \rightarrow [0, \infty) \) satisfying

\[
\theta(r) = \begin{cases} 
    r^2 & \text{if } 0 \leq r \leq 1, \\
    \text{const.} & \text{if } r \geq 2,
\end{cases}
\text{ and } \theta''(r) \leq 2 \text{ for } r \geq 0. \quad (3.6)
\]

Note that the precise constant here is not important. For \( R > 1 \), we define the radial function

\[
\varphi_R(x) = \varphi_R(r) := R^2 \theta(r/R), \quad r = |x|. 
\quad (3.7)
\]

It is easy to see that

\[
2 - \varphi''_R(r) \geq 0, \quad 2 - \varphi'_R(r) \geq 0, \quad 2d - \Delta \varphi_R(x) \geq 0. \quad (3.8)
\]

**Lemma 3.4.** Let \( d \geq 2, 0 < b < 2, 0 < \alpha \leq 4, R > 1 \) and \( \varphi_R \) be as in (3.7). Let \( u : I \times \mathbb{R}^d \rightarrow \mathbb{C} \) be a radial solution to the focusing (INLS). Then for any \( \epsilon > 0 \) and any \( t \in I \),

\[
\frac{d^2}{dt^2} V_{\varphi_R}(t) \leq 8 \| \nabla u(t) \|_{L^2}^2 - \frac{4(d\alpha + 2b)}{\alpha + 2} \int |x|^{-b} |u(t,x)|^{\alpha+2} dx 
\]

\[
+ \begin{cases} 
    O \left( R^{-2} + R^{-2(d-1)+b} \| \nabla u(t) \|_{L^2}^2 \right) & \text{if } \alpha = 4, \\
    O \left( R^{-2} + \epsilon^{-\frac{\alpha}{\alpha-b}} R^{-2(d-1)+b} + \epsilon \| \nabla u(t) \|_{L^2}^2 \right) & \text{if } \alpha < 4.
\end{cases} \quad (3.9)
\]

**Remark 3.5.**

1. The condition \( d \geq 2 \) comes from the radial Sobolev embedding. This is due to the fact that radial functions in dimension 1 do not have any decaying property. The restriction \( 0 < \alpha \leq 4 \) comes from the Young inequality below.

2. If we consider \( \alpha_* \leq \alpha \leq \alpha^* \), then there is a restriction on the validity of \( \alpha \) in 2D. More precisely, we need \( \alpha_* \leq \alpha \leq 4 \) when \( d = 2 \).

**Proof of Lemma 3.4.** We apply (3.4) for \( a(x) = \varphi_R(x) \) to get

\[
\frac{d^2}{dt^2} V_{\varphi_R}(t) = -\int \Delta^2 \varphi_R |u(t)|^2 dx + 4 \sum_{j,k=1}^{d} \partial^2_{jk} \varphi_R \text{Re}(\partial_k u(t) \partial_j \overline{u}(t)) dx 
\]

\[
- \frac{2\alpha}{\alpha + 2} \int \Delta \varphi_R |x|^{-b} |u(t)|^{\alpha+2} dx + \frac{4}{\alpha + 2} \int \nabla \varphi_R \cdot \nabla (|x|^{-b} |u(t)|^{\alpha+2}) dx.
\]

Since \( \varphi_R(x) = |x|^2 \) for \( |x| \leq R \), we use (3.5) to have

\[
\frac{d^2}{dt^2} V_{\varphi_R}(t) = 8 \| \nabla u(t) \|_{L^2}^2 - \frac{4(d\alpha + 2b)}{\alpha + 2} \int |x|^{-b} |u(t)|^{\alpha+2} dx 
\]

\[
- 8 \| \nabla u(t) \|_{L^2}^2 \int_{|x| > R} |x|^{-b} |u(t)|^{\alpha+2} dx + \int_{|x| > R} \Delta \varphi_R |u(t)|^2 dx + 4 \sum_{j,k=1}^{d} \int_{|x| > R} \partial^2_{jk} \varphi_R \text{Re}(\partial_k u(t) \partial_j \overline{u}(t)) dx 
\]

\[
- \frac{2\alpha}{\alpha + 2} \int_{|x| > R} \Delta \varphi_R |x|^{-b} |u(t)|^{\alpha+2} dx + \frac{4}{\alpha + 2} \int_{|x| > R} \nabla \varphi_R \cdot \nabla (|x|^{-b} |u(t)|^{\alpha+2}) dx.
\]
Since \( |\Delta \varphi_R| \lesssim 1, |\Delta^2 \varphi_R| \lesssim R^{-2} \) and \( |\nabla \varphi_R \cdot \nabla (|x|^{-b})| \lesssim |x|^{-b} \), we have
\[
\frac{d^2}{dt^2} V_{\varphi_R}(t) = 8\|\nabla u(t)\|_{L^2}^2 - \frac{4(\alpha + 2b)}{\alpha + 2} \int |x|^{-b}|u(t)|^{\alpha + 2} dx
\]
\[
+ 4 \sum_{j,k=1}^d \int_{|x|>R} \partial^2_{jk} \varphi_R \text{Re}(\partial_k u(t) \partial_j \overline{\varphi}(t)) dx - 8\|\nabla u(t)\|_{L^2(|x|>R)}^2
\]
\[
+ O\left( R^{-2} \|u(t)\|^2 + |x|^{-b}|u(t)|^{\alpha + 2} dx \right).
\]

Using (3.8) and the fact that
\[
\partial^2_{jk} = \left( \frac{\delta_{jk}}{r} - \frac{x_j x_k}{r^3} \right) \partial_r + \frac{x_j x_k}{r^2} \partial_r^2,
\]
we see that
\[
\sum_{j,k=1}^d \partial^2_{jk} \varphi_R \partial_k u \partial_j \overline{\varphi} = \varphi''_R(r) |\partial_r u|^2 \leq 2|\partial_r u|^2 = 2|\nabla u|^2.
\]

Therefore
\[
4 \sum_{j,k=1}^d \int_{|x|>R} \partial^2_{jk} \varphi_R \text{Re}(\partial_k u(t) \partial_j \overline{\varphi}(t)) dx - 8\|\nabla u(t)\|_{L^2(|x|>R)}^2 \leq 0.
\]

The conservation of mass then implies
\[
\frac{d^2}{dt^2} V_{\varphi_R}(t) \leq 8\|\nabla u(t)\|_{L^2}^2 - \frac{4(\alpha + 2b)}{\alpha + 2} \int |x|^{-b}|u(t)|^{\alpha + 2} dx + O\left( R^{-2} + \int_{|x|>R} |x|^{-b}|u(t)|^{\alpha + 2} dx \right).
\]

It remains to bound \( \int_{|x|>R} |x|^{-b}|u(t)|^{\alpha + 2} dx \). To do this, we recall the following radial Sobolev embedding ([25, 5]).

**Lemma 3.6** (Radial Sobolev embedding [25, 5]). Let \( d \geq 2 \) and \( \frac{1}{2} \leq s < 1 \). Then for any radial function \( f \),
\[
\sup_{x \neq 0} |x|^{\frac{d-2s}{2}} |f(x)| \leq C(d, s) \|f\|_{L^2}^{\frac{1-s}{s}} \|f\|_{H^s}^s. \tag{3.11}
\]

Moreover, the above inequality also holds for \( d \geq 3 \) and \( s = 1 \).

Using (3.11) with \( s = \frac{1}{2} \) and the conservation of mass, we estimate
\[
\int_{|x|>R} |x|^{-b}|u(t)|^{\alpha + 2} dx \leq \left( \sup_{|x|>R} |x|^{-b}|u(t, x)|^\alpha \right) \|u(t)\|_{L^2}^2
\]
\[
\lesssim R^{\left[ \frac{(d-1)\alpha}{2} + b \right]} \left( \sup_{|x|>R} |x|^{\frac{d-1}{2}} |u(t, x)| \right)^\alpha \|u(t)\|_{L^2}^2
\]
\[
\lesssim R^{\left[ \frac{(d-1)\alpha}{2} + b \right]} \|\nabla u(t)\|_{L^2}^2 \|u(t)\|_{L^2}^2
\]
\[
\lesssim R^{\left[ \frac{(d-1)\alpha}{2} + b \right]} \|\nabla u(t)\|_{L^2}^2.
\]

When \( \alpha = 4 \), we are done. Let us consider \( 0 < \alpha < 4 \). To do so, we recall the Young inequality: for \( a, b \) non-negative real numbers and \( p, q \) positive real numbers satisfying \( \frac{1}{p} + \frac{1}{q} = 1 \), then for any \( \epsilon > 0 \), \( ab \lesssim \epsilon a^p + \epsilon^{-\frac{p}{q}} b^q \). Applying the Young inequality for \( a = \|\nabla u(t)\|_{L^2}^2, b = R^{-\left[ \frac{(d-1)\alpha}{2} + b \right]} \) and \( p = \frac{4}{\alpha}, q = \frac{4}{4-\alpha} \), we get for any \( \epsilon > 0 \),
\[
R^{-\left[ \frac{(d-1)\alpha}{2} + b \right]} \|\nabla u(t)\|_{L^2}^2 \lesssim \epsilon \|\nabla u(t)\|_{L^2}^2 + \epsilon^{-\frac{p \alpha}{q}} R^{-\frac{2(d-1)\alpha}{4-\alpha} + 2b}. 
\]
Note that the condition $0 < \alpha < 4$ ensures $1 < p,q < \infty$. The proof is complete. \hfill \Box

In the mass-critical case $\alpha = \alpha_*$, we have the following refined version of Lemma 3.4. The proof of this result is based on an argument of [22] (see also [2]).

**Lemma 3.7.** Let $d \geq 2, 0 < b < 2, R > 1$ and $\varphi_R$ be as in (3.7). Let $u : I \times \mathbb{R}^d \to \mathbb{C}$ be a radial solution to the focusing mass-critical (INLS), i.e. $\alpha = \alpha_*$. Then for any $\epsilon > 0$ and any $t \in I$,
\[
\frac{d^2}{dt^2} V_{\varphi_R}(t) \leq 16E(u_0) - 2 \int_{|x| > R} \left( \chi_{1,R} - \frac{\epsilon}{d + 2 - b} \chi_{2,R} \right) |\nabla u(t)|^2 \, dx \\
+ O\left( R^{-2} + \epsilon R^{-2} + \epsilon^{-\frac{2-b}{2d-2b}} R^{-2} \right),
\]
where
\[
\chi_{1,R} = 2(2 - \varphi''_R), \quad \chi_{2,R} = (2-b)(2d-\Delta \varphi_R) + db\left(2 - \frac{\varphi'_R}{R}\right).
\]

**Proof.** We first notice that
\[
\sum_{j,k} \partial^2_{jk} \varphi_R \partial_k u \partial_j \varphi = \varphi''_R |\partial_r u|^2, \quad \nabla \varphi_R \cdot \nabla (|x|^{-b}) = -b \frac{\varphi'_R}{R} |x|^{-b}.
\]
Using (3.10) with $\alpha = \alpha_*$ and rewriting $\varphi''_R = 2 - (2 - \varphi''_R)$, $\frac{\varphi'_R}{R} = 2 - \left(2 - \frac{\varphi'_R}{R}\right)$ and $\Delta \varphi_R = 2d - (2d - \Delta \varphi_R)$, we have
\[
\frac{d^2}{dt^2} V_{\varphi_R}(t) = 16E(u(t)) - \int_{|x| > R} \Delta^2 \varphi_R |u(t)|^2 \, dx - 4 \int_{|x| > R} (2 - \varphi''_R) |\partial_r u(t)|^2 \, dx \\
+ \frac{4 - 2b}{d + 2 - b} \int_{|x| > R} (2d - \Delta \varphi_R) |x|^{-b} |u(t)|^{\frac{4-2b}{d}} + 2 dx \\
+ \frac{2db}{d + 2 - b} \int_{|x| > R} \left(2 - \frac{\varphi'_R}{R}\right) |x|^{-b} |u(t)|^{\frac{4-2b}{d}} + 2 dx
\]
\[
\leq 16E(u(t)) + O(R^{-2}) - \frac{2}{d + 2 - b} \int_{|x| > R} \chi_{1,R} |\nabla u(t)|^2 \, dx \\
+ \frac{2}{d + 2 - b} \int_{|x| > R} \chi_{2,R} |x|^{-b} |u(t)|^{\frac{4-2b}{d}} + 2 dx,
\]
where $\chi_{1,R}$ and $\chi_{2,R}$ are as in (3.13). Using the radial Sobolev embedding (3.11) with $s = \frac{1}{2}$, the conservation of mass and the fact $|\chi_{2,R}| \lesssim 1$, we estimate
\[
\int_{|x| > R} \chi_{2,R} |x|^{-b} |u(t)|^{\frac{4-2b}{d}} + 2 dx = \int_{|x| > R} |x|^{-b} \left| \frac{d}{\chi_{2,R}} u(t) \right|^{\frac{4-2b}{d}} |u(t)|^2 \, dx
\]
\[
\leq \left( \sup_{|x| > R} |x|^{-b} \left| \frac{d}{\chi_{2,R}} (x) u(t,x) \right|^{\frac{4-2b}{d}} \right) \|u(t)\|_{L^2}^2
\]
\[
\leq R^{\frac{(2-b)(d-1)}{d}} \left( \sup_{|x| > R} |x|^{\frac{d-1}{2}} \left| \frac{d}{\chi_{2,R}} (x) u(t,x) \right| \right)^{\frac{4-2b}{d}} \|u(t)\|_{L^2}^2
\]
\[
\lesssim R\left( \frac{(2-b)(d-1)}{d} + b \right) \left( \sup_{|x| > R} \left| \frac{d}{\chi_{2,R}} u(t) \right| \right) \left( \|\nabla (\chi_{2,R} u(t))\|_{L^2}^{\frac{2-b}{d}} \right)^{\frac{2-b}{d}} \|u(t)\|_{L^2}^2
\]
\[
\lesssim R\left( \frac{(2-b)(d-1)}{d} + b \right) \left( \|\nabla (\chi_{2,R} u(t))\|_{L^2}^{\frac{2-b}{d}} \right)^{\frac{2-b}{d}} \|u(t)\|_{L^2}^2.
\]
We next apply the Young inequality with \( p = \frac{2d}{2-b} \) and \( q = \frac{2d}{2d-2+b} \) to get for any \( \epsilon > 0 \)
\[
R \left[ \left( \frac{2-b}{d-2b} \right)^{d-b} \right] \left\| \nabla \left( \frac{d}{\chi_{2,R}^{d-1} u(t)} \right)^{\frac{2-b}{2}} \right\|^2_{L^2} \leq \epsilon \left\| \nabla \left( \frac{d}{\chi_{2,R}^{d-1} u(t)} \right) \right\|^2_{L^2} + \epsilon^{-\frac{2-b}{d-2b}} R^{-2}.
\]
Moreover, using (3.6), (3.7) and (3.8), it is easy to check that \( |\nabla (\chi_{2,R}^{d/(4-2b)})| \lesssim R^{-1} \). Thus the conservation of mass implies
\[
\left\| \nabla \left( \frac{d}{\chi_{2,R}^{d-1} u(t)} \right) \right\|^2_{L^2} \lesssim R^{-2} + \left\| \frac{d}{\chi_{2,R}^{d-1}} \nabla u(t) \right\|^2_{L^2}.
\]
Combining the above estimates, we prove (3.12).

To prove the blowup in the 1D mass-critical case \( \alpha = 4 - 2b \), we need the following version of localized virial estimates due to [23]. Let \( \vartheta \) be a real-valued function in \( W^{3,\infty} \) satisfying
\[
\vartheta(x) = \begin{cases} 
2x & \text{if } 0 \leq |x| \leq 1, \\
2[x - (x - 1)^3] & \text{if } 1 < x \leq 1 + 1/\sqrt{3}, \\
2[x - (x + 1)^3] & \text{if } -(1 + 1/\sqrt{3}) \leq x < -1, \\
\vartheta' < 0 & \text{if } 1 + 1/\sqrt{3} < |x| < 2, \\
0 & \text{if } |x| \geq 2.
\end{cases}
\]
Set
\[
\theta(x) = \int_0^x \vartheta(s) ds.
\]

**Lemma 3.8.** Let \( 0 < b < 1 \) and \( \theta \) be as in (3.15). Let \( u: I \times \mathbb{R} \to \mathbb{C} \) be a solution to the focusing mass-critical (INLS), i.e. \( \alpha = 4 - 2b \). There exists \( a_0 > 0 \) such that if
\[
\|u(t)\|_{L^2(|x| > 1)} \leq a_0,
\]
for any \( t \in I \), then there exists \( C > 0 \) such that
\[
\frac{d^2}{dt^2} V_\theta(t) \leq 16E(u_0) + C(1 + N)^{2-b} \|u(t)\|^{6-2b}_{L^2(|x| > 1)} + N \|u(t)\|^2_{L^2(|x| > 1)},
\]
for any \( t \in I \), where \( N := \|\partial_x \vartheta\|_{L^\infty} + \|\partial_x^2 \vartheta\|_{L^\infty} + \|\partial_x^3 \vartheta\|_{L^\infty} \).

**Proof.** We apply (3.4) with \( a(x) = \theta(x) \) to get
\[
\frac{d^2}{dt^2} V_\theta(t) = -\int \partial_x^4 \theta |u(t)|^2 dx + 4 \int \partial_x^2 \theta |\partial_x u(t)|^2 dx - \frac{4 - 2b}{3 - b} \int \partial_x^2 \theta |x|^{-b} |u(t)|^{6-2b} dx + \frac{2}{3 - b} \int \partial_x \vartheta \partial_x (|x|^{-b}) |u(t)|^{6-2b} dx.
\]
Since \( \theta(x) = x^2 \) on \( |x| \leq 1 \), the definition of energy implies
\[
\frac{d^2}{dt^2} V_\theta(t) = 16E(u(t)) - \int_{|x| > 1} \partial_x^4 \theta |u(t)|^2 dx - 4 \int_{|x| > 1} (2 - \partial_x^2 \theta) |\partial_x u(t)|^2 dx + \frac{4 - 2b}{3 - b} \int_{|x| > 1} (2 - \frac{\partial_x \theta}{x}) |x|^{-b} |u(t)|^{6-2b} dx + \frac{2}{3 - b} \int_{|x| > 1} \chi_1 |\partial_x u(t)|^2 dx + \frac{2}{3 - b} \int_{|x| > 1} \chi_2 |x|^{-b} |u(t)|^{6-2b} dx,
\]
where
\[ \chi_1 := 2(2 - \partial_x^2 \theta), \quad \chi_2 := (2 - b)(2 - \partial_x^2 \theta) + b \left( 2 - \frac{\partial_x \theta}{x} \right). \]

We now estimate
\[ \int_{|x| > 1} \chi_2 |x|^{-b} |u(t)|^{6-2b} dx \leq \left( \sup_{|x| > 1} \chi_2 |x|^{-b} |u(t)|^{4-2b} \right) \| u(t) \|_{L^2(|x| > 1)}^2 \]
\[ \leq \| pu(t) \|_{L^\infty(|x| > 1)} \| u(t) \|_{L^2(|x| > 1)}^2, \]
where \( \rho(x) := \frac{1}{\chi_2} (x) \). Using a variant of the Gagliardo-Nirenberg inequality (see e.g. [23, Lemma 2.1]), we bound
\[ \| pu(t) \|_{L^\infty(|x| > 1)} \leq \| u(t) \|_{L^2(|x| > 1)}^{1/2} \left[ 2\| \rho^2 \partial_x u(t) \|_{L^2(|x| > 1)} + \| u(t) \partial_x (\rho^2) \|_{L^2(|x| > 1)} \right]^{1/2}. \]

Thus,
\[ \int_{|x| > 1} \chi_2 |x|^{-b} |u(t)|^{6-2b} dx \leq \| u(t) \|_{L^2(|x| > 1)}^{2-6} \left[ 2\| \rho^2 \partial_x u(t) \|_{L^2(|x| > 1)} + \| u(t) \partial_x (\rho^2) \|_{L^2(|x| > 1)} \right]^{2-6} \]
\[ \leq \| u(t) \|_{L^2(|x| > 1)}^{2-6} \left[ 2^{2-6} \| \rho^2 \partial_x u(t) \|_{L^2(|x| > 1)}^{2-6} + \| u(t) \partial_x (\rho^2) \|_{L^2(|x| > 1)}^{2-6} \right] \]
\[ \leq 2^{2-6} \| u(t) \|_{L^2(|x| > 1)}^{2-6} \| \rho^2 \partial_x u(t) \|_{L^2(|x| > 1)}^{2-6} + \| u(t) \|_{L^2(|x| > 1)} \| \partial_x (\rho^2) \|_{L^\infty(|x| > 1)}^{2-6}. \] (3.19)

We next estimate \( \| \partial_x (\rho^2) \|_{L^\infty(|x| > 1)} \). By the definition of \( \rho \), we write
\[ \partial_x (\rho^2) = \frac{1}{2-b} \frac{\partial_x \chi_2}{\chi_2}. \]

On \( 1 < |x| \leq 1 + 1/\sqrt{3} \), a direct computation shows
\[ 2 - \frac{\partial_x \theta}{x} = \frac{2(|x| - 1)^3}{|x|}, \quad 2 - \partial^2 \theta = 6(|x| - 1)^2. \]

Thus,
\[ \chi_2 = 6(2-b)(|x| - 1)^2 + 2b \frac{(|x| - 1)^3}{|x|}, \]
and
\[ \partial_x \chi_2 = \begin{cases} (x-1) \frac{12(2-b) + 2b(x-1)(3x-1)}{x^2} & \text{if } 1 < x \leq 1 + 1/\sqrt{3}, \\ (x+1) \frac{12(2-b) + 2b(x+1)(3x-1)}{x^2} & \text{if } -(1 + 1/\sqrt{3}) \leq x < -1. \end{cases} \]

Thus
\[ \frac{\partial_x \chi_2}{\chi_2} = \begin{cases} (x-1) \frac{12(2-b) + 2b(x-1)(3x-1)}{6(2-b) + 2b(x-1)} & \text{if } 1 < x \leq 1 + 1/\sqrt{3}, \\ (x+1) \frac{12(2-b) + 2b(x+1)(3x-1)}{6(2-b) + 2b(x+1)} & \text{if } -(1 + 1/\sqrt{3}) \leq x < -1. \end{cases} \]

This implies that \( \partial_x \chi_2 / \chi_2 \) is uniformly bounded on \( 1 < |x| \leq 1 + 1/\sqrt{3} \).

On \( |x| > 1 + 1/\sqrt{3} \), we note that \( \chi_2 \geq 4 \) since \( \partial_x^2 \theta \) and \( \partial_x \theta / x \) are both non-positive there by the choice of \( \theta \). We thus simply bound
\[ \left\| \partial_x \chi_2 / \chi_2 \right\|_{L^\infty} + \| \partial_x^2 \theta \|_{L^\infty} \lesssim N. \]
Therefore, \[ \| \partial_x (\rho^2) \|_{L^\infty(|x| > 1)} \lesssim 1 + N. \]

Combining this with (3.19), we obtain
\[
\int_{|x| > 1} \chi_2 |x|^{-b} |u(t)|^{6-2b} dx \leq 2^{3-2b} \| u(t) \|_{L_x^2(|x| > 1)}^{4-b} \| \rho^2 \partial_x u(t) \|_{L_x^2(|x| > 1)}^{2-b} + C (1 + N)^{2-b} \| u(t) \|_{L_x^2(|x| > 1)}^{6-2b},
\]
for some constant \( C > 0 \). We thus get from (3.18) and (3.20) that
\[
\frac{d^2}{dt^2} V_\theta(t) \leq 16 E(u_0) + N \| u(t) \|_{L_x^2(|x| > 1)}^2 - 2 \int_{|x| > 1} \chi_1 |\partial_x u(t)|^2 dx + \frac{2^{3-2b}}{3-b} \| u(t) \|_{L_x^2(|x| > 1)}^{4-b} \| \rho^2 \partial_x u(t) \|_{L_x^2(|x| > 1)}^{2-b} + C (1 + N)^{2-b} \| u(t) \|_{L_x^2(|x| > 1)}^{6-2b}
\leq 16 E(u_0) - 2 \int_{|x| > 1} \left( \chi_1 - \frac{2^{3-2b}}{3-b} \chi_2 |u(t)|_{L_x^2(|x| > 1)}^{4-b} \right) |\partial_x u(t)|^2 dx + C (1 + N)^{2-b} \| u(t) \|_{L_x^2(|x| > 1)}^{6-2b} + N \| u(t) \|_{L_x^2(|x| > 1)}^2.
\]
We will show that if \( \| u(t) \|_{L_x^2(|x| > 1)} \leq a_0 \) for some \( a_0 > 0 \) small enough, then
\[
\chi_1 - \frac{2^{3-2b}}{3-b} \chi_2 |u(t)|_{L_x^2(|x| > 1)}^{4-b} \geq 0,
\]
for any \( |x| > 1 \). It immediately yields (3.17). It remains to prove (3.21). To do so, it is enough to show for some \( a_1 > 0 \) small enough,
\[
\chi_1 - a_1 \frac{2^{3-2b}}{3-b} \chi_2 \geq 0,
\]
for any \( |x| > 1 \).

On \( 1 < |x| \leq 1 + 1/\sqrt{3} \), we have
\[
\chi_1 = 2(2 - \partial^2_x \theta) = 12(|x| - 1)^2,
\]
and
\[
\chi_2 = (2 - b)(2 - \partial^2_x \theta) + b \left( 2 - \frac{\partial_x \theta}{x} \right) = 6(2 - b)(|x| - 1)^2 + 2b \left( \frac{|x| - 1}{|x|} \right)^3
\leq 6(|x| - 1)^2 \left[ 2 - b + b \frac{|x| - 1}{3|x|} \right] < 6(|x| - 1)^2 \left[ 2 - b + \frac{b}{3\sqrt{3}} \right].
\]
Thus, by taking \( a_1 > 0 \) small enough, we have (3.22).

On \( |x| > 1 + 1/\sqrt{3} \), since \( \partial^2_x \theta = \partial_x \theta \leq 0 \), we have \( \chi_1 \geq 4 \). Moreover, \( \chi_2 \leq C \) for some constant \( C > 0 \). We thus get (3.22) by taking \( a_1 > 0 \) small enough. The proof is complete.

\[
4. \ \text{Mass-critical case } \alpha = \alpha_*. \]

In this section, we will give the proof of Theorem 1.1.

4.1. The case \( d \geq 1, E(u_0) < 0 \) and \( xu_0 \in L^2 \). Applying (3.5) with \( \alpha = \alpha_* \), we see that
\[
\frac{d^2}{dt^2} \| xu(t) \|_{L_x^2}^2 = 8 \| \nabla u(t) \|_{L_x^2}^2 - \frac{16}{\alpha_* + 2} \int |x|^{-b} |u(t,x)|^{\alpha_* + 2} dx = 16 E(u_0) < 0.
\]
By the classical argument of Glassey [17], the solution must blow up in finite time.
4.2. The case $d \geq 2, E(u_0) < 0$ and $u_0$ is radial. We use the localized virial estimate (3.12) to have
\[
\frac{d^2}{dt^2} V_\varphi(t) \leq 16 E(u_0) - 2 \int_{|x| > R} \left( \chi_{1,R} - \frac{\epsilon}{d + 2 - b} \chi_{2,R} \right) |\nabla u(t)|^2 \, dx \\
+ O\left( R^{-2} + \epsilon R^{-2} + \epsilon^{\frac{2}{d+1}} R^{-2} \right),
\]
where
\[
\chi_{1,R} = 2(2 - \varphi_R''), \quad \chi_{2,R} = (2 - b)(2d - \Delta \varphi_R) + db \left( 2 - \frac{\varphi_R'}{r} \right).
\]
If we choose a suitable radial function $\varphi_R$ defined by (3.7) so that
\[
\chi_{1,R} - \frac{\epsilon}{d + 2 - b} \chi_{2,R} \geq 0, \quad \forall r > R, \tag{4.1}
\]
for a sufficiently small $\epsilon > 0$, then by choosing $R > 1$ sufficiently large depending on $\epsilon$, we see that
\[
\frac{d^2}{dt^2} V_\varphi(t) \leq 8 E(u_0) < 0,
\]
for any $t$ in the existence time. This shows that the solution $u$ blows up in finite time. It remains to find $\varphi_R$ so that (4.1) holds true. To do so, we follow the argument of [22]. Let us define a function
\[
\vartheta(r) := \begin{cases} 
2r & \text{if } 0 \leq r \leq 1, \\
2[r - (r - 1)^3] & \text{if } 1 < r \leq 1 + 1/\sqrt{3}, \\
\vartheta' & \text{if } 1 + 1/\sqrt{3} < r < 2, \\
0 & \text{if } r \geq 2,
\end{cases}
\]
and
\[
\theta(r) := \int_0^r \vartheta(s) \, ds.
\]
It is easy to see that $\theta$ satisfies (3.6). We thus define $\varphi_R$ as in (3.7). We show that (4.1) holds true for this choice of $\varphi_R$. Using the fact
\[
\Delta \varphi_R(x) = \varphi_R''(r) + \frac{d - 1}{r} \varphi_R'(r),
\]
we have
\[
\chi_{2,R} = (2 - b)(2 - \varphi_R'') + (2d - 2 + b) \left( 2 - \frac{\varphi_R'}{r} \right).
\]
By the definition of $\varphi_R$,
\[
\varphi_R'(r) = R \vartheta'(r/R) = R \vartheta(r/R), \quad \varphi_R''(r) = R \vartheta''(r/R) = \vartheta'(r/R).
\]
When $R < r \leq (1 + 1/\sqrt{3})R$, we have
\[
\chi_{1,R}(r) = 12 \left( \frac{r}{R} - 1 \right)^2,
\]
and
\[
\chi_{2,R}(r) = 6 \left( \frac{r}{R} - 1 \right)^2 \left[ 2 - b + \frac{(2d - 2 + b)(r/R - 1)}{3r/R} \right] 
< 6 \left( \frac{r}{R} - 1 \right)^2 \left( 2 - b + \frac{2d - 2 + b}{3\sqrt{3}} \right).
\]
Since $0 < r/R - 1 < 1/\sqrt{3}$, we can choose $\epsilon > 0$ small enough so that (4.1) is satisfied.

When $r > (1 + 1/\sqrt{3})R$, we see that $\vartheta'(r/R) \leq 0$, so $\chi_{1,R}(r) = 2(2 - \varphi_R''(r)) \geq 4$. We also have that $\chi_{2,R}(r) \leq C$ for some constant $C > 0$. Thus by choosing $\epsilon > 0$ small enough, we have (4.1).
4.3. The case \( d = 1 \) and \( E(u_0) < 0 \). We follow the argument of [23]. We only consider the positive time, the negative one is treated similarly. We argue by contradiction and assume that the solution exists for all \( t \geq 0 \). We divide the proof in two steps.

**Step 1.** We assume that the initial data satisfies
\[
\delta := -16E(u_0) - C(1 + N)^2\|u_0\|_{L^2}^{6 - 2b} - N\|u_0\|_{L^2}^2 > 0,
\]
\[
\left(\int \theta|u_0|^2dx\right)^{1/2} \left(\frac{2}{\delta} |\partial_x u_0|_{L^2}^2 + 1\right)^{1/2} \leq \frac{1}{2}a_0,
\]
where \( C, N, \theta \) and \( a_0 \) are defined as in Lemma 3.8. We will show that if \( u_0 \) satisfies (4.2) and (4.3), then the corresponding solution satisfies (3.16) for all \( t \geq 0 \). Since \( \theta(x) \geq 1 \) for \( |x| > 1 \) and \( \delta > 0 \), we have from (4.3) that
\[
\|u_0\|_{L^2(|x| > 1)} \leq \frac{1}{2}a_0. \tag{4.4}
\]
Let us define
\[
T_0 := \sup\{t > 0 : \|u(s)\|_{L^2(|x| > 1)} \leq a_0, \quad 0 \leq s < t\}.
\]
Since \( s \mapsto \|u(s)\|_{L^2(|x| > 1)} \) is continuous, (4.4) implies \( T_0 > 0 \). If \( T_0 = \infty \), we are done. Suppose that \( T_0 < \infty \). The continuity in \( L^2 \) of \( u(t) \) gives
\[
\|u(T_0)\|_{L^2(|x| > 1)} = a_0. \tag{4.5}
\]
On the other hand, \( u(t) \) satisfies the assumption of Lemma 3.8 on \([0, T_0)\). We thus get from Lemma 3.8 and (4.2) that
\[
\int \theta|u(t)|^2dx \leq \int \theta|u_0|^2dx - 2\text{Im} \int \partial_x \theta \overline{u}_0 \partial_x u_0 dx - \frac{\delta^2}{2}
\]
\[
= -\frac{\delta}{2} \left(t + \frac{1}{\delta} \text{Im} \int \partial_x \theta \overline{u}_0 \partial_x u_0 dx\right)^2 + \frac{1}{2\delta} \left(\text{Im} \int \partial_x \theta \overline{u}_0 \partial_x u_0 dx\right)^2 + \int \theta|u_0|^2dx
\]
\[
\leq \frac{1}{2\delta} \left(\text{Im} \int \partial_x \theta \overline{u}_0 \partial_x u_0 dx\right)^2 + \int \theta|u_0|^2dx
\]
\[
\leq \frac{1}{2\delta}\|\partial_x \theta u_0\|_{L^2}^2 \|\partial_x u_0\|_{L^2}^2 + \int \theta|u_0|^2dx, \tag{4.6}
\]
for all \( 0 \leq t < T_0 \). By the definition of \( \theta \), it is easy to see that \( \theta \geq \vartheta^2/4 = (\partial_x \theta)^2/4 \) for any \( x \in \mathbb{R} \). Thus, (4.6) yields
\[
\int \theta|u(t)|^2dx \leq \left(\frac{2}{\delta}\|\partial_x u_0\|_{L^2}^2 + 1\right) \int \theta|u_0|^2dx,
\]
for all \( 0 \leq t < T_0 \). By (4.3) and the fact that \( \theta \geq 1 \) on \(|x| > 1\), we obtain
\[
\|u(t)\|_{L^2(|x| > 1)} \leq \left(\int \theta|u(t)|^2dx\right)^{1/2} \leq \frac{1}{2}a_0,
\]
for all \( 0 \leq t < T_0 \). By the continuity of \( u(t) \) in \( L^2 \), we get
\[
\|u(T_0)\|_{L^2(|x| > 1)} \leq \frac{1}{2}a_0.
\]
This contradicts with (4.5). Therefore, the assumptions of Lemma 3.8 are satisfied with \( I = [0, \infty) \) and we get
\[
\frac{d^2}{dt^2} V_\theta(t) \leq -\delta < 0,
\]
for all \( t \geq 0 \). This is impossible. Hence, if the initial data \( u_0 \) satisfies (4.2) and (4.3), then the corresponding solution must blow up in finite time.
Step 2. In this step, we will use the scaling
\[ u_\lambda(t, x) = \lambda^{-\frac{d}{2}} u(\lambda^{-2} t, \lambda^{-1} x), \quad \lambda > 0 \]  
(4.7)
to transform all initial data with negative energy into initial data satisfying (4.2) and (4.3). Note that the 1D mass-critical \((\text{INLS})\) is invariant under (4.7), that is, if \(u(t)\) is a solution to the 1D mass-critical \((\text{INLS})\) with initial data \(u_0\), then \(u_\lambda(t)\) is also a solution to the 1D mass-critical \((\text{INLS})\) with initial data \(u_\lambda(0)\). Moreover, we have
\[ \|u_\lambda(t)\|_{L^2} = \|u_\lambda(0)\|_{L^2} = \|u_0\|_{L^2}, \]  
(4.8)
\[ E(u_\lambda(t)) = E(u_\lambda(0)) = \lambda^{-2} E(u_0), \]  
(4.9)
for any \(t\) as long as the solution exists.

We will show that there exists \(\lambda > 0\) such that
\[ \delta_\lambda = -16E(u_\lambda(0)) - C(1 + N)^2 \|u_\lambda(0)\|_{L^2}^{6-2b} - N \|u_\lambda(0)\|_{L^2}^{2} > 0, \]  
(4.10)
\[ \left( \int \theta|u_\lambda(0)|^2 dx \right)^{1/2} \left( \frac{2}{\delta_\lambda} \|\partial_x u_\lambda(0)\|_{L^2}^2 + 1 \right)^{1/2} \leq \frac{1}{2} a_0. \]  
(4.11)
By (4.8) and (4.9),
\[ \delta_\lambda = -16\lambda^{-2} E(u_0) - C(1 + N)^2 \|u_0\|_{L^2}^{6-2b} - N \|u_0\|_{L^2}^{2}. \]  
(4.12)
Thus, if we choose \(\lambda > 0\) so that
\[ \lambda < \left[ -16E(u_0) \left( C(1 + N)^2 \|u_0\|_{L^2}^{6-2b} + N \|u_0\|_{L^2}^{2} \right) \right]^{-1/2} : = \lambda_0, \]  
(4.13)
then (4.10) holds true. Moreover, since \(\|\partial_x u_\lambda(0)\|_{L^2}^2 = \lambda^{-2} \|\partial_x u_0\|_{L^2}^2\), we have from (4.12) that
\[ \frac{2}{\delta_\lambda} \|\partial_x u_\lambda(0)\|_{L^2}^2 = \frac{2}{\lambda^2 \delta_\lambda} \|\partial_x u_0\|_{L^2}^2 \leq C_0, \quad 0 < \lambda < \lambda_1, \]  
(4.14)
for some \(\lambda_1 > 0\), where \(C_0\) depends on \(\lambda_1\) but does not depend on \(\lambda\). We next recall the following fact (see e.g. [23, Lemma 2.3]).

Lemma 4.1. Let \(v \in L^2\) and
\[ H(x) := \begin{cases} |x| & \text{if } |x| \leq 1, \\ 1 & \text{if } |x| > 1. \end{cases} \]
Set \(v_\lambda(x) = \lambda^{-1/2} v(\lambda^{-1} x)\) for \(\lambda > 0\). Then for any \(\epsilon > 0\), there exists \(\lambda_0 > 0\) such that
\[ \|H v_\lambda\|_{L^2} \leq \epsilon, \quad 0 < \lambda < \lambda_0. \]
Applying Lemma 4.1, there exists \(\lambda_2 > 0\) such that \(\lambda_2 < \lambda_1\) and
\[ \int \theta|u_\lambda(0)|^2 dx \leq 4 \|H u_\lambda(0)\|_{L^2}^2 \leq \frac{1}{4}(C_0 + 1)^{-1} a_0^2, \quad 0 < \lambda < \lambda_2. \]  
(4.14)
Combining this and (4.14), the condition (4.11) holds for \(0 < \lambda < \lambda_2\). Therefore, if we choose \(0 < \lambda < \min\{\lambda_0, \lambda_2\}\), then \(u_\lambda(0)\) satisfies (4.10) and (4.11). This completes the proof of the case \(d = 1\) and \(E(u_0) < 0\).

Combining three cases, we prove Theorem 1.1. \(\square\)

Remark 4.2. We now show that the condition \(E(u_0) < 0\) is sufficient for the blowup but it is not necessary. Let \(E > 0\). We find data \(u_0 \in H^1\) so that \(E(u_0) = E\) and the corresponding solution \(u\) blows up in finite time. We follow the standard argument (see e.g. [3, Remark 6.5.8]). Using the standard virial identity (3.5) with \(\alpha = \alpha_\star\), we have
\[ \frac{d^2}{dt^2}\|xu(t)\|_{L^2}^2 = 16E(u_0), \]
and hence

\[ \|xu(t)\|_{L^2}^2 = 8t^2 E(u_0) + 4t \left( \text{Im} \int \overline{u}_0 x \cdot \nabla u_0 dx \right) + \|xu_0\|_{L^2}^2 =: f(t). \]

We see that if \( f(t) \) takes negative values, then the solution must blow up in finite time. In order to make \( f(t) \) takes negative values, we need

\[ \left( \text{Im} \int \overline{u}_0 x \cdot \nabla u_0 dx \right)^2 > 2E(u_0)\|xu_0\|_{L^2}^2. \tag{4.15} \]

Now fix \( \theta \in C^\infty_0(\mathbb{R}^d) \) a real-valued function and set \( \psi(x) = e^{-i|x|^2} \theta(x) \). We see that \( \psi \in C^\infty_0(\mathbb{R}^d) \) and

\[ \text{Im} \int \overline{\psi} x \cdot \nabla \psi dx = -2 \int |x|^2 \theta^2(x) dx < 0. \]

We now set

\[ A = \frac{1}{2} \| \nabla \psi \|_{L^2}^2, \quad B = \frac{1}{\alpha^* + 2} \int |x|^{-b} |\psi(x)|^{\alpha^* + 2} dx, \]

\[ C = \| x \psi \|_{L^2}^2, \quad D = -\text{Im} \int \overline{\psi} x \cdot \nabla \psi dx. \]

Let \( \lambda, \mu > 0 \) be chosen later and set \( u_0(x) = \lambda \psi(\mu x) \). We will choose \( \lambda, \mu > 0 \) so that \( E(u_0) = E \) and (4.15) holds true. A direct computation shows

\[ E(u_0) = \lambda^2 \mu^2 \mu^{-d} \frac{1}{2} \| \nabla \psi \|_{L^2}^2 - \lambda^{\alpha^* + 2} \mu^b \mu^{-d} \frac{1}{\alpha^* + 2} \int |x|^{-b} |\psi(x)|^{\alpha^* + 2} dx = \lambda^2 \mu^{2-d} \left( A - \frac{\lambda^{\alpha^*}}{\mu^{2-b}} B \right), \]

and

\[ \text{Im} \int \overline{u}_0 x \cdot \nabla u_0 dx = \lambda^2 \mu^{-d} \text{Im} \int \overline{\psi} x \cdot \nabla \psi dx = -\lambda^2 \mu^{-d} D, \]

and

\[ \|xu_0\|_{L^2}^2 = \lambda^2 \mu^{-d-2} \|x \psi\|_{L^2}^2 = \lambda^2 \mu^{-d-2} C. \]

Thus, the conditions \( E(u_0) = E \) and (4.15) yield

\[ \lambda^2 \mu^{2-d} \left( A - \frac{\lambda^{\alpha^*}}{\mu^{2-b}} B \right) = E, \tag{4.16} \]

\[ \frac{D^2}{C} > 2 \left( A - \frac{\lambda^{\alpha^*}}{\mu^{2-b}} B \right). \tag{4.17} \]

Fix \( 0 < \epsilon < \min \left\{ A, \frac{D^2}{C} \right\} \) and choose

\[ \frac{\lambda^{\alpha^*}}{\mu^{2-b}} B = A - \epsilon. \]

It is obvious that (4.17) is satisfied. Condition (4.16) implies

\[ \epsilon \lambda^2 \mu^{2-d} = E \quad \text{or} \quad \epsilon \left( \frac{B}{A - \epsilon} \right)^{\frac{2-d}{\alpha^* - (2-d)\alpha^*}} \lambda^{2+\frac{(2-d)\alpha^*}{\alpha^* - (2-d)\alpha^*}} = E. \]

This holds true by choosing a suitable value of \( \lambda \).

5. Intercritical case \( \alpha^* < \alpha < \alpha^* \)

In this section, we will give the proof of Theorem 1.3. Let us consider separately two cases: \( E(u_0) < 0 \) and \( E(u_0) \geq 0 \).

5.1. The case \( E(u_0) < 0 \).
Moreover, using \((5.2)\) the standard virial identity \((3.5)\) and the conservation of energy, we have

\[
\frac{d^2}{dt^2} \|xu(t)\|^2_{L^2} = 8 \|\nabla u(t)\|^2_{L^2} - \frac{4(d\alpha + 2b)}{\alpha + 2} \int |x|^{-b} |u(t, x)|^{\alpha+2} \, dx
\]

\[
= 4(d\alpha + 2b)E(u(t)) - 2(d\alpha - 4 + 2b)\|\nabla u(t)\|^2_{L^2} < 4(d\alpha + 2b)E(u_0) < 0.
\]

Here \(d\alpha - 4 + 2b > 0\) in the intercritical case \(\alpha < \alpha^*\). The standard convexity argument implies that the solution blows up in finite time.

**The case \(u_0\) is radial.** We use Lemma 3.4 together with the conservation of energy to have for any \(\epsilon > 0\),

\[
\frac{d^2}{dt^2} V_{\varphi_R}(t) \leq 8 \|\nabla u(t)\|^2_{L^2} - \frac{4(d\alpha + 2b)}{\alpha + 2} \int |x|^{-b} |u(t, x)|^{\alpha+2} \, dx
\]

\[
+ \left\{ \begin{array}{ll}
O \left( R^{-2} + R^{-2[2(d-1)+b]} \|\nabla u(t)\|_{L^2}^2 \right) & \text{if } \alpha = 4 \\
O \left( R^{-2} + \epsilon \frac{4}{4-n} \frac{R}{4^{n/2}} + \|\nabla u(t)\|_{L^2}^2 \right) & \text{if } \alpha < 4
\end{array} \right.
\]

\[
= 4(d\alpha + 2b)E(u_0) - 2(d\alpha - 4 + 2b)\|\nabla u(t)\|^2_{L^2},
\]

for any \(t\) in the existence time. Since \(d\alpha - 4 + 2b > 0\), we take \(R > 1\) large enough when \(\alpha = 4\); and take \(\epsilon > 0\) small enough and \(R > 1\) large enough depending on \(\epsilon\) when \(0 < \alpha < 4\) to have that

\[
\frac{d^2}{dt^2} V_{\varphi_R}(t) \leq 2(d\alpha + 2b)E(u_0) < 0,
\]

for any \(t\) in the existence time. This implies that the solution must blow up in finite time.

**5.2. The case \(E(u_0) \geq 0\).** In this case, we assume that the initial data \(u_0\) satisfies \((1.10)\) and \((1.11)\). We first show \((1.13)\). By the definition of energy and multiplying both sides of \(E(u(t))\) by \(M(u(t))^\sigma\), the sharp Gagliardo-Nirenberg inequality \((2.1)\) yields

\[
E(u(t))M(u(t))^\sigma = \frac{1}{2} \left( \|\nabla u(t)\|_{L^2} \|u(t)\|_{L^2}^2 \right)^2 - \frac{1}{\alpha + 2} \left( \int |x|^{-b} |u(t, x)|^{\alpha+2} \, dx \right) \|u(t)\|_{L^2}^{2\sigma}
\]

\[
\geq \frac{1}{2} \left( \|\nabla u(t)\|_{L^2} \|u(t)\|_{L^2}^2 \right)^2 - \frac{C_G N}{\alpha + 2} \|u(t)\|_{L^2}^{\frac{4\alpha b - (d-1)\alpha}{2}} \|\nabla u(t)\|_{L^2}^{\frac{d\alpha + 2b}{2}}
\]

\[
= f(\|\nabla u(t)\|_{L^2} \|u(t)\|_{L^2}^2),
\]

where

\[
f(x) = \frac{1}{2} x^2 - \frac{C_G N}{\alpha + 2} x \frac{d\alpha + 2b}{2}.
\]

Moreover, using \((2.4)\) and \((2.5)\), it is easy to see that

\[
f(\|\nabla Q\|_{L^2} \|Q\|_{L^2}^2) = E(Q)M(Q)^\sigma.
\]

We also have that \(f\) is increasing on \((0, x_0)\) and decreasing on \((x_0, \infty)\), where

\[
x_0 = \left( \frac{2(\alpha + 2)}{d\alpha + 2b} \right) \frac{C_G N}{\alpha + 2} = \left( \frac{2(\alpha + 2)}{d\alpha + 2b} \right) \frac{C_G N}{\alpha + 2}.
\]

Using again \((2.4)\) and \((2.5)\), we see that \(x_0\) is exactly \(\|\nabla Q\|_{L^2} \|Q\|_{L^2}^2\). By \((5.1)\), the conservation of mass and energy together with the assumption \((1.10)\) imply

\[
f(\|\nabla u(t)\|_{L^2} \|u(t)\|_{L^2}^2) \leq E(u_0)M(u_0)^\sigma < E(Q)M(Q)^\sigma.
\]
Moreover, we have from the fact for any $t$ as long as the solution exists. This proves (1.13).

We next pick $\delta > 0$ small enough so that

$$E(u_0)M(u_0)^{\sigma} \leq (1 - \delta)E(Q)M(Q)^{\sigma}. \quad (5.3)$$

This implies

$$f(\|\nabla u(t)\|_{L^2}\|u(t)\|_{L^2}^{\sigma}) \leq (1 - \delta)E(Q)M(Q)^{\sigma}. \quad (5.4)$$

By Pohozaev identities (2.4), we learn that

$$E(Q)M(Q)^{\sigma} = \frac{d\alpha - (4 - 2b)}{2d\alpha + 2b}\left(\|\nabla Q\|_{L^2}\|Q\|_{L^2}^{\sigma}\right)^2. \quad (5.5)$$

Moreover, we have from the fact $x_0 = \|\nabla Q\|_{L^2}\|Q\|_{L^2}^{\sigma}$ that

$$C_{GN} = \frac{2(\alpha + 2)}{d\alpha + 2b}\left(\|\nabla Q\|_{L^2}\|Q\|_{L^2}^{\sigma}\right)^{\frac{d\alpha - 2b}{2}}. \quad (5.6)$$

By dividing both sides of (5.4) by $E(Q)M(Q)^{\sigma}$ and using (5.5) and (5.6), we obtain

$$\frac{d\alpha + 2b}{d\alpha - (4 - 2b)}\left(\frac{\|\nabla u(t)\|_{L^2}\|u(t)\|_{L^2}^{\sigma}}{\|\nabla Q\|_{L^2}\|Q\|_{L^2}^{\sigma}}\right)^2 - \frac{4}{d\alpha - (4 - 2b)}\left(\frac{\|\nabla u(t)\|_{L^2}\|u(t)\|_{L^2}^{\sigma}}{\|\nabla Q\|_{L^2}\|Q\|_{L^2}^{\sigma}}\right)^{\frac{d\alpha + 2b}{2}} \leq 1 - \delta.$$

The continuity argument then implies that there exists $\delta' > 0$ depending on $\delta$ so that

$$\frac{\|\nabla u(t)\|_{L^2}\|u(t)\|_{L^2}^{\sigma}}{\|\nabla Q\|_{L^2}\|Q\|_{L^2}^{\sigma}} \geq 1 + \delta' \quad \text{or} \quad \|\nabla u(t)\|_{L^2}\|u(t)\|_{L^2}^{\sigma} \geq (1 + \delta')\|\nabla Q\|_{L^2}\|Q\|_{L^2}^{\sigma}. \quad (5.7)$$

We also have that for $\epsilon > 0$ small enough,

$$8\|\nabla u(t)\|_{L^2}^2 - \frac{4(d\alpha + 2b)}{\alpha + 2}\int |x|^{-b}|u(t, x)|^{\alpha + 2}dx + \epsilon\|\nabla u(t)\|_{L^2}^2 \leq -c < 0, \quad (5.8)$$

for any $t$ in the existence time. Indeed, multiplying the left hand side of (5.8) with the conserved quantity $M(u(t))^{\sigma}$, we get

$$\text{LHS}(5.8) \times M(u(t))^{\sigma} = 4(d\alpha + 2b)E(u(t))M(u(t))^{\sigma} + (8 + \epsilon - 2d\alpha - 4b)\|\nabla u(t)\|_{L^2}^2M(u(t))^{\sigma}.$$

The conservation of mass and energy, (5.3), (5.5) and (5.7) then yield

$$\text{LHS}(5.8) \times M(u_0)^{\sigma} \leq 4(d\alpha + 2b)(1 - \delta)E(Q)M(Q)^{\sigma} + (8 + \epsilon - 2d\alpha - 4b)(1 + \delta')^2\|\nabla Q\|_{L^2}\|Q\|_{L^2}^{\sigma})^2$$

$$= (\|\nabla Q\|_{L^2}\|Q\|_{L^2}^{\sigma})^2\left[2(d\alpha - 4 + 2b)[1 - \delta - (1 + \delta')]^2 + \epsilon(1 + \delta')^2\right].$$

By taking $\epsilon > 0$ small enough, we prove (5.8).

The case $xu_0 \in L^2$. The finite time blowup for the intercritical (INLS) with initial data in $H^1 \cap L^2(|x|^2dx)$ satisfying (1.10) and (1.11) was proved in [9]. For the sake of completeness, we recall some details. By the standard virial identity (3.5) and (5.8),

$$\frac{d^2}{dt^2}\|xu(t)\|_{L^2}^2 = 8\|\nabla u(t)\|_{L^2}^2 - \frac{4(d\alpha + 2b)}{\alpha + 2}\int |x|^{-b}|u(t, x)|^{\alpha + 2}dx \leq -c < 0.$$

This shows that the solution blows up in finite time.
The case \( u_0 \) is radial. We first note that under the assumptions of Theorem 1.3, we can apply Lemma 3.4 to obtain for any \( \epsilon > 0 \),
\[
\frac{d^2}{dt^2} \phi(R)(t) \leq 8\|u(t)\|_{L^2}^2 - \frac{4(da+2b)}{\alpha+2} \int |x|^{-b}\|u(t, x)\|^{\alpha+2} dx
\]
\[
+ \begin{cases}
O\left(R^{-2} + R^{-[2(d-1)+\|\nabla u(t)\|_{L^2}^2]\right) & \text{if } \alpha = 4,
O\left(R^{-2} + \epsilon^{\frac{\alpha}{\alpha-2}}R^{\frac{2(d-1)+\alpha-2b}{\alpha-2}} + \epsilon\|\nabla u(t)\|_{L^2}^2\right) & \text{if } \alpha < 4,
\end{cases}
\]
for any \( t \) in the existence time. Taking \( R > 1 \) large enough when \( \alpha = 4 \), and \( \epsilon > 0 \) small enough and \( R > 1 \) large enough depending on \( \epsilon \) when \( 0 < \alpha < 4 \), we learn from (5.8) that
\[
\frac{d^2}{dt^2} \phi(R)(t) \leq -c/2 < 0.
\]
This shows that the solution must blow up in finite time.

Combining two cases, we prove Theorem 1.3.

ACKNOWLEDGMENTS

The author would like to thank his wife-Uyen Cong for her encouragement and support. He would like to thank his supervisor Prof. Jean-Marc Bouclet for the kind guidance and constant encouragement. He also would like to thank the reviewer for his/her helpful comments and suggestions, which greatly improved the presentation of the paper.
