Two modified Zagreb indices for random structures

Abstract: Random structure plays an important role in the composition of compounds, and topological index is an important index to measure indirectly the properties of compounds. The Zagreb indices and its revised versions (or redefined versions) are frequently used chemical topological indices, which provide the theoretical basis for the determination of various physical-chemical properties of compounds. This article uses the tricks of probability theory to determine the reduced second Zagreb index and hyper-Zagreb index of two kinds of vital random graphs: $G(n, p)$ and $G(n, m)$.

Keywords: theoretical chemistry, Zagreb index, random graph, hyper-Zagreb index, second Stirling number

1 Introduction

The Zagreb index named as the capital of Croatia is one of the first chemical topological indices to be defined. The research on Zagreb index has a long history. It has always been the primary chemical topological index studied by theoretical chemists and has a wide range of applications in various chemical engineering fields. The contributions in Zagreb indices in recent years can be referred to Ali et al. (2020), Ashrafi et al. (2019), Aslam et al. (2019), Buyantogtokh et al. (2020), Došlić et al. (2020), Du et al. (2019), Furtula et al. (2019), Gao et al. (2018b, 2019, 2020), Javaid et al. (2019), Noureen et al. (2020), Siddiqui (2020), and Wang et al. (2020). All the random graphs considered in our article are simple graphs, that is, loops, multi-edges and directed edges are not considered here.

The traditional first and second Zagreb indices are defined by:

\[ M_1(G) = \sum_{v \in V(G)} (d(v))^2 \]

and

\[ M_2(G) = \sum_{uv \in E(G)} d(u)d(v), \]

respectively. In recent ten years, various of variants of Zagreb index are introduced in different engineering applications. For instance, modified second Zagreb index is formulated by:

\[ M'_2(G) = \sum_{uv \in E(G)} \frac{1}{d(u)d(v)}. \]

Furthermore, different version and revised forms of Zagreb index are defined one after another. For example, first multiplicative Zagreb index and second multiplicative Zagreb index are stated as follows:

\[ \Pi'_1(G) = \prod_{v \in V(G)} (d(v))^2, \]

\[ \Pi'_2(G) = \prod_{uv \in E(G)} d(u)d(v), \]

In this paper, we focus on the following two versions of Zagreb index:

- Reduced second Zagreb index:
  \[ RM_2(G) = \sum_{uv \in E(G)} (d(u) - 1)(d(v) - 1). \]

- Hyper-Zagreb index:
  \[ HM(G) = \sum_{e \in E(G)} (d(u) + d(v))^2. \]
2 Prerequisite knowledge

The main purpose in this section is to list the degree distribution polynomial, Stirling number and indicator random variables which will be used in the proofing of main results.

Let $\delta(G)$ and $\Delta(G)$ be the minimum and maximum degree of graph $G$. The degree sequence polynomial $S_v(x)$ with degree sequence $\delta(G) = d_1 \leq \cdots \leq d_n = \Delta(G)$ is defined as generating polynomial by Sedghi et al. (2008) which is formulated by:

$$S_v(x) = \sum_{v \in V(G)} x^{d(v)} = \sum_{i=1}^{\Delta(G)} a_i x^i,$$

where $a_i = |\{v \in V(G) : d(v) = i\}|$. By simple computations, we acquire $S_v(1) = |V(G)|$ and $S_v'(1) = 2|E(G)|$.

Let $D_v$ be a random variable corresponding to the degree of vertex $v \in V(G)$ where $G \in G(n,p)$. Then its vertex degree distribution can be denoted as:

$$P(D_v = t) = \binom{n-1}{t} p^t (1-p)^{n-1-t}.$$

Došlić et al. (2020) introduced the corresponding polynomial function which is stated by:

$$f_{n,p}(x) = \sum_{i=0}^{n-1} \binom{n-1}{t} p^t (1-p)^{n-1-t} x^i = (1-p+px)^{n-1}.$$

In terms of directly calculating, we infer that for any $i \in \{1, \cdots, n-1\}$,

$$f_{n,p}^{(i)}(1) = (n-1) \cdots (n-i)p^i.$$

In combinatorial theory, it is well-known that there are two main types of Stirling numbers where the first kind of Stirling number (here denoted it by $\{ \}$) expresses the number of ways to arrange $n$ objects into cycles, and the second kind of Stirling number (here denoted it by $\{ \}$) expresses the number of partitions of a set with $n$ elements into $t$ non-empty subsets. It satisfies the following recursion condition:

$$\begin{cases} n \choose t = \binom{n-1}{t} + \binom{n-1}{t-1} \\
\end{cases}$$

where $n \in \mathbb{N}$ and the initial conditions are $\{0\} = 1$ and $\{i\} = \{0\} = 0$ for any $i, j > 0$. Let $x^t = x(x-1) \cdots (x-t+1)$ be falling factorial. We deduce:

$$x^t = \sum_{i} \binom{n}{t} (-1)^{n-t} x^i.$$
More details on the characters and applications of Stirling number can be referred to Arratia and DeSalvo (2017), Bagno et al. (2019), Ballantine and Merca (2018), Benyi et al. (2019), Kuba and Panholzer (2019), Maltenfort (2020), Mansour and Shattuck (2018), Merca (2019), and Prodinger (2019).

Let \( \mathbf{1} \) be all 1 vector and \( D = A \mathbf{1} \) (\( A \) is adjacency matrix of random graph \( G \), i.e., a random symmetric \((0,1)\)-matrix). For a random graph \( G \) with \( V(G) = \{v_1, \cdots, v_n\} \), the indicator random variables \( X_{ij} \) for \( i, j \in \{1, \cdots, n\} \) is formulated by:

\[
X_{ij} = \begin{cases} 
1, & \text{if } v_i v_j \in E(G) \\
0, & \text{otherwise}
\end{cases}
\]

Obviously, \( X_{ij} = X_{ji} \). We consider the following two situations:

- \( G \in G(n,p) \): \( X_{ij} \) and \( X_{is} \) are independent for \( i, j, r, s \in \{1, \cdots, n\} \) and \( \{i, j\} \neq \{r, s\} \);
- \( G \in G(n,m) \): \( X_{ij} \) and \( X_{is} \) are not independent for \( i, j, r, s \in \{1, \cdots, n\} \).

Let \( \mathbb{E}(\cdot) \) be expectation function. It is well-known that \( \mathbb{E}(XY) = \mathbb{E}(X)\mathbb{E}(Y) \) if \( X \) and \( Y \) are independent random variables. For \( G(n,m) \) case and \( i \in \{1,2,3\} \), set (defined by Došlić et al., 2020)

\[
p_i = \binom{n}{2}^{-i} \binom{m}{n-1-i} \binom{n}{2}^{-m-i} \binom{m}{n-1-i}.
\]

### 3 Results and proofs

The main theorem for random graph \( G(n,p) \) is presented as follows.

**Theorem 1**

Let \( G \in G(n,p) \). Then:

\[
\mathbb{E}(RM_2(G)) = \left( \frac{n}{2} \right)(n-2)^2 p^3,
\]

\[
\mathbb{E}(HM(G)) = 2n(n-1)p + 5n(n-1)(n-2)p^2 + n(n-1)(n-2)(2n-5)p^3.
\]

**Proof.** Set \( V(G) = \{v_1, \cdots, v_n\} \) and \( D \) as the corresponding random variable of vertex \( v_i \) for \( i \in \{1, \cdots, n\} \). We get:

\[
\mathbb{E}(RM_2(G)) = \mathbb{E}\left( \sum_{uv \in E(G)} (d(u)-1)(d(v)-1) \right)
\]

\[
= \mathbb{E}\left( \sum_{uv \in E(G)} (d(u)d(v) - d(u) - d(v) + 1) \right)
\]

\[
= \mathbb{E}\left( \sum_{uv \in E(G)} d(u)d(v) \right) - \mathbb{E}\left( \sum_{uv \in E(G)} d(u) + d(v) \right) + \mathbb{E}\left( |E(G)| \right)
\]

\[
= \mathbb{E}\left( \sum_{v \in V(G)} (d(v))d(v) \right) - \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) + \frac{n}{2}p
\]

\[
= \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) - \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) + \frac{n}{2}p
\]

\[
= \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) - \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) + \frac{n}{2}p
\]

\[
= \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) - \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) + \frac{n}{2}p
\]

\[
= \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) - \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) + \frac{n}{2}p
\]

\[
= \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) - \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) + \frac{n}{2}p
\]

\[
= \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) - \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) + \frac{n}{2}p
\]

\[
= \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) - \mathbb{E}\left( \sum_{v \in V(G)} d(v)^2 \right) + \frac{n}{2}p
\]
\[
\begin{align*}
&= \frac{1}{2} \sum_{j=1}^{n} \sum_{j \neq j, j} (p + 2(n-2)p^2 + (n-2)^2 p^3) \\
&- n \sum_{j=1}^{n} \left( \frac{n!}{(n-j-1)!} p^j + \left( \frac{n}{2} \right) p \right) \\
&= \frac{n^2 - n}{2} (p + 2(n-2)p^2 + (n-2)^2 p^3) \\
&- (n-1)p((n-2)p+1) + \left( \frac{n}{2} \right) p \\
&= \left( \frac{n}{2} \right) (2p + 2(n-2)p^2 + (n-2)^2 p^3) \\
&- \left( \frac{n}{2} \right) (2(n-2)p^2 + 2p) \\
&= \left( \frac{n}{2} \right) (n-2)^2 p^3.
\end{align*}
\]

Thus, we get the desired conclusions. The second main theorem for random graph \( G(n,m) \) is manifested as follows.

**Theorem 2**

Let \( G \in G(n,m) \). Then:

\[
\begin{align*}
E(RM_2(G)) &= \frac{n^2 - n}{2} p_1 + \frac{n^2 - 2n}{2} (n-2)^3 p_3 + m, \\
E(HM(G)) &= 2n(n-1)p_1 + 5n(n-1)(n-2)p_2 \\
&\quad + n(n-1)(n-2)(2n-5)p_3.
\end{align*}
\]

*Proof.* Set \( V(G) = \{ v_1, \cdots, v_n \} \) and \( D \) as the corresponding random variable of vertex \( v_i \) for \( i \in \{1, \cdots, n\} \). We get:

\[
\begin{align*}
E(RM_2(G)) &= E(\sum_{uv \in E(G)} (d(u)-1)(d(v)-1)) \\
&= E(\sum_{uv \in E(G)} (d(u)d(v)-d(u)-d(v)+1)) \\
&= E(\sum_{uv \in E(G)} (d(u)d(v)) - E(\sum_{uv \in E(G)} (d(u)+d(v))) + E[E(G)]) \\
&= E(\sum_{uv \in E(G)} (d(u)d(v))) - E(\sum_{uv \in E(G)} d^2(v)) + m.
\end{align*}
\]
\[ E(\sum_{v \in V(G)} d^i(D)) - E(\sum_{v \in V(G)} d^i(D)) + m = \frac{1}{2} E(\sum_{i=1}^{n} \sum_{j=1}^{n} D_i^j) - \sum_{v \in V(G)} E(D_i^j) + m \]

\[ = \frac{1}{2} E(\sum_{i=1}^{n} \sum_{j=1}^{n} D_i^j X_{ij}^j) - \sum_{v \in V(G)} E(D_i^j) + m \]

\[ = \frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} \sum_{k=1, k \neq i}^{n} \sum_{l=1, l \neq j}^{n} E(X_{ik}^j X_{lj}^j) - \sum_{v \in V(G)} E(D_i^j) + m \]

\[ + \sum_{i=1}^{n} \sum_{j=1}^{n} \sum_{k=1, k \neq i}^{n} \sum_{l=1, l \neq j}^{n} E(X_{ik}^j X_{lj}^j) \]

\[ = \frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} \sum_{k=1, k \neq i}^{n} \sum_{l=1, l \neq j}^{n} E(X_{ik}^j X_{lj}^j) - \sum_{v \in V(G)} E(D_i^j) + m \]

\[ = \frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} \sum_{k=1, k \neq i}^{n} \sum_{l=1, l \neq j}^{n} E(X_{ik}^j X_{lj}^j) \]

\[ + \sum_{i=1}^{n} \sum_{j=1}^{n} \sum_{k=1, k \neq i}^{n} \sum_{l=1, l \neq j}^{n} E(X_{ik}^j X_{lj}^j) \]

\[ = \frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} (p_i + 2(n-2)p_2 + (n-2)^2 p_3) - (n(n-1)p_1 + n(n-1)(n-2)p_2 + m) \]

\[ = \frac{n^2 - n}{2} p_1 + \frac{n^2 - n}{2} (n-2)^2 p_3 + m. \]

\[ E(HM(G)) = E(\sum_{(u, v) \in E(G)} (d(u) + d(v))^2) \]

\[ = E(\sum_{u \in V(G)} d^2(u) + d^2(v) + 2d(u)d(v)) \]

\[ = E(\sum_{u \in V(G)} d^2(u) + d^2(v) + 2E(\sum_{u \in V(G)} d(u)d(v)) \]

Therefore, we complete the proof of Theorem 2.

Theorem 1 and Theorem 2 presented the means of reduced second Zagreb index and hyper-Zagreb index of \(G(n, p)\) and \(G(n, m)\) respectively, which reflect the central location of indices of random graphs and the central tendency of random index values.
4 Conclusion and discussion

Random structure plays an important role in the synthesis of chemical molecular structure, and the analysis of random graph helps us understand the characteristics of compound molecular structure under probabilistic conditions. In this paper, we determine the reduced second Zagreb index and hyper-Zagreb index of $G(n,p)$ and $G(n,m)$ by means of probability tricks and mathematical derivation.

The following topics can be considered as the future ongoing works:

- More topological chemical indices of random graphs $G(n, p)$ and $G(n, m)$ should be discussed;
- More kinds of random graphs should be considered as well;
- It is stated in Newman et al. (2001) that the vertex degree distribution function has been in different expressions of different settings. Hence, the special topological chemical indices for specific random graphs (i.e., Poisson-distributed graphs, exponentially distributed graphs, and power-law distributed graphs) can be studied in the future.
