Supplementary Materials: Synthesis of Highly Branched Polyolefins Using Phenyl Substituted α-Diimine Ni(II) Catalysts

Fuzhou Wang, Ryo Tanaka, Zhengguo Cai, Yuushou Nakayama and Takeshi Shiono

1. X-ray Structure Determinations

The molecular structures of complexes C1 and C5′ were confirmed by single-crystal X-ray diffraction and the corresponding ORTEP diagrams are shown in Figure S1. Crystal data, data collection, and refinement parameters are listed in Table S1. Selected bond distances and angles are summarized in Table S2.

Figure S1. Molecular structures of the complexes C1 and C5′, where H atoms are omitted for clarity.

Table S1. Crystal data and structure refinements of complex C1.

| Identification Code | C1                                                                 |
|---------------------|----------------------------------------------------------------------|
| Empirical formula   | C60H32Br2N2Ni                                                        |
| Formula mass        | 759.21                                                              |
| Temperature (K)     | 292                                                                 |
| Wavelength (Å)      | 0.7107                                                              |
| Crystal size (mm³)  | 0.33 × 0.31 × 0.28                                                  |
| Crystal system      | Orthorhombic                                                        |
| Space group         | Cmcm                                                                |
| a (Å)               | 11.7266 (8)                                                         |
| b (Å)               | 11.5635 (5)                                                         |
| c (Å)               | 27.5587 (14)                                                       |
| V (Å³)              | 3,737.0 (4)                                                         |
| Z                   | 8                                                                   |
| Density (calcld.) (mg/cm³) | 2.699                                                              |

2. Experimental Sections

2.1. Synthesis and Characterizations of Complexes C1–C7

The synthesis of ligands L, L1–L7 and their complexes Pd-Cat, C1–C7 are outlined in Scheme S1. After the protection of the amino group by acetic acid, the aniline derivatives were brominated. The Suzuki-coupling reaction of the bromoaniline derivatives and phenylboronic acid obtained with a Pd(II) catalyst (Pd-Cat) in PEG-400/H2O led to the corresponding phenyl-substituted aniline derivatives 1–6. The ligands L1–L7 were prepared by the condensation of two equivalents of the appropriate aniline with one equivalent of acenaphthoquinone, in the presence of a formic acid catalyst. The reaction of equimolar amounts of NiBr2(DME) and the α-diimine ligands L1–L7 in CH2Cl2 led to the displacement of 1,2-dimethoxyethane and afforded the Ni(II) complexes C1–C7 as a moderately air-stable deep red microcrystalline solid in good yields, respectively. The corresponding palladium dichloride complex (Pd-Cat) is accessible by the reaction of the ortho-sec-phenethyl substituted chiral ligand L with (CH3CN)2PdCl2 in CH2Cl2 at ambient temperature. Compounds L1–L7 were well characterized by IR, 1H NMR, 13C NMR spectroscopy and elemental analysis.
Scheme S1. Synthesis of α-diimine ligands L, L1–L7 and their complexes Pd-Cat., C1–C7.

The new organic compounds were well characterized by \( ^1 \)H NMR and \( ^{13} \)C NMR (see below).

2.2. Living Polymerization of 1-Decene with C1-MMAO

Polymerization of 1-decene was investigated with C1-MMAO at 20 °C with the [Al]/[Ni] molar ratio of 300, and the results are summarized in Table S3.

Table S3. Polymerization of 1-decene with C1-MMAO. *

| Entry | Time (min) | Conversion (%) | $M_n$ b (kg·mol⁻¹) | $M_w/M_n$ b | $N$ c (mol) |
|-------|------------|----------------|---------------------|-------------|-------------|
| 1     | 5          | 7.3            | 18.8                | 1.09        | 5.4         |
| 2     | 15         | 19.5           | 51.4                | 1.08        | 5.3         |
| 3     | 30         | 45.4           | 110.0               | 1.07        | 5.8         |
| 4     | 40         | 58.1           | 151.8               | 1.10        | 5.4         |
| 5     | 50         | 75.1           | 186.9               | 1.15        | 5.6         |
| 6     | 60         | 91.3           | 233.5               | 1.14        | 5.5         |

* Polymerization conditions: Ni = 10 μmol; cocatalyst MMAO, [Al]/[Ni] = 300; 1-decene = 10 mmol; 20 °C; solvent = toluene, total volume = 20 mL; b $M_n$ in kg/mol, determined by GPC against polystyrene standard. c Number of polymer chain calculated by yield and $M_n$.

3. Microstructure Analysis of the Polymers

3.1. Equations (S1)–(S3) for the Microstructure Analysis of the Polymers

3.1.1. Calculation of the Degree of Branching

The degree of branching (B) was estimated by $^1$H NMR spectroscopy and was corrected for end groups as follows (S1):

$$B = \frac{2(I_{CH_3})}{2(I_{CH} + I_{CH_2} + I_{CH_3})} \times 1000$$  \hspace{1cm} (S1)

Branching degree, the number of methyl carbon in every 1000 carbons, CH$_3$, CH$_2$, CH refer to the intensities of the methyl, methylene and methine resonances in $^1$H NMR spectra.
3.1.2. Calculation of $\omega,1$-Insertions

The fraction of $\omega,1$-insertions was calculated using the following equation reported by Brookhart et al. [1].

$$\omega,1\% = \frac{1000 \cdot (\omega - 2)B}{1000 + 2B} \times 100$$  \hfill (S2)

where $B$ is the total branching calculated by Equation (S1), $\omega$ is the number of carbon atoms in the monomer.

Assignments of the $^{13}$CNMR spectra and equations for the quantitative analysis of the polyolefins under investigation, according to Equation (S3) reported by Azoulay et al. [2]. Chemical shift and assignment of the peak listed in the Table S4 are marked in the spectrum (Figure S12).

$$\text{CH}_3 = \frac{(I_2 + I_5)}{2} + I_1 + I_3 + I_6$$

Methyl branch, $\text{Me} = I_6 - I_4 + I_7$; Ethyl branch, $\text{Et} = (I_1 + I_{10})/2$  \hfill (S3)

Propyl branch, $\text{Pr} = (I_4 + I_{23})/2$; Butyl branch, $\text{Bu} = I_3 - I_8$

sec-Butyl branch, $^\text{a}\text{Bu} = (I_5 + I_9)/2$; Longer branch, $\text{Lg} = (I_8 + I_{17})/2$

![Figure S12. $^{13}$C NMR spectrum of the polyethylene obtained with Cl-MMAO at 20 °C (entry 11, Table 1).](image)

**Table S4. Chemical shift and assignment of peaks.**

| Peak No. | Chemical shift (ppm) | Assignment | Peak No. | Chemical shift (ppm) | Assignment |
|----------|----------------------|------------|----------|----------------------|------------|
| 1        | 11.09                | 1Bn        | 14       | 29.61                | 4Bn        |
| 2        | 11.53                | 1Bn        | 15       | 29.95                | CH3        |
| 3        | 14.25                | 1Bn, 1Bn   | 16       | 30.36                | $\gamma B_1, \gamma B_2$ |
| 4        | 14.66                | 1Bn        | 17       | 32.09                | 3Bn        |
| 5        | 19.33                | 1Bn        | 18       | 32.57                | 3Bn        |
| 6        | 19.81                | 1Bn        | 19       | 32.94                | brBn       |
| 7        | 19.98                | 2Bn        | 20       | 33.34                | aBn        |
| 8        | 22.85                | 2Bn        | 21       | 33.91                | aBn        |
| 9        | 23.24                | 2Bn        | 22       | 34.56                | nBn        |
| 10       | 26.03                | 2Bn        | 23       | 36.84                | 3Bn        |
| 11       | 26.95                | (n+1)Bn    | 24       | 37.33                | aBn        |
| 12       | 27.30                | /Bn        | 25       | 37.77                | brBn       |
| 13       | 27.66                | /Bn        | 26       | 39.03                | brBn       |

* $^{13}$C NMR (CDCl$_3$ $\delta$: 77.16 ppm) measurements of the polyethylene are marked in Figure S12; Note on labels: for $x$B$n$ B$n$ is a branch of length $n$ carbons, $x$ is the carbon being discussed, and the methyl at the end of the branch is numbered 1. Thus, the second carbon from the end of a butyl branch is 2B$n$. $x$B$n$+ refers to branches of length $n$ and longer.
3.2. $^1$H and $^{13}$C NMR Spectra of the Polyethylenes (Tables 1 and 2)

NMR spectra of the polyethylenes prepared by C1–C7 (see Figures S13–S21):
