Abstract
We provide a solution to a long-standing open problem that lives in the interface of pluripotential theory and multivariate approximation theory. The problem is to characterize the holomorphic maps which preserve Hölder continuity of the pluricomplex Green function associated with a compact subset of \( \mathbb{C}^N \). We also prove, under mild restrictions, that nondegenerate holomorphic maps preserve Markov’s inequality for polynomials.

1 Introduction
For each compact set \( \emptyset \neq K \subset \mathbb{C}^N \), the following function

\[
V_K(z) := \sup \left\{ \phi(z) : \phi \in \mathcal{L}(\mathbb{C}^N), \phi \leq 0 \text{ on } K \right\}
\]

\((z \in \mathbb{C}^N)\), where \( \mathcal{L}(\mathbb{C}^N) \) denotes the class of plurisubharmonic functions \( \phi \) in \( \mathbb{C}^N \) (see [23] for the definition and basic properties of plurisubharmonic functions) satisfying the logarithmic growth condition

\[
\sup_{z \in \mathbb{C}^N} \left[ \phi(z) - \log(1 + |z|) \right] < +\infty,
\]

Dedicated to the memory of Professor Józef Siciak.

is called the pluricomplex Green function of $K$ (with pole at infinity) or the Siciak-Zakharyuta extremal function; see for example [4,23,25,39,43,44] and the bibliography therein. Here and subsequently, $\| \|$ denotes the maximum norm in $\mathbb{C}^N$.

If $N = 1$, $K \subset \mathbb{C}$ is nonpolar (that is, of positive logarithmic capacity), and $K_\infty$ denotes the unbounded component of $\mathbb{C} \setminus K$, then $V_K$ is harmonic in $\mathbb{C} \setminus K$ and the restriction of $V_K$ to $K_\infty$ is the Green function of $K_\infty$ with pole at infinity; see [44, 7.1 and 7.2].

Definition 1.1 (see [23]) A set $A \subset \mathbb{C}^N$ is said to be pluripolar if, for each point $a \in A$, there exists an open neighbourhood $U$ of $a$ such that $A \cap U \subset \{ z \in U : \varphi(z) = -\infty \}$ for some plurisubharmonic function $\varphi : U \to (-\infty, +\infty)$.

If $K \subset \mathbb{C}^N$ is a nonpluripolar compact set, then the upper semicontinuous regularization $V^*_K(z) := \limsup_{\zeta \to z} V_K(\zeta)$ of $V_K$ is plurisubharmonic in $\mathbb{C}^N$ and satisfies the complex Monge-Ampère equation:

$$(dd^c V^*_K)^N = 0 \quad \text{in } \mathbb{C}^N \setminus K;$$

see [4,23,26] for more details. Moreover, for each compact set $\emptyset \neq K \subset \mathbb{C}^N$,

$$K \text{ is pluripolar } \iff V^*_K \equiv +\infty \iff V^*_K \notin \mathcal{L}(\mathbb{C}^N); \quad (1.1)$$

see [44, Corollary 3.9 and Theorem 3.10]).

We should also recall that the pluricomplex Green function is essentially equivalent to the Siciak extremal function. The latter is defined by the formula

$$\Phi_K(z) := \sup \left\{ |Q(z)|^{1/\deg Q} : Q \in \mathbb{C}[z_1, \ldots, z_N], \deg Q > 0 \text{ and } \| Q \|_K \leq 1 \right\}$$

$(z \in \mathbb{C}^N)$, where $\| Q \|_K := \sup_{z \in K} |Q(z)|$. Strictly speaking, for each compact set $\emptyset \neq K \subset \mathbb{C}^N$,

$$V_K = \log \Phi_K; \quad (1.2)$$

see [23, Theorem 5.1.7].

It may be worth noting that, for each $Q \in \mathbb{C}[z_1, \ldots, z_N]$ with $\| Q \|_K > 0$ and each $z \in \mathbb{C}^N$,

$$|Q(z)| \leq (\Phi_K(z))^{\deg Q} \| Q \|_K. \quad (1.3)$$

(We adopt here the convention that, for each $r \geq 0$, $(+\infty)^r := +\infty$. Moreover, for $K$ being nonpluripolar, the additional assumption that $\| Q \|_K > 0$ is superfluous.) This trivial (but useful) estimate is called the Bernstein-Walsh inequality.

The pluricomplex Green function has been used to study various problems in (real and complex) analysis, functional analysis, pluripotential theory, complex dynamics and in approximation theory. From the point of view of applications, the most desirable property of this function is the HCP property.
**Definition 1.2** (see [29]) We say that a compact set \( \emptyset \neq K \subset \mathbb{C}^N \) has the HCP property if there exist \( \sigma, \mu > 0 \) such that, for each \( z \in K_{(1)} \),

\[
V_K(z) \leq \sigma (\text{dist}(z, K))^\mu.
\]  

(1.4)

In the above definition, and subsequently, we use the following notation: for each set \( \emptyset \neq A \subset \mathbb{C}^N \) and each \( r > 0 \), we put

\[
A_r := \{ z \in \mathbb{C}^N : \text{dist}(z, A) \leq r \}.
\]

Since \( V_K \equiv 0 \) in \( K \), the HCP property can be reformulated in the following way: for each \( z \in K_{(1)} \) and each \( z' \in K \),

\[
|V_K(z) - V_K(z')| \leq \sigma |z - z'|^\mu.
\]

Surprisingly, a simple argument due to Błocki shows that this estimate already implies Hölder continuity of \( V_K \) in \( \mathbb{C}^N \); cf. [46, Proposition 3.5] or [42, Lemma 2.3]. More precisely, for each \( \mu > 0 \), the following two conditions are equivalent:

- There exists \( \sigma > 0 \) such that (1.4) holds.
- There exists \( \tilde{\sigma} > 0 \) such that, for all \( z, z' \in \mathbb{C}^N \),

\[
|V_K(z) - V_K(z')| \leq \tilde{\sigma} |z - z'|^\mu.
\]

**Example 1.3** Assume that \( K_1, \ldots, K_N \) are nonempty compact subsets of \( \mathbb{C} \) such that, for each \( j \leq N \) and each connected component \( E_j \) of \( K_j \), we have \( \text{diam}(E_j) \geq \eta \), the constant \( \eta > 0 \) being independent of \( j \). Set \( K := K_1 \times \cdots \times K_N \). By [45, Lemma 3.1], for each \( j \leq N \) and each \( u \in (K_j)_{(1)} \),

\[
V_{K_j}(u) \leq \sigma \sqrt{\text{dist}(u, K_j)},
\]

where

\[
\sigma := \frac{4}{\eta} \left( 1 + \sqrt{1 + \frac{\eta}{2}} \right).
\]

Fix \( z = (z_1, \ldots, z_N) \in K_{(1)} \). By [23, Theorem 5.1.8],

\[
V_K(z) = \max \{ V_{K_1}(z_1), \ldots, V_{K_N}(z_N) \}
\]

\[ \leq \sigma \max \left\{ \sqrt{\text{dist}(z_1, K_1), \ldots, \sqrt{\text{dist}(z_N, K_N)}} \right\}
\]

\[ = \sigma \sqrt{\text{dist}(z, K)},
\]

which yields the HCP property for the set \( K \), with the exponent \( \mu = 1/2 \). Let us emphasize that, for some product sets of planar compact sets, this exponent is not the best possible. For example, for a polydisk.
\[ \mathbb{D}(a, r) := \{ z \in \mathbb{C}^N : |z - a| \leq r \} \]

\((a \in \mathbb{C}^N, r > 0)\), the HCP property holds with the exponent \( \mu = 1 \). Indeed, since

\[ V_{\mathbb{D}(a, r)}(z) = \max \left\{ 0, \log \frac{|z - a|}{r} \right\} \]

(see [23, Example 5.1.1]), it follows that

\[ V_{\mathbb{D}(a, r)}(z) \leq \frac{\text{dist}(z, \mathbb{D}(a, r))}{r} \]

for all \( z \in \mathbb{C}^N \). On the other hand, however, for the cube \([-1, 1]^N \subset \mathbb{R}^N \subset \mathbb{C}^N\), the exponent \( \mu = 1/2 \) is the best possible, which follows from the formula

\[ V_{[-1,1]^N}(z) = \max \left\{ \log |z_1 + \sqrt{z_1^2 - 1}|, \ldots, \log |z_N + \sqrt{z_N^2 - 1}| \right\}, \]

valid for all \( z = (z_1, \ldots, z_N) \in \mathbb{C}^N \); see [23, Corollary 5.4.5]. For each \( j \leq N \), the square root is so chosen that \( |z_j + \sqrt{z_j^2 - 1}| \geq 1 \).

There have been several significant advances in understanding the HCP property for compact subsets of \( \mathbb{C} \). In particular, we should mention here a very interesting work of Carleson and Totik [16], in which they give a sufficient Wiener-type criterion for a compact set \( K \subset \mathbb{C} \) to have the HCP property. Incomparably less has been done so far in the multivariate case (that is, for \( N > 1 \)). However, Pawłucki and Pleśniak in a seminal paper [29] give a sufficient geometric condition (UPC condition) for a compact set \( K \subset \mathbb{R}^N \) to have the HCP property. Furthermore, in [29,30,32] large and natural classes of compact sets in \( \mathbb{R}^N \) satisfying the UPC condition (and hence with the HCP property) are provided. More precisely, these classes consist of all compact, fat (a set \( E \) is said to be fat if \( E = \text{Int}E \)) and definable sets in certain o-minimal structures; see [18] for the definition of an o-minimal structure. Each compact, fat and semianalytic subset of \( \mathbb{R}^N \) is an explicit example of such a set.

**Definition 1.4** (see [5,27]) Let \( \Omega \subset \mathbb{R}^N \) be an open set. A set \( A \subset \Omega \) is said to be a semianalytic subset of \( \Omega \) if, for each point in \( \Omega \), we can find a neighbourhood \( W \) such that \( A \cap W \) is a finite union of sets of the form

\[ \{ x \in W : \xi(x) = 0, \xi_1(x) > 0, \ldots, \xi_m(x) > 0 \}, \]

where \( \xi, \xi_1, \ldots, \xi_m \) are real analytic functions in \( W \).

One of the long-standing open problems concerning the HCP property is the following.

**Problem 1.5** (Pleśniak, 1988) Let \( h : U \to \mathbb{C}^{N'} \), where \( U \subset \mathbb{C}^N \) is an open set, be a holomorphic map \((N, N' \in \mathbb{N} := \{1, 2, 3, \ldots\})\). Assume that a compact set
\[ \emptyset \neq K \subset C^N \] has the HCP property and \( \hat{K} \subset U \). Under what conditions does it happen that \( h(K) \) has the HCP property?

Recall that \( \hat{K} \) denotes the polynomially convex hull of \( K \):

\[
\hat{K} := \left\{ z \in C^N : |Q(z)| \leq \|Q\|_K \text{ for each } Q \in \mathbb{C}[z_1, \ldots, z_N] \right\}.
\]

(We set \( \hat{\emptyset} := \emptyset \).) If \( \hat{K} = K \), then we say that \( K \) is polynomially convex. Occasionally, we will write \( K^\wedge \) instead of \( \hat{K} \). It is well known that:

- A compact set \( K \subset C \) is polynomially convex if and only if \( C \setminus K \) is connected; see [22, Corollary 1.3.2].
- Each compact subset of \( \mathbb{R}^N \) is polynomially convex in \( C^N \); see [23, Lemma 5.4.1].

**Remark 1.6** Note that, in Problem 1.5, the assumption that \( \hat{K} \subset U \) is quite natural. Indeed, consider the simplest example: take \( a \in C \) with \( |a| > 1 \), and put

\[
U := C \setminus \{0\}, \quad h : U \ni z \mapsto \frac{1}{z} \in C, \quad K := \{|z| = 1\} \cup \left\{ \frac{1}{a} \right\} \subset C.
\]

Moreover, for each \( n \in \mathbb{N} \), set

\[
Q_n(z) := z^n(z - a), \quad a_n := a + \frac{1}{n}.
\]

Since \( \hat{K} = \{|z| \leq 1\} \), it follows that

\[
\Phi_K(z) = \Phi_{\hat{K}}(z) = \max\{1, |z|\}
\]

for all \( z \in C \); see Example 1.3. In particular, the set \( K \) has the HCP property. On the other hand,

\[
\liminf_{n \to +\infty} \Phi_{h(K)}(a_n) \geq \lim_{n \to +\infty} \frac{|Q_n(a_n)|}{|a| + 1} = |a| > 1 = \Phi_{h(K)}(a),
\]

and hence \( \Phi_{h(K)} \) (and \( V_{h(K)} \)) is not even continuous.

Problem 1.5 is well known to specialists in the field and, at least since the 1980s, a number of attempts have been made to give a solution. We should mention here a result due to Pleśniak [37], which reads as follows. Let \( h : U \to C^N \), where \( U \subset C^N \) is an open set, be a holomorphic map \((N \in \mathbb{N})\). Assume that a compact, polynomially convex set \( \emptyset \neq K \subset U \) has the HCP property and \( h \) is nonsingular (see Definition 1.7) on \( K \). Then \( h(K) \) has the HCP property as well. To my knowledge, except for this result of Pleśniak, which goes back to 1988, there has been no satisfactory progress on Problem 1.5. In this paper, we prove Theorem 1.8, which gives a complete solution of this problem. Before we state it, however, we set up terminology.
Definition 1.7 Let \( h : U \to \mathbb{C}^{N'} \), where \( U \subset \mathbb{C}^N \) is an open set, be a holomorphic map \((N, N' \in \mathbb{N})\).

- We say that \( h \) is nondegenerate if, for each connected component \( U_i \) of \( U \), there exists \( \xi_i \in U_i \) such that \( \text{rank } d_{\xi_i} h = N' \).
- Let \( K \subset U \). We say that \( h \) is nonsingular on \( K \) if \( N = N' \) and, for each \( \xi \in K \), we have \( \text{rank } d_{\xi} h = N \).

Theorem 1.8 Let \( h : U \to \mathbb{C}^{N'} \), where \( U \subset \mathbb{C}^N \) is an open set, be a holomorphic map \((N, N' \in \mathbb{N})\). Set

\[
I_* := \{ i \in I : h|_{U_i} \text{ is nondegenerate} \}, \quad U_* := \bigcup_{i \in I_*} U_i,
\]

where \( \{U_i\}_{i \in I} \) is the family of all connected components of \( U \). Assume that a compact set \( \emptyset \neq K \subset \mathbb{C}^N \) has the HCP property and \( \hat{K} \subset U \). Then the following three statements are equivalent:

(i) \( h(K) \) has the HCP property;
(ii) \( h(K) \) is L-regular (that is, \( V_{h(K)} \) is continuous);
(iii) \( h(K) \subset h(K \cap U_*) \cap \hat{K} \).

In particular, condition (iii) is the answer to Problem 1.5. Obviously, this condition is automatically satisfied if \( h \) nondegenerate. Hence, we get the following result.

Theorem 1.9 Let \( h : U \to \mathbb{C}^{N'} \), where \( U \subset \mathbb{C}^N \) is an open set, be a nondegenerate holomorphic map \((N, N' \in \mathbb{N})\). Assume that a compact set \( \emptyset \neq K \subset \mathbb{C}^N \) has the HCP property and \( \hat{K} \subset U \). Then \( h(K) \) has the HCP property as well.

One of the most important applications of the HCP property concerns multivariate polynomial inequalities. More precisely, the HCP property is a sufficient condition for Markov’s inequality.

Definition 1.10 We say that a compact set \( \emptyset \neq K \subset \mathbb{C}^N \) satisfies Markov’s inequality (or: is a Markov set) if there exist \( \varepsilon, C > 0 \) such that, for each polynomial \( Q \in \mathbb{C}[z_1, \ldots, z_N] \) and each \( \alpha = (\alpha_1, \ldots, \alpha_N) \in \mathbb{N}_0^N \),

\[
\| D^\alpha Q \|_K \leq (C(\deg Q)^\varepsilon)^{|\alpha|} \| Q \|_K,
\]

where \( \mathbb{N}_0 := \mathbb{N} \cup \{0\} \), \( D^\alpha Q := \frac{\partial^{|\alpha|} Q}{\partial z_1^{\alpha_1} \cdots \partial z_N^{\alpha_N}} \) and \( |\alpha| := \alpha_1 + \cdots + \alpha_N \).

This is a generalization of the classical inequality due to Markov: If \( Q \) is a polynomial of one variable, then

\[
\| Q' \|_{[-1,1]} \leq (\deg Q)^2 \| Q \|_{[-1,1]}.
\]

It is perhaps worth remarking that, for a compact set \( \emptyset \neq K \subset \mathbb{C}^N \), Markov’s inequality (Definition 1.10) is equivalent to the following condition: there exist
\( \varepsilon, D, M > 0 \) such that, for each polynomial \( Q \in \mathbb{C}[z_1, \ldots, z_N] \) with \( \deg Q \leq n \) \((n \in \mathbb{N})\),

\[
\|Q\|_{K(Dn^{-\varepsilon})} \leq M \|Q\|_K.
\]

This follows easily from Cauchy’s inequalities and Taylor’s formula.

Markov type inequalities and related topics have been studied by many authors; see for instance [1–3,6–15,19–21,24,29,30,32,34,35,38,40,47]. In this paper, we are interested in the following problem.

**Problem 1.11** Let \( h : U \to \mathbb{C}^{N'} \), where \( U \subset \mathbb{C}^N \) is an open set, be a nondegenerate holomorphic map \((N, N' \in \mathbb{N})\). Assume that a compact set \( \emptyset \neq K \subset \mathbb{C}^N \) satisfies Markov’s inequality and \( \hat{K} \subset U \). Under what conditions does it happen that \( h(K) \) satisfies Markov’s inequality?

This problem has attracted considerable interest over the past decades, and certain partial results have been produced:

- Baran and Pleśniak [3, Theorem 2.5]. If additionally \( N = N' \), \( K \) is polynomially convex, \( h : U \to \mathbb{C}^N \) is nonsingular on \( K \), and \( h(K) \) is nonpluripolar, then \( h(K) \) satisfies Markov’s inequality.
- Baran, Białas-Cież and Milówka [2, Theorem 4.2]. If additionally \( N = N' = 1 \) and \( K \) is polynomially convex, then \( h(K) \) satisfies Markov’s inequality. However, the proof of this result essentially relies on the assumption that \( h \) is a polynomial map and cannot be adapted to holomorphic maps.
- Pierzchała [35, Theorem 1.4]. If additionally \( U = \mathbb{C}^N \) and \( h \) is a polynomial map, then \( h(K) \) satisfies Markov’s inequality. However, the proof of this result essentially relies on the assumption that \( h \) is a polynomial map and cannot be adapted to holomorphic maps.

In the present article, we give the following answer to the question raised in Problem 1.11.

**Theorem 1.12** Let \( h : U \to \mathbb{C}^{N'} \), where \( U \subset \mathbb{C}^N \) is an open set, be a nondegenerate holomorphic map \((N, N' \in \mathbb{N})\). Assume that \( K \subset \mathbb{C}^N \) satisfies Markov’s inequality, \( \hat{K} \subset U \), and \( h(K) \) is a nonpluripolar subset of \( \mathbb{C}^{N'} \). Then \( h(K) \) satisfies Markov’s inequality as well.

Theorem 1.12 “almost” solves Problem 1.11. The only issue here is the non-pluripolarity assumption on the set \( h(K) \). However, this assumption is really weak (in particular, pluripolar sets have Lebesgue measure zero; see [23, Corollary 2.9.10]). Furthermore, it is conjectured that all (nonempty) Markov sets are nonpluripolar. If this conjecture is true, then the set \( K \) of Theorem 1.12 is nonpluripolar and an elementary argument shows (cf. the proof of [36, Lemma 2.5]) that \( h(K) \) is nonpluripolar as well.

The proofs of Theorems 1.8 and 1.12 involve several ingredients. One of them is common to both proofs. It is the following result describing the geometry of nondegenerate holomorphic mappings.

**Theorem 1.13** Let \( h : U \to \mathbb{C}^{N'} \), where \( U \subset \mathbb{C}^N \) is an open set, be a nondegenerate holomorphic map \((N, N' \in \mathbb{N})\). Assume that \( K \subset U \) is a compact set. Then there
exist \( \varkappa, \theta, t_\ast > 0 \) and \( q \in \mathbb{N} \) such that, for each \( a \in K, \mathbb{D}(a, t_\ast) \subset U \) and we can choose a polynomial map \( Q_a : \mathbb{C} \to \mathbb{C}^{N'} \) with \( \deg Q_a \leq q \) such that

- \( Q_a(0) = h(a) \),
- \( \text{dist}\left(Q_a(t), \mathbb{C}^{N'} \setminus h(\mathbb{D}(a, t))\right) \geq \theta t^{\varkappa} \) for all \( t \in (0, t_\ast] \).

Recall that in our notation \( \mathbb{D}(a, t_\ast) := \{ z \in \mathbb{C}^N : |z - a| \leq t_\ast \} \).

### 2 Proof of Theorem 1.13

#### 2.1 Notation

For any \( N, N' \in \mathbb{N} \), put

\[
A(N, N') := \{ \sigma : \{1, \ldots, N'\} \to \{1, \ldots, N\} : 1 \leq \sigma(1) < \cdots < \sigma(N') \leq N \}.
\]

If \( N' < N \) and \( \sigma \in A(N, N') \), then \( \bar{\sigma} \) denotes the unique element of \( A(N, N - N') \) such that

\[
\{\sigma(1), \ldots, \sigma(N')\} \cup \{\bar{\sigma}(1), \ldots, \bar{\sigma}(N - N')\} = \{1, \ldots, N\}.
\]

#### 2.2 Key lemmas

We have divided the proof into a sequence of lemmas. The last lemma is the desired conclusion.

Take an open and bounded set \( \Omega \subset \mathbb{C}^N \) such that \( K \subset \Omega \), \( \overline{\Omega} \subset U \) and \( \Omega \) is a semianalytic subset of \( \mathbb{R}^{2N} \). Moreover, set

\[
E := \{ \xi \in \Omega : \text{rank} \, d\xi h = N' \}.
\]

**Lemma 2.1** There exist \( \theta_1, \theta_2, \upsilon > 0 \) and \( d \in \mathbb{N} \) such that, for each \( a \in \overline{E} \), we can choose a polynomial map \( R_a : \mathbb{C} \to \mathbb{C}^N \) with \( \deg R_a \leq d \), satisfying the following conditions:

(S1) \( \text{dist}(R_a(t), \mathbb{C}^N \setminus E) \geq \theta_1 t^{\upsilon} \) for all \( t \in [0, 1] \),

(S2) \( |R_a(t) - a| \leq \theta_2 t \) for all \( t \in [0, 1] \). In particular, \( R_a(0) = a \).

**Lemma 2.2** There exist \( \theta_3, \theta_4, \omega > 0 \) such that, for each \( a \in \overline{E} \) and each \( t \in [0, 1] \),

\[
\theta_3 \geq \sum_{\sigma \in A(N, N')} \left| \frac{\partial(h_1, \ldots, h_{N'})}{\partial(z_{\sigma(1)}, \ldots, z_{\sigma(N')})}(R_a(t)) \right| \geq \theta_4 t^{\omega}.
\]

**Lemma 2.3** There exist \( \theta_5, \theta_6, \varkappa > 0 \) such that, for each \( a \in \overline{E} \) and each \( t \in (0, 1] \),

\[
\mathbb{D}(R_a(t), \theta_5) \subset U \quad \text{and} \quad \mathbb{D}(h(R_a(t)), \theta_6 t^{\varkappa}) \subset h(\mathbb{D}(R_a(t), \theta_5 t))
\].
Lemma 2.4 There exist $\theta, t_\ast > 0$ and $q \in \mathbb{N}$ such that, for each $a \in K$, $D(a, t_\ast) \subset U$ and we can choose a polynomial map $Q_a : \mathbb{C} \to \mathbb{C}^{N'}$ with $\deg Q_a \leq q$ such that

- $Q_a(0) = h(a)$,
- $\text{dist}\left(Q_a(t), \mathbb{C}^{N'} \setminus h(D(a, t))\right) \geq \theta t^\kappa$ for all $t \in (0, t_\ast]$.

2.3 Proofs of key lemmas

Proof of Lemma 2.1

Set

$$Y := \{ \zeta \in U : \text{rank } d\zeta h < N' \}. $$

Note that

$$Y = \bigcap_{\sigma \in A(N, N')} \left\{ \zeta \in U : \frac{\partial (h_1, \ldots, h_{N'})}{\partial (z_{\sigma(1)}, \ldots, z_{\sigma(N')})} (\zeta) = 0 \right\}. $$

It follows that $Y$ is a closed and semianalytic subset of $U \subset \mathbb{R}^{2N}$, which implies that $E = \Omega \setminus Y$ is an open, bounded and semianalytic subset of $\mathbb{R}^{2N}$. By [29, Theorem 6.4], there exist $\theta_1, \upsilon > 0$ and $d \in \mathbb{N}$ such that, for each $x \in E$, we can choose a polynomial map $P_x : \mathbb{R} \to \mathbb{R}^{2N}$ with $\deg P_x \leq d$, satisfying the following conditions:

- $P_x(0) = x$,
- $\text{dist}(P_x(t), \mathbb{R}^{2N} \setminus E) \geq \theta_1 t^\upsilon$ for all $t \in [0, 1]$.

Take $\varphi_1, \ldots, \varphi_d : E \to \mathbb{R}^{2N}$ such that, for each $x \in E$ and each $t \in \mathbb{R}$,

$$P_x(t) = x + \varphi_1(x)t + \cdots + \varphi_d(x)t^d.$$ 

By [30, Lemma 3.1], the maps $\varphi_1, \ldots, \varphi_d$ are bounded, and hence

$$C := \|\varphi_1\|_E + \cdots + \|\varphi_d\|_E < +\infty.$$ 

For each $a \in E$ and $t \in \mathbb{R}$, set $R_a(t) := \chi_N(P_a(t))$, where

$$\chi_N : \mathbb{R}^{2N} \ni (u_1, v_1, \ldots, u_N, v_N) \mapsto (u_1 + iv_1, \ldots, u_N + iv_N) \in \mathbb{C}^N.$$ 

It is straightforward to see that conditions (S1) and (S2) hold with $\theta_2 := \sqrt{2C}$. \qed

Proof of Lemma 2.2

Note that, for each $a \in E$ and each $t \in [0, 1]$, $R_a(t) \in E$, and hence the first required estimate holds with the constant

$$\theta_3 := \max_{\zeta \in E} \left( \sum_{\sigma \in A(N, N')} \left| \frac{\partial (h_1, \ldots, h_{N'})}{\partial (z_{\sigma(1)}, \ldots, z_{\sigma(N')})} (\zeta) \right| \right).$$ 

Let $Y$ be as in the proof of Lemma 2.1. There are two cases to consider.
CASE 1: \( Y = \emptyset \). Then the second required estimate holds with \( \omega := 1 \) and
\[
\theta_4 := \min_{\zeta \in E}\left( \sum_{\sigma \in \mathcal{A}(N, N')} \left| \frac{\partial (h_1, \ldots, h_{N'})}{\partial (z_{\sigma(1)}, \ldots, z_{\sigma(N')})}(\zeta) \right| \right).
\]

CASE 2: \( Y \neq \emptyset \). By [28, p. 243], there exist \( C_1, \omega_1 > 0 \) such that, for each \( \zeta \in E \),
\[
\sum_{\sigma \in \mathcal{A}(N, N')} \left| \frac{\partial (h_1, \ldots, h_{N'})}{\partial (z_{\sigma(1)}, \ldots, z_{\sigma(N')})}(\zeta) \right| \geq C_1 \text{dist}(\zeta, Y)^{\omega_1}.
\]
(2.1)

Set \( \theta_4 := C_1 \theta_1^{\omega_1} \) and \( \omega := \nu \omega_1 \), where \( \theta_1, \nu > 0 \) are of Lemma 2.1. Fix \( a \in E \) and \( t \in [0, 1] \). By (2.1) and Lemma 2.1 (condition (S1)), we get
\[
\sum_{\sigma \in \mathcal{A}(N, N')} \left| \frac{\partial (h_1, \ldots, h_{N'})}{\partial (z_{\sigma(1)}, \ldots, z_{\sigma(N')})}(R_a(t)) \right| \geq C_1 \left( \text{dist}(R_a(t), Y) \right)^{\omega_1} 
\]
\[
\geq C_1 \left( \text{dist}(R_a(t), C_N \backslash E) \right)^{\omega_1} \geq \theta_4 t^{\omega},
\]
which yields the second required estimate. \( \square \)

Proof of Lemma 2.3 Let \( \theta_3, \theta_4, \omega > 0 \) be of Lemma 2.2. Take \( \epsilon \in (0, 1) \), and also take \( r_0 > 0 \) such that \( E(r_0) \subset U \). Set
\[
\eta_1 := \max_{1 \leq j \leq N'} \left( \sum_{1 \leq k \leq N} \left\| \frac{\partial h_j}{\partial z_k} \right\|_E \right),
\]
\[
\eta_2 := \max_{1 \leq j \leq N'} \left( \sum_{1 \leq k \leq N, 1 \leq \nu \leq N} \left\| \frac{\partial^2 h_j}{\partial z_k \partial z_\nu} \right\|_E \right).
\]
Furthermore, fix \( a \in E, t \in (0, 1) \), and put \( b = b(a, t) := R_a(t) \). Note that \( b \in E \). By Lemma 2.2, there exists \( \sigma \in \mathcal{A}(N, N') \) such that
\[
\theta_3 \geq \left| \frac{\partial (h_1, \ldots, h_{N'})}{\partial (z_{\sigma(1)}, \ldots, z_{\sigma(N')})}(b) \right| \geq \frac{\theta_4 t^{\omega}}{N^{N'}},
\]
(2.2)

Define \( H_{\sigma} : U \rightarrow \mathbb{C}^N \) by the formula
\[
H_{\sigma}(z) := \begin{cases} (h(z), z_{\sigma(1)}, \ldots, z_{\sigma(N-N')}) & \text{if } N' < N \\ h(z) & \text{if } N' = N. \end{cases}
\]
Note that $d_b H_\sigma : \mathbb{C}^N \to \mathbb{C}^N$ is an isomorphism, because
\[ |\text{Jac } H_\sigma (b)| = \left| \frac{\partial (h_1, \ldots , h_{N'})}{\partial (z_{\sigma (1)}, \ldots , z_{\sigma (N')})} (b) \right| \neq 0. \]

Set $\varrho_b := 1 / \| (d_b H_\sigma)^{-1} \|$. Here, and throughout this proof, $\| \|$ denotes the operator norm.

Note that, for each $\zeta \in E$,
\[ \max_{1 \leq j \leq N'} \max_{1 \leq k \leq N} \left| \frac{\partial H_{\sigma, j}}{\partial z_k} (\zeta) \right| \leq \max \{ \eta_1, 1 \}, \quad (2.3) \]
where
\[ H_{\sigma, j} := \begin{cases} h_j & \text{if } 1 \leq j \leq N' \\ z_{\sigma(j-N')} & \text{if } N' + 1 \leq j \leq N. \end{cases} \]

For $1 \leq j \leq N$, $1 \leq k \leq N$, let $\Delta_{jk}(\zeta) \in \mathbb{C}$ denote the entries of the classical adjoint of the jacobian matrix of the map $H_\sigma$ at the point $\zeta$. It follows from (2.3) that, for each $\zeta \in E$, $|\Delta_{jk}(\zeta)| \leq M$, where $M = M(\eta_1, N)$ is a positive constant depending only on $\eta_1$ and $N$. For example, we can take
\[ M := \left( \max \{ \eta_1, 1 \} \right)^{N-1} (N - 1)^{(N-1)/2}. \]

Thus, we have in particular the following estimate:
\[ \left\| (d_b H_\sigma)^{-1} \right\| \leq \frac{MN}{|\text{Jac } H_\sigma (b)|} = \frac{MN}{\left| \frac{\partial (h_1, \ldots , h_{N'})}{\partial (z_{\sigma (1)}, \ldots , z_{\sigma (N')})} (b) \right|}, \]
and hence
\[ \varrho_b \geq \frac{\left| \frac{\partial (h_1, \ldots , h_{N'})}{\partial (z_{\sigma (1)}, \ldots , z_{\sigma (N')})} (b) \right|}{MN}, \quad (2.4) \]

Set
\[ \eta := \max \left\{ \frac{\epsilon \eta_1}{r_0}, \frac{\epsilon}{r_0}, \eta_2, \frac{\epsilon \theta_3}{r_0 MN} \right\}, \]
\[ \theta_5 := \frac{\epsilon \theta_3}{MN \eta}, \]
\[ \theta_6 := \frac{\epsilon (1 - \epsilon)}{\eta} \left( \frac{\theta_4}{\left( \frac{N}{N'} \right)^{2}} MN \right)^2, \]
\[ \kappa := 2\omega + 1, \]
\[ r = r(a, t) := \frac{\epsilon t}{MN\eta} \left| \frac{\partial(h_1, \ldots, h_N)}{\partial(z_{\sigma(1)}, \ldots, z_{\sigma(N)})}(b) \right|. \]

Note that \( \theta_5 \) and \( \theta_6 \) depend neither on \( a \) nor \( t \). Moreover, (2.4) gives
\[ r \leq \frac{\epsilon \rho_b}{\eta}. \] (2.5)

Clearly, \( \|d_b H_{\sigma}\| \leq \max\{\eta_1, 1\} \), and hence, by (2.5),
\[ r \leq \frac{\epsilon \rho_b}{\eta} \leq \frac{r_0 \rho_b}{\max\{\eta_1, 1\}} \leq \frac{r_0 \|d_b H_{\sigma}\|}{\max\{\eta_1, 1\}} \leq r_0. \]

Consequently, \( r \leq r_0 \) and \( \mathbb{D}(b, r) \subset E_{(r_0)} \subset U \).

Put \( g_b := d_b H_{\sigma} - H_{\sigma} : U \rightarrow \mathbb{C}^N \). Observe that, for each \( \zeta \in \mathbb{D}(b, r) \),
\[ \|d_\zeta g_b\| \leq \eta_2 r. \] (2.6)

Indeed, \( d_\zeta g_b = d_b H_{\sigma} - d_\zeta H_{\sigma} \) and therefore
\[ \|d_\zeta g_b\| = \|d_b H_{\sigma} - d_\zeta H_{\sigma}\| \leq \eta_2 |\zeta - b| \leq \eta_2 r, \]
which gives (2.6).

Consider the map \( \psi_b := (d_b H_{\sigma})^{-1} \circ g_b \). For \( z, z' \in \mathbb{D}(b, r) \), we have
\[ |\psi_b(z) - \psi_b(z')| \leq \| (d_b H_{\sigma})^{-1} \| \cdot |g_b(z) - g_b(z')| \]
\[ \leq \eta_2 r \| (d_b H_{\sigma})^{-1} \| \cdot |z - z'| \quad \text{(by (2.6))} \]
\[ \leq \frac{\eta r}{\rho_b} |z - z'| \leq \epsilon |z - z'| \quad \text{(by (2.5))}, \]
and hence
\[ |\psi_b(z) - \psi_b(z')| \leq \epsilon |z - z'|. \] (2.7)

[17, Theorem 4.4.1], together with (2.7), yields
\[ \mathbb{D}\left( (d_b H_{\sigma})^{-1}(H_{\sigma}(b)), (1 - \epsilon)r \right) \subset (d_b H_{\sigma})^{-1}\left( H_{\sigma}(\mathbb{D}(b, r)) \right). \] (2.8)

But, for each \( z \in \mathbb{C}^N \) and \( \tau > 0 \),
\[ \mathbb{D}(d_b H_{\sigma}(z), \rho_b \tau) \subset d_b H_{\sigma}(\mathbb{D}(z, \tau)). \]
Combining this with (2.8), we get
\[ \mathbb{D}(H_\sigma(b), \varrho_b(1 - \epsilon)r) \subset H_\sigma(\mathbb{D}(b, r)). \]
Let
\[ \pi : \mathbb{C}^N \ni (u_1, \ldots, u_N) \mapsto (u_1, \ldots, u_{N'}) \in \mathbb{C}^{N'}. \]
The above inclusion implies that
\[ \pi \left( \mathbb{D}(H_\sigma(b), \varrho_b(1 - \epsilon)r) \right) \subset (\pi \circ H_\sigma)(\mathbb{D}(b, r)), \]
and hence
\[ \mathbb{D}(h(b), \varrho_b(1 - \epsilon)r) \subset h(\mathbb{D}(b, r)). \]
Since \( \varrho_b(1 - \epsilon)r \geq \theta_6 t^{\kappa_6} \) (see (2.2) and (2.4)) and \( r \leq \theta_5 t \) (see (2.2)), we get
\[ \mathbb{D}(h(b), \theta_6 t^{\kappa_6}) \subset h(\mathbb{D}(b, \theta_5 t)), \]
which is the desired conclusion. \( \square \)

**Proof of Lemma 2.4** Let \( \theta_2 > 0, d \in \mathbb{N} \) be of Lemma 2.1 and let \( \theta_5, \theta_6, \kappa > 0 \) be of Lemma 2.3. Take \( q_0 \in \mathbb{N} \) such that \( q_0 > \kappa - 1 \) and put
\[ \theta_7 := \frac{1}{\theta_2 + \theta_5}, \quad \theta := \frac{\theta_6 \theta_7^{\kappa}}{2}, \quad q := dq_0. \]
For each \( u \in (-1, 1) \), set
\[ \varphi(u) := \sum_{v=q_0+1}^{+\infty} \binom{v + N - 1}{v} u^{v-q_0-1}. \]
Furthermore, take \( r_0 > 0 \) such that \( E(r_0) \subset U. \)
Clearly, there exists \( t_* > 0 \) such that \( t_* \leq \min \left\{ r_0, 1/\theta_7 \right\} \) and
\[ t_*^{q_0+1-\kappa} \varphi \left( \frac{\theta_2 \theta_7 t_*}{r_0} \right) \leq \frac{\theta}{\|h\|_{E(r_0)}} \left( \frac{r_0}{\theta_2 \theta_7} \right)^{q_0+1}. \] (2.9)
Note that \( t_* \leq r_0 < r_0/(\theta_2 \theta_7). \)
Fix \( a \in \overline{E} \) (observe that \( K \subset \Omega \subset \overline{E} \)). Define \( Q_a = (Q_{a,1}, \ldots, Q_{a,N'}) : \mathbb{C} \to \mathbb{C}^{N'} \) by the formula
\[ Q_{a,j}(t) := \sum_{\alpha \in \mathbb{N}^N_0, |\alpha| \leq q_0} \frac{D^\alpha h_j(a)}{\alpha!} (R_a (\theta_7 t) - a)^\alpha, \]
where $R_a : \mathbb{C} \to \mathbb{C}^N$ is the polynomial map of Lemma 2.1. Clearly, $\deg Q_a \leq q$ and $Q_a(0) = h(a)$; see Lemma 2.1. Note also that, for each $t \in [0, t_\ast]$,

$$|h(R_a(\theta t)) - Q_a(t)| \leq \theta t^{\kappa}.$$  \hfill (2.10)

Indeed, the estimate (S2) of Lemma 2.1 gives

$$|R_a(\theta t) - a| \leq \theta_2 \theta t < r_0.$$  \hfill (2.11)

In particular,

$$R_a(\theta t) \in D(a, r_0) \subset E(r_0) \subset U.$$  \hfill (2.12)

Hence, for each $j \leq N'$,

$$h_j(R_a(\theta t)) = \sum_{\alpha \in \mathbb{N}_0^N} \frac{D^\alpha h_j(a)}{\alpha!} (R_a(\theta t) - a)^\alpha.$$  \hfill (2.13)

Finally, for each $j \leq N'$,

$$|h_j(R_a(\theta t)) - Q_{a,j}(t)|$$

$$\leq \sum_{\alpha \in \mathbb{N}_0^N \atop |\alpha| \geq q_0 + 1} \frac{|D^\alpha h_j(a)|}{\alpha!} |R_a(\theta t) - a|^{\alpha} \leq \sum_{\alpha \in \mathbb{N}_0^N \atop |\alpha| \geq q_0 + 1} \frac{|D^\alpha h_j(a)|}{\alpha!} (\theta_2 \theta t)^{\alpha} \leq \sum_{\alpha \in \mathbb{N}_0^N \atop |\alpha| \geq q_0 + 1} \|h_j\|_{E(r_0)} (\frac{\theta_2 \theta t}{r_0})^{\alpha} \leq \sum_{v = q_0 + 1}^{+\infty} \|h_j\|_{E(r_0)} (v + N - 1)^v \frac{\theta_2 \theta t}{r_0}^v \leq \theta t^{\kappa}.$$  \hfill (2.10) and Cauchy’s inequalities

which yields (2.10).

It follows from (2.11) that, for each $t \in (0, t_\ast]$,

$$D(R_a(\theta t), \theta t_\ast) \subset D(a, t) \subset D(a, t_\ast) \subset U.$$  \hfill (2.14)
Therefore, for each $t \in (0, t^*_a]$, 
\[
\begin{align*}
\text{dist} \left( Q_a(t), C^N \setminus h(D(a, t)) \right) \\
&\geq \text{dist} \left( h(R_a(\theta_7 t)), C^N \setminus h(D(a, t)) \right) - \theta t^{2\kappa} \quad \text{(by (2.10))} \\
&\geq \text{dist} \left( h(R_a(\theta_7 t)), C^N \setminus h(D(a, t), \theta_5 \theta_7 t) \right) - \theta t^{2\kappa} \quad \text{(by (2.14))} \\
&\geq \theta(t \theta_7)^{2\kappa} - \theta t^{2\kappa} = \theta t^{2\kappa} \quad \text{(by Lemma 2.3)},
\end{align*}
\]
which completes the proof of the lemma (and hence proves Theorem 1.13). □

3 Proof of Theorem 1.9

**Proof of Theorem 1.9** Take an open, bounded set $\Omega \subset C^N$ such that $\hat{K} \subset \Omega$ and $\overline{\Omega} \subset U$. Furthermore, take a compact and polynomially convex set $E \subset C^N$ such that $K \subset \text{Int} E$ and $E \subset \Omega$; cf. [22, Proof of Lemma 2.7.4]. By the uniform version of the Bernstein-Walsh-Siciak theorem (see [36,41] and see also [33]), there exist $C_1 > 0$ and $\rho \in (0, 1)$ with the following property: for each holomorphic and bounded function $f : \Omega \to C$ and each $\nu \in N$, there exists a polynomial $W_\nu \in C[z_1, \ldots, z_N]$ with $\deg W_\nu \leq \nu$ and such that
\[
\| f - W_\nu \|_E \leq C_1 \| f \|_\Omega \rho^\nu. \quad (3.1)
\]

By Theorem 1.13, there exist $\varkappa, \theta, t^*_a > 0$ and $q \in N$ such that, for each $a \in K$, $D(a, t^*_a) \subset U$ and we can choose a polynomial map $Q_a : C \to C^N$ with $\deg Q_a \leq q$ such that
\[
\begin{align*}
(i) \quad &Q_a(0) = h(a), \\
(ii) \quad &\text{dist} \left( Q_a(t), C^N \setminus h(D(a, t)) \right) \geq \theta t^{2\kappa} \text{ for all } t \in (0, t^*_a].
\end{align*}
\]

We can clearly assume that $\nu \in N$ and $K(t_a) \subset E$.

Note that the set $h(K)$ is nonpluripolar; cf. [36, Proof of Lemma 2.5]. Therefore, by (1.1) and (1.2), $\Phi_{h(K)}$ is locally bounded in $C^N$. In particular, there exists $k \in N$ such that
\[
\rho^k \sup_{h(\Omega)} \Phi_{h(K)} \leq 1. \quad (3.2)
\]

Since the set $K$ has the HCP property, there exist $C_2, \mu > 0$ such that, for each $z \in K(t_a)$,
\[
\Phi_K(z) \leq 1 + C_2 (\text{dist}(z, K))^{\mu}. \quad (3.3)
\]

Set
\[
\gamma := \frac{\mu}{\nu(2\mu + 1)},
\]

\[\text{Geometry of holomorphic mappings...} \quad 1377\]
\[ \tau_* := \tau_n^{2\mu+1}, \]
\[ C_3 := 2\sqrt{\frac{2N' - 1}{\theta^{1/\varkappa}}} \left( \sqrt{\frac{2\gamma}{\tau_*^{2\gamma}}} \frac{2N' - 1}{\theta^{1/\varkappa}} + \sqrt{\frac{2\gamma}{\tau_*^{2\gamma}}} \frac{2N' - 1}{\theta^{1/\varkappa}} + 1 \right), \]
\[ C_4 := \sup_{\tau \in (0, \tau_*]} \left( 1 + \max \{ C_2, C_3 \} \tau^{\gamma} \right)^{\max \{ q, \varkappa \} + k} - 1 \]
\[ = \left( 1 + \max \{ C_2, C_3 \} \tau_*^{\gamma} \right)^{\max \{ q, \varkappa \} + k} - 1. \]

We claim that, for each \( y \in h(K)(\tau_*), \)
\[ \Phi_{h(K)}(y) \leq 1 + C_4 \left( \text{dist} \left( y, h(K) \right) \right)^\gamma, \tag{3.4} \]
which then proves the theorem.

To see the claim, fix a polynomial \( P \in \mathbb{C}[y_1, \ldots, y_{N'}] \) with \( \deg P \leq n \) \((n \in \mathbb{N})\), and also fix \( y \in h(K)(\tau_*). \) Take \( a \in K \) such that \( \text{dist}(y, h(K)) = \| y - h(a) \| \) and set \( \tau := |y - h(a)|. \) Note that \( \tau \leq \tau_* \). It suffices to show that
\[ |P(y)| \leq (1 + C_4 \tau^\gamma)^n \| P \|_{h(K)}. \tag{3.5} \]

We may assume that \( \tau > 0, \) because otherwise (3.5) is trivial. Put \( r := \tau^{\gamma/\mu} \) and let \( H_r : \mathbb{C}^{N'+1} \rightarrow \mathbb{C}^{N'} \) be the map
\[ H_r(s, \chi_1, \ldots, \chi_{N'}) = Q_a \left( \frac{r}{N' + 1} \left( s + \chi_1 + \cdots + \chi_{N'} \right) \right) \]
\[ + \theta \left( \frac{r}{N' + 1} \right)^{\varkappa} \left( (s - \chi_1)^{\varkappa}, \ldots, (s - \chi_{N'})^{\varkappa} \right). \]

Clearly, \( H_r \) is a polynomial map with \( \deg H_r \leq \max \{ q, \varkappa \}. \) Using (i) and (ii) we easily verify that
\[ H_r([0, 1]^{N'+1}) \subset h(\mathbb{D}(a, r)). \tag{3.6} \]

Let \( \zeta(y) = (\zeta_1(y), \ldots, \zeta_{N'}(y)) \in \mathbb{C}^{N'} \) be such that
\[ \theta \left( \frac{r}{N' + 1} \right)^{\varkappa} \left( \zeta_1^{\varkappa}(y), \ldots, \zeta_{N'}^{\varkappa}(y) \right) = y - h(a). \tag{3.7} \]

Note that
\[ |\zeta(y)| \leq \left( \frac{\tau}{\theta} \right)^{1/\varkappa} \frac{N' + 1}{r}. \tag{3.8} \]
Set
\[ s(y) := \frac{\zeta_1(y) + \cdots + \zeta_{N'}(y)}{N' + 1}, \]
\[ \chi_1(y) := \frac{\zeta_1(y) + \cdots + \zeta_{N'}(y)}{N' + 1} - \zeta_1(y), \]
\[ \vdots \]
\[ \chi_{N'}(y) := \frac{\zeta_1(y) + \cdots + \zeta_{N'}(y)}{N' + 1} - \zeta_{N'}(y). \]

By (i) and (3.7),
\[ H_r\left(s(y), \chi_1(y), \ldots, \chi_{N'}(y)\right) = y. \] (3.9)

On account of (3.8), we have moreover
\[ \begin{cases} 
|s(y)| \leq \left(\frac{\tau}{\theta}\right)^{1/N'} \frac{N'}{r}, \\
|\chi_1(y)| \leq \left(\frac{\tau}{\theta}\right)^{1/N'} \frac{2N' - 1}{r}, \\
\vdots \\
|\chi_{N'}(y)| \leq \left(\frac{\tau}{\theta}\right)^{1/N'} \frac{2N' - 1}{r}.
\end{cases} \] (3.10)

Recall that, for each \( w \in \mathbb{C} \),
\[ \Phi_{[-1, 1]}(w) = |w + \sqrt{w^2 - 1}|, \]
where the square root is so chosen that \( |w + \sqrt{w^2 - 1}| \geq 1 \); see the last formula in Example 1.3. Consequently,
\[ \Phi_{[0, 1]}(w) = |2w - 1 + 2\sqrt{w^2 - w}|, \]
and hence
\[ \Phi_{[0, 1]}(w) \leq 1 + 2\sqrt{|w| (\sqrt{|w|} + \sqrt{|w| + 1})} \] (3.11)
for all \( w \in \mathbb{C} \).

By [44, Proposition 5.9],
\[ \Phi_{[0, 1]N'+1}\left(s(y), \chi_1(y), \ldots, \chi_{N'}(y)\right) \]
\[ = \max \left\{ \Phi_{[0, 1]}(s(y)), \Phi_{[0, 1]}(\chi_1(y)), \ldots, \Phi_{[0, 1]}(\chi_{N'}(y)) \right\} \]
\[
\begin{align*}
&\leq 1 + 2\sqrt{\frac{\tau}{\theta}} - \frac{1}{\kappa^2} \left( \frac{\tau}{\theta} - \frac{1}{\kappa^2} \right) + 1
\end{align*}
\]

by (3.10) and (3.11)

\[
\leq 1 + C_3 \tau^\gamma.
\]

Hence

\[
\Phi_{[0, 1]^{N'+1}}(s(y), \chi_1(y), \ldots, \chi_{N'}(y)) \leq 1 + C_3 \tau^\gamma. \tag{3.12}
\]

Note that

\[
|P(y)| \leq \left(1 + C_3 \tau^\gamma\right)^{n_{\text{max}(q, \kappa)}} \|P\|_{\Omega} \|h(D(a, r))\|. \tag{3.13}
\]

Indeed,

\[
|P(y)| = \left|(P \circ H_r)(s(y), \chi_1(y), \ldots, \chi_{N'}(y))\right|
\leq \left(\Phi_{[0, 1]^{N'+1}}(s(y), \chi_1(y), \ldots, \chi_{N'}(y))\right)^{n_{\text{max}(q, \kappa)}} \|P \circ H_r\|_{[0, 1]^{N'+1}} \tag{by (3.9)}
\leq \left(1 + C_3 \tau^\gamma\right)^{n_{\text{max}(q, \kappa)}} \|P\| \|h(D(a, r))\| \tag{by (3.12)}
\leq \left(1 + C_3 \tau^\gamma\right)^{n_{\text{max}(q, \kappa)}} \|P\|_{\Omega} \|h(D(a, r))\| \tag{by (3.6)},
\]

which yields (3.13).

By (3.1), for each \(j \in \mathbb{N}\), there exists a polynomial \(R_j \in \mathbb{C}[z_1, \ldots, z_N]\) with \(\deg R_j \leq jkn\) such that

\[
\|P_j \circ h - R_j\|_{\Omega} \leq C_1 \|P_j \circ h\|_{\Omega} \rho^{jkn}.
\]

Then

\[
\|P_j \circ h - R_j\|_{\Omega} \leq C_1 \|P_j \circ h\|_{\Omega} \rho^{jkn}
\leq C_1 \left(\sup_{h(\Omega)} \Phi_{h(K)}\right)^{jN} \|P\|_{h(K)} \rho^{jkn} \tag{by (1.3)}
\leq C_1 \|P\|_{h(K)} \tag{by (3.2)}.
\]

Consequently,

\[
\|P_j \circ h - R_j\|_{E} \leq C_1 \|P_j\|_{h(K)} \tag{3.14}
\]

Since \(r \leq t_\ast\), it follows that \(D(a, r) \subset K_{(t_\ast)} \subset E\). Therefore,

\[
\|P\|_{h(D(a, r))} \leq \|P_j \circ h - R_j\|_{D(a, r)} + \|R_j\|_{D(a, r)}
\leq C_1 \|P\|_{h(K)} + \|R_j\|_{D(a, r)} \tag{by (3.14)}.
\]
\begin{align*}
\leq C_1 \| P \|_{h(K)}^j + \left( \sup_{D(a,r)} \Phi_K \right)^{jkn} \| R_j \|_K & \quad \text{(by (1.3))} \\
\leq C_1 \| P \|_{h(K)}^j + (1 + C_2 r^\mu)^{jkn} \| R_j \|_K & \quad \text{(by (3.3)).}
\end{align*}

But
\begin{align*}
\| R_j \|_K & \leq \| P^j \circ h - R_j \|_K + \| P^j \circ h \|_K \\
& \leq (C_1 + 1) \| P \|_{h(K)}^j & \quad \text{(by (3.14)).}
\end{align*}

Therefore,
\begin{align*}
\| P \|_{h(D(a,r))}^j & \leq (2C_1 + 1)(1 + C_2 r^\mu)^{jkn} \| P \|_{h(K)}^j.
\end{align*}

Since \( j \in \mathbb{N} \) was arbitrary, we get
\begin{align*}
\| P \|_{h(D(a,r))} & \leq (1 + C_2 r^\mu)^{kn} \| P \|_{h(K)}.
\end{align*}

Together with (3.13), this implies that
\begin{align*}
| P(y) | & \leq \left( 1 + C_3 \tau^\gamma \right)^{n \max[q, \kappa]} \| P \|_{h(D(a,r))} \\
& \leq \left( 1 + C_2 r^\mu \right)^{kn} \left( 1 + C_3 \tau^\gamma \right)^{n \max[q, \kappa]} \| P \|_{h(K)} \\
& = (1 + C_2 r^\mu)^{kn} \left( 1 + C_3 \tau^\gamma \right)^{n \max[q, \kappa]} \| P \|_{h(K)} \\
& \leq (1 + \max \{ C_2, C_3 \} \tau^\gamma)^{n \max[q, \kappa] + k} \| P \|_{h(K)} \\
& \leq (1 + C_4 \tau^\gamma)^n \| P \|_{h(K)}.
\end{align*}

The above estimates yield (3.5) and hence (3.4). The proof of the theorem is complete, because (3.4) means that \( h(K) \) has the HCP property, which is our assertion. \( \square \)

### 4 Proof of Theorem 1.8

**Proof of Theorem 1.8** For each \( \zeta \in U \setminus U_\ast \) := \bigcup_{i \in I \setminus J_\ast} U_i \), we have rank \( d_\zeta h \leq N' - 1 \). It follows from [28, p. 254] that \( h(U \setminus U_\ast) \) is a countable union of submanifolds of dimension \( \leq N' - 1 \). In particular, the set \( h(U \setminus U_\ast) \) is pluripolar (recall that countable unions of pluripolar sets are pluripolar; see [23, Corollary 4.7.7]) and hence \( h(K \setminus U_\ast) \) is pluripolar as well.

- (i) \( \implies \) (ii). Trivial (see Introduction).
- (ii) \( \implies \) (iii). Assume that \( h(K) \) is \( L \)-regular. To obtain a contradiction, suppose \( h(K) \not\subset h(K \cap U_\ast) \), and take \( b \in h(K \setminus (K \cap U_\ast)) \). Note that \( h(K \cap U_\ast) \neq \emptyset \) (otherwise, \( h(K) \) would be pluripolar, in contradiction with \( Vh(K) \) being continuous; see (1.1)) and that \( Vh(K \cap U_\ast)(b) > 0 \) (see [44, Corollary 4.14]). Since \( h(K \setminus U_\ast) \) is
pluripolar, [23, Theorem 5.2.4 and Corollary 5.2.5] imply that

\[ V^*_h(K) = V^*_h(K\setminus U_*) \cup V^*_h(K \cap U_*) = V^*_h(K \cap U_*) \, , \]

and hence

\[ 0 = V_h(K)(b) = V^*_h(K)(b) = V^*_h(K \cap U_*)(b) \geq V_h(K \cap U_*)(b) > 0 \, , \]

a contradiction. Therefore, \( h(K) \subset h(K \cap U_*)^c \), which is our claim.

Suppose that (iii) holds, that is, \( h(K) \subset h(E)^c \), where \( E := K \cap U_* \). We can, clearly, assume that \( U_* \neq U \), because otherwise Theorem 1.9 immediately completes the proof. In brief outline, the idea of the proof is the following:

- we use the hypothesis that \( K \) has the HCP property (4.1) to show that \( E \) satisfies Markov’s inequality (4.8);
- then we show, with the aid of (4.1) and (4.8), that \( E \) has the HCP property (4.9);
- finally, we apply Theorem 1.9 to the set \( E \) and the map \( h|_{U_*} \) to deduce that \( h(E) \) has the HCP property (4.11);

The HCP property of \( K \) means that there exist \( \theta_1, \mu > 0 \) such that, for each \( z \in K_1 \),

\[ \Phi_K(z) \leq 1 + \theta_1 \text{dist}(z, K)^\mu \, . \quad (4.1) \]

By [46, Remark 3.7], \( \mu \leq 1 \).

Consider \( f : U \to \mathbb{C} \) given by

\[ f(z) := \begin{cases} 1 & \text{if } z \in U_* \\ 0 & \text{if } z \in U \setminus U_* \end{cases} \]

Also, take a compact and polynomially convex set \( \Delta \subset \mathbb{C}^N \) such that \( \hat{K} \subset \text{Int} \Delta \) and \( \Delta \subset U \); cf. [22, Proof of Lemma 2.7.4]. By [44, Theorem 8.5(1)], there exist \( \theta_2 > 0, \rho \in (0, 1) \), and a sequence of polynomials \( W_v \in \mathbb{C}[z_1, \ldots, z_N] \) (\( v \in \mathbb{N} \)) with \( \deg W_v \leq v \) such that, for each \( v \in \mathbb{N} \),

\[ \| f - W_v \|_{\Delta} \leq \theta_2 \rho^v \, . \quad (4.2) \]

We can, clearly, assume that \( \theta_2 \geq 1 \).

Take \( \nu_0 \in \mathbb{N} \) such that \( 2\theta_2 \rho^{\nu_0} < 1 \). We now show that

\[ \hat{E} \subset U_* \, . \quad (4.3) \]

To this end, take \( c \in \hat{E} \), and suppose, towards a contradiction, that \( c \notin U_* \). Since \( c \in \hat{K} \setminus U_* \subset U \setminus U_* \), we have from (4.2)

\[ \| 1 - W_{\nu_0} \|_{\hat{E}} < \frac{1}{2} \quad \text{and} \quad |W_{\nu_0}(c)| < \frac{1}{2} \, . \]
Hence,

$$\|1 - W_{v_0}\|_E < |1 - W_{v_0}(c)|,$$

which implies that $c \notin \hat{E}$, a contradiction.

Similarly, we show that $E$ is nonpluripolar. Indeed, striving for a contradiction, assume that $E$ is pluripolar. Note that $\emptyset \neq h(K) \subset h(E)^c$, which implies that $E \neq \emptyset$. Take $\tilde{c} \in E$. Then, from (4.2),

$$\|W_{v_0}\|_{K \setminus E} < \frac{1}{2} \quad \text{and} \quad |W_{v_0}(\tilde{c})| > \frac{1}{2}.$$

Hence, $\tilde{c} \notin (K \setminus E)^c$, and by [23, Theorem 5.2.4 and Corollary 5.2.5],

$$0 = V_K(\tilde{c}) = V_{E \cup (K \setminus E)}^*(\tilde{c}) = V_{K \setminus E}^*(\tilde{c}) \geq V_{K \setminus E}(\tilde{c}) > 0,$$

which is a contradiction.

Nonpluripolarity of $E$ implies that $\Phi_E$ is locally bounded in $\mathbb{C}^N$; see (1.1) and (1.2). In particular, there exists $m \in \mathbb{N}$ such that $\theta_2 \rho^m < 1$ and

$$\sup_K \Phi_E \leq \frac{1}{\theta_2 \rho^m}.$$  \hfill (4.4)

For each nonconstant polynomial $T \in \mathbb{C}[z_1, \ldots, z_N]$ set $P^T := W_m \deg T$. Note that, for each $z \in \Delta \cap U^*$,

$$|P^T(z)| \geq (1 - \theta_2 \rho^m \deg T)|T(z)| \geq (1 - \theta_2 \rho^m)|T(z)|.$$ \hfill (4.5)

Indeed, by (4.2),

$$|P^T(z)| = |W_m \deg T(z)| \cdot |T(z)| \geq (1 - |W_m \deg T(z) - 1|)|T(z)| \geq (1 - \theta_2 \rho^m \deg T)|T(z)|.$$

We now show that, for each nonconstant polynomial $T \in \mathbb{C}[z_1, \ldots, z_N]$,

$$\|P^T\|_K \leq (1 + \theta_2 \rho^m \deg T)\|T\|_E \leq (1 + \theta_2 \rho^m)\|T\|_E.$$ \hfill (4.6)

To this end, fix $z \in K$. By (4.2),

$$|P^T(z)| = |W_m \deg T(z)| \cdot |T(z)| \leq (|f(z)| + |f(z) - W_m \deg T(z)|)|T(z)| \leq (|f(z)| + \theta_2 \rho^m \deg T)|T(z)|.$$
Thus,

\[ |P^T(z)| \leq \begin{cases} 
(1 + \theta_2 \rho^m \deg T) \|T\|_E & \text{if } z \in E \\
\theta_2 \rho^m \deg T |T(z)| & \text{if } z \in K \setminus E.
\end{cases} \tag{4.7} \]

Moreover,

\[ \theta_2 \rho^m \deg T |T(z)| \leq (\theta_2 \rho^m)^\deg T |T(z)| \]
\[ \leq \left( \theta_2 \rho^m \sup_{K} \Phi_E \right)^\deg T \|T\|_E \quad \text{(by (1.3))} \]
\[ \leq \|T\|_E \quad \text{(by (4.4)).} \]

Combining the above estimates with (4.7) yields (4.6).

Take \( \theta_3 \in (0, 1) \) such that \( E(\theta_3) \subset \Delta \cap U_* \), and set

\[ \theta_4 := \exp \left( \frac{\theta_1 \theta_3 \mu (m + 1)}{\theta_3} \right) \cdot \frac{1 + \theta_2 \rho^m}{1 - \theta_2 \rho^m}, \]
\[ \theta_5 := \sup_{t \in (0, \theta_3 \theta_4]} \frac{\exp(t) - 1}{t} = \frac{\exp(N \theta_3 \theta_4) - 1}{N \theta_3 \theta_4}, \]
\[ \theta_6 := \max \left\{ \theta_1, \frac{2 \theta_2 \rho^m}{(1 - \theta_2 \rho^m) \theta_3^\mu} \right\}, \]
\[ \theta_7 := \sup_{t \in (0, \theta_5 \theta_6]} \frac{(1 + t)^m + 1}{t} = \frac{(1 + \theta_3^\mu \theta_6)^{m + 2} - 1}{\theta_3^\mu \theta_6}, \]
\[ \theta_8 := \max \left\{ N \theta_3^{1 - \mu} \theta_4 \theta_5, \theta_6 \theta_7 \right\}. \]

We now show that, for each polynomial \( Q \in \mathbb{C}[z_1, \ldots, z_N] \) and each \( \alpha = (\alpha_1, \ldots, \alpha_N) \in \mathbb{N}_0^N \),

\[ \|D^\alpha Q\|_E \leq \left( \theta_4 (\deg Q)^{1/\mu} \right)^{|\alpha|} \|Q\|_E. \tag{4.8} \]

(If \( Q \) is constant and \( \alpha = 0 \in \mathbb{N}_0^N \), then \( (\theta_4 (\deg Q)^{1/\mu})^{|\alpha|} := 1 \).) Obviously, it suffices to check (4.8) for \( \alpha \in \mathbb{N}_0^N \) such that \( |\alpha| = 1 \). So, fix such an \( \alpha \), and also fix \( Q \in \mathbb{C}[z_1, \ldots, z_N] \). Put \( d := \deg Q \). We may assume that \( d \geq 1 \), because (4.8) is trivial for \( Q \) being constant.

Then, for each \( z \in E \),

\[ |D^\alpha Q(z)| \leq \frac{d^{1/\mu}}{\theta_3} \|Q\|_{\mathbb{D}(z, \theta_3 d^{-1/\mu})} \]
\[ \leq \frac{d^{1/\mu}}{\theta_3 (1 - \theta_2 \rho^m)} \|Q\|_{\mathbb{D}(z, \theta_3 d^{-1/\mu})} \quad \text{(by Cauchy’s inequalities)} \]
\[ \leq \frac{d^{1/\mu}}{\theta_3 (1 - \theta_2 \rho^m)} \|P Q\|_{\mathbb{D}(z, \theta_3 d^{-1/\mu})} \quad \text{(by (4.5))} \]
Geometry of holomorphic mappings...

\[
\begin{align*}
&\leq \frac{d^{1/\mu}}{\theta_3(1-\theta_2 \rho^m)} \left(1 + \frac{\theta_1 \theta_3^{\mu}}{d}\right)^{d(m+1)} \|PQ\|_K \quad \text{(by (1.3) and (4.1))} \\
&\leq \frac{d^{1/\mu} \exp\left(\theta_1 \theta_3^{\mu}(m+1)\right)}{\theta_3(1-\theta_2 \rho^m)} \|PQ\|_K \\
&\leq \frac{d^{1/\mu} \exp\left(\theta_1 \theta_3^{\mu}(m+1)\right)}{\theta_3} \cdot \frac{1 + \theta_2 \rho^m}{1 - \theta_2 \rho^m} \|Q\|_E \quad \text{(by (4.6))} \\
&= \theta_4 d^{1/\mu} \|Q\|_E,
\end{align*}
\]

which implies (4.8).

We are now in a position to show that, for each \(a \in E_{(\theta_3)}\),

\[
\Phi_E(a) \leq 1 + \theta_8 \left(\text{dist}(a, E)\right)^\mu.
\]  

(4.9)

To prove this, fix \(a \in E_{(\theta_3)}\) and \(Q \in \mathbb{C}[z_1, \ldots, z_N]\) such that \(d := \text{deg } Q > 0\). We need to check that

\[
|Q(a)| \leq (1 + \theta_8 \delta^\mu)^d \|Q\|_E.
\]  

(4.10)

where \(\delta := \text{dist}(a, E)\).

**Case 1:** \(\delta \leq \theta_3 d^{-1/\mu}\). Take \(b \in E\) such that \(|a - b| = \delta\). Then

\[
|Q(a)| = \left| \sum_{\alpha \in \mathbb{N}_0^N} \frac{D^\alpha Q(b)}{\alpha!} (a - b)^\alpha \right|
\]

\[
\leq \sum_{\alpha \in \mathbb{N}_0^N} \|D^\alpha Q\|_E \delta^{|\alpha|}
\]

\[
\leq \sum_{\alpha \in \mathbb{N}_0^N} \left(\theta_4 d^{1/\mu} \delta\right)^{|\alpha|} \frac{\alpha!}{\alpha!} \|Q\|_E \quad \text{(by (4.8))}
\]

\[
= \exp\left(N \theta_4 d^{1/\mu} \delta\right) \|Q\|_E
\]

\[
= \exp\left(d N \theta_4 (d^{1/\mu} \delta)^{1-\mu} \delta^\mu\right) \|Q\|_E
\]

\[
\leq \exp\left(d N \theta_3^{1-\mu} \theta_4 \theta_5 \delta^\mu\right) \|Q\|_E \quad \text{(since } \mu \leq 1 \text{ and } \delta \leq \theta_3 d^{-1/\mu})
\]

\[
\leq (1 + N \theta_3^{1-\mu} \theta_4 \theta_5 \delta^\mu)^d \|Q\|_E \quad \text{(since } \delta \leq \theta_3)
\]

\[
\leq (1 + \theta_8 \delta^\mu)^d \|Q\|_E,
\]

which yields (4.10) in case 1.

**Case 2:** \(\delta > \theta_3 d^{-1/\mu}\). Then

\[
|Q(a)| \leq \frac{1}{1 - \theta_2 \rho^m} |PQ(a)| \quad \text{(by (4.5))}
\]
\[ \leq \frac{1}{1 - \theta_2 \rho^m} (\Phi_K(a))^{d(m+1)} \| P Q \|_K \]  
(by (1.3))

\[ \leq \frac{1}{1 - \theta_2 \rho^m} \left( 1 + \theta_1 \delta^\mu \right)^{d(m+1)} \| P Q \|_K \]  
(by (4.1))

\[ \leq \frac{1 + \theta_2 \rho^m}{1 - \theta_2 \rho^m} \left( 1 + \theta_1 \delta^\mu \right)^{d(m+1)} \| Q \|_E \]  
(by (4.6))

\[ = \left( 1 + \frac{2 \theta_2 \rho^m}{1 - \theta_2 \rho^m} \right) \left( 1 + \theta_1 \delta^\mu \right)^{d(m+1)} \| Q \|_E \]  
(since \( \delta > \theta_3 d^{-1/\mu} \))

\[ \leq (1 + d \theta_6 \delta^\mu) \left( 1 + \theta_1 \delta^\mu \right)^{d(m+1)} \| Q \|_E \]  

\[ \leq (1 + \theta_6 \delta^\mu)^d \left( 1 + \theta_1 \delta^\mu \right)^{d(m+1)} \| Q \|_E \]  

\[ \leq (1 + \theta_6 \theta_7 \delta^\mu)^d \| Q \|_E \]  
(since \( \delta \leq \theta_3 \))

\[ \leq (1 + \theta_8 \delta^\mu)^d \| Q \|_E , \]

which establishes the estimate (4.10).

To complete the proof, note that \( h(E) \) has the HCP property. Indeed, since \( \hat{E} \subset U_* \) (see (4.3)) and \( E \) has the HCP property (see (4.9)), we can apply Theorem 1.9 to the set \( E \) and the map \( h|_{U_*} \). Therefore, there exist \( \theta, \gamma > 0 \) such that, for all \( y, y' \in \mathbb{C}^N \),

\[ |V_{h|E}(y) - V_{h|E}(y')| \leq \theta |y - y'|^\gamma . \]  
(4.11)

Recall also that we are now working under the assumption that (iii) holds, and so

\[ h(E) \subset h(K) \subset h(E)^\wedge . \]

Consequently,

\[ V_{h(E)} \geq V_{h(K)} \geq V_{h(E)^\wedge} . \]

On the other hand, [23, Theorem 5.1.7] tell us that \( V_{h(E)^\wedge} = V_{h(E)} \). Therefore, \( V_{h(K)} = V_{h(E)} \). Together with (4.11), this completes the proof of (i) under the assumption that (iii) holds. \( \square \)

5 Proof of Theorem 1.12

**Proof of Theorem 1.12** Take an open, bounded set \( \Omega \subset \mathbb{C}^N \) such that \( \hat{K} \subset \Omega \) and \( \overline{\Omega} \subset U \). Since \( h(K) \) is a nonpluripolar subset of \( \mathbb{C}^{N'} \) and \( h(\Omega) \) is bounded,

\[ C_1 := \sup_{h(\Omega)} \Phi_{h(K)} < +\infty ; \]
see (1.1) and (1.2).

As in the proof of Theorem 1.9, we show that there exist a set \( E \subset \mathbb{C}^N \) and constants \( C_2 > 0, \rho \in (0, 1) \) such that

- \( K \subset \text{Int} E \) and \( E \subset \Omega \),
- for each holomorphic and bounded function \( f : \Omega \to \mathbb{C} \) and each \( \nu \in \mathbb{N} \), there exists a polynomial \( R_\nu \in \mathbb{C}[z_1, \ldots, z_N] \) with \( \deg R_\nu \leq \nu \) and such that

\[
\| f - R_\nu \|_E \leq C_2 \| f \|_{\Omega} \rho^\nu.
\] (5.1)

Furthermore, take \( k \in \mathbb{N} \) and \( t_1 > 0 \) such that

\[
C_1 \rho^k \leq 1
\] (5.2)

and

\[
K(t_1) \subset E.
\] (5.3)

Let \( \varepsilon, C > 0 \) be of the definition of Markov’s inequality for the set \( K \). That is, for each polynomial \( R \in \mathbb{C}[z_1, \ldots, z_N] \) and each \( \beta \in \mathbb{N}_0^N \),

\[
\| D^\beta R \|_K \leq \left( C(\deg R)^\varepsilon \right)^{|\beta|} \| R \|_K.
\] (5.4)

Moreover, let \( \varkappa, \theta, t_*, q \in \mathbb{N} \) be of Theorem 1.13. Set

\[
\kappa := \varkappa(2 + \varepsilon),
\]
\[
C_3 := \min \left\{ t_*, t_1, \frac{1}{Ck^\varepsilon} \right\},
\]
\[
C_4 := \sup_{j \in \mathbb{N}} \left( \frac{1 + \frac{1}{\sqrt{2} j}}{1 - \frac{1}{\sqrt{2} j}} \right)^{jq},
\]
\[
C_5 := \frac{\theta C_3^\varepsilon}{2^{\varkappa} + 1},
\]
\[
C_6 := C_2C_42^{N'} + (C_2 + 1)C_4e^{N}2^{N'}.
\]

Fix a polynomial \( P \in \mathbb{C}[y_1, \ldots, y_{N'}] \) with \( \deg P \leq n (n \in \mathbb{N}) \), and also fix \( y \in h(K)_{(C_5n^{-k})} \). We now show that

\[
|P(y)| \leq C_6 \| P \|_{h(K)}.
\] (5.5)

Set \( l = l(n) := kn \). By (5.1), there exists a polynomial \( R_l \in \mathbb{C}[z_1, \ldots, z_N] \) with \( \deg R_l \leq l \) and such that

\[
\| P \circ h - R_l \|_E \leq C_2 \| P \circ h \|_{\Omega} \rho^l.
\] (5.6)
Note that

\[ \| P \circ h - R_l \|_E \leq C_2 \| P \|_{h(K)} \cdot \] \tag{5.7} \]

Indeed,

\[
\| P \circ h - R_l \|_E \leq C_2 \| P \|_{h(\Omega)} \rho^l \leq \left( \sup_{h(\Omega)} \Phi_{h(K)} \right)^n \| P \|_{h(K)} \quad \text{(by (1.3))}
\]

\[
= C_2 (C_1 \rho^k)^n \| P \|_{h(K)} \leq C_2 \| P \|_{h(K)} \quad \text{(by (5.2))},
\]

which proves (5.7).

Put \( v_n := C_3/n^\varepsilon \) and \( \tau_n := v_n/2n^2 \). Take \( a \in K \) such that \( \text{dist}(y, h(K)) = |y - h(a)| \). Note that \( v_n \leq t_1 \), and hence

\[
\mathcal{D}(a, v_n) \subset E; \quad \text{(5.8)}
\]

see (5.3).

Let \( Q_a : \mathbb{C} \to \mathbb{C}^{N'} \) be the polynomial map of Theorem 1.13. In particular, \( Q_a(0) = h(a) \). Then

\[
|P(y)| = \left| \sum_{\alpha \in \mathbb{N}_0^{N'}} \frac{D^\alpha P(h(a))}{\alpha!} (y - h(a))^\alpha \right|
\]

\[
\leq \sum_{\alpha \in \mathbb{N}_0^{N'}} \frac{|D^\alpha P(Q_a(0))|}{\alpha!} \left( \frac{C_5}{n^\varepsilon} \right)^{|\alpha|} \quad \text{(since } y \in h(K)(C_5 n^{-\varepsilon}))
\]

\[
\leq \sum_{\alpha \in \mathbb{N}_0^{N'}} \| D^\alpha P \circ Q_a \|_{[\tau_n, v_n]} (\Phi_{[\tau_n, v_n]}(0))^{nq} \left( \frac{C_5}{n^\varepsilon} \right)^{|\alpha|} \quad \text{(by (1.3))}
\]

\[
= \sum_{\alpha \in \mathbb{N}_0^{N'}} \| D^\alpha P \circ Q_a \|_{[\tau_n, v_n]} \left( 1 + \frac{1}{\sqrt{2n}} \right)^{nq} \left( \frac{C_5}{n^\varepsilon} \right)^{|\alpha|}. \]

Here we have used the following formula:

\[
\Phi_{[\tau, v]}(u) = \frac{1}{\left| 1 - \sqrt{\frac{\tau - u}{\tau - u}} \right|},
\]

\( \mathcal{D} \) Springer
which is valid for all \( \tau, v \in \mathbb{R} \) with \( \tau < v \) and all \( u \in (\infty, \tau] \cup (u, +\infty) \); see for example [31, Lemma 2.1]. Consequently,

\[
|P(y)| \leq \sum_{\alpha \in \mathbb{N}_{0}^{N'}} C_4 \frac{C_5}{\alpha!} \left| D^\alpha P \circ Q_a(s_n(\alpha)) \right| \left( \frac{C_5}{n^k} \right)^{\alpha}
\]  \hspace{1cm} (5.9)

for some \( s_n(\alpha) \in [\tau_n, v_n] \).

Theorem 1.13 and the estimates \( 0 < s_n(\alpha) \leq v_n \leq t^* \) imply that

\[
\mathbb{D}(Q_a(s_n(\alpha)), \theta s_n(\alpha) v^\tau) \subset h(\mathbb{D}(a, v_n)).
\]  \hspace{1cm} (5.10)

Therefore,

\[
|P(y)| \leq \sum_{\alpha \in \mathbb{N}_{0}^{N'}} C_4 \frac{C_5}{\alpha!} \left| D^\alpha P \right| \left( \frac{C_5}{n^k} \right)^{\alpha}
\]  \hspace{1cm} (by (5.9), (5.10), and Cauchy’s ineq.)

\[
\leq \sum_{\alpha \in \mathbb{N}_{0}^{N'}} C_4 \left( \frac{C_5}{\theta \tau_n^\tau n^k} \right)^{\alpha} \| P \| \left( \mathbb{D}(a, v_n) \right)
\]

\[
= \sum_{\alpha \in \mathbb{N}_{0}^{N'}} C_4 \left( \frac{C_5}{\theta \tau_n^\tau n^k} \right)^{\alpha} \| P \| \left( \mathbb{D}(a, v_n) \right)
\]

\[
= C_4 2^{N'} \| P \| \left( \mathbb{D}(a, v_n) \right)
\]

\[
\leq C_4 2^{N'} \left( \| P \| \left( \mathbb{D}(a, v_n) \right) + \| R_l \| \left( \mathbb{D}(a, v_n) \right) \right) \]  \hspace{1cm} (by (5.8)).

Hence, by (5.7),

\[
|P(y)| \leq C_4 2^{N'} \left( C_2 \| P \| \left( \mathbb{D}(a, v_n) \right) + \| R_l \| \left( \mathbb{D}(a, v_n) \right) \right).
\]  \hspace{1cm} (5.11)

Take \( z_0 \in \mathbb{D}(a, v_n) \) such that \( |R_l(z_0)| = \| R_l \| \left( \mathbb{D}(a, v_n) \right) \). Then

\[
\| R_l \| \left( \mathbb{D}(a, v_n) \right) = \sum_{\beta \in \mathbb{N}_{0}^{N}} \left| \frac{D^\beta R_l(a)}{\beta!} (z_0 - a)^\beta \right|
\]

\[
\leq \sum_{\beta \in \mathbb{N}_{0}^{N}} \left| \frac{D^\beta R_l(a)}{\beta!} \right| \left| (z_0 - a)^\beta \right|
\]

\[
\leq \sum_{\beta \in \mathbb{N}_{0}^{N}} \left( C l^{k} \right)^{\beta} \| R_l \| \left( \mathbb{D}(a, v_n) \right) \]  \hspace{1cm} (by (5.4))

\[
= \sum_{\beta \in \mathbb{N}_{0}^{N}} \left( C C_3 k^{k} \right)^{\beta} \| R_l \| \left( \mathbb{D}(a, v_n) \right)
\]
\[ \sum_{\beta \in \mathbb{N}_0} \frac{\|R_\beta\|_K}{\beta!} = e^N \| R_l \|_K \leq e^N (\| P \circ h - R_l \|_K + \| P \circ h \|_K) \leq (C_2 + 1)e^N \| P \|_h(K) \] (by (5.7)).

Combining this with (5.11), we get

\[ |P(y)| \leq C_4 2^{N'} \left( C_2 \| P \|_{h(K)} + (C_2 + 1)e^N \| P \|_{h(K)} \right) = C_6 \| P \|_{h(K)}, \]

which establishes the estimate (5.5).

By the remark following Definition 1.10 and by (5.5), \( h(K) \) satisfies Markov’s inequality, which is the desired conclusion. \( \square \)

6 A refinement of Theorems 1.9 and 1.12

We conclude this paper with one more result, which is a slight strengthening of Theorems 1.9 and 1.12.

**Theorem 6.1** Let \( h : U \rightarrow \mathbb{C}^{N'} \), where \( U \subset \mathbb{C}^N \) is an open set, be a nondegenerate holomorphic map \((N, N' \in \mathbb{N})\). Assume that \( Z \subset \mathbb{C}^N \) is a compact set with \( \hat{Z} \subset U \). Then there exist \( \eta_1, \eta_2 > 0 \) such that:

1. For each compact set \( \emptyset \neq K \subset Z \) having the HCP property with the exponent \( \mu > 0 \) (that is, (1.4) holds with some \( \varpi > 0 \)), the set \( h(K) \) has the HCP property with the exponent \( \eta_1 \mu \).
2. For each compact set \( K \subset Z \) satisfying Markov’s inequality with the exponent \( \varepsilon > 0 \) (that is, (1.5) holds with some \( C > 0 \)) and such that \( h(K) \) is a nonpluripolar subset of \( \mathbb{C}^{N'} \), the set \( h(K) \) satisfies Markov’s inequality with the exponent \( \eta_2 \varepsilon \).

**Proof** Let \( \varkappa > 0 \) be of Theorem 1.13 applied to \( Z \) (instead of \( K \)) and take \( \tilde{\varkappa} \in \mathbb{N} \) such that \( \tilde{\varkappa} \geq \varkappa \). Set \( \eta_1 := 1/(3 \tilde{\varkappa}) \) and \( \eta_2 := 3 \varkappa \). Fix a compact set \( \emptyset \neq K \subset Z \). Note that \( \hat{K} \subset \hat{Z} \subset U \). Put

\[ r := \sup \left\{ |z_1| : (z_1, \ldots, z_N) \in K \right\}, \]

and take \( a \in K \) such that \( |a_1| = r \). If \( r > 0 \), then for each \( n \in \mathbb{N} \), let \( Q_n \in \mathbb{C}[z_1, \ldots, z_N] \) be defined by \( Q_n(z) := (z_1/r)^n \). Clearly, \( \| Q_n \|_K = 1 \). Note that \( K \) being a Markov set implies \( r > 0 \). This is immediately seen by considering the polynomial \( Q(z) := z_1 \).

Assume first that \( K \) has the HCP property with the exponent \( \mu > 0 \), that is, there exists \( \varpi > 0 \) such that, for each \( z \in K_{(1)} \),

\[ V_K(z) \leq \varpi (\text{dist}(z, K))^\mu. \] (6.1)
Then $r > 0$ and, for each $n \in \mathbb{N}$, we have from (1.2), (1.3) and (6.1):

$$\frac{n}{r} < n^{1/\mu} \left(1 + \frac{1}{n^{1/\mu} r}\right)^n = n^{1/\mu} \|Q_n\|_{\mathbb{D}(a, n^{-1/\mu})}^n \leq n^{1/\mu} \left(\sup_{\mathbb{D}(a, n^{-1/\mu})} \Phi_K\right)^n \|Q_n\|_K \leq n^{1/\mu} e^{\sigma r}.$$ 

Thus, $n/r \leq n^{1/\mu} e^{\sigma r}$, which implies $\mu \leq 1$; see also [46, Remark 3.7]. Analysis of the proof of Theorem 1.9 shows that the set $h(K)$ has the HCP property with the exponent $\mu/(\mathcal{Z}(2\mu + 1))$. However, $\mu/(\mathcal{Z}(2\mu + 1)) \geq \mu/(3\mathcal{Z}) = \eta_1 \mu$. Therefore, $h(K)$ has the HCP property with the exponent $\eta_1 \mu$, and (1) is proved.

In order to prove (2), assume that $h(K)$ is a nonpluripolar subset of $\mathbb{C}^N$ and $K$ satisfies Markov’s inequality with the exponent $\varepsilon > 0$, that is, there exists $C > 0$ such that, for each polynomial $Q \in \mathbb{C}[z_1, \ldots, z_N]$ and each $\alpha \in \mathbb{N}_0^N$,

$$\|D^\alpha Q\|_K \leq \left(C (\deg Q)^\varepsilon\right)^{|\alpha|} \|Q\|_K.$$ 

(6.2)

Then $r > 0$ and, for each $n \in \mathbb{N}$, we have from (6.2):

$$\frac{n}{r} = \left|\frac{\partial Q_n}{\partial z_1}(a)\right| \leq C n^\varepsilon \|Q_n\|_K = C n^\varepsilon.$$

It follows that $n/r \leq C n^\varepsilon$, which implies $\varepsilon \geq 1$. A careful look at the proof of Theorem 1.12 reveals that the set $h(K)$ satisfies Markov’s inequality with the exponent $\mathcal{Z}(2 + \varepsilon)$. But $\mathcal{Z}(2 + \varepsilon) \leq 3 \mathcal{Z} \varepsilon = \eta_2 \varepsilon$. Consequently, $h(K)$ satisfies Markov’s inequality with the exponent $\eta_2 \varepsilon$, which proves (2).

\[\square\]
