Abstract

$\mathcal{N} = 2$ supersymmetric $Spin(n)$ gauge theory admits hypermultiplets in spinor representations of the gauge group, compatible with $\beta \leq 0$, for $n \leq 14$. The theories with $\beta < 0$ can be obtained as mass-deformations of the $\beta = 0$ theories, so it is of greatest interest to construct the $\beta = 0$ theories. In previous works, we discussed the $n \leq 8$ theories. Here, we turn to the $9 \leq n \leq 14$ cases. By compactifying the $D_N (2,0)$ theory on a 4-punctured sphere, we find Seiberg-Witten solutions to almost all of the remaining cases. There are five theories, however, which do not seem to admit a realization from six dimensions.

Acknowledgements
1. Introduction

$\mathcal{N} = 2$ supersymmetric $Spin(n)$ gauge theory, with $n - 2$ hypermultiplets in the vector representation, is superconformal for any $n > 2$, and the Seiberg-Witten solutions are known from the mid 1990’s [1,2]. Replacing some number of vectors by hypermultiplets in spinor representations is only possible for sufficiently low $n$. The corresponding Seiberg-Witten solutions do not seem to be known [1]. For $Spin(5) \simeq Sp(2)$ and $Spin(6) \simeq SU(4)$, the solutions were presented in [5,6]. The solutions to $Spin(7), Spin(8)$ appeared in our previous papers [7,8] (see [9] for an alternative formulation). As a further application of [7,8], we will discuss $Spin(n)$ gauge theories for $n = 9, 10, \ldots, 14$, with matter content such that $\beta = 0$. These are all of the remaining cases where one can have matter in the spinor representation. For $n > 14$, only matter in the vector representation is compatible with $\beta \leq 0$.

These 4D gauge theories can be obtained by compactifying a 6D $(2,0)$ theory of type $D_N$ on a 4-punctured sphere, where the punctures are labeled by nilpotent orbits in $\mathfrak{o}_N$ (or in $\mathfrak{c}_{N-1}$ for twisted-sector punctures) [5,6,12]. When the 4-punctured sphere degenerates into a pair of 3-punctured spheres (“fixtures”), connected by a long thin cylinder, the gauge theory description is weakly-coupled. Fixtures with only hypermultiplets in the vector representation are, necessarily, twisted. With at least one (half-)hypermultiplet in the spinor representation, we can find an untwisted fixture and — wherever possible — we prefer to work in the untwisted theory.

From these realizations as 4-punctured spheres, we construct the corresponding Seiberg-Witten geometries, and discuss the strong-coupling S-dual realizations [15] of the gauge theories.

2. Seiberg-Witten Geometry

2.1. Seiberg-Witten curve

In the $D_N$ theory, the Seiberg-Witten curve, $\Sigma \subset \text{tot}(K_C)$, is the spectral curve (in the vector representation) for $D_N$. In other words, it can be written as the locus

$$0 = \lambda^{2N} + \phi_2(z)\lambda^{2N-2} + \phi_4(z)\lambda^{2N-4} + \cdots + \phi_{2N-2}(z)\lambda^2 + \tilde{\phi}(z)^2$$

(2.1)
$g(\Sigma) = g(\tilde{C}) = N$. The SW solution is obtained by computing the periods of $\lambda$ over the cycles which are anti-invariant under $\iota$. Said differently, the fibers of the Hitchin integrable system are the Prym variety for $\Sigma \to \tilde{C}$.

For the $\text{Spin}(2N)$ gauge theories considered below, the above description is completely adequate, as $\tilde{\phi}(z)$ is nowhere-vanishing on $C$. For the $\text{Spin}(2N - 1)$ gauge theories, $\tilde{\phi}(z)$ vanishes identically. So $\Sigma$ is reducible similarly, we work on the resolution, $\hat{\Sigma}$.

Let $\Sigma_0$ be the component

$$0 = \lambda^2(2^{N-2} + \phi_2(z)\lambda^{2N-4} + \phi_4(z)\lambda^{2N-6} + \cdots + \phi_{2N-2}(z)) .$$

As before, $\Sigma_0$ admits an involution $\iota: \lambda \to -\lambda$, with quotient $\tilde{C}_0 = \Sigma_0/\iota$, and the SW solution, for the $\text{Spin}(2N - 1)$ gauge theory, is given by the periods of $\lambda$ on the anti-invariant cycles. There is one subtlety which did not occur in the previous case: $\phi_{2N-2}(z)$ typically does have zeroes on $C$, which means that $\Sigma_0$ is slightly singular. It has ordinary double-points over the zeroes of $\phi_{2N-2}(z)$. As in Hitchin’s original paper [19], we actually work over the resolutions $\hat{\Sigma}_0 \to \tilde{C}_0$, whose Prym variety has the desired dimension, $g(\hat{\Sigma}_0) - g(\tilde{C}_0) = N - 1$.

### 2.2. Calabi-Yau geometry

An alternative formulation [20,21], more directly related to the Type-IIB description of these 4D theories is as follows. Consider a family of noncompact Calabi-Yau 3-folds, $X_{\tilde{g}}$, realized as the hypersurface

$$0 = w^2 + xy^2 - y^{N-1} - \phi_2(z)y^{N-2} - \phi_4(z)y^{N-3} - \cdots - \phi_{2N-2}(z) - 2\tilde{\phi}(z)x$$

in the total space of the bundle $V = (K^{(N-1)}_C \oplus K^{(N-2)}_C \oplus K^2_C) \to C$. Here, $\vec{u}$ are the Coulomb branch parameters, on which the $\phi_k(z)$ depend, and

$$w = \tilde{w}(dz)^{N-1}, \quad x = \tilde{x}(dz)^{N-2}, \quad y = \tilde{y}(dz)^2$$

are the tautological differentials on $V$. The $g_s \to 0$ limit of Type IIB on $\mathbb{R}^{3,1} \times X_{\tilde{g}}$ is the 4D $\mathcal{N} = 2$ field theory (decoupled from the bulk gravity).

$X_{\tilde{g}}$ has a collection of 3-cycles of the form of an $S^2$ in the fiber over a curve on $C$. The Seiberg-Witten solutions to the $\text{Spin}(2N)$ theories below are constructed from the periods of the holomorphic 3-form,

$$\Omega = \frac{d\tilde{x} \wedge d\tilde{y} \wedge dz}{\tilde{w}}$$

over a (rational) symplectic basis of these 3-cycles. For the $\text{Spin}(2N - 1)$ theories, $\tilde{\phi}(z) \equiv 0$, and $X_{\tilde{g}}$ has an involution $\iota: (w, x) \to (-w, -x)$, under which $\Omega$ is invariant. $\iota$ acts by exchanging two of the $S^2$s in the fiber (fixing the rest). Integrating $\Omega$ over the invariant cycles yields the $2(N - 1)$ periods which comprise the solution for the $\text{Spin}(2N - 1)$ theories.

---

3In the $D_4$ theory, there are examples of $\text{Spin}(8)$ gauge theory, with matter in the $n_s(8_s) + n_c(8_c) + (6 - n_s - n_c)(8_c)$, where $\tilde{\phi}(z)$ has isolated zeroes on $C$. Over those points, $\Sigma$ has ordinary double points and, similarly, we work on the resolution, $\Sigma$. 

2
2.3. Dependence on the gauge coupling

The Seiberg-Witten solutions to the $\beta = 0$ gauge theories, which are our focus, have elaborate (but holomorphic) dependence \cite{22} on the complexified gauge coupling

$$\tau = \frac{\theta}{\pi} + \frac{8\pi i}{g^2} .$$

In particular, any such theory, which can be realized by compactifying the (2,0) theory on a 4-punctured sphere, automatically has a symmetry under $\Gamma(2) \subset PSL(2, \mathbb{Z})$, generated by

$$T^2 : \tau \mapsto \tau + 2, \quad ST^2 S : \tau \mapsto \frac{\tau}{1 - 2\tau} .$$

That is, the dependence on the gauge coupling is through the function

$$f(\tau) \equiv -\frac{\theta_4^4(0, \tau)}{\theta_4^4(0, \tau)} = -\left(16q^{1/2} + 128q + 704q^{3/2} + \ldots\right)$$

where $q = e^{2\pi i \tau}$.

In the untwisted theory, $f(\tau)$ is simply identified with the cross-ratio of the 4-punctured sphere:

$$f(\tau) = x \equiv \frac{z_{13}z_{24}}{z_{14}z_{23}} . \quad (2.2)$$

The limit $x \to 0$ is the usual weak-coupling limit. $x \to 1$ and $x \to \infty$ are limits which admit an alternative (physically-distinct) S-dual description as a weakly coupled gauge theory.

When the punctures at $z_1$ and $z_2$ are identical, then the theory has a larger symmetry under $\Gamma_0(2) \supset \Gamma(2)$, where the extra generator acts on the $x$-plane as

$$S : x \mapsto \frac{1}{x} .$$

The theories, below, with two (one full and one minimal) twisted punctures and two untwisted punctures, have a similar story, except that the relation between $f(\tau)$ (which parametrizes the gauge theory moduli space) and the cross-ratio is more complicated. The gauge theory moduli space is a branched double-cover \cite{5} of the moduli space of the 4-punctured sphere, $M_{0,4}$. Instead of (2.2),

$$w^2 = x \equiv \frac{z_{13}z_{24}}{z_{14}z_{23}} \quad (2.3)$$

and the gauge coupling

$$f(\tau) = \frac{w - 1}{w + 1} . \quad (2.4)$$

In particular, this means that $x \to 0$ corresponds to $f(\tau) \to -1$ (i.e. $\tau \to i$), which is an interior point of the gauge theory moduli space and intrinsically strongly coupled. As in our previous works on the twisted sector \cite{6,8}, we denote these peculiar degenerations as involving a “gauge theory fixture.” The other degeneration limits have more prosaic interpretations.
The limit \( f(\tau) \to 1 \) projects to \( x \to \infty \) and the limits \( f(\tau) \to 0 \) and \( f(\tau) \to \infty \) (which have isomorphic physics) both project to \( x \to 1 \).

In presenting the solutions, below, we write the dependence on the positions of the four punctures in a manifestly \( PSL(2, \mathbb{C}) \)-invariant form. For calculational purposes, it is invariably easier to fix the \( PSL(2, \mathbb{C}) \) symmetry by setting \((z_1, z_2, z_3, z_4) = (0, \infty, x, 1)\).

3. \( Spin(2N) + (2N - 2)(V) \) and \( Spin(2N - 1) + (2N - 3)(V) \)

Just as \( Spin(2N) \) gauge theory with \( 2(N-1) \) fundamentals is realized as the compactification of the \( D_N \) theory with four \( \mathbb{Z}_2 \)-twisted punctures [12N], there is a universal realization of \( Spin(2N-1) \) with \( 2N-3 \) fundamentals plus \((N-1)\) free hypermultiplets as a four-punctured sphere in the (twisted) \( D_N \) theory

\[
\phi_{2k}(z) = \frac{u_{2k} z_{14} z_{23} z_{34}^{2(k-1)}(dz)^{2k}}{(z - z_1)(z - z_2)(z - z_3)^{2k-1}(z - z_4)^{2k-1}} \\
\tilde{\phi}(z) = \frac{\tilde{u} z_{14}^{1/2} z_{23}^{1/2} z_{34}^{N-1}(dz)^N}{(z - z_1)^{1/2}(z - z_2)^{1/2}(z - z_3)^{(2N-1)/2}(z - z_4)^{(2N-1)/2}}.
\]

The Seiberg-Witten curve for [3.2] takes the same form, but with \( \tilde{\phi} \equiv 0 \).

This pattern will repeat, in many of the examples below. The \( Spin(2N-1) \) theory, with the same number of hypermultiplets in the spinor, but one fewer in the vector representation, is obtained by replacing the puncture at \( z_4 \), with one where the last box in the Young diagram is shifted to a new row. Physically, this corresponds to using one of the vector
hypermultiplets to Higgs $Spin(2N) \to Spin(2N-1)$. The “surprise” is that integrating out the massive modes has such a simple effect on the Coulomb branch geometry.

The strong-coupling dual of (3.2) is an $SU(2)$ gauging of the $Sp(2N-3)_{2N-1} \times SU(2)_8$ SCFT, with $N - 1$ additional free hypermultiplets

$$\text{Spin}(2N-1) \rightarrow \text{Spin}(2N).$$

These theories have vanishing $\beta$-function for any $N$.

Including hypermultiplets in spinor representations will follow a similar pattern, where we will realize $Spin(2N-1)$ and $Spin(2N)$ gauge theories as 4-punctured spheres in the $D_N$ theory. The Seiberg-Witten curve for each of these theories takes the form (2.1). We list the invariant $k$-differentials for each theory below.

As we saw above, the solutions for $Spin(2N-1)$ is obtained from the corresponding $Spin(2N)$ theory (i.e, the theory with the same number of spinors (ignoring their chirality, for $N$ even) and one more vector) by setting $\tilde{u} = 0$.

4. $Spin(9)$ and $Spin(10)$ Gauge Theories

All of the following arise in the $D_5$ theory, possibly with $\mathbb{Z}_2$-twisted punctures.

4.1. $Spin(9)$

4.1.1. $Spin(9) + 1(16) + 5(9)$

The other degeneration limits yield a gauge theory fixture

\[ \text{(4.1)} \]
and an $Sp(2)$ gauging of the $Sp(7)_9$ SCFT $+ \frac{3}{2}(4) + 4(1)$

4.1.2. $Spin(9) + 2(16) + 3(9)$

The S-dual theory is an $SU(2)$ gauging of the $Sp(3)_{16} \times Sp(2)_9 \times SU(2)_7$ SCFT $+ \frac{1}{2}(2) + 2(1)$
4.1.3. $\text{Spin}(9) + 3(16) + 1(9)$

The S-dual theories are an $SU(2)$ gauging of the $Sp(3)_{16} \times SU(2)_8 \times SU(2)_9$ SCFT

and a $G_2$ gauging of the $(E_7)_{16} \times SU(2)_9$ SCFT$^4$

---

$^4$This interacting fixture is another realization of the $(E_7)^n \times SU(2)_{(n-1)(4n+1)}$ SCFT, which arises on the world volume of $n$ D3-branes probing a III$^*$ singularity in F-theory (see [23,24,25] and §5.3 of [26]).
4.2.  Spin(10)

4.2.1.  Spin(10) + 1(16) + 6(10)

The other degenerations involve a gauge theory fixture

and an Sp(2) gauging of the Sp(8)_{10} SCFT + 1(4)

The invariant $k$-differentials for (4.4) are given by

\[
\begin{align*}
\phi_2(z) &= \frac{u_2 z_1 z_2 (dz)^2}{(z-z_1)(z-z_2)(z-z_3)(z-z_4)} \\
\phi_4(z) &= \frac{u_4 (z - z_3) z_{24} - \frac{1}{4} u_2^2 (z - z_2) z_{34}}{(z-z_1)(z-z_2)^3(z-z_3)^3(z-z_4)^3} z_{13} z_{24} (dz)^4 \\
\phi_6(z) &= \frac{u_6 z_{13} z_{23} z_{24}^4 (dz)^6}{(z-z_1)(z-z_2)^5(z-z_3)^4(z-z_4)^4} \\
\phi_8(z) &= \frac{u_8 z_{13} z_{23} z_{24}^6 (dz)^8}{(z-z_1)(z-z_2)^7(z-z_3)^2(z-z_4)^6}
\end{align*}
\]
\[
\tilde{\phi}(z) = \frac{\tilde{u} z_{12}^{1/2} z_{23}^{1/2} z_{34}^{1/2} (dz)^5}{(z - z_1)^{1/2} (z - z_2)^{1/2} (z - z_3)^{1/2} (z - z_4)^{1/2}} .
\]

The gauge theory moduli space is a branched double-cover of \( \mathcal{M}_{0,4} \) and the gauge couplings are given by (2.4).

The invariant \( k \)-differentials for (4.1) are as above, but with \( \tilde{\phi} \equiv 0 \).

### 4.2.2. \( Spin(10) + 2(16) + 4(10) \)

![Diagram](image)

The S-dual is an \( SU(2) \) gauging of the \( \text{Sp}(4)_{10} \times SU(2)_{16} \times SU(2)_{7} \times U(1) \) SCFT + \( \frac{1}{2} (2), SU(2) \) × \( \text{Sp}(4)_{10} \times SU(2)_{16} \times SU(2)_{7} \times U(1) \)

The invariant \( k \)-differentials for (4.6) are given by

\[
\phi_2(z) = \frac{u_2 z_{12} z_{34} (dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)}
\]

\[
\phi_4(z) = \frac{[u_4 (z - z_1)(z - z_2) z_{34} + \frac{1}{4} u_2^2 ((z - z_2)(z - z_3) z_{14} - (z - z_1)(z - z_4) z_{23})] z_{12} z_{34}^2 (dz)^4}{(z - z_1)^2 (z - z_2)^2 (z - z_3)^2 (z - z_4)^3}
\]

\[
\phi_6(z) = \frac{u_6 z_{12}^2 z_{34}^4 (dz)^6}{(z - z_1)^2 (z - z_2)^2 (z - z_3)^4 (z - z_4)^4}
\]

\[
\phi_8(z) = \frac{u_8 z_{12}^4 z_{34}^8 (dz)^8}{(z - z_1)^2 (z - z_2)^2 (z - z_3)^6 (z - z_4)^6}
\]

\[
\tilde{\phi}(z) = \frac{\tilde{u} z_{12} z_{34} (dz)^5}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)^4} .
\]

The \( k \)-differentials for (4.2) are as above, but with \( \tilde{\phi} \equiv 0 \).

Since we are in the untwisted theory, the gauge theory moduli space is \( \mathcal{M}_{0,4} \) (or more precisely, in this case, its \( \mathbb{Z}_2 \) quotient), and the gauge coupling is given by (2.2).
4.2.3. \( \text{Spin}(10) + 3(16) + 2(10) \)

\[
\begin{array}{c}
\text{Spin}(10) \\
\text{1(16) + 2(10)} \\
\end{array}
\begin{array}{c}
\text{2(16)} \\
\end{array}
\]

The S-dual theories are an \( SU(2) \) gauging of the \( SU(3)_{32} \times Sp(2)_{10} \times SU(2)_8 \times U(1) \) SCFT

and a \( G_2 \) gauging of the \( (E_6)_{16} \times Sp(2)_{10} \times U(1) \) SCFT

The invariant \( k \)-differentials for (4.8) are given by

\[
\begin{align*}
\phi_2(z) &= u_2 z_{12} z_{34} (dz)^2 \\
&= \frac{u_2 z_{12} z_{34} (dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)} \\
\phi_4(z) &= \left[u_4 (z - z_2) z_{14} + \frac{1}{3} u_2^3 (z - z_4) z_{12} \right] z_{12} z_{34}^2 (dz)^4 \\
&= \frac{u_4 (z - z_2) z_{14} + \frac{1}{3} u_2^3 (z - z_4) z_{12} \right] z_{12} z_{34}^2 (dz)^4}{(z - z_1)^2 (z - z_2)^2 (z - z_3)^2 (z - z_4)^3} \\
\phi_6(z) &= \left[u_6 (z - z_1) z_{34} + \frac{1}{3} u_2 u_4 (z - z_4) z_{13} \right] z_{12}^2 z_{34}^3 (dz)^6 \\
&= \frac{u_6 (z - z_1) z_{34} + \frac{1}{3} u_2 u_4 (z - z_4) z_{13} \right] z_{12}^2 z_{34}^3 (dz)^6}{(z - z_1)^3 (z - z_2)^2 (z - z_3)^4 (z - z_4)^4} \\
\phi_8(z) &= \left[u_8 (z - z_1) z_{34} + \frac{1}{3} u_2^3 (z - z_4) z_{13} \right] z_{14} z_{12}^2 z_{34}^4 (dz)^8 \\
&= \frac{u_8 (z - z_1) z_{34} + \frac{1}{3} u_2^3 (z - z_4) z_{13} \right] z_{14} z_{12}^2 z_{34}^4 (dz)^8}{(z - z_1)^4 (z - z_2)^2 (z - z_3)^5 (z - z_4)^6}
\end{align*}
\]
\[ \tilde{\phi}(z) = \frac{\tilde{u} z_{14} z_{12} z_{34}^3 (dz)^5}{(z - z_1)^2 (z - z_2)^2 (z - z_3)^3 (z - z_4)^4}. \]

The \( k \)-differentials for (4.3) are as above, but with \( \tilde{\phi} \equiv 0 \).

4.2.4. \( Spin(10) + 4(16) \)

\begin{align*}
\phi_2(z) &= \frac{u_2 z_{12} z_{34} (dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)} \\
\phi_4(z) &= \frac{u_4 z_{12}^2 z_{34}^2 (dz)^4}{(z - z_1)^2 (z - z_2)^2 (z - z_3)^2 (z - z_4)^2} \\
\phi_6(z) &= \frac{u_6 (z - z_1)(z - z_2) z_{34} - \frac{1}{2} u_2 (u_4 - \frac{1}{4} u_2^2) ((z - z_1)(z - z_3) z_{24} - (z - z_2)(z - z_4) z_{13})}{(z - z_1)^3 (z - z_2)^3 (z - z_3)^3 (z - z_4)^3} z_{12}^2 z_{34}^3 (dz)^6 \\
\phi_8(z) &= \frac{u_8 (z - z_1)(z - z_2) z_{34} - \frac{1}{4} (u_4 - \frac{1}{4} u_2^2)^2 ((z - z_1)(z - z_3) z_{24} - (z - z_2)(z - z_4) z_{13})}{(z - z_1)^4 (z - z_2)^4 (z - z_3)^4 (z - z_4)^4} z_{12}^4 z_{34}^4 (dz)^8 \\
\tilde{\phi}(z) &= \frac{\tilde{u} z_{12}^2 z_{34}^3 (dz)^5}{(z - z_1)^2 (z - z_2)^2 (z - z_3)^3 (z - z_4)^3}. \tag{4.11}
\end{align*}

In this case, there are no hypermultiplets in the vector, which one could use to Higgs \( Spin(10) \to Spin(9) \). Equivalently, it’s not possible to move the last box, in the Young diagram at \( z_4 \), to a new row while keeping it a D-partition. So there is no corresponding \( Spin(9) \) gauge theory.
5. **Spin(11) and Spin(12) Gauge Theories**

These arise in the compactification of the $D_6$ theory, possibly with $\mathbb{Z}_2$-twisted punctures.

5.1. **Spin(11)**

5.1.1. $\text{Spin}(11) + \frac{1}{2}(32) + 7(11)$

\[
\begin{array}{c}
\frac{1}{2}(32) + 2(11) \\
\text{Spin}(11)
\end{array}
\quad \quad \quad
\begin{array}{c}
5(11) + 5(1) \\
\text{Spin}(11)
\end{array}
\]

The other degenerations involve a gauge theory fixture

\[
\emptyset
\]

and an $Sp(2)$ gauging of the $Sp(9)_{11} \text{ SCFT} + \frac{1}{2}(4) + 5(1)$

\[
\begin{array}{c}

\[ 1^{(32)} \]

\[ 1^{(32)} + 1^{(11)} + 1^{(1)} \]

\[ 1^{(32)} \]

\[ 1^{(32)} + 1^{(11)} + 1^{(1)} \]

The S-dual theory is an $Sp(2)$ gauging of the $Sp(3)_{11} \times SU(2)^2_{32} SCFT + \frac{1}{2}(4) + 1(1)$
5.2. \textit{Spin}(12)

5.2.1. \textit{Spin}(12) + \frac{1}{2}(32) + 8(12)

The other degenerations involve an gauge theory fixture

and an \textit{Sp}(2) gauging of the \textit{Sp}(10)_{12} SCFT
The invariant $k$-differentials for (5.5) are given by

\[
\begin{align*}
\phi_2(z) &= \frac{u_2 z_{13} z_{24} (dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)} \\
\phi_4(z) &= \frac{u_4 (z - z_3) z_{24} - \frac{1}{4} u_2^2 (z - z_2) z_{34} - z_{13} z_{24}^2 (dz)^4}{(z - z_1)(z - z_2)^3(z - z_3)^2(z - z_4)^3} \\
\phi_6(z) &= \frac{[u_6 (z - z_4) z_{13} + 2 u (z - z_3) z_{14}] z_{23} z_{24}^4 (dz)^6}{(z - z_1)(z - z_2)^5(z - z_3)^3(z - z_4)^5} \\
\phi_8(z) &= \frac{u_8 z_{13} z_{23} z_{24}^6 (dz)^8}{(z - z_1)(z - z_2)^7(z - z_3)^2(z - z_4)^6} \\
\phi_{10}(z) &= \frac{u_{10} z_{13} z_{23} z_{24}^8 (dz)^{10}}{(z - z_1)(z - z_2)^9(z - z_3)^2(z - z_4)^8} \\
\tilde{\phi}(z) &= \frac{u z_{14}^{1/2} z_{24}^{9/2} z_{23} (dz)^6}{(z - z_1)^{1/2}(z - z_2)^{11/2}(z - z_3)(z - z_4)^5}.
\end{align*}
\]

(5.6)

For (5.1), they are as above, but with $\tilde{u} \equiv 0$.

### 5.2.2. $\text{Spin}(12) + 1(32) + 6(12)$

\[
\begin{align*}
\phi_2(z) &= \frac{u_2 z_{13} z_{24} (dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)} \\
\phi_4(z) &= \frac{u_4 (z - z_3) z_{24} - \frac{1}{4} u_2^2 (z - z_2) z_{34} - z_{13} z_{24}^2 (dz)^4}{(z - z_1)(z - z_2)^3(z - z_3)^2(z - z_4)^3} \\
\phi_6(z) &= \frac{[u_6 (z - z_4) z_{13} + 2 u (z - z_3) z_{14}] z_{23} z_{24}^4 (dz)^6}{(z - z_1)(z - z_2)^5(z - z_3)^3(z - z_4)^5} \\
\phi_8(z) &= \frac{u_8 z_{13} z_{23} z_{24}^6 (dz)^8}{(z - z_1)(z - z_2)^7(z - z_3)^2(z - z_4)^6} \\
\phi_{10}(z) &= \frac{u_{10} z_{13} z_{23} z_{24}^8 (dz)^{10}}{(z - z_1)(z - z_2)^9(z - z_3)^2(z - z_4)^8} \\
\tilde{\phi}(z) &= \frac{u z_{14}^{1/2} z_{24}^{9/2} z_{23} (dz)^6}{(z - z_1)^{1/2}(z - z_2)^{11/2}(z - z_3)(z - z_4)^5}.
\end{align*}
\]

(5.7)

The S-dual theory is an $SU(2)$ gauging of the $Sp(6)_{12} \times SU(2)_7 \times U(1)\text{SCFT} + \frac{1}{2}(2)$
5.2.3. $\text{Spin}(12) + \frac{1}{2}(32) + \frac{1}{2}(32') + 6(12)$

The S-dual is an $SU(2)$ gauging of the $Sp(6)_{12} \times SU(2)_7 \times U(1)$ SCFT $+ \frac{1}{2}(2)$

The invariant $k$-differentials for (5.7) and (5.8) are

\[
\phi_2(z) = \frac{u_2 z_{12} z_{34} (dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)}
\]

\[
\phi_4(z) = \frac{\left[u_4 (z - z_1)(z - z_2) z_{34} + \frac{1}{2} u_2^2 \left( (z - z_2)(z - z_3) z_{14} - (z - z_1)(z - z_4) z_{23} \right) \right] z_{12} z_{34}^2 (dz)^4}{(z - z_1)^2 (z - z_2)^2 (z - z_3)^3 (z - z_4)^3}
\]
\[ \phi_6(z) = \frac{u_6 (z - z_3)(z - z_4)z_{12} + 2u((z - z_1)(z - z_4)z_{23} \mp (z - z_2)(z - z_3)z_{14})}{(z - z_1)^2(z - z_2)^2(z - z_3)(z - z_4)^6} z_{12}z_{34}^4(dz)^6 \]

\[ \phi_8(z) = \frac{u_8 z_{12}^2z_{34}^6(dz)^8}{(z - z_1)^2(z - z_2)^2(z - z_3)^6(z - z_4)^6} \]  \[ \phi_{10}(z) = \frac{u_{10} z_{12}^2z_{34}^8(dz)^{10}}{(z - z_1)^2(z - z_2)^2(z - z_3)^8(z - z_4)^8} \]

\[ \tilde{\phi}(z) = \frac{\tilde{u} z_{12} z_{34}^5 (dz)^6}{(z - z_1)(z - z_2)(z - z_3)^5(z - z_4)^5} . \]

where the upper/lower sign in the expression for \( \phi_6 \) is for (5.7)/(5.8), respectively. The invariant \( k \)-differentials for (5.2) are as above, but with \( \tilde{u} \equiv 0 \).

5.2.4. \( Spin(12) + \frac{3}{2}(32) + 4(12) \)

The S-dual theories are an \( SU(2) \) gauging of the \( Sp(4)_{12} \times SU(2)_8 \times SU(2)_{128} \) SCFT

and a \( G_2 \) gauging of the \( (F_4)_{16} \times Sp(4)_{12} \) SCFT
The invariant $k$-differentials for (5.10) are given by

\[
\phi_2(z) = \frac{u_2z_{12}z_{34}(dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)}
\]

\[
\phi_4(z) = \frac{[u_4(z - z_2)z_{14} + \frac{1}{4}u_2^2(z - z_4)z_{12}]z_{12}z_{34}(dz)^4}{(z - z_1)^2(z - z_2)^2(z - z_3)^2(z - z_4)^3}
\]

\[
\phi_6(z) = \frac{[u_6(z - z_1)(z - z_4)z_{23} - 2\bar{u}(z - z_1)(z - z_2)z_{34} + (2\bar{u} + \frac{1}{4}u_2u_4)(z - z_3)(z - z_4)z_{12}]z_{12}z_{14}z_{34}^3(dz)^6}{(z - z_1)^3(z - z_2)^2(z - z_3)^4(z - z_4)^5}
\]

\[
\phi_8(z) = \frac{[u_8(z - z_1)z_{34} + (\frac{1}{4}u_4^2 + \bar{u}u_2)(z - z_4)z_{13}z_{14}z_{12}z_{34}^4(dz)^8}{(z - z_1)^4(z - z_2)^2(z - z_3)^5(z - z_4)^6}
\]

\[
\phi_{10}(z) = \frac{[u_{10}(z - z_1)z_{34} + \bar{u}u_4(z - z_4)z_{13}z_{12}z_{14}^2z_{34}^5(dz)^{10}}{(z - z_1)^5(z - z_2)^2(z - z_3)^6(z - z_4)^8}
\]

\[
\bar{\phi}(z) = \frac{\bar{u}z_{12}z_{14}z_{34}^3(dz)^6}{(z - z_1)^3(z - z_2)(z - z_3)^3(z - z_4)^5}
\]

(5.11)

For (5.3), they are as above, but with $\bar{u} \equiv 0$.

5.2.5. $\text{Spin(12)} + 1(32) + \frac{1}{2}(32') + 4(12)$

\[
\begin{align*}
\text{Spin(12)} & \rightarrow \frac{1}{2}(32) + 3(12) \\
\frac{1}{2}(32) + \frac{1}{2}(32') + 1(12) & \rightarrow \text{Spin(12)}
\end{align*}
\]

(5.12)
The S-dual theories are an $SU(2)$ gauging of the $Sp(4)_{12} \times SU(2)_8 \times U(1)$ SCFT

![Diagram](image)

and a $G_2$ gauging of the $Sp(4)_{12} \times Spin(9)_{16}$ SCFT

![Diagram](image)

The invariant $k$-differentials for (5.12) are given by

\[
\phi_2(z) = \frac{u_2 z_{12} z_{34} (dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)}
\]

\[
\phi_4(z) = \frac{u_4 (z - z_2)z_{14} + \frac{1}{4} u_2^2 (z - z_4)z_{12} z_{34}^2 (dz)^4}{(z - z_1)^2(z - z_2)^2(z - z_3)^2(z - z_4)^3}
\]

\[
\phi_6(z) = \frac{u_6(z - z_1)(z - z_4)z_{23} - 2\bar{u}(z - z_1)(z - z_2)z_{34} + \frac{1}{4} u_2u_4(z - z_3)(z - z_4)z_{12}z_{14}z_{34}^3 (dz)^6}{(z - z_1)^3(z - z_2)^2(z - z_3)^4(z - z_4)^5}
\]

\[
\phi_8(z) = \frac{u_8 (z - z_1)z_{34} + \frac{1}{4} u_2^2 (z - z_4)z_{13} z_{12} z_{34}^2 z_{34}^4 (dz)^8}{(z - z_1)^4(z - z_2)^2(z - z_3)^5(z - z_4)^6}
\]

(5.13)

\[
\phi_{10}(z) = \frac{u_{10} z_{12}^2 z_{14}^2 z_{34}^6 (dz)^{10}}{(z - z_1)^4(z - z_2)^2(z - z_3)^6(z - z_4)^8}
\]

\[
\tilde{\phi}(z) = \frac{\bar{u} z_{12} z_{14} z_{34}^4 (dz)^6}{(z - z_1)^2(z - z_2)(z - z_3)^4(z - z_4)^5}
\]

For (5.3), they are as above, but with $\bar{u} \equiv 0$ (note that (5.13) and (5.11) become equal at $\bar{u} = 0$).
5.2.6. $\text{Spin}(12) + 2(32) + 2(12)$

\[ \phi_2(z) = \frac{u_2 z_{12} z_{34} (dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)} \]
\[ \phi_4(z) = \frac{u_4 z_{12}^2 z_{34}^2 (dz)^4}{(z - z_1)^2(z - z_2)^2(z - z_3)^2(z - z_4)^2} \]
\[ \phi_6(z) = \frac{[u_6(z - z_1)(z - z_2)z_{34} - (\frac{1}{4}(u_4 - \frac{1}{4}u_2^2) + \bar{u}u_2)(z - z_1)(z - z_4)z_{23}}{(z - z_1)^3(z - z_2)^3(z - z_3)^3(z - z_4)^4}
+ (\frac{1}{4}(u_4 - \frac{1}{4}u_2^2) + \bar{u}u_2)(z - z_2)(z - z_3)z_{14}z_{12}^2z_{34}^3(dz)^6 \]

\[ \phi_8(z) = \frac{[u_8(z - z_1)(z - z_2)z_{34} - (\frac{1}{4}(u_4 - \frac{1}{4}u_2^2) + \bar{u}u_2)(z - z_1)(z - z_4)z_{23}}{(z - z_1)^4(z - z_2)^4(z - z_3)^4(z - z_4)^5}
+ (\frac{1}{4}(u_4 - \frac{1}{4}u_2^2) + \bar{u}u_2)(z - z_2)(z - z_3)z_{14}z_{12}^3z_{34}^4(dz)^8 \]

\[ \phi_{10}(z) = \frac{[u_{10}(z - z_1)(z - z_2)z_{34} - \bar{u}(u_4 - \frac{1}{4}u_2^2)(z - z_1)(z - z_4)z_{23}}{(z - z_1)^5(z - z_2)^5(z - z_3)^5(z - z_4)^6}
+ \bar{u}(u_4 - \frac{1}{4}u_2^2)(z - z_2)(z - z_3)z_{14}z_{12}^4z_{34}^5(dz)^{10} \]

\[ \bar{\phi}(z) = \frac{\bar{u}z_{12}^3z_{34}^3(dz)^6}{(z - z_1)^3(z - z_2)^3(z - z_3)^3(z - z_4)^3} \].
5.2.7. $\text{Spin}(12) + \frac{3}{2}(32) + \frac{1}{2}(32') + 2(12)$

The S-dual theories are an $\text{Sp}(2)$ gauging of the $\text{Sp}(4)_{12} \times SU(2)_{128}$ SCFT

and a $\text{Spin}(11)$ gauging of the $(E_8)_{12}$ SCFT + $\frac{3}{2}(32)$

The invariant $k$-differentials for (5.16) are given by

\[
\phi_2(z) = \frac{u_2 z_{12} z_{34} (dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)}
\]

\[
\phi_4(z) = \frac{u_4 z_{12}^2 z_{34}^2 (dz)^4}{(z - z_1)^2 (z - z_2)^2 (z - z_3)^2 (z - z_4)^2}
\]

\[
\phi_6(z) = \frac{u_6 (z - z_1)(z - z_2)z_{34} + (2\tilde{u} - \frac{1}{2}u_2(u_4 - \frac{1}{2}u_2^2))(z - z_1)(z - z_4)z_{23}}{(z - z_1)^4 (z - z_2)^3 (z - z_3)^4 (z - z_4)^4}
\]
\[
\phi_8(z) = \frac{u_8(z - z_1)(z - z_2)z_{34} - (\frac{1}{4}u_4 - \frac{1}{4}u_2^2(z - z_1)(z - z_4)z_{23}}{u_4(z - z_2)^4(z - z_3)^5(z - z_4)^5)}
\]
\[
\phi_{10}(z) = \frac{u_{10}(z - z_2)z_{34} + \bar{u}(u_4 - \frac{1}{4}u_2^2)(z - z_4)z_{23}z_{12}^4z_{34}^5(dz)^{10}}{(z - z_1)^4(z - z_2)^5(z - z_3)^6(z - z_4)^6)}
\]
\[
\tilde{\phi}(z) = \frac{\bar{u}z_{23}z_{12}^2z_{34}^3(dz)^6}{(z - z_1)^2(z - z_2)^3(z - z_3)^4(z - z_4)^3}.
\]

5.2.8. Spin(12) + 1(32) + 1(32') + 2(12)

The S-dual theory is an Sp(2) gauging of the Sp(2)_{12} × Sp(2)_{11} × U(1)^2 SCFT + \frac{1}{2}(4)

The invariant k-differentials for (5.18) are given by

\[
\phi_2(z) = \frac{u_2 z_{12}z_{34}(dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)}
\]
\[
\phi_4(z) = \frac{u_4 z_{12}z_{34}(dz)^4}{(z - z_1)^2(z - z_2)^2(z - z_3)^2(z - z_4)^2}
\]
\[
\phi_6(z) = \frac{u_6(z - z_1)(z - z_2)z_{34} - \frac{1}{2}u_2(u_4 - \frac{1}{4}u_2^2)((z - z_1)(z - z_3)z_{24} - (z - z_2)(z - z_4)z_{13})z_{12}z_{34}(dz)^6}{(z - z_1)^4(z - z_2)^4(z - z_3)^4(z - z_4)^4}
\]
\[
\phi_8(z) = \left[ u_8(z - z_1)(z - z_2)z_{34} - \frac{1}{4} \left( u_4 - \frac{1}{4} u_2^2 \right)^2 \left( (z - z_1)(z - z_3)z_{24} - (z - z_2)(z - z_4)z_{13} \right) \right] z_{12}^3 z_{34}^4 (dz)^8
\]
\[
\phi_{10}(z) = \frac{u_{10} z_{12}^4 z_{34}^6 (dz)^{10}}{(z - z_1)^4 (z - z_2)^4 (z - z_3)^6 (z - z_4)^6}
\]
\[
\tilde{\phi}(z) = \frac{\tilde{u} z_{12}^2 z_{34}^4 (dz)^6}{(z - z_1)^2 (z - z_2)^2 (z - z_3)^6 (z - z_4)^4}
\]

For (5.4), they are as above, but with \( \tilde{u} \equiv 0 \). As before, \( 5.15), (5.17) and (5.19) become identical when you set \( \tilde{u} = 0 \).

5.2.9. More Spinors

We cannot obtain

- \( Spin(12) + \frac{5}{2}(32) \)
- \( Spin(12) + 2(32) + \frac{1}{2}(32') \)
- \( Spin(12) + \frac{3}{2}(32) + 1(32') \)

from compactifying the \( D_6 \) theory.

6. \( Spin(13) \) and \( Spin(14) \) Gauge Theories

Here, we work in the \( D_7 \) theory.

6.1. \( Spin(13) + \frac{1}{2}(64) + 7(13) \)

Over the other degenerations, we have a gauge theory fixture
and an $SU(2)$ gauging of the $Sp(7)_{13} \times SU(2)_{7}$ SCFT $\pm \frac{1}{2}(2) + 6(1)$

The invariant $k$-differentials for (6.1) are given by

\[
\phi_2(z) = \frac{u_2 z_{13} z_{24}(dz)^2}{(z - z_1)(z - z_2)(z - z_3)(z - z_4)}
\]

\[
\phi_4(z) = \frac{u_4 z_{13} z_{23} z_{24}^2(dz)^4}{(z - z_1)(z - z_2)^3(z - z_3)^2(z - z_4)^2}
\]

\[
\phi_6(z) = \frac{[u_6(z - z_3)z_{12} - \frac{1}{2}u_2(u_4 - \frac{1}{4}u_2^2)(z - z_2)z_{13}z_{23}z_{24}^3(dz)^6}{(z - z_1)(z - z_2)^5(z - z_3)^4(z - z_4)^4}
\]

\[
\phi_8(z) = \frac{[u_8(z - z_3)z_{12} - \frac{1}{4}(u_4 - \frac{1}{4}u_2^2)^2(z - z_2)z_{13}z_{23}z_{24}^2z_{24}^4(dz)^8}{(z - z_1)(z - z_2)^7(z - z_3)^4(z - z_4)^5}
\]

\[
\phi_{10}(z) = \frac{u_{10} z_{13} z_{24} z_{23} z_{24}^3 z_{24}^5(dz)^{10}}{(z - z_1)(z - z_2)^9(z - z_3)^4(z - z_4)^6}
\]

\[
\phi_{12}(z) = \frac{u_{12} z_{13} z_{24} z_{23} z_{24}^3 z_{24}^7(dz)^{12}}{(z - z_1)(z - z_2)^{11}(z - z_3)^4(z - z_4)^8}
\]
\[ \tilde{\phi}(z) = 0. \]

### 6.2. More Spinors

We cannot obtain

- \( \text{Spin}(13) + 1(64) + 3(13) \)
- \( \text{Spin}(14) + 1(64) + 4(14) \)

from compactifying the \( D_7 \) theory.

### 7. Higher \( N \)?

For the “missing” theories of §6.2 and §5.2.9, we might hope to find realizations in the higher \( D_N \) or \( A_{2N-1} \) theories. It is easy to see that is no help. The key realization is that we need a candidate free-field fixture, consisting of three regular punctures. One of these punctures must be a full puncture.

In the \( D_N \) theory, the full puncture, \([1^{2N}]\), has a \( \text{Spin}(2N)_{4(N-1)} \) flavour symmetry. The free fields transform as some representation of \( \text{Spin}(2N) \) which reproduce the level \( k = 4(N-1) \). If the representation should happen to decompose correctly under a \( \text{Spin}(12) \) (\textit{mutatis mutandis} for a \( \text{Spin}(13) \) or \( \text{Spin}(14) \)) subgroup, then we would have a chance to build a realization of one of our missing gauge theories.

- For the \( \text{Spin}(12) \) theories of §5.2.9, we could note that the 64 of \( \text{Spin}(14) \) decomposes as \( 1(32) + 1(32') \). But getting the right level would require a puncture with level \( k = 32 \), whereas the full puncture of the \( D_7 \) theory has only \( k = 24 \).

- For the \( \text{Spin}(13) \) and \( \text{Spin}(14) \) theories of §6.2, going to higher \( D_N \) could only produce the 64 with multiplicity > 1, which also does not help.

In the twisted sector of the \( A_{2N-1} \) theory, the full puncture has \( \text{Spin}(2N+1)_{2(2N-1)} \) flavour symmetry.

- For the \( \text{Spin}(12) \) theories of §5.2.9, we need \( k \) to be a multiple of 8, so none of these are satisfactory.
- For the \( \text{Spin}(13) \) and \( \text{Spin}(14) \) theories of §6.2, we need \( k \) to be a multiple of 4, which also does not work.

What about the exceptional \((2,0)\) theories? \( E_7 \) and \( E_8 \) contain our desired gauge groups as subgroups. But neither the 56 of \( E_7 \), nor the 248 of \( E_8 \) decompose correctly to provide candidate free field fixtures with one full puncture (and two other regular punctures).

So it appears that the missing theories of §5.2.9 and §6.2 are not realizable as compactifications of the \((2,0)\) theory.
Acknowledgements

We would like to thank D. Ben-Zvi, S. Katz, G. Moore, D. Morrison, A. Neitzke, R. Plesser and Y. Tachikawa for helpful discussions. J. D. and O. C. would like to thank the Aspen Center for Physics (supported, in part, by the National Science Foundation under Grant PHY-1066293) for their hospitality when this work was initiated. O. C. would further like to thank the Simons Foundation for partial support in Aspen. The work of J. D. and A. T. was supported in part by the National Science Foundation under Grant PHY-1316033. The work of O. C. was supported in part by the INCT-Matemática and the ICTP-SAIFR in Brazil through a Capes postdoctoral fellowship.
