Abstract

Background: Although the application of ultraviolet B (UVB) in phototherapy of human skin is a common therapeutic method, it is known as a risk factor for skin cancer. This study aims to assess the role of differentially expressed genes (DEGs) to find the critical one that is mainly responsible for skin protection against UVB radiation.

Methods: The gene expression profiles of irradiated mice by UVB that issued skin protection against exposure are extracted from Gene Expression Omnibus (GEO) and analyzed by GEO2R. The significant DEGs are assessed via gene ontology (GO) analysis and the critical individuals are investigated via action mapping.

Results: Thirty-eight significant DEGs that provide skin resistance against UVB irradiation were determined. Among the query DEGs, 26 individuals were related to 43 biological terms. Flt4, F3, Tspan6, Cblb, and Itgb6 were highlighted as the critical DEGs to promote skin protection against UVB irradiation.

Conclusion: The finding indicates that Flt4 is the key DEG that is mainly responsible for protecting skin from UVB exposure.

Keywords: UVB; Skin; Mouse; Gene ontology; Flt4.

Introduction

Human skin receives ultraviolet (UV) radiation from sunlight, the prominent factor in promoting skin cancer. Since UV rays cannot penetrate into the deep part of the body, skin is the main target for UV radiation. Three types of UV light have been introduced as UVA, UVB, and UVC that are discriminated based on their wavelength. UVC (180-280 nm) has the highest level of energy while UVA (320-400 nm) has the lowest amounts of energy. The middle energy level belongs to the UVB (280-320 nm). UVB is known as a risk factor in promoting human skin cancer. The application of UVB in phototherapy of skin disorders such as vitiligo, cutaneous T-cell lymphoma, atopic dermatitis, alopecia, and psoriasis is accompanied by this question that ‘Is using UVB phototherapy harmful for the patients’?

Previous studies have shown that each kind of human body damage is accompanied by large changes in the expression of different genes in hurt individuals. There are various accessible data banks that store the differential expressed genes related to diseases and disorders. Gene expression Omnibus is the source that provides access to the numerous gene expression profiles. The analysis of the large numbers of differentially expressed genes (DEGs) implies the application of bioinformatics tools to discriminate the query DEGs based on the impact and importance of gene products relative to each other. In such analysis among the large numbers of DEGs, the limited individuals are introduced as the critical genes which are responsible for the main part of changes. The gene ontology approach is a useful method for determining the biological processes, cellular components, molecular function, and biochemical pathways that are involved with the studied DEGs. Another useful tool is action mapping that helps to find the precise DEGs that are mainly responsible for skin protection against UVB exposure.
Material and Methods

GSE79073/GPL6246 was extracted from GEO (a public functional genomics data repository). As it is reported, two groups of mice (each group includes 3 mice) were exposed to a single dose of 80 mJ/cm² of UVB (emission range, 280-300; peak 324 nm) radiation. The first group which was a wild type in this study is shown as group 1 and it is considered as the control group and the second group (group 2) included CBL-b⁻/⁻ mice, considered as the sample group. Dorsal skin RNA samples of two studied groups before and 24 hours after exposure to UV were collected and analyzed by an Affymetrix Muse Gene 1.0 ST array. The details of methods are described in the report by Singh et al, published in a paper in 2018. In the present study, gene expression profiles of the two groups are analyzed via GEO2R software. First of all, the 6 gene expression profiles were statistically matched. Among all DEGs, 250 top individuals (based on P value) were extracted by GEO2R software. Considering fold change (FC) more than 1.5 and P value < 0.001, the significant DEGs were identified among the selected 250 top DEGs. The significant uncharacterized DEGs were omitted. If, for a certain spot, several genes were suggested, the individuals with the first one were considered and the others were not included in the next step of the analysis.

Gene ontology analysis via the ClueGo application of Cytoscape software was applied to identify pathways, cellular components, biological processes, and molecular function which were related to the 38 significant DEGs. The biological terms which included at least 6 genes and P value < 0.05 were considered for more analysis. The frequency of involved biological terms was identified for each significant DEG. CluPedia, the other plugin of Cytoscape, was applied to determine the action map for the 38 significant DEGs.

Results

Statistical matching of gene expression profiles is shown in Figure 1. As it is depicted in the figure distributions of gene expression amounts of the samples are median center and can be matched. The 38 significant DEGs among the 250 extracted DEGs were included in the study. The significant DEGs and their properties are presented in Table 1 and Figure 2.

As it is depicted in Tables 2-4, gene ontology analysis revealed that 26 significant DEGs among all query DEGs are involved in 17 cellular components, 24 biological processes and pathways, and 2 molecular function terms. The numbers and titles of the involved DEGs and also the percentage of participation of DEGs in the biological terms are presented in Tables 2-4.

For better understanding, the 26 DEGs that are involved in the biological terms and the frequency of the related biological terms for the individual DEGs are tabulated in Table 5.

The action map including activation, inhibition, regulation, binding, and reaction, for the 38 significant DEGs was provided by the CluePedia application of Cytoscape software. Action map presentation (see Figure 3) revealed that Flt4, F3, Tspan6, Cntfr, Nr1d1, Cblb, Itgb6, and Masp1 are connected with different types of actions. As it is presented in Figure 3, Flt4 not only activates Cblb but also inhibits this gene. Flt4 was up-regulated by Itgb6,
There are numerous documents about the mechanism of radiation (especially UV radiation) effect on skin\textsuperscript{17-19} but more investigations should be planned to achieve clear presentation of the molecular mechanism related to the damages and also repair processes. In the present study, gene expression changes of dorsal skin of mice in the absence of CBL-b activity (CBL-b\texttextsuperscript{-/-}mouse) after exposure to UVB in comparison with the wild types were investigated. Singh et al. have reported that in the absence of CBL-b activity, UVB irradiation leads to lower numbers of DNA photoproducts and sunburn cells.\textsuperscript{14} We assessed the genes that are possibly responsible for this protection.

As it is presented in the result part, there are 38 significant DEGs that discriminate the studied samples. GO analysis highlighted 26 DEGs among the 38 significant DEGs which were involved in the related biological terms. Action map analysis revealed that 8 DEGs among 26 individuals were connected to each other via action roles. A comparison between Table 5 and Figure 3 indicates that 63% of genes that are connected in the action map including Flt4, F3, Tspan6, Cblb, and Itgb6 are characterized with the “frequency of the involved biological terms” above 95% in Table 5. It seems that these 5 genes are the critical individuals that play a significant role in protection against UVB radiation. The illustrated connections in Figure 3 indicate that connections between Flt4, Tspan6, Cblb, and Itgb6 are so important and the genes are linked in a complex pattern of connections.

Table 1. List of 38 DEGs That Differentiate the Two Studied Groups of Mice.

| Gene Symbol | Gene Title                                      | logFC |
|-------------|-------------------------------------------------|-------|
| Nnt         | Nicotinamide nucleotide transhydrogenase       | 1.214 |
| Serpina1c    | Serine (or cysteine) peptidase inhibitor, clade A, member 1C | 1.076 |
| Atp10d       | ATPase, class V, type 10D                       | 1.015 |
| Nectd1       | Nuclear receptor subfamily 1, group D, member 1  | 0.731 |
| Fbn1f7       | Ferritin, heavy polypeptide-like 17, member F   | 0.697 |
| F3           | Coagulation factor III                          | 0.663 |
| Il22ra1      | Interleukin 22 receptor, alpha 1                | 0.651 |
| Cd300b       | CD300 molecule like family member B             | 0.643 |
| Masp1        | Mannan-binding lectin serine peptidase 1        | 0.626 |
| Flt4         | FMS-like tyrosine kinase 4                      | 0.616 |
| Proxl        | Prospero homeobox 1                             | 0.608 |
| Sox15        | SRY (sex-determining region Y)-box 15           | 0.606 |
| Slc7a2       | Solute carrier family 7 (cationic amino acid transporter, y+ system), member 2 | -0.631 |
| Gm7120       | Predicted gene 7120                             | -0.616 |
| Abhd10       | Abhydrolase domain containing 10                | -0.643 |
| Itgb6        | Integrin beta 6                                 | -0.677 |
| Serpinb6ic   | Serine (or cysteine) peptidase inhibitor, clade B, member 6d | -0.69 |
| Tspan6       | Tetraspanin 6                                   | -0.697 |
| Hmgn5        | High-mobility group nucleosome binding domain 5 | -0.76 |
| TcrgV6       | T-cell receptor gamma, variable 6               | -0.764 |
| Steap4       | STEAP family member 4                           | -0.922 |
| Dab2         | Dppa2 upstream binding RNA                      | -0.942 |
| Snoe116d2    | Small nuclear RNA, C/D box 116-like 2           | -0.961 |
| Cntfr        | Ciliary neurotrophic factor receptor            | -1.031 |
| Vaultr5      | Vault RNA component 5                           | -1.034 |
| Plac9b       | Placenta specific 9b                            | -1.051 |
| Bc005685     | cDNA sequence BC005685                         | -1.101 |
| Cblb         | Casitas B-lineage lymphoma b                    | -1.123 |
| Tmem254b     | Transmembrane protein 254b                     | -1.174 |
| Snoe1068     | Small nuclear RNA, C/D box 68                   | -1.195 |
| Gm10309      | predicted gene 10309                           | -1.237 |
| Slc15a2      | Solute carrier family 13 (H+/peptide transporter, member 2) | -1.28 |
| Gm42035      | Predicted gene, 42035                          | -1.496 |
| Roy1         | RNA, Y1 small cytoplasmic, Ro-associated        | -1.66 |
| Slc13a3      | Solute carrier family 13 (sodium-dependent dicarboxylate transporter), member 3 | -1.816 |
| Saa3         | Serum amyloid A 3                               | -2.155 |
| Derb8        | Defensin beta 8                                | -2.429 |
| Multfm1      | Multimeerin 1                                  | -2.888 |

Note. P value < 0.001 and fold change (FC) more than 1.5 were considered. Positive and negative values refer to up- and down-regulation in the CBL-b\texttextsuperscript{-/-} mice relative to the wild types.

**Discussion**

Figure 3. The Action Map of 38 Significant DEGs. Green, red, yellow, blue, purple, and black refer to activation, inhibition, regulation, binding, reaction, and catalysis actions respectively.

Cblb, and Prpx1 and up-regulates Itgb6 and Cblb.
### Table 2. Seventeen Cellular Component Terms That Are Related to the Several Queried DEGs

| GO Term                        | % AGs | NGs | Associated Genes                                                                 |

| Membrane-bounded organelle    | 0.17  | 18  | [Ahdh10, Atp10d, Chlb, Flt4, Hmgn5, Itgb6, Maspl1, Nnt, Nr1d1, Prox1, Serpin1c, Slc13a3, Slc15a2, Slc7a2, Sox15, Steap4, Tspan6] |
| Intracellular membrane-bounded organelle | 0.14  | 13  | [Ahdh10, Atp10d, Chlb, Flt4, Hmgn5, Maspl1, Nnt, Nr1d1, Prox1, Serpin1c, Slc7a2, Sox15, Steap4] |

Note: The term $P$ value and the term $P$ value corrected with Bonferroni step-down < 0.05 were considered. %AGs and NGs correspond to the percent of the associated genes and the number of the involved genes respectively. The GO cellular component is the ontology source.

### Table 3. Twenty-Three Biological Processes Which Are Related to a Number of Queried DEGs.

| GO Term                        | % AGs | NGs | Associated Genes Found                                                                       |
|-------------------------------|-------|-----|------------------------------------------------------------------------------------------------|
| Defense response              | 0.68  | 9   | [Defb8, F3, Il22ra1, Itgb6, Maspl1, Nr1d1, Sa3a, Slc7a2, Tspan6]                                |
| Regulation of biological process | 0.17  | 16  | [Chlb, Cd100b, Cntfr, F3, Flt4, Hmgn5, Il22ra1, Itgb6, Maspl1, Nr1d1, Prox1, Sa3a, Serpin1c, Slc13a3, Slc15a2, Slc7a2, Sox15, Tspan6] |
| Response to stress            | 0.37  | 12  | [Defb8, F3, Flt4, Il22ra1, Itgb6, Maspl1, Menm1, Nr1d1, Sa3a, Slc7a2, Sox15, Tspan6]          |
| Response to external stimulus | 0.44  | 9   | [Cd300b, Defb8, Il22ra1, Nr1d1, Prox1, Sa3a, Slc7a2, Sox15, Tspan6]                           |
| Response to chemical          | 0.22  | 8   | [Cd300b, Cntfr, F3, Flt4, Il22ra1, Nr1d1, Sa3a, Serpin1c]                                    |
| Positive regulation of biological process | 0.21  | 11  | [Chlb, Cd100b, Cntfr, F3, Flt4, Hmgn5, Maspl1, Nr1d1, Prox1, Sox15, Tspan6]                  |
| Negative regulation of biological process | 0.19  | 9   | [Chlb, Cntfr, Flt4, Hmgn5, Nr1d1, Prox1, Serpin1c, Sox15, Tspan6]                           |
| Regulation of immune system process | 0.53  | 6   | [Chlb, Cd100b, Maspl1, Nr1d1, Slc7a2, Tspan6]                                               |
| Regulation of response to stimulus | 0.23  | 8   | [Chlb, F3, Flt4, Maspl1, Nr1d1, Slc7a2, Sox15, Tspan6]                                      |
| Regulation of cellular process | 0.17  | 15  | [Chlb, Cd100b, Cntfr, F3, Flt4, Hmgn5, Il22ra1, Itgb6, Nr1d1, Prox1, Sa3a, Serpin1c, Slc7a2, Sox15, Tspan6] |
| Signal transduction           | 0.19  | 9   | [Chlb, Cntfr, F3, Flt4, Il22ra1, Itgb6, Nr1d1, Sa3a, Tspan6]                                |
| Response to organic substance | 0.29  | 8   | [Cd300b, Cntfr, F3, Flt4, Il22ra1, Nr1d1, Sa3a, Serpin1c]                                    |
| Regulation of cell proliferation | 0.52  | 8   | [Chlb, Cntfr, F3, Flt4, Hmgn5, Nr1d1, Prox1, Sox15]                                         |
| Positive regulation of cellular process | 0.19  | 9   | [Cd300b, Cntfr, F3, Flt4, Hmgn5, Nr1d1, Prox1, Sox15, Tspan6]                               |
| Negative regulation of cellular process | 0.21  | 9   | [Chlb, Cntfr, Flt4, Hmgn5, Nr1d1, Prox1, Serpin1c, Sox15, Tspan6]                           |
| Positive regulation of response to stimulus | 0.37  | 7   | [Chlb, F3, Flt4, Maspl1, Nr1d1, Sox15, Tspan6]                                             |
| Cellular response to chemical stimulus | 0.27  | 7   | [Cd300b, Cntfr, F3, Flt4, Il22ra1, Nr1d1, Sa3a]                                             |
| Organonitrogen compound metabolic process | 0.17  | 10  | [Chlb, F3, Flt4, Hmgn5, Maspl1, Nnt, Nr1d1, Prox1, Sa3a, Serpin1c]                         |
regulated similarly. Also, it is shown that there is possible binding action between Tspan6 and Itgb6. Investigations into the role of exosomes in the promotion of important processes in intercellular communication and different types of diseases indicated that tetraspanin family proteins (Tspans) and integrins (Itga and Itgb) are key elements for process that exosomes select the recipient cells and bind to the surface of the cells. Itgb6 is linked to Flt4 by four types of actions including reciprocal activation, binding, reaction, and catalysis. The importance of dysregulation of integrins in different kinds of diseases is reported by researchers. Integrins are members of proteins that participate in the facilitation of signaling between the intracellular and extracellular environments. These proteins are cell-surface proteins and are formed from two heterodimers.

The central protein in Figure 3 is Flt4 which is connected to Itgb6, Cbl-b, and Il22ra1. As it is shown in Table 2, Flt4 is up-regulated and it is the top participant protein in the identified biological terms (see Table 5). Flt4, as the receptor of vascular endothelial growth factor C (Vegfc) beside transcription factor Prox1 and Vegfc, plays an essential role in lymphatic system formation. Its dysregulation is tied to disorders such as Milroy, heart, and cardiovascular diseases. Prox1 is the 13th element of Table 5 that is characterized by 37% of the “Frequency of the involved biological terms”. As it is shown in Figure 3, Prox1 activates Flt4 and up-regulates its expression. Here, Cbl-b was the main gene, the direct effect of which on sensitivity against UVB irradiation was studied. The wide range of connections between Cbl-b and Flt4 (see Figure 3) reflects the key role of Flt4 in this study. However, there is a reciprocal activation connection between Cbl-b and Itgb6 but Flt4 inhibits Cbl-b, the central hypothesis of this project. A binding action between Cbl-b and Itgb6 is highlighted in Figure 3, which links axis Itgb6-Tspan6 directly to Cbl-b.

### Table 4. Two Molecular Function Terms Related to 13 Queried DEGs.

| GO Term                      | % AGs | NGs | Associated Genes Found |
|------------------------------|-------|-----|------------------------|
| Receptor activity            | 0.53  | 6   | [Cntfr, F3, Flt4, Il22ra1, Itgb6, Nr1d1] |
| Protein binding              | 0.16  | 13  | [Cblb, Cd300lb, Cntfr, F3, Flt4, Il22ra1, Itgb6, Maspl, Serpina1c, Serpinb6d] |

Note: The term P value and the term P value corrected with Bonferroni step-down < 0.05 were considered. %AGs and NGs correspond to the percent of the associated genes and the number of the involved genes respectively. GO molecular function is the ontology source.

### Table 5. Twenty-Six DEGs That Are Involved in the Biological Terms and the Frequency of the Related Biological Terms for the Individual DEGs Are Shown

| Gene Symbol | Number of Involved Biological Terms | % Frequency of Involved Biological Terms |
|-------------|-------------------------------------|----------------------------------------|
| Flt4        | 33                                  | 77                                     |
| F3          | 33                                  | 77                                     |
| Tspan6      | 29                                  | 67                                     |
| Cntfr       | 28                                  | 65                                     |
| Nr1d1       | 27                                  | 73                                     |

Since this project was administered with clear knowledge about the effect of Cbl-b on the promotion of radiation damages and the absence of a connection between F3-Masp1axis and the core elements of the action map, it can be concluded that Flt4, Itgb6, and Tspan6 are critical genes in the protection of skin against UVB irradiation. On the other hand, Flt4 plays a prominent role in the connection between Cbl-b and the other elements of the action map. Finally, Flt4 is a suitable candidate which is the main responsible agent involved in the events related to the irradiated skin. It seems that the up-regulation of Flt4 is a protective process in response to the radiation.

**Conclusion**

It can be concluded that the protection process against UVB irradiation on skin implies gene expression changes in different types of genes. Our analysis revealed some biological terms which are related to the fundamental biological processes were affected by 26 genes. Screening methods showed Flt4 was a central differential expressed gene which issued a significant regulatory property relative to the other critical genes. Compact regulatory action between Flt4 and neighbors corresponds to its prominent role in the protective response of the body against UVB irradiation.
