Abstract

In this work, we obtain some new generalized weighted trapezoid and Grüss type inequalities on time scales for parameter functions. Our results give a broader generalization of the results due to Pachpatte in [14]. In addition, the continuous and discrete cases are also considered from which, other results are obtained.

Keywords: Montgomery’s identity, trapezoid inequality, Grüss inequality, time scales.

2000 Mathematics Subject Classification: 26D15, 54C30, 26D10.

1 Introduction

In 2003, Pachpatte [14] obtained the following versions (see also [10, 11] for the original versions) of the trapezoid and Grüss type inequalities:

Theorem 1. Let $f : [a, b] \rightarrow \mathbb{R}$ be continuous on $[a, b]$ and differentiable on $(a, b)$, whose derivative $f' : (a, b) \rightarrow \mathbb{R}$ is bounded on $(a, b)$. Then

$$\left| \frac{1}{2} \left( f^2(b) - f^2(a) \right) - \frac{f(b) - f(a)}{b - a} \int_a^b f(x)dx \right| \leq \frac{1}{3} (b - a)^2 \|f'\|_\infty^2.$$

Theorem 2. Let $f, g : [a, b] \rightarrow \mathbb{R}$ be continuous on $[a, b]$ and differentiable on $(a, b)$, whose derivative $f', g' : (a, b) \rightarrow \mathbb{R}$ are bounded on $(a, b)$. Then

$$\left| \frac{1}{b - a} \int_a^b f(x)g(x)dx - \left( \frac{1}{b - a} \int_a^b f(x)dx \right) \left( \frac{1}{b - a} \int_a^b g(x)dx \right) \right| \leq \frac{1}{2(b - a)^2} \int_a^b \left( \|f'\|_\infty |g(x)| + ||g'||_\infty |f(x)| \right) E(x)dx,$$

where $E(x)$ is a positive function on $[a, b]$. 

This is a preprint of a paper whose final and definite form is published open access in the Australian Journal of Mathematical Analysis and Applications. Cite this paper as “E. R. Nwaeze, Generalized weighted trapezoid and Grüss type inequalities on time scales, Aust. J. Math. Anal. Appl., 11(1)(2017), Article 4, 113.”
Theorem 4. Let \( h : [a, b, s, t] = \sup M \) where \( E \) is differentiable and \( p, q : [a, b] \to \mathbb{R} \) be continuous and positive and \( h : [a, b] \to \mathbb{R} \) be differentiable such that \( h^\Delta(t) = g(t) \) on \([a, b] \). Suppose also that \( a, b, s, t \in T, \ a < b, \) and \( f : [a, b] \to \mathbb{R} \) is differentiable. Then the following inequality holds
\[
\begin{align*}
&\left| (1 - k) \left( f^2(b) - f^2(a) \right) + k \left( f(\sigma(a))f(b) - f(\sigma(b))f(a) \right) \\
&+ \left[ (k - 1) \frac{f(b) - f(a)}{\int_a^b g(t)\Delta t} + k \frac{f(\sigma(b)) - f(\sigma(a))}{\int_a^b g(t)\Delta t} \right] \int_a^b g(t)f(\sigma(t))\Delta t \\
&- \frac{f(b) - f(a)}{\int_a^b g(t)\Delta t} \int_a^b g(t)f(\sigma^2(t))\Delta t \right| \\
&\leq \frac{M(N + M)}{\int_a^b g(t)\Delta t} \int_a^b \left( \int_a^b |S(t, s)|\Delta s \right) \Delta t,
\end{align*}
\]
where
\[
S(t, s) = \begin{cases}
h(s) - (1 - k)h(a) + kh(t), & s \in [a, t), \\
h(s) - (kh(t) + (1 - k)h(b)), & s \in [t, b],
\end{cases}
\]
and
\[
M = \sup_{a < t < b} \left| f^\Delta(t) \right| < \infty \quad \text{and} \quad N = \sup_{a < t < b} \left| f^\Delta(\sigma(t)) \right| < \infty.
\]

Theorem 3. Let \( 0 \leq k \leq 1, g : [a, b] \to [0, \infty) \) be continuous and positive and \( h : [a, b] \to \mathbb{R} \) be differentiable such that \( h^\Delta(t) = g(t) \) on \([a, b] \). Suppose also that \( a, b, s, t \in T, \ a < b, \) and \( f : [a, b] \to \mathbb{R} \) is differentiable. Then the following inequality holds
\[
\begin{align*}
&\left| 2(1 - k) \left( \int_a^b g(t)\Delta t \right) \left( \int_a^b p(t)q(t)\Delta t \right) \\
&+ k \int_a^b \left\{ q(t) \left[ \left( \int_a^t g(s)\Delta s \right) p(a) + \left( \int_t^b g(s)\Delta s \right) p(b) \right] \\
&+ p(t) \left[ \left( \int_a^t g(s)\Delta s \right) q(a) + \left( \int_t^b g(s)\Delta s \right) q(b) \right] \right\} \Delta t \\
&- \left[ \left( \int_a^b q(t)\Delta t \right) \left( \int_a^b g(t)p(\sigma(t))\Delta t \right) + \left( \int_a^b p(t)\Delta t \right) \left( \int_a^b g(t)q(\sigma(t))\Delta t \right) \right] \right| \\
&\leq \int_a^b \left( |P|q(t) + |Q|p(t) \right) \left( \int_a^b |S(t, s)|\Delta s \right) \Delta t,
\end{align*}
\]
where
\[ S(t,s) = \begin{cases} h(s) - (1 - k)h(a) + kh(t), & s \in [a, t), \\ h(s) - (kh(t) + (1 - k)h(b)), & s \in [t, b], \end{cases} \]
and
\[ P = \sup_{a < t < b} \mid p^\Delta(t) \mid < \infty \quad \text{and} \quad Q = \sup_{a < t < b} \mid q^\Delta(t) \mid < \infty. \]

Recently, Xu and Fang \cite{15} introduced a technique of parameter functions. In light of this, they obtained a new Ostrowski type inequality for parameter functions. Inspired by this technique and the idea used in \cite{6}, we prove another version of the trapezoid and Grüss type inequalities for parameter functions via a new weighted Peano Kernel.

The paper is arranged as follows. In Section 2 we recall necessary results and definitions in time scale theory. Our results are formulated and proved in Section 3.

2 Preliminaries

We start by presenting the following time scale essentials that will come handy in what follows. For more on the theory of time scales, we refer the reader to the books of Bohner and Peterson \cite{1} and Bohner and Peterson \cite{2}.

Definition 5. A time scale \( \mathbb{T} \) is an arbitrary nonempty closed subset of \( \mathbb{R} \). The forward jump operator \( \sigma : \mathbb{T} \to \mathbb{T} \) and backward jump operator \( \rho : \mathbb{T} \to \mathbb{T} \) are defined by \( \sigma(t) := \inf \{ s \in \mathbb{T} : s > t \} \) for \( t \in \mathbb{T} \) and \( \rho(t) := \sup \{ s \in \mathbb{T} : s < t \} \) for \( t \in \mathbb{T} \), respectively. Clearly, we see that \( \sigma(t) \geq t \) and \( \rho(t) \leq t \) for all \( t \in \mathbb{T} \). If \( \sigma(t) > t \), then we say that \( t \) is right-scattered, while if \( \rho(t) < t \), then we say that \( t \) is left-scattered. If \( \sigma(t) = t \), then \( t \) is called right dense, and if \( \rho(t) = t \) then \( t \) is called left dense. Points that are both right dense and left dense are called dense. The set \( \mathbb{T}^k \) is defined as follows: if \( \mathbb{T} \) has a left scattered maximum \( m \), then \( \mathbb{T}^k = \mathbb{T} - m \); otherwise, \( \mathbb{T}^k = \mathbb{T} \). For \( a, b \in \mathbb{T} \) with \( a \leq b \), we define the interval \( [a, b] \) in \( \mathbb{T} \) by \( [a, b] = \{ t \in \mathbb{T} : a \leq t \leq b \} \).

Open intervals and half-open intervals are defined in the same manner.

Definition 6. The function \( f : \mathbb{T} \to \mathbb{R} \), is called differentiable at \( t \in \mathbb{T}^k \), with delta derivative \( f^\Delta(t) \in \mathbb{R} \), if for any given \( \epsilon > 0 \) there exist a neighborhood \( U \) of \( t \) such that
\[ \left| f(\sigma(t)) - f(s) - f^\Delta(t)(\sigma(t) - s) \right| \leq \epsilon |\sigma(t) - s|, \quad \forall s \in U. \]

If \( \mathbb{T} = \mathbb{R} \), then \( f^\Delta(t) = \frac{df(t)}{dt} \), and if \( \mathbb{T} = \mathbb{Z} \), then \( f^\Delta(t) = f(t + 1) - f(t) \).

Theorem 7. Let \( f, g : \mathbb{T} \to \mathbb{R} \) be two differentiable functions at \( t \in \mathbb{T}^k \). Then the product \( fg : \mathbb{T} \to \mathbb{R} \) is also differentiable at \( t \) with
\[ (fg)^\Delta(t) = f^\Delta(t)g(t) + f(\sigma(t))g^\Delta(t) = f(t)g^\Delta(t) + f^\Delta(t)g(\sigma(t)). \]

Definition 8. The function \( f : \mathbb{T} \to \mathbb{R} \) is said to be rd–continuous if it is continuous at all dense points \( t \in \mathbb{T} \) and its left-sided limits exist at all left dense points \( t \in \mathbb{T} \).

Definition 9. Let \( f \) be a rd–continuous function. Then \( g : \mathbb{T} \to \mathbb{R} \) is called the antiderivative of \( f \) on \( \mathbb{T} \) if it is differentiable on \( \mathbb{T} \) and satisfies \( g^\Delta(t) = f(t) \) for any \( t \in \mathbb{T}^k \). In this case, we have
\[ \int_a^b f(s) \Delta s = g(b) - g(a). \]
Theorem 10. If \(a, b, c \in \mathbb{T}\) with \(a < c < b\), \(\alpha \in \mathbb{R}\) and \(f, g\) are rd-continuous, then

(i) \(\int_a^b [f(t) + g(t)] \Delta t = \int_a^b f(t) \Delta t + \int_a^b g(t) \Delta t\).

(ii) \(\int_a^b \alpha f(t) \Delta t = \alpha \int_a^b f(t) \Delta t\).

(iii) \(\int_a^b f(t) \Delta t = - \int_a^b f(t) \Delta t\).

(iv) \(\int_a^b f(t) \Delta t = \int_a^b f(t) \Delta t + \int_a^b f(t) \Delta t\).

(v) \(\int_a^b f(t) \Delta t \leq f(t) |f(t)| \Delta t\) for all \(t \in [a, b]\).

(vi) \(\int_a^b (fg(t)) \Delta t = (fg)(b) - (fg)(a) - \int_a^b f^{\Delta}(t)g(\sigma(t)) \Delta t\).

Definition 11. Let \(h_k : \mathbb{T}^2 \rightarrow \mathbb{T}\), \(k \in \mathbb{N}\) be functions that are recursively defined as

\[ h_0(t, s) = 1 \]

and

\[ h_{k+1}(t, s) = \int_s^t h_k(\tau, s) \Delta \tau, \quad \text{for all } s, t \in \mathbb{T}. \]

When \(\mathbb{T} = \mathbb{R}\), then for all \(s, t \in \mathbb{T}\),

\[ h_k(t, s) = \frac{(t-s)^k}{k!}. \]

3 Main results

For the proof of our main results, we will need the following lemma due to Nwaeze [13].

Lemma 12 (A weighted generalized Montgomery Identity). Let \(\nu : [a, b] \rightarrow [0, \infty)\) be rd-continuous and positive and \(w : [a, b] \rightarrow \mathbb{R}\) be differentiable such that \(w^{\Delta}(t) = \nu(t)\) on \([a, b]\). Suppose also that \(a, b, s, t \in \mathbb{T}\), \(a < b\), \(f : [a, b] \rightarrow \mathbb{R}\) is differentiable, and \(\psi\) is a function of \([0, 1]\] into \([0, 1]\]. Then we have the following equation

\[
\left[\frac{1 + \psi(1 - \lambda) - \psi(\lambda)}{2} f(t) + \frac{\psi(\lambda) f(a) + (1 - \psi(1 - \lambda)) f(b)}{2}\right] \int_a^b \nu(t) \Delta t
= \int_a^b K(s, t) f^{\Delta}(s) \Delta s + \int_a^b \nu(s) f(\sigma(s)) \Delta s, \quad (1)
\]

where

\[
K(s, t) = \begin{cases} 
  w(s) - \left( w(a) + \psi(\lambda) \frac{w(b) - w(a)}{2} \right), & \text{if } s \in [a, t), \\
  w(s) - \left( w(a) + (1 + \psi(1 - \lambda)) \frac{w(b) - w(a)}{2} \right), & \text{if } s \in [t, b].
\end{cases} \quad (2)
\]

3.1 A weighted trapezoid type inequality on time scales

Theorem 13. Let \(\nu : [a, b] \rightarrow [0, \infty)\) be continuous and positive and \(w : [a, b] \rightarrow \mathbb{R}\) be differentiable such that \(w^{\Delta}(t) = \nu(t)\) on \([a, b]\). Suppose also that \(a, b, s, t \in \mathbb{T}\), \(a < b\), \(f : [a, b] \rightarrow \mathbb{R}\) is differentiable, and \(\psi\) is a function of \([0, 1]\] into \([0, 1]\]. Then we have the following inequality
Proof. From Lemma 12, we have
\[
\left| \frac{1 + \psi(1 - \lambda) - \psi(\lambda)}{2} \left( f^2(b) - f^2(a) \right) - \frac{f(b) - f(a)}{\int_a^b \nu(t) \Delta t} \int_a^b \nu(s) \left( f(\sigma(s)) + f(\sigma^2(s)) \right) \Delta s \right| \\
+ \frac{\psi(\lambda) \left( f(a) + f(\sigma(a)) \right) + (1 - \psi(1 - \lambda)) \left( f(b) + f(\sigma(b)) \right)}{2} \left( f(b) - f(a) \right) \\
\leq \frac{M(N + M)}{\int_a^b \nu(t) \Delta t} \int_a^b \left( \int_a^b |K(s, t)| \Delta s \right) \Delta t, \tag{3}
\]
where
\[
K(s, t) = \begin{cases}
w(s) - \left( w(a) + \psi(\lambda) \frac{w(b) - w(a)}{2} \right), & s \in [a, t), \\
& s \in [t, b],
\end{cases} \tag{4}
\]
\[
M = \sup_{a < t < b} \left| f^\Delta(t) \right| < \infty \quad \text{and} \quad N = \sup_{a < t < b} \left| f^\Delta(\sigma(t)) \right| < \infty.
\]

Proof. From Lemma 12 we have
\[
\frac{1 + \psi(1 - \lambda) - \psi(\lambda)}{2} f(t) = \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b K(s, t) f^\Delta(s) \Delta s + \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b \nu(s) f(\sigma(s)) \Delta s \\
- \frac{\psi(\lambda) f(a) + (1 - \psi(1 - \lambda)) f(b)}{2}, \tag{5}
\]
and
\[
\frac{1 + \psi(1 - \lambda) - \psi(\lambda)}{2} f(\sigma(t)) = \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b K(s, t) f^\Delta(\sigma(s)) \Delta s + \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b \nu(s) f(\sigma^2(s)) \Delta s \\
- \frac{\psi(\lambda) f(\sigma(a)) + (1 - \psi(1 - \lambda)) f(\sigma(b))}{2}. \tag{6}
\]

Adding Equations (5) and (6), we get
\[
\frac{1 + \psi(1 - \lambda) - \psi(\lambda)}{2} \left( f(t) + f(\sigma(t)) \right) = \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b K(s, t) \left( f^\Delta(s) + f^\Delta(\sigma(s)) \right) \Delta s \\
+ \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b \nu(s) \left( f(\sigma(s)) + f(\sigma^2(s)) \right) \Delta s \\
- \frac{\psi(\lambda) \left( f(a) + f(\sigma(a)) \right) + (1 - \psi(1 - \lambda)) \left( f(b) + f(\sigma(b)) \right)}{2}. \tag{7}
\]

Multiplying (7) by \( f^\Delta(t) \) and using Theorem 7 gives
\[ \frac{1 + \psi(1 - \lambda) - \psi(\lambda)}{2} \left( f^2(t) \right) = \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b K(s, t) \left( f^2(s) + f^2(\sigma(s)) \right) \Delta s \]
\[ + \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b \nu(s) \left( f(s) + f(\sigma(s)) \right) \Delta s \]
\[ - \frac{1}{\nu(t) \Delta t} \int_a^b \nu(s) \left( f(s) + f(\sigma(s)) \right) \Delta s \]
\[ \psi(1 - \lambda) \left( f(a) + f(\sigma(a)) \right) + (1 - \psi(1 - \lambda)) \left( f(b) + f(\sigma(b)) \right) f^2(t). \]

Now, integrating (8) on \([a, b]\), we have

\[ \frac{1 + \psi(1 - \lambda) - \psi(\lambda)}{2} \left( f^2(b) - f^2(a) \right) = \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b \nu(s) \left( f^2(s) + f^2(\sigma(s)) \right) \Delta s \]
\[ + \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b \nu(s) \left( f^2(s) + f^2(\sigma(s)) \right) \Delta s \]
\[ - \frac{1}{\nu(t) \Delta t} \int_a^b \nu(s) \left( f^2(s) + f^2(\sigma(s)) \right) \Delta s \]
\[ = \frac{1}{\nu(t) \Delta t} \int_a^b \nu(s) \left( f^2(s) + f^2(\sigma(s)) \right) \Delta s \] \[ \int_a^b \nu(t) \Delta t \]

This implies

\[ \frac{1 + \psi(1 - \lambda) - \psi(\lambda)}{2} \left( f^2(b) - f^2(a) \right) = \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b \nu(s) \left( f^2(s) + f^2(\sigma(s)) \right) \Delta s \]
\[ + \psi(1 - \lambda) \left( f(a) + f(\sigma(a)) \right) + (1 - \psi(1 - \lambda)) \left( f(b) + f(\sigma(b)) \right) \]
\[ \frac{1}{\nu(t) \Delta t} \int_a^b \nu(s) \left( f^2(s) + f^2(\sigma(s)) \right) \Delta s \] \[ \int_a^b \nu(t) \Delta t \]

Taking the absolute value of both sides of (10) and using item (v) of Theorem 13, we get the desired result.

**Corollary 14.** For \( T = R \) in Theorem 13, we get

\[ \left| \frac{1 + \psi(1 - \lambda) - \psi(\lambda)}{4} \left( f^2(b) - f^2(a) \right) - \frac{f(b) - f(a)}{\int_a^b \nu(t) dt} \int_a^b \nu(s) f(s) ds \right| \]
\[ + \frac{\psi(1 - \lambda)}{2} \left( f(a) + (1 - \psi(1 - \lambda)) f(b) \right) \left| f(b) - f(a) \right| \]
\[ \leq \frac{M^2}{\int_a^b \nu(t) dt} \int_a^b \left( \left| K(s, t) \right| ds \right) dt. \]
where \( \nu(t) = w'(t) \) on \([a, b]\),

\[
K(s, t) = \begin{cases} 
  w(s) - \left( w(a) + \psi(\lambda) \frac{w(b) - w(a)}{2} \right), & s \in [a, t), \\
  w(s) - \left( w(a) + (1 + \psi(1 - \lambda)) \frac{w(b) - w(a)}{2} \right), & s \in [t, b],
\end{cases}
\]

(12)

and \( M = \sup_{a < t < b} |f'(t)| < \infty \).

**Corollary 15.** For \( w(t) = t \), we have that \( \nu(t) = 1 \). Using this, the inequality in Theorem 13 becomes

\[
\left| 1 + \psi(1 - \lambda) - \psi(\lambda) \frac{f^2(b) - f^2(a)}{2} - \frac{f(b) - f(a)}{b - a} \int_a^b \left( f(\sigma(s)) + f(\sigma^2(s)) \right) \Delta s 
+ \psi(\lambda) \left( f(a) + f(\sigma(a)) \right) \right| \frac{f(b) - f(a)}{2} \leq \frac{M(N + M)}{b - a} \int_a^b \left[ h_2 \left( a, a + \psi(\lambda) \frac{b - a}{2} \right) + h_2 \left( t, a + \psi(\lambda) \frac{b - a}{2} \right) 
+ h_2 \left( t, a + (1 + \psi(1 - \lambda)) \frac{b - a}{2} \right) + h_2 \left( b, a + (1 + \psi(1 - \lambda)) \frac{b - a}{2} \right) \right] \Delta t,
\]

(13)

for all \( \lambda \in [0, 1] \) such that \( a + \psi(\lambda) \frac{b - a}{2} \) and \( a + (1 + \psi(1 - \lambda)) \frac{b - a}{2} \) are in \( T \), and \( t \in \left[ a + \psi(\lambda) \frac{b - a}{2}, a + (1 + \psi(1 - \lambda)) \frac{b - a}{2} \right] \). Here,

\[
K(s, t) = \begin{cases} 
  s - \left( a + \psi(\lambda) \frac{b - a}{2} \right), & s \in [a, t), \\
  s - \left( a + (1 + \psi(1 - \lambda)) \frac{b - a}{2} \right), & s \in [t, b],
\end{cases}
\]

(14)

\[
M = \sup_{a < t < b} |f^\Delta(t)| < \infty \text{ and } N = \sup_{a < t < b} |f^\Delta(\sigma(t))| < \infty.
\]

**Proof.** Here, we only need to justify the right hand side of the inequality. We proceed
as follows.

\[
\int_a^b |K(s, t)| \Delta s = \int_a^t |K(s, t)| \Delta s + \int_t^b |K(s, t)| \Delta s \\
= \int_a^t \left| s - \left( a + \psi(\lambda) \frac{b-a}{2} \right) \right| \Delta s + \int_t^b \left| s - \left( a + (1 + \psi(1 - \lambda)) \frac{b-a}{2} \right) \right| \Delta s \\
= \int_a^{a+\psi(\lambda) \frac{b-a}{2}} \left| s - \left( a + \psi(\lambda) \frac{b-a}{2} \right) \right| \Delta s + \int_t^{a+\psi(\lambda) \frac{b-a}{2}} \left| s - \left( a + \psi(\lambda) \frac{b-a}{2} \right) \right| \Delta s \\
+ \int_t^{a+(1+\psi(1-\lambda)) \frac{b-a}{2}} \left| s - \left( a + (1 + \psi(1 - \lambda)) \frac{b-a}{2} \right) \right| \Delta s \\
+ \int_t^{a+(1+\psi(1-\lambda)) \frac{b-a}{2}} \left| s - \left( a + (1 + \psi(1 - \lambda)) \frac{b-a}{2} \right) \right| \Delta s \\
= \int_a^b \left[ s - \left( a + \psi(\lambda) \frac{b-a}{2} \right) \right] \Delta s + \int_t^b \left[ s - \left( a + (1 + \psi(1 - \lambda)) \frac{b-a}{2} \right) \right] \Delta s \\
+ h_2 \left( a + (1 + \psi(1 - \lambda)) \frac{b-a}{2} \right) + h_2 \left( t, a + \psi(\lambda) \frac{b-a}{2} \right) + h_2 \left( t, a + (1 + \psi(1 - \lambda)) \frac{b-a}{2} \right) \\
+ h_2 \left( b, a + (1 + \psi(1 - \lambda)) \frac{b-a}{2} \right). \\
\]

Hence, the result follows. \( \square \)

**Corollary 16.** Taking \( \psi(\lambda) = \lambda \), in Corollary 15 above yields

\[
\left| (1-\lambda) \left( f^2(b) - f^2(a) \right) - \frac{f(b) - f(a)}{b-a} \int_a^b \left( f(\sigma(s)) + f(\sigma^2(s)) \right) \Delta s \right| \\
+ \lambda \left( f(a) + f(b) + f(\sigma(a)) + f(\sigma(b)) \right) \frac{f(b) - f(a)}{b-a} \\
\leq \frac{M(N+M)}{b-a} \int_a^b \left[ h_2 \left( a, a + \lambda \frac{b-a}{2} \right) + h_2 \left( t, a + \lambda \frac{b-a}{2} \right) \right. \\
\left. + h_2 \left( t, a + (2 - \lambda) \frac{b-a}{2} \right) + h_2 \left( b, a + (2 - \lambda) \frac{b-a}{2} \right) \right] \Delta t, \quad (15)
\]

for all \( \lambda \in [0,1] \) such that \( a + \lambda \frac{b-a}{2} \) and \( a + (2 - \lambda) \frac{b-a}{2} \) are in \( \mathcal{T} \), and \( t \in [a + \lambda \frac{b-a}{2}, a + (2 - \lambda) \frac{b-a}{2}] \). Here,

\[
K(s, t) = \begin{cases} 
    s - \left( a + \lambda \frac{b-a}{2} \right), & s \in [a, t), \\
    s - \left( a + (2 - \lambda) \frac{b-a}{2} \right), & s \in [t, b]. 
\end{cases} \quad (16)
\]

Then \( M = \sup_{a \leq t \leq b} |f^\Delta(t)| < \infty \) and \( N = \sup_{a \leq t \leq b} |f^\Delta(\sigma(t))| < \infty \).
Remark 17. If we take \( \lambda = 0 \) and \( T = \mathbb{R} \), Corollary 16 reduces to Theorem 7.

Corollary 18. For the case when \( T = \mathbb{Z} \), Theorem 16 becomes

\[
\left| \frac{1 + \psi(1 - \lambda) - \psi(\lambda)}{2} \left( f^2(b) - f^2(a) \right) - \frac{f(b) - f(a)}{\sum_{s=a}^{b-1} \nu(s)} \sum_{s=a}^{b-1} \nu(s) \left( f(s + 1) + f(s + 2) \right) \right|
\]

\[
+ \frac{\psi(\lambda) \left( f(a) + f(a + 1) \right) + (1 - \psi(1 - \lambda)) \left( f(b) + f(b + 1) \right)}{2} (f(b) - f(a)) \right| \leq \frac{M(N + M)}{\sum_{s=a}^{b-1} \nu(s)} \left( \sum_{s=a}^{b-1} |K(s, t)| \right),
\]

where \( \nu(t) = w(t + 1) - w(t) \) on \([a, b]\),

\[
K(s, t) = \begin{cases} 
    w(s) - \left( w(a) + \psi(\lambda) w(b) - w(a) \right), & s \in [a, t), \\
    w(s) - \left( w(a) + (1 + \psi(1 - \lambda)) w(b) - w(a) \right), & s \in [t, b]. 
\end{cases}
\]

3.2 A weighted Grüss type inequality on time scales

Theorem 19. Let \( \nu : [a, b] \to [0, \infty) \) be continuous and positive and \( w : [a, b] \to \mathbb{R} \) be differentiable such that \( w^\Delta(t) = \nu(t) \) on \([a, b]\). Suppose also that \( a, b, s, t \in T \), \( a < b \), \( p, q : [a, b] \to \mathbb{R} \) is differentiable, and \( \psi \) is a function of \([0, 1]\) into \([0, 1]\). Then we have the following inequality

\[
\left| \left( 1 + \psi(1 - \lambda) - \psi(\lambda) \right) \left( \int_a^b \nu(t) \Delta t \right) \left( \int_a^b p(t) q(t) \Delta t \right) \right|
\]

\[
+ \frac{\psi(\lambda) p(a) + (1 - \psi(1 - \lambda)) p(b)}{2} \left( \int_a^b \nu(t) \Delta t \right) \left( \int_a^b q(t) \Delta t \right)
\]

\[
+ \frac{\psi(\lambda) q(a) + (1 - \psi(1 - \lambda)) q(b)}{2} \left( \int_a^b \nu(t) \Delta t \right) \left( \int_a^b p(t) \Delta t \right)
\]

\[
- \int_a^b q(t) \left( \int_a^b \nu(s) p(\sigma(s)) \Delta s \right) \Delta t - \int_a^b p(t) \left( \int_a^b \nu(s) q(\sigma(s)) \Delta s \right) \Delta t \right|
\]

\[
\leq \int_a^b \left( |P| q(t) + Q|p(t)| \right) \left( \int_a^b |K(s, t)| \Delta s \right) \Delta t,
\]

where

\[
K(s, t) = \begin{cases} 
    w(s) - \left( w(a) + \psi(\lambda) w(b) - w(a) \right), & s \in [a, t), \\
    w(s) - \left( w(a) + (1 + \psi(1 - \lambda)) w(b) - w(a) \right), & s \in [t, b]. 
\end{cases}
\]

\( P = \sup_{a < t < b} |p^\Delta(t)| < \infty \) and \( Q = \sup_{a < t < b} |q^\Delta(t)| < \infty \).
Proof. Applying Lemma 12 to the differentiable functions \( p \) and \( q \), we obtain

\[
\frac{1 + \psi(1-\lambda) - \psi(\lambda)}{2} p(t) = \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b K(s, t)p^\Delta(s) \Delta s + \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b \nu(s)p(\sigma(s)) \Delta s - \frac{1}{2} \psi(\lambda)p(a) + (1 - \psi(1-\lambda)) p(b),
\]

and

\[
\frac{1 + \psi(1-\lambda) - \psi(\lambda)}{2} q(t) = \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b K(s, t)q^\Delta(s) \Delta s + \frac{1}{\int_a^b \nu(t) \Delta t} \int_a^b \nu(s)q(\sigma(s)) \Delta s - \frac{1}{2} \psi(\lambda)q(a) + (1 - \psi(1-\lambda)) q(b).
\]

Multiplying (21) by \( q(t) \) and (22) by \( p(t) \) and then adding the resulting identity gives

\[
\left(\frac{1 + \psi(1-\lambda) - \psi(\lambda)}{2}\right) p(t)q(t) = \frac{1}{\int_a^b \nu(t) \Delta t} \left[ q(t) \int_a^b K(s, t)p^\Delta(s) \Delta s + p(t) \int_a^b K(s, t)q^\Delta(s) \Delta s \right] + \frac{1}{\int_a^b \nu(t) \Delta t} \left[ q(t) \int_a^b \nu(s)p(\sigma(s)) \Delta s + p(t) \int_a^b \nu(s)q(\sigma(s)) \Delta s \right] - \frac{1}{2} \psi(\lambda)p(a) + (1 - \psi(1-\lambda)) p(b)q(t) - \frac{1}{2} \psi(\lambda)q(a) + (1 - \psi(1-\lambda)) q(b)p(t).
\]

Now integrating (23) on \([a, b]\) amounts to

\[
\left(\frac{1 + \psi(1-\lambda) - \psi(\lambda)}{2}\right) \int_a^b p(t)q(t) \Delta t = \frac{1}{\int_a^b \nu(t) \Delta t} \left[ \int_a^b q(t) \left( \int_a^b K(s, t)p^\Delta(s) \Delta s \right) \Delta t + \int_a^b p(t) \left( \int_a^b K(s, t)q^\Delta(s) \Delta s \right) \Delta t \right] + \frac{1}{\int_a^b \nu(t) \Delta t} \left[ \int_a^b q(t) \left( \int_a^b \nu(s)p(\sigma(s)) \Delta s \right) \Delta t + \int_a^b p(t) \left( \int_a^b \nu(s)q(\sigma(s)) \Delta s \right) \Delta t \right] - \frac{1}{2} \psi(\lambda)p(a) + (1 - \psi(1-\lambda)) p(b) \int_a^b q(t) \Delta t - \frac{1}{2} \psi(\lambda)q(a) + (1 - \psi(1-\lambda)) q(b) \int_a^b p(t) \Delta t.
\]

This implies that
\[ (1 + \psi(1 - \lambda) - \psi(\lambda)) \left( \int_a^b \nu(t) \Delta t \right) \left( \int_a^b p(t)q(t) \Delta t \right) \]
\[ = \int_a^b q(t) \left( \int_a^b K(s, t)p^\Delta(s) \Delta s \right) \Delta t + \int_a^b p(t) \left( \int_a^b K(s, t)q^\Delta(s) \Delta s \right) \Delta t \]
\[ + \int_a^b q(t) \left( \int_a^b \nu(s)p(\sigma(s)) \Delta s \right) \Delta t + \int_a^b p(t) \left( \int_a^b \nu(s)q(\sigma(s)) \Delta s \right) \Delta t \]
\[ - \frac{\psi(\lambda)p(a) + (1 - \psi(1 - \lambda))p(b)}{2} \left( \int_a^b \nu(t) \Delta t \right) \left( \int_a^b q(t) \Delta t \right) \]
\[ - \frac{\psi(\lambda)q(a) + (1 - \psi(1 - \lambda))q(b)}{2} \left( \int_a^b \nu(t) \Delta t \right) \left( \int_a^b p(t) \Delta t \right). \quad (25) \]

Rearranging, taking absolute value and using item (v) of Theorem 10 yields

\[ \left| \left(1 + \psi(1 - \lambda) - \psi(\lambda)\right) \left( \int_a^b \nu(t) \Delta t \right) \left( \int_a^b p(t)q(t) \Delta t \right) \right| \]
\[ + \frac{\psi(\lambda)p(a) + (1 - \psi(1 - \lambda))p(b)}{2} \left( \int_a^b \nu(t) dt \right) \left( \int_a^b q(t) dt \right) \]
\[ + \frac{\psi(\lambda)q(a) + (1 - \psi(1 - \lambda))q(b)}{2} \left( \int_a^b \nu(t) dt \right) \left( \int_a^b p(t) dt \right) \]
\[ - \int_a^b q(t) \left( \int_a^b \nu(s)p(\sigma(s)) \Delta s \right) \Delta t - \int_a^b p(t) \left( \int_a^b \nu(s)q(\sigma(s)) \Delta s \right) \Delta t \]
\[ \leq \int_a^b \left| q(t) \left( \int_a^b K(s, t)p^\Delta(s) \Delta s \right) + p(t) \left( \int_a^b K(s, t)q^\Delta(s) \Delta s \right) \right| \Delta t. \quad (26) \]

Hence, the result follows. \( \square \)

**Corollary 20.** For the case when \( T = \mathbb{R} \), Theorem 12 becomes

\[ \left| \left(1 + \psi(1 - \lambda) - \psi(\lambda)\right) \left( \int_a^b \nu(t) dt \right) \left( \int_a^b p(t)q(t) dt \right) \right| \]
\[ + \frac{\psi(\lambda)p(a) + (1 - \psi(1 - \lambda))p(b)}{2} \left( \int_a^b \nu(t) dt \right) \left( \int_a^b q(t) dt \right) \]
\[ + \frac{\psi(\lambda)q(a) + (1 - \psi(1 - \lambda))q(b)}{2} \left( \int_a^b \nu(t) dt \right) \left( \int_a^b p(t) dt \right) \]
\[ - \int_a^b q(t) \left( \int_a^b \nu(s)p(s) ds \right) dt - \int_a^b p(t) \left( \int_a^b \nu(s)q(s) ds \right) dt \]
\[ \leq \int_a^b \left( P|q(t)| + Q|p(t)| \right) \left( \int_a^b \left| K(s, t) \right| ds \right) dt, \quad (27) \]
where \( \nu(t) = w'(t) \) on \([a, b]\),

\[
K(s, t) = \begin{cases} 
  w(s) - \left( w(a) + \psi(\lambda) \frac{w(b) - w(a)}{2} \right), & s \in [a, t), \\
  w(s) - \left( w(a) + (1 + \psi(1 - \lambda)) \frac{w(b) - w(a)}{2} \right), & s \in [t, b], 
\end{cases}
\] (28)

\[
P = \sup_{a < t < b} \left| p'(t) \right| < \infty \quad \text{and} \quad Q = \sup_{a < t < b} \left| q'(t) \right| < \infty.
\]

**Corollary 21.** For the case when \( T = \mathbb{Z} \), Theorem 17 amounts to

\[
\begin{align*}
&\left| (1 + \psi(1 - \lambda) - \psi(\lambda)) \left( \sum_{t=a}^{b-1} \nu(t) \right) \left( \sum_{t=a}^{b-1} p(t)q(t) \right) \\
+ &\frac{\psi(\lambda) p(a) + (1 - \psi(1 - \lambda)) p(b)}{2} \left( \sum_{t=a}^{b-1} \nu(t) \right) \left( \sum_{t=a}^{b-1} q(t) \right) \\
+ &\frac{\psi(\lambda) q(a) + (1 - \psi(1 - \lambda)) q(b)}{2} \left( \sum_{t=a}^{b-1} \nu(t) \right) \left( \sum_{t=a}^{b-1} p(t) \right) \\
- &\sum_{t=a}^{b-1} q(t) \left( \sum_{s=a}^{b-1} \nu(s)p(s + 1) \right) - \sum_{t=a}^{b-1} p(t) \left( \sum_{s=a}^{b-1} \nu(s)q(s + 1) \right) \right| \\
\leq &\sum_{t=a}^{b-1} \left( P|q(t)| + Q|p(t)| \right) \left( \sum_{s=a}^{b-1} |K(s, t)| \right),
\end{align*}
\] (29)

where \( \nu(t) = w(t + 1) - w(t) \) on \([a, b]\),

\[
K(s, t) = \begin{cases} 
  w(s) - \left( w(a) + \psi(\lambda) \frac{w(b) - w(a)}{2} \right), & s \in [a, t), \\
  w(s) - \left( w(a) + (1 + \psi(1 - \lambda)) \frac{w(b) - w(a)}{2} \right), & s \in [t, b], 
\end{cases}
\] (30)

\[
P = \sup_{a < t < b-1} \left| \Delta p(t) \right| < \infty \quad \text{and} \quad Q = \sup_{a < t < b-1} \left| \Delta q(t) \right| < \infty.
\]

**Corollary 22.** For the case when \( \psi(\lambda) = \lambda \), \( w(t) = t \) and \( T = \mathbb{R} \), Theorem 18 boils down to

\[
\begin{align*}
&\left| 2(1 - \lambda)(b - a) \left( \int_a^b p(t)q(t)dt \right) + \frac{\lambda(b - a) (p(a) + p(b))}{2} \left( \int_a^b q(t)dt \right) \\
+ &\frac{\lambda(b - a) (q(a) + q(b))}{2} \left( \int_a^b p(t)dt \right) - 2 \left( \int_a^b q(t)dt \right) \left( \int_a^b p(t)dt \right) \right| \\
\leq &\int_a^b \left( P|q(t)| + Q|p(t)| \right) \left( t^2 - t(a + b) + \frac{a^2 + b^2}{2} \right) dt.
\end{align*}
\] (31)

Here,

\[
K(s, t) = \begin{cases} 
  s - (a + \lambda \frac{b - a}{2}), & s \in [a, t), \\
  s - (a + (2 - \lambda) \frac{b - a}{2}), & s \in [t, b], 
\end{cases}
\] (32)

\[
P = \sup_{a < t < b} \left| p'(t) \right| < \infty \quad \text{and} \quad Q = \sup_{a < t < b} \left| q'(t) \right| < \infty.
\]

**Remark 23.** If we take \( \lambda = 0 \), Corollary 22 reduces to Theorem 20.
