Curvature invariants in type-III spacetimes

V. Pravda

Žitná 25, 115 67 Prague 1, Czech Republic

Abstract. The results of paper [1] are generalized for vacuum type-III solutions with, in general, a non-vanishing cosmological constant \( \Lambda \). It is shown that all curvature invariants containing derivatives of the Weyl tensor vanish if a type-III spacetime admits a non-expanding and non-twisting null geodesic congruence.

A non-vanishing curvature invariant containing first derivatives of the Weyl tensor is found in the case of type-III spacetime with expansion or twist.

PACS numbers: 0420, 0430

1. Introduction

In [1] we proved that in Petrov type-N vacuum spacetimes which admit a non-expanding and non-twisting null geodesic congruence all curvature invariants constructed from the Weyl tensor and its derivatives of arbitrary order vanish. We generalize this paper and obtain the same result for non-expanding and non-twisting Petrov type-III vacuum spacetimes. Thus it is useful to study these spacetimes in quantum gravity, as all their quantum corrections vanish (see Gibbons [2]). The proof for type-III vacuum spacetimes is based on the same ideas as that for type-N vacuum spacetimes given in [1]. Here we just outline the basic ideas of the proof (see Section 3). For understanding and rigorous reconstruction of the proof, paper [1] is indispensable.

In the case of type-III vacuum spacetime with expansion or twist we find a nonzero curvature invariant of the first order (containing the first derivatives of the Weyl tensor).

First let us recall some basic relations from spinor calculus and Newman-Penrose formalism. We can use basis \( \o_A, \iota_A \), which satisfies

\[
o_A \tau^A = 1, \quad o_A o^a = 0, \quad \iota_A \iota^A = 0, \quad (1.1)
\]

to decompose the Weyl spinor (see [3])

\[
\Psi_{ABCD} = \Psi_0 \o_A \o_B \o_C \o_D - 4 \Psi_1 \o_A \o_B \iota_C \iota_D + 6 \Psi_2 \o_A \o_B \o_C \iota_D - 4 \Psi_3 \o_A \o_B \iota_C \iota_D + \Psi_4 \o_A \o_B \o_C \o_D , \quad (1.2)
\]

where

\[
\Psi_0 = \Psi_{ABCD} \o^A \o^B \o^C \o^D , \quad \Psi_1 = \Psi_{ABCD} \o^A \o^B \o^C \iota^D , \quad \Psi_2 = \Psi_{ABCD} \o^A \o^B \iota^C \iota^D , \quad \Psi_3 = \Psi_{ABCD} \o^A \iota^B \iota^C \iota^D , \quad \Psi_4 = \Psi_{ABCD} \iota^A \iota^B \iota^C \iota^D .
\]
\[ \Psi_2 = \Psi_{ABCD} o^A o^B t^C t^D, \]
\[ \Psi_3 = \Psi_{ABCD} o^A t^B o^C t^D, \]
\[ \Psi_4 = \Psi_{ABCD} t^A t^B t^C t^D. \]

There exist four principal spinors \(\alpha_A, \beta_A, \gamma_A, \delta_A\) such that
\[ \Psi_{ABCD} = o_{(A} o_{B} o_{C} o_{D)}. \]

(1.3)

Since three principal spinors of \(\Psi_{ABCD}\) coincide in type-II spacetimes, it is convenient to choose this repeated principal spinor as a basis spinor \(o_A\). Then
\[ \Psi_{ABCD} = o_{(A} o_{B} o_{C} o_{D)}. \]

(1.4)

We choose the second basis spinor \(\iota_A\) to satisfy
\[ D\iota_A = 0, \]
which implies that a complex null tetrad induced by \(o_A\) and \(\iota_A\) is parallelly propagated along the geodetic null congruence and several Newman-Penrose coefficients vanish:
\[ \sigma = \kappa = \varepsilon = \pi = 0. \]

(1.5)

To end this section let us write down the relations
\[ \nabla^{(X} = t^{(X} D + o^{(X} \bar{o}^{X} \Delta - t^{(X} \bar{o}^{X} \bar{\delta} - o^{(X} \bar{\delta} \bar{\delta}), \]
\[ \nabla^{(X} o^{B} = \gamma o^{(A} o^{B} \bar{o}^{X} - \alpha o^{(A} o^{B} \bar{t}^{X} - \tau o^{(A} t^{B} \bar{o}^{X} - \beta t^{(A} o^{B} \bar{o}^{X} \]
\[ + \rho o^{A} t^{B} \bar{t}^{X} + \varepsilon t^{A} o^{B} \bar{o}^{X} + \sigma t^{A} t^{B} \bar{o}^{X} - \kappa t^{A} t^{B} \bar{t}^{X}, \]
\[ \nabla^{(X} t^{B} = \nu o^{(A} o^{B} \bar{t}^{X} - \lambda o^{(A} o^{B} \bar{t}^{X} - \gamma o^{(A} t^{B} \bar{o}^{X} - \mu t^{(A} o^{B} \bar{o}^{X} \]
\[ + \alpha o^{A} t^{B} \bar{t}^{X} + \pi t^{A} o^{B} \bar{t}^{X} + \beta t^{A} t^{B} \bar{t}^{X} - \epsilon t^{A} t^{B} \bar{t}^{X}. \]

(1.6)

Equations (1.1) and (1.7) imply that all invariant quantities constructed from \(\Psi_{ABCD}\) without derivatives vanish and thus all curvature invariants of the zeroth order vanish too. In next sections we study curvature invariants of higher orders.

2. Expanding or twisting solutions

Regarding (1.1) and (1.3), the Bianchi identity (see Eq. (7.67) in [4]) gives
\[ D \Psi_3 = 2 \rho \Psi_3. \]

(2.1)

Using (1.1), (1.10) - (1.12), one can easily show that all first order invariants of the Weyl tensor vanish if they contain only squares or cubes in \(C_{\alpha\beta\gamma\delta\varepsilon}\). However, there is a non-vanishing curvature invariant
\[ I = C^{\alpha\beta\gamma\delta\varepsilon} C_{\alpha\beta\gamma\nu\rho} C^{\lambda\mu\nu\sigma} C_{\lambda\beta\rho\delta\varepsilon}. \]

(2.2)
which, in terms of Newman-Penrose quantities, reads
\[ I = (48 \rho \bar{\rho} \Psi_3 \bar{\Psi}_3)^2. \] (2.3)

The Robinson-Trautman metric of type-III, that is the general vacuum type-III solution admitting a geodesic, shearfree, twistfree and diverging null congruence, has the form
\[ ds^2 = \frac{2r^2}{P^2} d\zeta d\bar{\zeta} - 2 du dr - (\Delta \ln P - 2 r (\ln P)_{,u}) du^2, \] (2.4)
where \( P(u, \zeta, \bar{\zeta}) \) satisfies
\[ \Delta \Delta P = 0, \quad (\Delta \ln P, \zeta) \neq 0, \quad \Delta \equiv 2 P^2 \partial_{\zeta} \partial_{\bar{\zeta}} \] (2.5)
and \( \partial/\partial r \) is the repeated null eigenvector. In an appropriately chosen complex null tetrad (given for example in Chapter 23 in [4]) we obtain
\[ \sigma = \kappa = \varepsilon = \pi = \Psi_0 = \Psi_1 = \Psi_2 = 0, \quad \rho = -\frac{1}{r}, \]
\[ \Psi_3 = -\frac{P}{r^2} (\Delta \ln P)_{,\zeta}, \]
\[ \Psi_4 = \frac{1}{r^3} \left( P^2 \left( \frac{1}{2} \Delta \ln P - r (\ln P)_{,u} \right) \right)_{,\bar{\zeta}}. \] (2.6)

Substituting (2.6) into the invariant (2.3), we get
\[ I = \left( \frac{48}{r^6} P (\Delta \ln P, \zeta) (\Delta \ln P, \zeta) \right)^2. \] (2.7)

This invariant, which is non-zero in general, can be used for analyzing singularities in Robinson-Trautman solutions.

3. Non-expanding and non-twisting solutions

Non-expanding and non-twisting solutions satisfying (1.9) and \( \rho = 0 \) belong to Kundt’s class and they are completely known (see Chapter 27.5.1. in [4]).

In [4] we have proved that for type-N vacuum spacetimes, without expansion and without twist, all curvature invariants of all orders vanish. This proof, with slight modifications, is also valid for type-III vacuum spacetimes without expansion and without twist. Thus we give here only the basic ideas of the proof.

In the following we need NP equations containing operator \( D \):
\[ D \tau = 0, \]
\[ D \alpha = 0, \]
\[ D \beta = 0, \]
\[ D \gamma = \tau \alpha + \bar{\tau} \beta - R/24, \]
\[ D \lambda = 0, \]
\[ D \mu = R/12, \]
\[ D \nu = \bar{\tau} \mu + \tau \lambda + \Psi_3, \] (3.1)
and the commutators
\[(\Delta D - D \Delta) = (\gamma + \bar{\gamma})D - \bar{\gamma} \delta - \gamma \delta ,\]
\[(\delta D - D \delta) = (\bar{\alpha} + \beta)D .\] (3.2)

The Bianchi identity [2.1] has the form
\[D \Psi_3 = 0 .\] (3.3)

Let us now turn attention to the behaviour of the NP quantities under the constant boost transformation
\[o'^A = ao^A , \quad t'^A = a^{-1}t^A .\] (3.4)

A quantity \( \Omega \), which transforms under this boost as
\[\Omega' = a^n \Omega ,\] (3.5)
has the boost-weight \( b(\Omega) = q \). Summary of the boost-weights for NP coefficients (NP) and operators (OP) is given in Table 1 in [1]. For \( \Psi_3 \) we have
\[\Psi_3' = a^{-2} \Psi_3 \implies b(\Psi_3) = -2 .\] (3.6)

Now we analyze invariants of \( \nabla^{c_n x_n} \ldots \nabla^{c_1 x_1} (\Psi_3 o^{(A} o^B o^C l^{D)} \). The quantity \( \Psi_3 o^{(A} o^B o^C l^{D)} \) is invariant under the boost transformation \( \{3.4\} \)
\[\Psi_3'' o^{(A} o^B o^C l^{D)} = \Psi_3 o^{(A} o^B o^C l^{D)} \] (3.7)
and thus also \( \nabla^{c_n x_n} \ldots \nabla^{c_1 x_1} (\Psi_3 o^{(A} o^B o^C l^{D)} \) is invariant under \( \{\} \) and 
\[b(\nabla^{c_n x_n} \ldots \nabla^{c_1 x_1} (\Psi_3 o^{(A} o^B o^C l^{D)} \) \) = 0. Using Leibniz’s formula and relations \( \{1.10\} \)-(1.12), we decompose the spinor derivative \( \nabla^{c_n x_n} \ldots \nabla^{c_1 x_1} (\Psi_3 o^{(A} o^B o^C l^{D)} \) into the spinor basis of the appropriate spinor space. Each term in such a sum has the form
\[K o^{A_1} \ldots o^{A_{m_1}} o^{B_1} \ldots o^{B_{m_2}} l^{C_1} \ldots l^{C_{n_1}} \ldots \bar{\gamma}^1 \ldots \bar{\gamma}^{n_2} ,\] (3.8)
where \( K \) is a product of NP quantities. This term is also invariant under the boost \( \{3.4\} \) and thus
\[b(K) = n_1 + n_2 - m_1 - m_2 .\] (3.9)

In the following we show that NP equations imply \( K = 0 \) if \( b(K) \geq 0 \) and thus the decomposition of \( \nabla^{c_n x_n} \ldots \nabla^{c_1 x_1} (\Psi_3 o^{(A} o^B o^C l^{D)} \) consists only of terms containing more \( o^i \)'s then \( l^i \)'s and, as a consequence of Eq. \( \{1.1\} \), all invariants of \( \nabla^{c_n x_n} \ldots \nabla^{c_1 x_1} (\Psi_3 o^{(A} o^B o^C l^{D)} \) vanish.

**Lemma 1:**
Let an invariant constructed from the products of the spinors
\( \nabla^{c_n x_n} \ldots \nabla^{c_1 x_1} (\Psi_3 o^{(A} o^B o^C l^{D)} \), for fixed \( n \), be non-vanishing. Then there exists a non-vanishing quantity \( K = X_1 X_2 \ldots X_n \Psi_3 \), \( X_i \in NP \cup OP \) such that
\[b(X_1 X_2 \ldots X_n \Psi_3) = \sum_{i=1}^{n} b(X_i) + b(\Psi_3) \geq 0 , \text{ i.e. } \sum_{i=1}^{n} b(X_i) \geq 2 .\]

See the proof in [1].
We introduce a number \( p \) for each NP-coefficient (or its derivatives) that describes its behaviour under the action of the operator \( D \) (see [1] for the exact definition and Table 2).

Comparing (3.1) and (3.2) with Eqs. (3.2)-(3.4) in [1] we see that Table 2 and Lemma 2 in [1] remain unchanged. This enables us to reformulate Lemma 3 (as a consequence of (3.1)-(3.3)) and Proposition 1:

**Lemma 3:**
Consider a quantity \( X_1 X_2 \ldots X_n \) where \( X_i \in NP \cup OP \).

If \( \sum_{i=1}^{n} p(X_i) < 0 \) then \( X_1 X_2 \ldots X_n \Psi_3 = 0 \).

The proof of Lemma 3 remains unchanged.

**Proposition 1:**
In type-III vacuum spacetimes with \( \Lambda \) admitting a non-expanding and non-twisting null geodesic congruence all \( n \)-th order invariants formed from the products of spinors \( \nabla^{\nu_1 \nu_2} \ldots \nabla^{\nu_n} (\Psi_3 \sigma^\nu_1 \sigma^\nu_2 \ldots \sigma^\nu_n) \), with \( n \) arbitrary but fixed, vanish.

Proof: We follow a similar procedure as in [1], replacing Eq. (3.8) in [1] by

\[
\sum_{i=1}^{n} b(X_i) \geq 2 \quad \text{and} \quad \sum_{i=1}^{n} p(X_i) \geq 0 ,
\]

which leads to the same conclusion.

Invariants constructed from the second term in (1.7) and its derivatives, \( \nabla^{\nu_1 \nu_2} \ldots \nabla^{\nu_n} (\Psi_4 \sigma^\nu_1 \sigma^\nu_2 \ldots \sigma^\nu_n) \), also vanish. The proof is similar to that in [1], with the only difference

\[
D \Psi_4 = 0 \quad \text{for type-III} ,
\]

(3.11)

\[
D \Psi_4 = (\bar{\delta} - 2\alpha) \Psi_4 , \quad D^2 \Psi_4 = 0 \quad \text{for type-III} ,
\]

(3.12)

and thus we reformulate Lemma 3 of [1]:

**Lemma 3’:**
Consider a quantity \( X_1 X_2 \ldots X_n \) where \( X_i \in NP \cup OP \).

If \( \sum_{i=1}^{n} p(X_i) < -1 \) then \( X_1 X_2 \ldots X_n \Psi_4 = 0 \).

Proposition 1 remains unchanged:

**Proposition 1’:**
In type-III vacuum spacetimes with \( \Lambda \) admitting a non-expanding and non-twisting null geodesic congruence all \( n \)-th order invariants formed from the products of spinors \( \nabla^{\nu_1 \nu_2} \ldots \nabla^{\nu_n} (\Psi_4 \sigma^\nu_1 \sigma^\nu_2 \ldots \sigma^\nu_n) \), with \( n \) arbitrary but fixed, vanish.

Since each term in decompositions of the spinors \( \nabla^{\nu_1 \nu_2} \ldots \nabla^{\nu_n} (\Psi_4 \sigma^\nu_1 \sigma^\nu_2 \ldots \sigma^\nu_n) \) and \( \nabla^{\nu_1 \nu_2} \ldots \nabla^{\nu_n} (\Psi_3 \sigma^\nu_1 \sigma^\nu_2 \ldots \sigma^\nu_n) \) into the spinor basis contains more \( \bar{\sigma} \)’s then \( \bar{\iota} \)’s, we conclude our analysis with the following propositions:

**Proposition 3:**
In type-III vacuum spacetimes with \( \Lambda \), admitting a non-expanding and non-twisting null geodesic congruence, all invariants constructed from \( \Psi_{ABCD} \), \( \bar{\Psi}_{ABCD} \) and their derivatives of arbitrary order vanish.
The same proposition formulated in the tensor formalism reads:

**Proposition 4:**
In type-III vacuum spacetimes with $\Lambda$, admitting a non-expanding and non-twisting null geodesic congruence, all invariants constructed from the Weyl tensor and its covariant derivatives of arbitrary order vanish.

4. Conclusion

A general Petrov type spacetime has non-zero curvature invariants of the zeroth order.

For type-$N$ spacetimes we have shown in [1] that all Weyl's invariants of all orders for non-twisting and non-expanding solutions vanish. For twisting or expanding solutions of type-$N$ we have proven that Weyl's invariants of the zeroth and first orders vanish but we have found a non-zero invariant of the second order

$$C^{\alpha\beta\gamma\delta;\varepsilon\phi}C_{\alpha\mu\gamma\nu;\varepsilon\phi}C^{\lambda\mu\rho\nu;\sigma\tau}C_{\lambda\beta\rho\delta;\sigma\tau} = (48\rho^2\bar{\rho}^2\Psi_4\bar{\Psi}_4)^2. \quad (4.1)$$

In this paper we show that for type-III vacuum spacetimes without twist and expansion all Weyl’s invariants of all orders vanish. This fact can be used in quantum gravity (see [2]). In the case with expansion or twist only invariants of the zeroth order vanish and there exists a non-vanishing invariant of the first order

$$C^{\alpha\beta\gamma\delta;\varepsilon}C_{\alpha\mu\gamma\nu;\varepsilon}C^{\lambda\mu\rho\nu;\sigma}C_{\lambda\beta\rho\delta;\sigma} = (48\rho\bar{\rho}\Psi_3\bar{\Psi}_3)^2. \quad (4.2)$$

This invariant can be used for analyzing singularities in type-III vacuum spacetimes with expansion or twist. The form of the invariant in terms of NP quantities (4.2) can be also helpful for constructing approximate solutions of Einstein’s vacuum field equations in the type-III with twist (see [3] for type-$N$).

Let us summarize our results in Table 1:

**Table 1:** Curvature invariants in vacuum spacetimes (0 - vanish, 1 - do not vanish)

| Petrov type | I, II, D | III | III | N | N |
|-------------|---------|-----|-----|---|---|
| expansion and twist | $\rho \neq 0$ | $\rho = 0$ | $\rho \neq 0$ | $\rho = 0$ |
| curvature invariants of order 0 | 1 | 0 | 0 | 0 | 0 |
| curvature invariants of order 1 | 1 | 1 | 0 | 0 | 0 |
| curvature invariants of order 2 | 1 | 1 | 0 | 1 | 0 |
| curvature invariants of order > 2 | 1 | 1 | 0 | 1 | 0 |
