Abstract. We investigate the structure of the double Ringel–Hall algebras associated with cyclic quivers and its connections with quantum loop algebras of $\mathfrak{gl}_n$, affine quantum Schur algebras and affine Hecke algebras. This includes their Drinfeld–Jimbo type presentation, affine quantum Schur–Weyl reciprocity, representations of affine quantum Schur algebras, and connections with various existing works by Lusztig, Varagnolo–Vasserot, Schiffmann, Hubery, Chari–Pressley, Frenkel–Mukhin, etc. We will also discuss conjectures on a realization of Beilinson–Lusztig–MacPherson type and Lusztig type integral forms for double Ringel–Hall algebras.

Introduction

Quantum Schur–Weyl theory refers to a three-level duality relation. At Level I, it investigates a certain double centralizer property, the quantum Schur–Weyl reciprocity, associated with some bimodules of quantum $\mathfrak{gl}_n$ and the Hecke algebra (of type $A$)—the tensor spaces of the natural representation of quantum $\mathfrak{gl}_n$ (see [43], [20], [27]). This is the quantum version of the well-known Schur–Weyl reciprocity which was beautifully used in H. Weyl’s influential book [81]. The key ingredient of the reciprocity is a class of important finite dimensional endomorphism algebras, the quantum Schur algebras, whose classical version was introduced by I. Schur over a hundred years ago (see [72], [73]). At Level II, it establishes a certain Morita equivalence between quantum Schur algebras and Hecke algebras. Thus, quantum Schur algebras are used to bridge representations of quantum $\mathfrak{gl}_n$ and Hecke algebras. More precisely, they link polynomial representations of quantum $\mathfrak{gl}_n$ with representations of Hecke algebras via the Morita equivalence. The third level of this duality relation is motivated by two simple questions associated with the structure of (associative) algebras. If an algebra is defined by generators and relations, the realization problem is to reconstruct the algebra as a vector space with hopefully explicit multiplication formulas on elements of a basis; while, if an algebra is defined in term of a vector space such as an endomorphism algebra, it is natural to seek their generators and defining relations.

As one of the important problems in quantum group theory, the realization problem is to construct a quantum group in terms of a vector space and certain multiplication rules on basis elements. This problem is crucial to understand their structure and representations (see [47], p. xiii] for a similar problem for Kac–Moody Lie algebras). Though the Ringel–Hall algebra realization of the ±-part of quantum enveloping algebras associated with symmetrizable Cartan matrices is an important breakthrough in the early nineties of the last century, especially for the introduction of the geometric approach to the theory, the same problem for the entire quantum groups is far from completion. However, Beilinson–Lusztig–MacPherson (BLM) [3] solved the problem for quantum $\mathfrak{gl}_n$ by exploring further properties coming out from the quantum Schur–Weyl reciprocity. On the other hand, as endomorphism algebras and as homomorphic images of quantum $\mathfrak{gl}_n$, it is natural to look for presentations for quantum Schur algebras via the presentation of quantum $\mathfrak{gl}_n$. This problem was first considered in [16] (see also [26]). Thus, as a particular feature in the type $A$ theory, realizing quantum $\mathfrak{gl}_n$ and presenting quantum Schur algebras form the Level III of this duality relation. For a complete account of the quantum Schur–Weyl theory and further references, see Parts 3 and 5 of [11].
There are several developments in the establishment of an affine analogue of the quantum Schur–Weyl theory. Soon after BLM’s work, Ginzburg and Vasserot \([32, 79]\) used a geometric and \(K\)-theoretic approach to investigate affine quantum Schur algebras\(^1\) as homomorphic images of quantum loop algebra \(U(\widehat{\mathfrak{gl}}_n)\) of \(\mathfrak{gl}_n\) in the sense of Drinfeld’s new presentation \([19]\), called quantum affine \(\mathfrak{gl}_n\) (at level 0) in this paper. This establishes at Level I the first centralizer property for the affine analogue of the quantum Schur–Weyl reciprocity. Six years later, investigations around affine quantum Schur algebras focused on their different definitions and hence different applications. For example, Lusztig \([58]\) generalized the fundamental multiplication formulas \([3, 3.4]\) for quantum Schur algebras to the affine case and showed that (extended) quantum affine \(\mathfrak{sl}_n\) does not map onto affine quantum Schur algebras; Varagnolo–Vasserot \([77]\) investigated Ringel–Hall algebra actions on tensor spaces and described the geometrically-defined affine quantum Schur algebras in terms of the endomorphism algebras of tensor spaces. Moreover, they proved that the tensor space definition coincides with Green’s definition \([35]\) via \(q\)-permutation modules. Some progress on the second centralizer property has also been made recently by Pouchin \([62]\). The approaches used in these works are mainly geometric. However, like the non-affine case, there would be more favorable algebraic and combinatorial approaches.

At Level II, representations at non-roots-of-unity of quantum affine \(\mathfrak{sl}_n\) and \(\mathfrak{gl}_n\) over the complex number field \(\mathbb{C}\), including classifications of finite dimensional simple modules, have been thoroughly investigated by Chari–Pressley \([5, 6, 7]\), and Frenkel–Mukhin \([28]\) in terms of Drinfeld polynomials. Moreover, an equivalence between the module category of the Hecke algebra \(H_\triangle(r)_{\mathbb{C}}\) and a certain full subcategory of quantum affine \(\mathfrak{sl}_n\) (resp., \(\mathfrak{gl}_n\)) has also been established algebraically by Chari–Pressley \([8]\) (resp., geometrically by Ginzburg–Reshetikhin–Vasserot \([31]\)) under the condition \(n > r\) (resp., \(n \geq r\)). Note that the approach in \([31]\) uses intersection cohomology complexes. It would be interesting to know how affine quantum Schur algebras would play a role in these works.

Much less progress has been made at Level III. When \(n > r\), Doty-Green \([16]\) and McGerty \([60]\) have found a presentation for affine quantum Schur algebras, while the last two authors of the paper have investigated the realization problem in \([23]\), where they first developed an approach without using the stabilization property, a key property used in the BLM approach, and presented an ideal candidate for the realization of quantum affine \(\mathfrak{gl}_n\).

This paper attempts to establish the affine quantum Schur–Weyl theory as a whole and is an outcome of algebraically understanding the works mentioned above.

First, building on Schiffmann \([70]\) and Hubery \([40]\), our starting point is to interpret Drinfeld’s quantum affine \(\mathfrak{gl}_n\) in the sense of \([19]\) as the double Ringel–Hall algebra \(\mathcal{D}_\triangle(n)\) over \(\mathbb{Q}(r)\) of the cyclic quiver \(\triangle(n)\) with \(n\) vertices, and present the latter in terms of Chevalley type generators. In this way, we easily obtain an action

\(^1\)Perhaps, it should be called quantum affine Schur algebras. Since our purpose is to establish an affine analogue of the quantum Schur–Weyl theory, this terminology seems more appropriate to reflect this.
Hecke algebras. Moreover, we obtain a classification of simple\(\text{\textsc{s}}\)chur algebras between representations of quantum affine\(\text{\textsc{g}}\)l\(n\), we prove that every simple\(\text{\textsc{s}}\)dimensional simple polynomial representations of\(U_{\text{\textsc{c}}}\) with the action on tensor spaces and a result of Chari–Pressley to prove that finite\(\text{\textsc{s}}\)dimensional simple\(U_{\text{\textsc{c}}}\)classification of simple\(\text{\textsc{h}}\) case.

This is another kind of phenomenon of infinite type in contrast with the finite type observed in\([22]\) unlikely to be completely reducible and all simple objects are finite dimensional. As\(\xi\)algebra epimorphisms\(D\)posable generators for\(\text{\textsc{d}}\) and multiplication formulas. We first use the new presentation for\(\text{\textsc{h}}\)especially at Levels II and III. For example, the homomorphic image of commutator formulas remains mysterious.

Like the quantum Schur algebra case, we will establish for\(n \geq r\) a Morita equivalence between affine quantum Schur algebras\(\text{\textsc{s}}(n, r)\) and affine Hecke algebras\(\mathcal{H}(r)\) of type\(A\) over a field\(\mathbb{F}\) with a non-root-of-unity parameter. As a by-product, we prove that every simple\(\text{\textsc{s}}(n, r)_{\mathbb{F}}\)-module is finite dimensional. Thus, applying the classification of simple\(\mathcal{H}(r)_{\text{\textsc{c}}}\)-modules by Zelevinsky\([35]\) and Rogawski\([69]\) yields a classification of simple\(\text{\textsc{s}}(n, r)_{\text{\textsc{c}}}\)-modules. Hence, inflation via\(\xi_{r,c}\) gives many finite dimensional simple\(U_{\text{\textsc{c}}}(\hat{\text{\textsc{g}}}l_{n})\)-modules. We will also use the epimorphisms\(\xi_{r,c}\) together with the action on tensor spaces and a result of Chari–Pressley to prove that finite dimensional simple polynomial representations of\(U_{\text{\textsc{c}}}\) are all inflations of simple\(\text{\textsc{s}}(n, r)_{\text{\textsc{c}}}\)-modules. In this way, we can see the bridging role played by affine quantum Schur algebras between representations of quantum affine\(\text{\textsc{g}}\)l\(n\) and those of affine Hecke algebras. Moreover, we obtain a classification of simple\(\text{\textsc{s}}(n, r)_{\text{\textsc{c}}}\)-modules in terms of Drinfeld polynomials and, when\(n > r\), we identify them with those arising from simple\(\mathcal{H}(r)_{\text{\textsc{c}}}\)-modules.

Our findings also show that, if we regard the category\(\text{\textsc{s}}(n, r)_{\text{\textsc{c}}}-\text{\textsc{m}}\)od of\(\text{\textsc{s}}(n, r)_{\text{\textsc{c}}}\)-modules as a full subcategory of\(U_{\text{\textsc{c}}}(\hat{\text{\textsc{g}}}l_{n})\)-modules, this category is quite different from the category\(\text{\textsc{c}}^{\text{\textsc{h}}} \cap \text{\textsc{c}}^{\text{\textsc{t}}}\) considered in\([56]\, \S6.2\). For example, the latter is completely reducible and simple objects are usually infinite dimensional, while\(\text{\textsc{s}}(n, r)_{\text{\textsc{c}}}-\text{\textsc{m}}\)od is unlikely to be completely reducible and all simple objects are finite dimensional. As observed in\([22]\, \text{Rem. 9.4(2)}\) for quantum\(\text{\textsc{g}}\)l\(\infty\) and infinite quantum Schur algebras, this is another kind of phenomenon of infinite type in contrast with the finite type case.

The discussion of the realization and presentation problems is also based on the algebra epimorphisms\(\xi_{r}\) and relies on the use of semisimple generators and indecomposable generators for\(\text{\textsc{d}}\) which are crucial to understand the integral structure and multiplication formulas. We first use the new presentation for\(\text{\textsc{d}}\) to give a decomposition for\(\text{\textsc{s}}(n, r) = U_{\text{\textsc{d}}}(n, r)Z_{\text{\textsc{d}}}(n, r)\) into a product of two subalgebras, where\(Z_{\text{\textsc{d}}}(n, r)\) is a central subalgebra and\(U_{\text{\textsc{d}}}(n, r)\) is the homomorphic image of\(U_{\text{\textsc{d}}}(n)\), the extended quantum affine\(\text{\textsc{s}}\)l\(_{n}\). By a close look at this structure, we manage to get a presentation for\(\text{\textsc{s}}(r, r)\) for all\(r \geq 1\) and acknowledge that the presentation problem is very complicated in the\(n < r\) case. On the other hand, we formulate a realization conjecture suggested by the work\([23]\) and prove the conjecture in the classical\((v = 1)\) case.
We remark that, unlike the geometric approach in which the ground ring must be a field or mostly the complex number field $\mathbb{C}$, the algebraic, or rather, the representation-theoretic approach we used in the paper works largely over a ring or mostly the integral Laurent polynomial ring $\mathbb{Z}[v, v^{-1}]$.

We organize the paper as follows.

In the first preliminary chapter, we introduce in §1.4 three different types of generators and their associated monomial bases for the Ringel–Hall algebras of cyclic quivers, and display in §1.5 the Green–Xiao Hopf structure on the extended version of these algebras.

Chapter 2 introduces a new presentation using Chevalley generators for Drinfeld’s quantum loop algebra $U(\hat{\mathfrak{g}l}_n)$ of $\mathfrak{g}l_n$. This is achieved by constructing the presentation for the double Ringel–Hall algebra $\mathcal{D}_\Delta(n)$ associated with cyclic quivers (Theorem 2.2.3), based on works of Schiffmann and Hubery, and by lifting Beck’s algebra monomorphism from the quantum $\hat{\mathfrak{sl}}_n$ with a Drinfeld–Jimbo presentation into $U(\hat{\mathfrak{g}l}_n)$ to obtain an isomorphism between $\mathcal{D}_\Delta(n)$ and $U(\hat{\mathfrak{g}l}_n)$ (Theorem 2.3.5).

Chapter 3 investigates the structure of affine quantum Schur algebras. We first recall the geometric definition by Ginzburg–Vasserot and Lusztig, the Hecke algebra definition by R. Green and the tensor space definition by Varagnolo–Vasserot. Using the Chevalley generators, we easily obtain an action on the $\mathbb{Q}(v)$-space $\mathcal{Q}$ with a basis indexed by $\mathbb{Z}$, and hence, an action on $\mathcal{Q}^{\text{red}}$ (§3.5). We prove that this action commutes with the affine Hecke algebra action defined in [77]. Moreover, we show that the restriction of the action to the $\pm$-part of $\mathcal{D}_\Delta(n)$ (i.e., to the corresponding Ringel–Hall algebra) coincides with the Ringel–Hall algebra action geometrically defined by Varagnolo–Vasserot (Theorem 3.6.3). As an application of this coincidence, the commutator formula associated with semisimple generators, arising from the skew-Hopf pairing, gives rise to certain polynomial identity associated with a pair of elements $\lambda, \mu \in \mathbb{N}_0^n$ (Corollary 3.9.6). The main result of the chapter is an elementary proof of the surjective homomorphism $\xi_r$ from the double Ringel–Hall algebra $\mathcal{D}_\Delta(n)$ onto the affine quantum Schur algebra $\mathcal{S}_\Delta(n, r)$ (Theorem 3.8.1). The approach we used is the establishment of a triangular decomposition of $\mathcal{S}_\Delta(n, r)$ (Theorem 3.7.7) through an analysis of the BLM type bases.

In Chapter 4, we discuss the representation theory of affine quantum Schur algebras over $\mathbb{C}$ and its connection to polynomial representations of quantum affine $\mathfrak{g}l_n$ and representations of affine Hecke algebras. We first establish a category equivalence between the module categories $\mathcal{S}_\Delta(n, r)_\mathbb{C}\text{-mod}$ and $\mathcal{H}_\Delta(r)_\mathbb{C}\text{-mod}$ for $n \geq r$ (Theorem 4.1.3). As an application, we will reinterpret Chari–Pressley’s category equivalence ([8], Th. 4.2) between (level $r$) representations of $U_\mathbb{C}(\mathfrak{sl}_n)$ and those of affine Hecke algebras $\mathcal{H}_\Delta(r)_\mathbb{C}$, where $n > r$, in terms of representations of $\mathcal{S}_\Delta(n, r)_\mathbb{C}$ (Proposition 4.2.1). We then develop two approaches to the classification of simple $\mathcal{S}_\Delta(n, r)_\mathbb{C}$-modules. In the so-called upwards approach, we use the classification of simple $\mathcal{H}_\Delta(r)_\mathbb{C}$-modules of Zelevinsky and Rogawski to classify simple $\mathcal{S}_\Delta(n, r)_\mathbb{C}$-modules (Theorem 4.3.4), while in the downwards approach, we determine the classification of simple $\mathcal{S}_\Delta(n, r)_\mathbb{C}$-modules (Theorem 4.5.8) in terms of simple polynomial representations of $U_\mathbb{C}(\hat{\mathfrak{g}l}_n)$. When $n > r$, we prove an identification theorem (Theorem 4.4.2) for the two classifications. Finally, in §4.6, a classification of simple $U_\Delta(n, r)_\mathbb{C}$-modules is...
also completed and its connection to finite dimensional simple $U_C(\mathfrak{sl}_n)$-modules and
finite dimensional simple (polynomial) $U_C(\mathfrak{gl}_n)$-modules are also discussed.

We move on to look at the presentation and realization problems in Chapter 5. Since $D_\Delta(n) \cong U_\Delta(n) \otimes Z_\Delta(n)$, it follows that $S_\Delta(n, r) = U_\Delta(n, r)Z_\Delta(n, r)$, where $U_\Delta(n, r)$ and $Z_\Delta(n, r)$ are homomorphic images of $U_\Delta(n)$ and $Z_\Delta(n)$, respectively. Thus, $Z_\Delta(n, r) \subseteq U_\Delta(n, r)$ if and only if $n > r$. A presentation for $U_\Delta(n, r)$ is given in [60] (see also [17] for the case $n > r$). Building on McGerty’s presentation, we first give a Drinfeld–Jimbo type presentation for the subalgebra $U_\Delta(n, r)$ (Theorem 5.1.3). We then describe a presentation for the central subalgebra $Z_\Delta(n, r)$ as a Laurent polynomial ring in one indeterminate over a polynomial ring in $r − 1$ indeterminates over $\mathbb{Q}(v)$. We manage to describe a presentation for $S_\Delta(r, r)$ for all $r \geqslant 1$ (Theorem 5.3.5) by adding an extra generator (and its inverse) together with an additional set of relations on top of the relations given in Theorem 5.1.3. What we will see from this case is that the presentation for $S_\Delta(n, r)$ with $r > n$ can be very complicated.

We discuss the realization problem from §5.4 onwards. We first describe the modified BLM approach developed in [23]. With some supporting evidence, we then formulate the realization conjecture (Conjecture 5.4.2) as suggested in [23, 5.5(2)], and state its classical ($v = 1$) version. We end the chapter with a closer look at Lusztig’s transfer maps [59] by displaying some explicit formulas for their action on the semisimple generators for $S_\Delta(n, r)$ (Corollary 5.5.2). These formulas show also that the homomorphism from $U(\mathfrak{sl}_n)$ to $\lim \leftarrow S_\Delta(n, n + m)$ induced by the transfer maps cannot either be extended to the double Ringel–Hall algebra $'D_\Delta(n)$. (Lusztig already pointed out that it cannot be extended to $U_\Delta(n)$.) This somewhat justifies the realization conjecture in which a direct product is used instead of the inverse limit.

In the last Chapter 6, we prove the realization conjecture for the classical ($v = 1$) case. The key step to the proof is the establishment of more multiplication formulas (Proposition 6.2.3) between homogeneous indecomposable generators and an arbitrary BLM type basis element. As a by-product, we display a basis for the universal enveloping algebra of the loop algebra of $\mathfrak{gl}_n$ (Theorem 6.3.4) together with explicit multiplication formulas between generators and arbitrary basis elements (Corollary 6.3.5).

There are two Appendixes §§3.10,6.4 which collect a number of lengthy calculations used in some proofs.

**Conjectures and problems.** There are quite few conjectures and problems throughout the paper. The conjectures are mostly natural generalizations to the affine case, for example, the realization conjecture 5.4.2 and the conjectures in §3.8 on an integral form for double Ringel–Hall algebras and the second centralizer property in the affine quantum Schur–Weyl reciprocity. Some problems are designed to seek further solutions to certain questions such as “quantum Serre relations” for semisimple generators (Problem 2.4.5), Affine Branching Rules (Problem 4.3.7), and further identification of simple modules from different classifications (Problem 4.5.11). There are also problems for seeking different proofs. Problems 3.4.3 and 6.4.2 form a key step towards the proof of the realization conjecture.

**Notational scheme.** For most of the notations throughout the paper, if it involves a subscript $\Delta$ or a superscript $\hat{\Delta}$, it indicates that the same notation without $\Delta$
has been used in the non-affine case, say, in [3], [33], etc. Here the triangle $\triangle$ depicts the cyclic Dynkin diagram of affine type $A$.

For a ground ring $\mathcal{Z}$ and a $\mathcal{Z}$-module (or a $\mathcal{Z}$-algebra) $\mathcal{A}$, we often use the notation $\mathcal{A}_F := \mathcal{A} \otimes F$ to represent the object obtained by base change to a field $F$, which itself is a $\mathcal{Z}$-module. In particular, if $\mathcal{Z} = \mathbb{Z}[v, v^{-1}]$, then we write $\mathcal{A}$ for $\mathcal{A}_{\mathbb{Q}(v)}$.

Acknowledgements. The main results of the paper have been presented by the authors at the following conferences and workshops. We would like to thank the organizers for the opportunities of presenting our work.

CHAPTER 1

Preliminaries

We start with the loop algebra of \( \mathfrak{gl}_n(\mathbb{C}) \) and its interpretation in terms of matrix Lie algebra. We use the subalgebra of integer matrices of the latter to introduce several important index sets which will be used throughout the paper. Ringel–Hall algebras \( \mathcal{H}_\Delta(n) \) associated with cyclic quivers \( \Delta(n) \) and their geometric construction are introduced in §1.2. In §1.3, we discuss the composition subalgebra \( C_{\Delta}(n) \) of \( \mathcal{H}_\Delta(n) \) and relate it to the quantum loop algebra \( \mathcal{U}(\widehat{\mathfrak{sl}}_n) \). We then describe in §1.4 three types of generators for \( \mathcal{H}_\Delta(n) \), which consist of all simple modules together with, respectively, the Schiffmann–Hubery central elements, homogeneous semisimple modules, and homogeneous indecomposable modules, and their associated monomial bases (Corollaries 1.4.2 and 1.4.6). These generating sets will play different roles in the sequel. Finally, extended Ringel–Hall algebras and their Hopf structure are discussed in §1.5.

1.1. The loop algebra \( \widehat{\mathfrak{gl}}_n \) and some notations

For a positive integer \( n \), let \( \mathfrak{gl}_n(\mathbb{C}) \) be the complex general linear Lie algebra, and let

\[
\widehat{\mathfrak{gl}}_n(\mathbb{C}) := \mathfrak{gl}_n(\mathbb{C}) \otimes \mathbb{C}[t, t^{-1}]
\]

be the loop algebra associated to \( \mathfrak{gl}_n(\mathbb{C}) \); see [47]. Thus, \( \widehat{\mathfrak{gl}}_n(\mathbb{C}) \) is spanned by \( E_{i,j} \otimes t^m \) for all \( 1 \leq i, j \leq n \) and \( m \in \mathbb{Z} \), where \( E_{i,j} \) is the matrix \( (\delta_{k,i} \delta_{l,j})_{1 \leq k,l \leq n} \). The (Lie) multiplication is the bracket product associated with the multiplication \((E_{i,j} \otimes t^m)(E_{k,l} \otimes t^{m'}) = \delta_{j,k} E_{i,l} \otimes t^{m+m'}\).

We may interpret the Lie algebra \( \widehat{\mathfrak{gl}}_n(\mathbb{C}) \) as a matrix Lie algebra. Let \( M_{\Delta,n}(\mathbb{C}) \) be the set of all \( \mathbb{Z} \times \mathbb{Z} \) complex matrices \( A = (a_{i,j})_{i,j \in \mathbb{Z}} \) with \( a_{i,j} \in \mathbb{C} \) such that

(a) \( a_{i,j} = a_{i+n,j+n} \) for \( i, j \in \mathbb{Z} \);
(b) for every \( i \in \mathbb{Z} \), the set \( \{ j \in \mathbb{Z} \mid a_{i,j} \neq 0 \} \) is finite.

Clearly, conditions (a) and (b) imply that there are only finitely many nonzero entries in each column of \( A \). For \( A, B \in M_{\Delta,n}(\mathbb{C}) \), let \( [A, B] = AB - BA \). Then \( (M_{\Delta,n}(\mathbb{C}), [ , ]) \) becomes a Lie algebra over \( \mathbb{C} \).

Denote by \( M_{n,\bullet}(\mathbb{C}) \) the set of \( n \times \mathbb{Z} \) matrices \( A = (a_{i,j}) \) over \( \mathbb{C} \) satisfying (b). Then there is a bijection

\[
b_1 : M_{\Delta,n}(\mathbb{C}) \rightarrow M_{n,\bullet}(\mathbb{C}), \quad (a_{i,j})_{i,j \in \mathbb{Z}} \mapsto (a_{i,j})_{1 \leq i \leq n, j \in \mathbb{Z}}.
\]
For \( i, j \in \mathbb{Z} \), let \( E_{i,j}^{\lambda} \in M_{\lambda,n}(\mathbb{C}) \) be the matrix \((e_{k,l}^{i,j})_{k,l \in \mathbb{Z}}\) defined by
\[
e_{k,l}^{i,j} = \begin{cases} 
1 & \text{if } k = i + sn, l = j + sn \text{ for some } s \in \mathbb{Z}, \\
0 & \text{otherwise}.
\end{cases}
\]
The set \( \{E_{i,j}^{\lambda}| 1 \leq i \leq n, j \in \mathbb{Z}\} \) is a \( \mathbb{C} \)-basis of \( M_{\lambda,n}(\mathbb{C}) \). Since \( E_{i,j}^{\lambda}E_{p,q}^{\mu} = \delta_{j,q}E_{i,q+i+k}^{\lambda,\mu} \) for all \( i, j, p, q, k \in \mathbb{Z} \) with \( 1 \leq j, p \leq n \), it follows that the map
\[
M_{\lambda,n}(\mathbb{C}) \rightarrow \hat{gl}_n(\mathbb{C}), \quad E_{i,j}^{\lambda} \rightarrow E_{i,j} \otimes t^l, \ 1 \leq i, j \leq n, l \in \mathbb{Z}
\]
is a Lie algebra isomorphism. We will identify the loop algebra \( \hat{gl}_n(\mathbb{C}) \) with \( M_{\lambda,n}(\mathbb{C}) \) in the sequel.

In Chapter 6, we will consider the loop algebra \( \hat{gl}_n := \hat{gl}_n(\mathbb{Q}) = M_{\lambda,n}(\mathbb{Q}) \) defined over \( \mathbb{Q} \) and its universal enveloping algebra \( U(\hat{gl}_n) \) and triangular parts \( U(\hat{gl}_n)^+, U(\hat{gl}_n)^- \) and \( U(\hat{gl}_n)^0 \). Here \( U(\hat{gl}_n)^+ \) (resp., \( U(\hat{gl}_n)^-, U(\hat{gl}_n)^0 \)) is the subalgebra of \( U(\hat{gl}_n) \) generated by \( E_{i,j}^{\lambda} \) for all \( i < j \) (resp., \( E_{i,j}^{\lambda} \) for all \( i > j \), \( E_{i,i}^{\lambda} \) for all \( i \)). We will also relate these algebras in §6.1 with the specializations at \( v = 1 \) of the Ringel–Hall algebra \( S_\lambda(n) \) and the double Ringel–Hall algebra \( D_\lambda(n) \).

We now introduce some notations which will be used throughout the paper.

Consider the subset \( M_{\lambda,n}(\mathbb{Z}) \) of \( M_{\lambda,n}(\mathbb{C}) \) consisting of matrices with integer entries. For each \( A \in M_{\lambda,n}(\mathbb{Z}) \), let
\[
\text{ro}(A) = \left( \sum_{j \in \mathbb{Z}} a_{i,j} \right)_{i \in \mathbb{Z}}, \quad \text{co}(A) = \left( \sum_{i \in \mathbb{Z}} a_{i,j} \right)_{j \in \mathbb{Z}}.
\]
We obtain functions
\[
\text{ro}, \text{co} : M_{\lambda,n}(\mathbb{Z}) \rightarrow \mathbb{Z}^n_{\lambda},
\]
where
\[
\mathbb{Z}^n_{\lambda} := \{(\lambda_i)_{i \in \mathbb{Z}} | \lambda_i \in \mathbb{Z}, \lambda_i = \lambda_{i-n} \text{ for } i \in \mathbb{Z}\}.
\]
For \( \lambda = (\lambda_i)_{i \in \mathbb{Z}} \in \mathbb{Z}^n_{\lambda}, A \in M_{\lambda,n}(\mathbb{Z}) \) and \( i_0 \in \mathbb{Z} \), let
\[
\sigma(\lambda) = \sum_{i_0+1 \leq i \leq i_0+n} \lambda_i, \quad \sigma(A) = \sum_{i_0+1 \leq i \leq i_0+n} a_{i,j} = \sum_{i_0+1 \leq j \leq i_0+n} a_{i,j}.
\]
Clearly, both \( \sigma(\lambda) \) and \( \sigma(A) \) are defined and independent of \( i_0 \). We sometimes identify \( \mathbb{Z}^n_{\lambda} \) with \( \mathbb{Z}^n \) via the following bijection
\[
b_2 : \mathbb{Z}^n_{\lambda} \rightarrow \mathbb{Z}^n, \quad \lambda \mapsto b_2(\lambda) = (\lambda_1, \ldots, \lambda_n).
\]
For example, we define a “dot product” on \( \mathbb{Z}^n_{\lambda} \) by \( \lambda \cdot \mu := b_2(\lambda) \cdot b_2(\mu) = \sum_{i=1}^n \lambda_i \mu_i \), and define the order relation \( \leq \) on \( \mathbb{Z}^n_{\lambda} \) by setting
\[
\lambda \leq \mu \iff b_2(\lambda) \leq b_2(\mu) \iff \lambda_i \leq \mu_i \text{ for all } 1 \leq i \leq n.
\]
Also, let \( e_i^\lambda \in \mathbb{Z}^n_{\lambda} \) be defined by \( b_2(e_i^\lambda) = e_i = (0, \ldots, 0, 1, 0, \ldots, 0) \).

Let
\[
\Theta_\lambda(n) := \{ A = (a_{i,j}) \in M_{\lambda,n}(\mathbb{Z}) | a_{i,j} \in \mathbb{N} \} = M_{\lambda,n}(\mathbb{N}),
\]
\[
N^n_{\lambda} := \{(\lambda_i)_{i \in \mathbb{Z}} \in \mathbb{Z}^n_{\lambda} | \lambda_i \geq 0\},
\]
and for $r \geq 0$,

$$\Theta_{\Delta}(n, r) := \{ A \in \Theta_{\Delta}(n) \mid \sigma(A) = r \}$$

$$\Lambda_{\Delta}(n, r) := \{ \lambda \in \mathbb{N}_0^n \mid \sigma(\lambda) = r \}.$$

The set $M_n(\mathbb{Z})$ can be naturally regarded as a subset of $M_n(\mathbb{Z})$ by sending $(a_{i,j})_{1 \leq i,j \leq n}$ to $(a_{i,j})_{1 \leq i \leq n, j \in \mathbb{Z}}$, where $a_{i,j} = 0$ if $j \in \mathbb{Z}\setminus[1, n]$. Thus, (the inverse of) $b_1$ induces an embedding

$$\nu_1 : M_n(\mathbb{Z}) \rightarrow M_{\Delta,n}(\mathbb{Z}).$$

By removing the subscripts $\Delta$, we define similarly the subsets $\Theta(n)$, $\Theta(n, r)$ of $M_n(\mathbb{Z})$ and subset $\Lambda(n, r)$ of $\mathbb{N}^n$, etc. Note that $b_2(\Lambda_{\Delta}(n, r)) = \Lambda(n, r)$.

Let $\mathcal{Z} = \mathbb{Z}[v, v^{-1}]$, where $v$ is an indeterminate, and let $\mathbb{Q}(v)$ be the fraction field of $\mathcal{Z}$. For integers $N, t$ with $t \geq 0$, let

$$\left[\begin{array}{c} N \\ t \end{array}\right] = \prod_{1 \leq i \leq t} \frac{v^{N-i+1} - v^{-(N-i+1)}}{v^i - v^{-i}} \in \mathcal{Z} \quad \text{and} \quad \left[\begin{array}{c} N \\ 0 \end{array}\right] = 1. \quad (1.1.0.5)$$

If we put $[m] = \frac{v^m - v^{-m}}{v - v^{-1}} = [m]_1$ and $[N] := [1][2] \cdots [N]$, then $\left[\begin{array}{c} N \\ t \end{array}\right] = \frac{[N]^t}{[t][N-t]}$ for all $1 \leq t \leq N$.

When counting occurs, we often use

$$\left[\begin{array}{c} N \\ t \end{array}\right] := v^{t(N-t)} \left[\begin{array}{c} N \\ t \end{array}\right]$$

to denote the Gaussian polynomials in $v^2$.

Also, for any $\mathbb{Q}(v)$-algebra $\mathcal{A}$ and an invertible element $X \in \mathcal{A}$, let

$$\left[\begin{array}{c} X; a \\ t \end{array}\right] = \prod_{s=1}^t \frac{Xv^{a-s+1} - X^{-1}v^{-a+s-1}}{v^s - v^{-s}} \quad \text{and} \quad \left[\begin{array}{c} X; a \\ 0 \end{array}\right] = 1. \quad (1.1.0.6)$$

for all $a, t \in \mathbb{Z}$ with $t \geq 1$.

1.2. Representations of cyclic quivers and Ringel–Hall algebras

Let $\Delta(n)$ ($n \geq 2$) be the cyclic quiver

![Cyclic Quiver](image)

with vertex set $I = \mathbb{Z}/n\mathbb{Z} = \{1, 2, \ldots, n\}$ and arrow set $\{i \rightarrow i + 1 \mid i \in I\}$. Let $\mathbb{F}$ be a field. By $\text{Rep}_{\mathbb{F}}^{\Delta}(n) = \text{Rep}_{\mathbb{F}}^0(\Delta(n))$ we denote the category of finite-dimensional nilpotent representations of $\Delta(n)$ over $\mathbb{F}$, i.e., representations $V = (V_i, f_i)_{i \in I}$ of $\Delta(n)$ such that all $V_i$ are finite dimensional and the composition $f_n \cdots f_2 f_1 : V_1 \rightarrow V_1$ is nilpotent. The vector $\text{dim} V = (\text{dim}_\mathbb{F} V_i)_{i \in I} \in \mathbb{N} I = \mathbb{N}^n$ is called the dimension vector of $V$. (We shall sometimes identify $\mathbb{N} I$ with $\mathbb{N}^n$ under $(1.1.0.2)$.). For each vertex $i \in I$, there is a one-dimensional representation $S_i$ in $\text{Rep}_{\mathbb{F}}^{\Delta}(n)$ satisfying $(S_i)_i = \mathbb{F}$ and $(S_i)_j = 0$ for $j \neq i$. It is known that the $S_i$ form a complete set of simple objects in $\text{Rep}_{\mathbb{F}}^{\Delta}(n)$. Hence, each semisimple representation in $\text{Rep}_{\mathbb{F}}^{\Delta}(n)$ is given by
$S_a = \oplus_{i \in I} a_i S_i$, where $a = (a_1, \ldots, a_n) \in \mathbb{N}$. A semisimple representation $S_a$ is called *sincere* if $a$ is sincere, namely, all $a_i$ are positive. In particular, the vector 
\[ \delta := (1, \ldots, 1) \in \mathbb{N}^n \]
will be often used.

Moreover, up to isomorphism, all indecomposable representations in $\text{Rep}^\circ (n)$ are given by $S_i[l]$ ($i \in I$ and $l \geq 1$) of length $l$ with top $S_i$. Thus, the isoclasses of representations in $\text{Rep}^\circ (n)$ are indexed by multisegments $\pi = \sum_{i \in I, l \geq 1} \pi_{i,l}[i;l]$, where the representation $M(\pi)$ corresponding to $\pi$ is defined by 
\[ M(\pi) = M_{\pi}(\pi) = \bigoplus_{1 \leq i \leq n, j \geq 1} \pi_{i,j} S_i[l]. \]

Since the set $\Pi$ of all multisegments can be identified with the set 
\[ \Theta^+_\circ(n) = \{ A = (a_{i,j}) \in \Theta_\circ(n) \mid a_{i,j} = 0 \text{ for } i \geq j \} \]
of all strictly upper triangular matrices via 
\[ \varphi_3 : \Theta^+_\circ(n) \dashrightarrow \Pi, \quad A = (a_{i,j})_{i,j \in \mathbb{Z}} \mapsto \sum_{i < j, 1 \leq i \leq n} a_{i,j}[i;j-i], \]
we will use $\Theta^+_\circ(n)$ to index the finite dimensional nilpotent representations. In particular, for any $i, j \in \mathbb{Z}$ with $i < j$, we have 
\[ M^{i,j} := M(E_{i,j}^\circ) = S_i[j-i], \text{ and } M^{i+n,j+n} = M^{i,j}. \]
Thus, for any $A = (a_{i,j}) \in \Theta^+_\circ(n)$ and $i_0 \in \mathbb{Z}$, 
\[ M(A) = M_{\pi}(A) = \bigoplus_{1 \leq i \leq n, j < j} a_{i,j} M^{i,j} = \bigoplus_{i_0+1 \leq i \leq i_0+n, i < j} a_{i,j} M^{i,j}. \]
For $A = (a_{i,j}) \in \Theta^+_\circ(n)$, set 
\[ \vartheta(A) = \sum_{i < j, 1 \leq i \leq n} a_{i,j}(j-i). \]
Then $\dim_{\mathbb{F}} M(A) = \vartheta(A)$. Moreover, for each $\lambda = (\lambda_i) \in \mathbb{N} I$, set $A_\lambda = (a_{i,j})$ with $a_{i,j} = \delta_{j,i+1} \lambda_i$, i.e., $A_\lambda = \sum_{i=1}^n \lambda_i E_{i,i+1}^\circ$. Then 
\[ M(A_\lambda) = \bigoplus_{1 \leq i \leq n} \lambda_i S_i =: S_\lambda \] (1.2.0.7)
is semisimple. Also, for $A \in \Theta^+_\circ(n)$, we write $d(A) = \dim M(A) \in \mathbb{Z} I$, the dimension vector of $M(A)$. Hence, $\mathbb{Z} I$ is identified with the Grothendieck group of $\text{Rep}^\circ (n)$.

A matrix $A = (a_{i,j}) \in \Theta^+_\circ(n)$ is called *aperiodic* if for each $l \geq 1$, there exists $i \in \mathbb{Z}$ such that $a_{i,i+l} = 0$. Otherwise, $A$ is called *periodic*. A nilpotent representation $M(A)$ is called aperiodic (resp., periodic) if $A$ is aperiodic (resp., periodic).

It is well known that there exist Auslander–Reiten sequences in $\text{Rep}^\circ (n)$; see [1]. More precisely, for each $i \in I$ and each $l \geq 1$, there is an Auslander–Reiten sequence 
\[ 0 \longrightarrow S_{i+1}[l] \longrightarrow S_i[l+1] \oplus S_{i+1}[l-1] \longrightarrow S_i[l] \longrightarrow 0, \]
where we set $S_{i+1}[0] = 0$ by convention. The $S_{i+1}[l]$ is called the Auslander–Reiten translate of $S_i[l]$, denoted by $\tau S_i[l]$. In this case, $\tau$ indeed defines an equivalence
from $\text{Rep}^0_\Delta(n)$ to itself, called the Auslander–Reiten translation. For each $A = (a_{i,j}) \in \Theta^+(n)$, we define $\tau(A) = (b_{i,j}) \in \Theta^+(n)$ by $M(\tau(A)) = \tau M(A)$. Thus, if we write $\tau(A) = (b_{i,j}) \in \Theta^+(n)$, then $b_{i,j} = a_{i-1,j-1}$ for all $i,j$.

We now introduce the degeneration order on $\Theta^+(n)$ and generic extensions of nilpotent representations. These notions play an important role in the study of bases for both the Ringel–Hall algebra $\mathcal{H}_\Delta(n)$ of $\Delta(n)$ and its composition subalgebra $\mathcal{C}_\Delta(n)$; see, for example, [10, 12]. For two nilpotent representations $M, N$ in $\text{Rep}^0_\Delta(n)$ with $\dim M = \dim N$, define

$$N \leq_{\text{deg}} M \iff \dim_F \text{Hom}(X, N) \geq \dim_F \text{Hom}(X, M) \text{ for all } X \in \text{Rep}^0_\Delta(n);$$

see [86]. This gives rise to a partial ordering on the set of isoclasses of representations in $\text{Rep}^0_\Delta(n)$, called the degeneration order. Thus, it also induces a partial order on $\Theta^+(n)$ by letting

$$A \leq_{\text{deg}} B \iff M(A) \leq_{\text{deg}} M(B).$$

By [63] and [10, §3], for any two nilpotent representations $M$ and $N$, there exists a unique extension $G$ (up to isomorphism) of $M$ by $N$ with minimal $\dim \text{End}(G)$. This representation $G$ is called the generic extension of $M$ by $N$ and will be denoted by $M \ast N$ in the sequel. Moreover, for nilpotent representations $M_1, M_2, M_3$,

$$(M_1 \ast M_2) \ast M_3 \cong M_1 \ast (M_2 \ast M_3).$$

Also, taking generic extensions preserves the degeneration order. More precisely, if $N_1 \leq_{\text{deg}} M_1$ and $N_2 \leq_{\text{deg}} M_2$, then $N_1 \ast N_2 \leq_{\text{deg}} M_1 \ast M_2$. For $A, B \in \Theta^+(n)$, let $A \ast B \in \Theta^+(n)$ be defined by $M(A \ast B) \cong M(A) \ast M(B)$.

As above, let $Z = \mathbb{Z}[v, v^{-1}]$ be the Laurent polynomial ring in indeterminate $v$. By [68] and [36], for $A, B_1, \ldots, B_m \in \Theta^+(n)$, there is a polynomial $\varphi_{B_1,\ldots,B_m}^A \in \mathbb{Z}[v^2]$ in $v^2$, called the Hall polynomial, such that for any finite field $\mathbb{F}$ of $q$ elements, $\varphi_{B_1,\ldots,B_m}^A|_{v^2=q}$ equals to the number $F_{M_{\varphi(A)}(B_1),\ldots,M_{\varphi(A)}(B_m)}$ of the filtrations

$$0 = M_m \subseteq M_{m-1} \subseteq \cdots \subseteq M_1 \subseteq M_0 = M\varphi(A)$$

such that $M_{t-1}/M_t \cong M\varphi(B_t)$ for all $1 \leq t \leq m$.

Moreover, for each $A = (a_{i,j}) \in \Theta^+(n)$, there is a polynomial $a_A = a_A(v^2) \in \mathbb{Z}$ in $v^2$ such that, for each finite field $\mathbb{F}$ with $q$ elements, $a_A|_{v^2=q} = |\text{Aut}(M\varphi(A))|$; see, for example, [61, Cor. 2.1.1]. For later use, we give an explicit formula for $a_A$. Let $m_A$ denote the dimension of $\text{rad} \text{End}(M\varphi(A))$, which is known to be independent of the field $\mathbb{F}$. We also have

$$\text{End}(M\varphi(A))/\text{rad} \text{End}(M\varphi(A)) \cong \prod_{1 \leq i \leq m, a_{i,j} \neq 0} M_{a_{i,j}}(\mathbb{F}),$$

where $M_{a_{i,j}}(\mathbb{F})$ denotes the full matrix algebra of $a_{i,j} \times a_{i,j}$ matrices over $\mathbb{F}$. Hence,

$$|\text{Aut}(M\varphi(A))| = |\mathbb{F}|^{m_A} \prod_{1 \leq i \leq m, a_{i,j} \neq 0} |\text{GL}_{a_{i,j}}(\mathbb{F})|.$$
Consequently, the polynomial
\[ a_A = v^{2m_A} \prod_{1 \leq i \leq n, a_{i,j} > 0} (v^{2a_{i,j}} - 1)(v^{2a_{i,j}} - v^2) \cdots (v^{2a_{i,j}} - v^{2a_{i,j}-2}). \]  \hspace{1cm} (1.2.0.9)

In particular, if \( z \in \mathbb{C} \) is not a root of unity, then \( a_A|_{z^2 = z} \neq 0 \).

Let \( \mathcal{H}_0(n) \) be the \textit{(generic) Ringel–Hall algebra} of the cyclic quiver \( \triangle(n) \), which is by definition the free \( \mathcal{Z} \)-module over with basis \{ \( u_A = u_{[M(A)]} | A \in \Theta^+_0(n) \) \}. The multiplication is given by
\[ u_A u_B = v^{\langle d(A), d(B) \rangle} \sum_{C \in \Theta^+_0(n)} \varphi_{A,B}^{C} u_C \]
for \( A, B \in \Theta^+_0(n) \), where
\[ \langle d(A), d(B) \rangle = \dim \hom(M(A), M(B)) - \dim \ext^1(M(A), M(B)) \]  \hspace{1cm} (1.2.0.10)
is the \textit{Euler form} associated with the cyclic quiver \( \triangle(n) \). If we write \( d(A) = (a_i) \) and \( d(B) = (b_i) \), then
\[ \langle d(A), d(B) \rangle = \sum_{i \in I} a_i b_i - \sum_{i \in I} a_i b_{i+1}. \]  \hspace{1cm} (1.2.0.11)

Since both \( \dim \hom(M_F(A)) \) and \( \dim \hom(M_F(A)) = \vartheta(A) \) are independent of the ground field, we put for each \( A \in \Theta^+_0(n) \),
\[ d'_A = \dim \hom(M_F(A)) - \dim \hom(M_F(A)) \text{ and } \tilde{u}_A = v^{d'_A} u_A; \]  \hspace{1cm} (1.2.0.12)
cf. [12] (8.1)]. As seen in [12], it is convenient sometimes to work with the PBW type basis \( \{ \tilde{u}_A | A \in \Theta^+_0(n) \} \) of \( \mathcal{H}_0(n) \).

The degeneration ordering gives rise to the following “triangular relation” in \( \mathcal{H}_0(n) \): for \( A_1, \ldots, A_t \in \Theta^+_0(n) \),
\[ u_{A_1} \cdots u_{A_t} = v^{\sum_{1 \leq r < s \leq t} \langle d(A_r), d(A_s) \rangle} \sum_{B \leq d_A, A_1 \cdots A_s} \varphi_{A_1 \cdots A_t}^{B} u_{B}. \]  \hspace{1cm} (1.2.0.13)

There is a natural NI-grading on \( \mathcal{H}_0(n) \):
\[ \mathcal{H}_0(n) = \bigoplus_{d \in \mathbb{N} I} \mathcal{H}_0(n)_d, \]  \hspace{1cm} (1.2.0.14)
where \( \mathcal{H}_0(n)_d \) is spanned by all \( u_A \) with \( d(A) = d \). Moreover, we will frequently consider in the sequel the algebra \( \mathcal{H}_0(n) = \mathcal{H}_0(n) \otimes \mathcal{Z} \mathbb{Q}(v) \) obtained by base change to the fraction field \( \mathbb{Q}(v) \).

In order to relate Ringel–Hall algebras \( \mathcal{H}_0(n) \) of cyclic quivers with affine quantum Schur algebras later on, we recall Lusztig’s geometric construction of \( \mathcal{H}_0(n) \) (simplifying \( v \) to a square root of a prime power) developed in [55, 56] (cf. also [57]).

Let \( \mathbb{F} = \mathbb{F}_q \) be the finite field of \( q \) elements and \( d \in \mathbb{N} I \). Fix an \( I \)-graded \( \mathbb{F} \)-vector space \( V = \bigoplus_{i \in I} V_i \) of dimension vector \( d \), i.e., \( \dim \mathbb{F} V_i = d_i \) for all \( i \in I \). Then each element in
\[ E_V = \{ (f_i) \in \bigoplus_{i \in I} \hom_{\mathbb{F}}(V_i, V_{i+1}) | f_n \cdots f_1 \text{ is nilpotent} \} \]
\footnote{There is another notation, called \( d_A \), which will be defined in (3.1.3.2) for all \( A \in \Theta_0(n) \).}
can be viewed as a nilpotent representation of $\triangle(n)$ over $\mathbb{F}$ of dimension vector $\mathbf{d}$. The group $G_V = \prod_{i \in I} \text{GL}(V_i)$ acts on $E_V$ by conjugation. Then there is a bijection between the $G_V$-orbits in $E_V$ and the isoclasses of nilpotent representations of $\triangle(n)$ of dimension vector $\mathbf{d}$. For each $A \in \Theta(n)$ with $\mathbf{d}(A) = \mathbf{d}$, we will denote by $\mathfrak{O}_A$ the orbit in $E_V$ corresponding to the isoclass of $M(A)$.

Define $H_\mathbf{d} = \mathbb{C}G_V(E_V)$ to be the vector space of $G_V$-invariant functions from $E_V$ to $\mathbb{C}$. Now let $\mathbf{a}, \mathbf{b} \in \mathbb{N}_0^I$ with $\mathbf{d} = \mathbf{a} + \mathbf{b}$ and fix $I$-graded $\mathbb{F}$-vector spaces $U = \oplus_{i \in I} U_i$ and $W = \oplus_{i \in I} W_i$ with dimension vectors $\mathbf{a}$ and $\mathbf{b}$, respectively. Let $E$ be the set of triples $(x, \phi, \psi)$ such that $x \in E_V$ and the sequence

$$0 \longrightarrow W \overset{\phi}{\longrightarrow} V \overset{\psi}{\longrightarrow} U \longrightarrow 0$$

of $I$-graded spaces is exact and $\phi(W)$ is stable by $x$, and let $F$ be the set of pairs $(x, W')$, where $x \in E_V$ and $W' \subseteq V$ is an $x$-stable $I$-graded subspace of dimension vector $\mathbf{b}$. Consider the diagram

$$E_U \times E_W \overset{p_1}{\longrightarrow} E \overset{p_2}{\longrightarrow} F \overset{p_3}{\longrightarrow} E_V,$$

where $p_1, p_2, p_3$ are projections defined in an obvious way. Given $f \in \mathbb{C}G_V(E_U) = H_a$ and $g \in \mathbb{C}G_W(E_W) = H_b$, define the convolution product of $f$ and $g$ by

$$fg = q^{-\frac{1}{2}m(\mathbf{a}, \mathbf{b})} (p_3)h \in \mathbb{C}G_V(E_V) = H_d,$$

where $h \in \mathbb{C}(F)$ is the function such that $p_3^*h = p_1^*(fg)$ and

$$m(\mathbf{a}, \mathbf{b}) = \sum_{1 \leq i \leq n} a_ib_i + \sum_{1 \leq i \leq n} a_ib_{i+1}.$$ 

Consequently, $H = \bigoplus_{\mathbf{d} \in \mathbb{N}_0^I} H_\mathbf{d}$ becomes an associative algebra over $\mathbb{C}$\footnote{The algebra $H$, defined also geometrically in \cite{77}, 3.2, has a multiplication opposite to the one for $H$ here.}. For each $A \in \Theta(n)$, let $\chi_{\mathfrak{O}_A}$ be the characteristic function of $\mathfrak{O}_A$ and put

$$\langle \mathfrak{O}_A \rangle = q^{-\frac{1}{2} \text{dim} \mathfrak{O}_A} \chi_{\mathfrak{O}_A}.$$ 

By [\cite{12}, 8.1], there is an algebra isomorphism

$$\mathfrak{H}_n(n) \otimes \mathbb{Z} \mathbb{C} \longrightarrow H, \quad u_A \longmapsto v^{\mathbf{d}(A) - \mathbf{d}(A) \cdot \mathbf{d}(A)} \chi_{\mathfrak{O}_A}, \quad \text{for} \ A \in \Theta(n),$$

where $\mathbb{C}$ is viewed as a $\mathbb{Z}$-module by specializing $v$ to $q^{\frac{1}{2}}$. In particular, this isomorphism takes $\mathfrak{H}$ to $\langle \mathfrak{O}_A \rangle$.

### 1.3. The quantum loop algebra $U(\hat{\mathfrak{sl}}_n)$

As mentioned in the introduction, an important breakthrough for the structure of quantum groups associated with semisimple complex Lie algebras is Ringel’s Hall algebra realization of the $\pm$-part of the quantum enveloping algebra associated with the same quiver; see [\cite{65}, 67]. For the Ringel–Hall algebra $\mathfrak{H}_n(n)$ associated with a cyclic quiver, it is known from [\cite{68}] that a subalgebra, called the composition algebra, is isomorphic to the $\pm$-part of a quantum affine $\mathfrak{sl}_n$. We now describe this algebra and use it to display a certain monomial basis.
The \( \mathcal{Z} \)-subalgebra \( \mathfrak{C}_\Delta(n) \) of \( \mathfrak{H}_\Delta(n) \) generated by \( u_{[mS]} \) \((i \in I \text{ and } m \geq 1)\) is called the composition algebra of \( \Delta(n) \). By \((1.2.0.14)\), \( \mathfrak{C}_\Delta(n) \) inherits an \( \mathbb{N} I \)-grading by dimension vectors:
\[
\mathfrak{C}_\Delta(n) = \bigoplus_{d \in \mathbb{N} I} \mathfrak{C}_\Delta(n)_d,
\]
where \( \mathfrak{C}_\Delta(n)_d = \mathfrak{C}_\Delta(n) \cap \mathfrak{H}_\Delta(n)_d \). Define the divided power
\[
u_i^{(m)} = \frac{1}{[m]} u_i^m \in \mathfrak{C}_\Delta(n)
\]
for \( i \in I \) and \( m \geq 1 \). In fact,
\[
u_i^{(m)} = v^{m(m-1)} u_{[mS]} \in \mathfrak{C}_\Delta(n) \subset \mathfrak{H}_\Delta(n).
\]

We now use the strong monomial basis property developed in \([10,12]\) to construct an explicit monomial basis of \( \mathfrak{C}_\Delta(n) \). For each \( A = (a_{i,j}) \in \Theta_\Delta^+(n) \), define
\[
\ell = \ell_A = \max\{j - i \mid a_{i,j} \neq 0\}.
\]
In other words, \( \ell \) is the Loewy length of the representation \( M(A) \).

Suppose now \( A \) is aperiodic. Then there is \( i_1 \in [1,n] \) such that \( a_{i_1,i_1+\ell} \neq 0 \), but
\[
a_{i_1+1,i_1+1+\ell} = 0.
\]
If there are some \( a_{i_1+1,j} \neq 0 \), we let \( p \geq 1 \) satisfy that
\[
a_{i_1+1,i_1+1+p} \neq 0 \text{ and } a_{i_1+1,j} = 0 \text{ for all } j > i_1 + 1 + p; \text{ if } a_{i_1+1,j} = 0 \text{ for all } j > i_1 + 1, \text{ let } p = 0.
\]
Thus, \( \ell > p \). Now set
\[
t_1 = a_{i_1,i_1+1+p} + \cdots + a_{i_1,i_1+\ell}
\]
and define \( A_1 = (b_{i,j}) \in \Theta_\Delta^+(n) \) by letting
\[
b_{i,j} = \begin{cases} 
0, & \text{if } i = i_1, j \geq i_1 + 1 + p, \\
a_{i_1+1,j} + a_{i_1,j}, & \text{if } i = i_1 + 1 < j, j \geq i_1 + 1 + p, \\
a_{i,j}, & \text{otherwise}.
\end{cases}
\]

Then, \( A_1 \) is again aperiodic. Applying the above process to \( A_1 \), we get \( i_2 \) and \( t_2 \). Repeating the above process (ending with the zero matrix), we finally get two sequences \( i_1, \ldots, i_m \) and \( t_1, \ldots, t_m \). This gives a word
\[
w_A = i_1^{t_1} i_2^{t_2} \cdots i_m^{t_m},
\]
where \( i_1, \ldots, i_m \) are viewed as elements in \( I = \mathbb{Z}/n\mathbb{Z} \), and define the monomial
\[
u^{(A)} = \nu_{i_1}^{(t_1)} \nu_{i_2}^{(t_2)} \cdots \nu_{i_m}^{(t_m)} \in \mathfrak{C}_\Delta(n).
\]

The algorithm above can be easily modified to get a similar algorithm for quantum \( \mathfrak{gl}_n \). We illustrate the algorithm with an example in this case.

**Example 1.3.1.** If \( A = \begin{pmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 0 & 7 \\ 0 & 0 & 9 & 4 \\ 0 & 0 & 0 & 0 \end{pmatrix} \), then \( \ell = 4, i_1 = 1, p = 1 \) and \( t_1 = 2 + 3 + 4 = 9 \). Here we ignore all zero entries on and below the diagonal for simplicity. Then
\[
A_1 = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 7 & 3 & 4 & 0 \\ 6 & 0 & 0 & 7 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \quad \ell = 3, i_2 = 2, p = 1 \text{ and } t_2 = 3 + 4 = 7
\]
\[
A_2 = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 7 & 0 & 0 & 9 \\ 0 & 0 & 0 & 7 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \quad \ell = 2, i_3 = 3, p = 1 \text{ and } t_3 = 4
\]
\[
A_3 = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 7 & 0 & 0 & 0 \\ 9 & 0 & 0 & 0 \\ 0 & 0 & 0 & 11 \end{pmatrix}, \quad \ell = 1, i_4 = 4, p = 0 \text{ and } t_4 = 11
\]
and $i_5 = 3, p = 0, t_5 = 9, i_6 = 2, p = 0, t_6 = 7$ and $i_7 = 1, p = 0, t_7 = 1$. Hence,

$$u^{(A)} = u^{(9)}_1 u^{(7)}_2 u^{(4)}_3 u^{(11)}_3 u^{(9)}_2 u^{(7)}_1 u^{(1)}.$$  

**Proposition 1.3.2.** The set 

$$\{u^{(A)} \mid A \in \Theta^+_\Delta(n) \text{ aperiodic}\}$$

is a $\mathcal{Z}$-basis of $\mathcal{C}_\Delta(n)$.

**Proof.** Let $A \in \Theta^+_\Delta(n)$ be aperiodic and let $w_A = i_1^{t_1} i_2^{t_2} \cdots i_m^{t_m}$ be the corresponding word constructed as above. By [10] Th. 5.5, $w_A$ is distinguished, that is, $\varphi^{A}_{1,\ldots, A_m} = 1$, where $A_s = t_s E_{c_{i_s i_{s+1}}}^\#$ for $1 \leq s \leq m$. By [12] Th. 7.5(i), the $u^{(A)}$ with $A \in \Theta^+_\Delta(n)$ aperiodic form a $\mathcal{Z}$-basis of $\mathcal{C}_\Delta(n)$. \hfill $\square$

We now define the quantum enveloping algebra of the loop algebra (the *quantum loop algebra* for short) of $\mathfrak{sl}_n$. Let $C = C_\Delta(n) = (c_{i,j})_{i,j \in I}$ be the generalized Cartan matrix of type $\check{A}_{n-1}$, where $I = \mathbb{Z}/n\mathbb{Z}$. We always assume that if $n \geq 3$, then $c_{i,i} = 2$, $c_{i,i+1} = c_{i+1,i} = -1$ and $c_{i,j} = 0$ otherwise. If $n = 2$, then $c_{1,1} = c_{2,2} = 2$ and $c_{1,2} = c_{2,1} = -2$. In other words,

$$C = \begin{pmatrix} 2 & -1 & 0 & \cdots & 0 & -1 \\ -1 & 2 & -1 & \cdots & 0 & 0 \\ 0 & -1 & 2 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 2 & -1 \\ -1 & 0 & 0 & \cdots & -1 & 2 \end{pmatrix} \quad \text{or} \quad C = \begin{pmatrix} 2 & -1 & 0 & \cdots & 0 & -1 \\ -1 & 2 & -1 & \cdots & 0 & 0 \\ 0 & -1 & 2 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 2 & -1 \\ -1 & 0 & 0 & \cdots & -1 & 2 \end{pmatrix} \quad \text{for } n \geq 3. \quad (1.3.2.1)$$

The quantum group associated to $C$ is denoted by $U(\mathfrak{sl}_n)$.

**Definition 1.3.3.** Let $n \geq 2$ and $I = \mathbb{Z}/n\mathbb{Z}$. The affine quantum loop algebra $U(\mathfrak{sl}_n)$ is the algebra over $\mathbb{Q}(v)$ presented by generators 

$$E_i, \ F_i, \ \tilde{K}_i, \ \tilde{K}_i^{-1}, \ i \in I,$$

and relations: for $i, j \in I$

(QSL0) $\tilde{K}_i \tilde{K}_j \cdots \tilde{K}_9 = 1$

(QSL1) $\tilde{K}_i \tilde{K}_j = \tilde{K}_j \tilde{K}_i, \ \tilde{K}_i \tilde{K}_i^{-1} = 1$;

(QSL2) $\tilde{K}_i E_j = v^{c_{i,j}} E_j \tilde{K}_i$;

(QSL3) $\tilde{K}_i F_j = v^{-c_{i,j}} F_j \tilde{K}_i$;

(QSL4) $E_i E_j = E_j E_i, \ F_i F_j = F_j F_i$ if $i \neq j \pm 1$;

(QSL5) $E_i F_j - F_j E_i = \delta_{i,j} \left( \frac{K_i - K_i^{-1}}{v - v^{-1}} \right)$;

(QSL6) $E_i^2 E_j - (v + v^{-1}) E_i E_j E_i + E_j E_i^2 = 0$ if $i = j \pm 1$ and $n \geq 3$;

(QSL7) $F_i^2 F_j - (v + v^{-1}) F_i F_j F_i + F_j F_i^2 = 0$ if $i = j \pm 1$ and $n \geq 3$;

(QSL6') $E_i^2 E_j - (v^2 + 1 + v^{-2}) E_i E_j E_i + (v^2 + 1 + v^{-2}) E_j E_i^2 - E_j E_i^2 = 0$ if $i \neq j$

and $n = 2$;

(QSL7') $F_i^2 F_j - (v^2 + 1 + v^{-2}) F_i^2 F_j F_i + (v^2 + 1 + v^{-2}) F_i F_j F_i^2 - F_j F_i^3 = 0$ if $i \neq j$

and $n = 2$. 
For later use in representation theory, let $U_C(\hat{sl}_n)$ be the quantum loop algebra defined by the same generators and relations \((QSL0)-(QSL7)\) with $v$ replaced by a non-root of unity $z \in \mathbb{C}$ and $\mathbb{Q}(v)$ by $\mathbb{C}$.

A new presentation for $U(\hat{sl}_n)$ and $U_C(\hat{sl}_n)$, known as Drinfeld’s new presentation, will be discussed in \S 2.3.

In this paper, *quantum affine* $\mathfrak{sl}_n$ always refers to the *quantum loop (Hopf) algebra* $U(\hat{sl}_n)$\(^3\). We will mainly work with $U(\hat{sl}_n)$ or quantum groups defined over $\mathbb{Q}(v)$ and mention from time to time a parallel theory over $\mathbb{C}$.

Let $U(\hat{sl}_n)^+$ (resp., $U(\hat{sl}_n)^-$, $U(\hat{sl}_n)^0$) be the positive (resp., negative, zero) part of the quantum enveloping algebra $U(\hat{sl}_n)$. In other words, $U(\hat{sl}_n)^+$ (resp., $U(\hat{sl}_n)^-$, $U(\hat{sl}_n)^0$) is a $\mathbb{Q}(v)$-subalgebra generated by $E_i$ (resp., $F_i$, $K^{\pm 1}$), $i \in I$.

Let

$$\mathcal{C}_\delta(n) = \mathcal{C}_\delta(n) \otimes_\mathbb{Z} \mathbb{Q}(v).$$

Thus, $\mathcal{C}_\delta(n)$ identifies with the $\mathbb{Q}(v)$-subalgebra $\mathfrak{H}_\delta(n)$ generated by $u_i := u_{[s_i]}$ for $i \in I$.

**Theorem 1.3.4.** ([68]) There are $\mathbb{Q}(v)$-algebra isomorphisms

$$\mathfrak{H}_\delta(n) \rightarrow U(\hat{sl}_n)^+,$$  
$$u_i \mapsto E_i$$  
and

$$\mathfrak{H}_\delta(n) \rightarrow U(\hat{sl}_n)^-,$$  
$$u_i \mapsto F_i.$$  

By this theorem and the triangular decomposition

$$U(\hat{sl}_n) = U(\hat{sl}_n)^+ \otimes U(\hat{sl}_n)^0 \otimes U(\hat{sl}_n)^-,$$

the basis displayed in Proposition 1.3.2 gives rise to a monomial basis for the $U(\hat{sl}_n)$.

### 1.4. Three types of generators and associated monomial bases

In this section, we display three distinct minimal sets of generators for $\mathfrak{H}_\delta(n)$, each of which contains the generators $\{u_i\}_{i \in I}$ for $\mathcal{C}_\delta(n)$. We also describe their associated monomial bases for $\mathfrak{H}_\delta(n)$ in the respective generators.

The first minimal set of generators contains simple modules and certain central elements. These generators are convenient for a presentation for the double Ringel–Hall algebra over $\mathbb{Q}(v)$ (or a specialization at a non-root of unity) associated to cyclic quivers (see Chapter 2).

In [70] Schiffmann first described the structure of $\mathfrak{H}_\delta(n)$ as a tensor product of $\mathcal{C}_\delta(n)$ and a polynomial ring in infinitely many indeterminates. Later Hubery explicitly constructed these central elements in [39]. More precisely, for each $m \geq 1$, let\(^4\)

$$c_m = (-1)^m v^{-2nm} \sum_A (-1)^{\text{dim End}(M(A))} a_A u_A \in \mathfrak{H}_\delta(n),$$  
(1.4.0.1)

where the sum is taken over all $A \in \Theta_\delta^+(n)$ such that $d(A) = \text{dim } M(A) = m\delta$ with $\delta = (1, \ldots, 1) \in \mathbb{N}^n$, and $\text{soc } M(A)$ is square-free, i.e., $\text{dim } \text{soc } M(A) \leq \delta$. Note that in this case, $\text{soc } M(A)$ is square-free if and only if $\text{top } M(A) := M(A)/\text{rad } M(A)$ is square-free. The following result is proved in [70, 39].

---

\(^3\)If (QSL0) is dropped, it also defines a quantum affine $\mathfrak{sl}_n$ with the *central extension*; see, e.g., [8].

\(^4\)The element $c_m$ is the same element as $c_{n,m}$ defined in [40] \S 2.3.
Theorem 1.4.1. The elements $c_m$ are central in $\mathfrak{H}_\Delta(n)$. Moreover, there is a decomposition

$$\mathfrak{H}_\Delta(n) = \mathfrak{C}_\Delta(n) \otimes \mathbb{Q}(v) \otimes \mathbb{Q}(v)[c_1, c_2, \ldots],$$

where $\mathbb{Q}(v)[c_1, c_2, \ldots]$ is the polynomial algebra in $c_m$ for $m \geq 1$. In particular, $\mathfrak{H}_\Delta(n)$ is generated by $u_i$ and $c_m$ for $i \in I$ and $m \geq 1$.

We will call the central elements $c_i$ the Schiffmann–Hubery generators.

Let $A = (a_{i,j}) \in \Theta_\Delta^+(n)$. For each $s \geq 1$, define

$$m_s = m_s(A) = \min\{a_{i,j} \mid j - i = s\} \text{ and } A' = A - \sum_{1 \leq i \leq n, i < j} m_{j-i}E_{i,j}.$$  \hfill (1.4.1.1)

Then $A'$ is aperiodic. Moreover, for $A, B \in \Theta_\Delta^+(n)$,

$$A = B \iff A' = B' \text{ and } m_s(A) = m_s(B), \forall s \geq 1.$$  

Finally, for $A \in \Theta_\Delta^+(n)$, define

$$c^A = \prod_{s \geq 1} c_s^{m_s} \in \mathfrak{H}_\Delta(n), \text{ where } m_s = m_s(A).$$

The next corollary is a direct consequence of Theorem 1.4.1 and Proposition 1.3.2.

Corollary 1.4.2. The set

$$\{u^{(A)}c^A \mid A \in \Theta_\Delta^+(n)\}$$

is a $\mathbb{Q}(v)$-basis of $\mathfrak{H}_\Delta(n)$.

Next, we look at the minimal set of generators consisting of simple modules and homogeneous semisimple modules. It is known from [77 Prop. 3.5] (or [12 Th. 5.2(i)]) that $\mathfrak{H}_\Delta(n)$ is also generated by $u_a = u_{[s_a]}$ for $a \in \mathbb{N}I$; see also (1.4.4.1) below. If $a$ is not sincere, say $a_i = 0$, then

$$u_a = \prod_{j \in I, j \neq i} v^{a_j(1-a_j)} [a_j]^{a_{i-1}} u_1^{a_1} \cdots u_i^{a_i} u_n \cdots u_{i+1} \in \mathfrak{C}_\Delta(n).$$  \hfill (1.4.2.1)

Thus, $\mathfrak{H}_\Delta(n)$ is generated by $u_i$ and $u_a$ for $i \in I$ and $a \in \mathbb{N}I$ sincere. Indeed, this result can be strengthened as follows; see also [70 p. 421].

Proposition 1.4.3. The Ringel–Hall algebra $\mathfrak{H}_\Delta(n)$ is generated by $u_i$ and $u_{m_\delta}$ for $i \in I$ and $m \geq 1$.

**Proof.** Let $\mathfrak{H}'$ be the $\mathbb{Q}(v)$-subalgebra generated by $u_i$ and $u_{m_\delta}$ for $i \in I$ and $m \geq 1$. To show $\mathfrak{H}' = \mathfrak{H}_\Delta(n)$, it suffices to prove $u_a = u_{[s_a]} \in \mathfrak{H}'$ for all $a \in \mathbb{N}I$.

Take an arbitrary $a \in \mathbb{N}I$. We proceed induction on $\sigma(a) = \sum a_i$ to show $u_a \in \mathfrak{H}'$. If $\sigma(a) = 0$ or $1$, then clearly $u_a \in \mathfrak{H}'$. Now let $\sigma(a) > 1$. If $a$ is not sincere, then by (1.4.2.1), $u_a \in \mathfrak{H}'$. So we may assume $a$ is sincere. The case where $a_1 = \cdots = a_i$ is trivial. Suppose now there exists $i \in I$ such that $a_i \neq a_{i+1}$. Define $a' = (a'_j), a'' = (a''_j) \in \mathbb{N}I$ by

$$a'_j = \begin{cases} a_i - 1, & \text{if } j = i; \\ a_i, & \text{otherwise,} \end{cases} \quad \text{and} \quad a''_j = \begin{cases} a_{i+1} - 1, & \text{if } j = i + 1; \\ a_i, & \text{otherwise.} \end{cases}$$
Then, we have in $\mathfrak{H}_0(n)$

$$u_iu_{a'} = v^{a_i-a_{i+1}-1}(u_X + v^{a_i-1}[a_i]u_a)$$

and

$$u_{a''}u_{i+1} = v^{a_{i+1}-a_i-1}(u_X + v^{a_{i+1}-1}[a_{i+1}]u_a),$$

where $X \in \Theta_0^+(n)$ is given by

$$M(X) \cong \bigoplus_{i \neq j, i+1} a_j S_j \oplus (a_i - 1)S_i \oplus (a_{i+1} - 1)S_{i+1} \oplus S_i[2].$$

Therefore,

$$u_iu_{a'} - v^{2a_i-2a_{i+1}}u_{a''}u_{i+1} = v^{a_i-a_i-1-1}(v^{a_i-1}[a_i] - v^{a_{i+1}-1}[a_{i+1}])u_a.$$

The inequality $a_i \neq a_{i+1}$ implies $v^{a_i-1}[a_i] - v^{a_{i+1}-1}[a_{i+1}] \neq 0$. Thus, we obtain

$$u_a = \frac{v^{a_i-1}[a_i] - v^{a_{i+1}-1}[a_{i+1}]}{u_iu_{a'} - v^{a_i-a_i-1-1}}u_{a''}u_{i+1}.$$ 

Since $\sigma(a') = \sigma(a'') = \sigma(a) - 1$, we have by the induction hypothesis that both $u_{a'}$ and $u_{a''}$ belong to $\mathfrak{H}_0'$. Hence, $u_a \in \mathfrak{H}_0'$. This finishes the proof. \hfill $\square$

**Remark 1.4.4.** We will see that semisimple modules as generators are convenient for the description of Lusztig type integral form. First, by [12, Th. 5.2(ii)], they generate the integral Ringel–Hall algebra $\mathfrak{H}_0(n)$ over $\mathcal{Z}$. Second, there are in §2.4 explicit commutator formulas between semisimple generators in the double Ringel–Hall algebra. Thus, a natural candidate for the Lusztig type form of quantum affine $\mathfrak{gl}_n$ is proposed in §3.7.

Finally, we introduce a set of generators for $\mathfrak{H}_0(n)$ consisting of simple and homogeneous indecomposable modules in $\mathbf{Rep}_0^\Delta(n)$. Since indecomposable modules correspond to simplest non-diagonal matrices, these generators are convenient for deriving explicit multiplication formulas; see §3.4, §5.4 and §6.2.

For each $A \in \Theta_0^+(n)$, consider the radical filtration of $M(A)$

$$M(A) \supseteq \text{rad} M(A) \supseteq \cdots \supseteq \text{rad}^{t-1} M(A) \supseteq \text{rad}^t M(A) = 0$$

where $t$ is the Loewy length of $M(A)$. For $1 \leq s \leq t$, we write

$$\text{rad}^{s-1} M(A)/\text{rad}^s M(A) = S_{a_s} \quad \text{for some } a_s \in \mathbb{N}I.$$ 

Write $m_A = u_{a_1} \cdots u_{a_t}$. Applying (1.2.0.13) gives that

$$m_A = \sum_{B \leq dg A} f(B)u_B,$$

where $f(B) \in \mathbb{Q}(v)$ with $f(A) = v^{\sum_{s \leq s} (a_{s}, a_s)}$. In other words,

$$u_A = f(A)^{-1}m_A - \sum_{B \leq dg A} f(A)^{-1}f(B)u_B.$$ 

Repeating the above construction for maximal $B$ with $B < dg A$ and continuing this process, we finally get that

$$u_A = \sum_{B \leq dg A} \phi^B_A m_B,$$ \hspace{1cm} (1.4.1)

where $\phi^B_A \in \mathbb{Q}(v)$ with $\phi^A_A = f(A)^{-1} \neq 0$. 

\hfill 18
Proposition 1.4.5. For each \( s \geq 1 \), choose \( i_s \in \mathbb{Z}^+ \). Then \( \mathfrak{H}_\delta(n) \) is generated by \( u_i \) and \( u_{E_{i_s,i_s+s}} \) for \( i \in I \) and \( s \geq 1 \).

**Proof.** For each \( m \geq 1 \), let \( \mathfrak{H}_\delta(n)^{(m)} \) be the \( \mathbb{Q}(v) \)-subalgebra of \( \mathfrak{H}_\delta(n) \) generated by \( u_i \) and \( u_{s \delta} \) for \( i \in I \) and \( 1 \leq s \leq m \). By convention, we set \( \mathfrak{H}_\delta(n)^{(0)} = C_\delta(n) \).

Clearly, each \( \mathfrak{H}_\delta(n)^{(m)} \) is also \( NI \)-graded. By Theorem 1.4.1, \( \mathfrak{H}_\delta(n)^{(m)} \) is also generated by \( u_i \) and \( c_s \) for \( i \in I \) and \( 1 \leq s \leq m \). Moreover, \( \mathfrak{H}_\delta(n)^{(m-1)} \nsubseteq \mathfrak{H}_\delta(n)^{(m)} \) for all \( m \geq 1 \).

We use induction on \( m \) to show the following

**Claim:** \( \mathfrak{H}_\delta(n)^{(m)} \) is generated by \( u_i \) and \( u_{E_{i_s,i_s+s}} \) for \( i \in I \) and \( 1 \leq s \leq m \).

Let \( m \geq 1 \) and suppose the claim is true for \( \mathfrak{H}_\delta(n)^{(m-1)} \). Applying (1.4.4.1) to \( E = E_{m,m,1+m+mn} \) gives

\[
u_E = \sum_{B \leq dg E} \phi^B_E m_B = \phi^E_E m_E + \sum_{B \leq dg E, B \neq C} \phi^B_E m_B + \phi^C_E m_C^1, (1.4.5.1)\]

where \( C = A_{m \delta} = \sum_{i \in I} m E_{i,i+1} \), i.e., \( M(C) \cong S_{m \delta} \) and \( m_C = u_{m \delta} \). For each \( B \) with \( B \leq dg E \) and \( B \neq C \), the Loewy length of \( M(B) \) is strictly greater than 1. Using an argument similar to the proof of Proposition 1.4.3, we have \( m_B \in \mathfrak{H}_\delta(n)^{(m-1)} \). We now prove that \( \phi^C_E \neq 0 \). Suppose \( \phi^C_E = 0 \). Then \( u_E \in \mathfrak{H}_\delta(n)^{(m-1)} \). Furthermore, for each \( j \in I \), there is \( 1 \leq p \leq n \) such that \( E_{j,j+mn}^\delta = \tau^p(E) \), where \( \tau \) is the Auslander–Reiten translation defined in §1.2. Thus, applying \( \tau^p \) to (1.4.5.1) gives that

\[
u_{E_{j,j+mn}} = u_{\tau^p(E)} = \phi^E_E m_{\tau^p E} + \sum_{B \leq dg E, B \neq C} \phi^B_E m_{\tau^p B}.
\]

Using a similar argument as above, we get \( u_{E_{i,j+mn}} \in \mathfrak{H}_\delta(n)^{(m-1)} \). By definition, we have

\[
\mathfrak{H}_\delta(n)^{(m-1)} = \mathfrak{H}_\delta(n)^{(m-1)} \quad \text{for all } d \in NI \text{ with } \sigma(d) < mn.
\]

In particular, \( u_{E_{i,j}} \in \mathfrak{H}_\delta(n)^{(m-1)} \) for all \( i < j \) with \( j - i < mn \). Consequently, we get

\[
u_{E_{i,i}} \in \mathfrak{H}_\delta(n)^{(m-1)} \quad \text{for all } i < j \text{ with } j - i \leq mn.
\]

By [63], Th. 3.1, each element in \( \mathfrak{H}_\delta(n) \) can be written as a linear combination of products of \( u_A \)'s with \( M(A) \) indecomposable. This together with the above discussion implies that \( \mathfrak{H}_\delta(n)^{(m-1)} = \mathfrak{H}_\delta(n)^{(m-1)} \). Thus, \( u_{m \delta} \in \mathfrak{H}_\delta(n)^{(m-1)} \). This contradicts the fact that \( \mathfrak{H}_\delta(n)^{(m-1)} \nsubseteq \mathfrak{H}_\delta(n)^{(m)} \). Therefore, \( \phi^C_E = 0 \). We conclude from (1.4.5.1) that

\[
u_E - \phi^C_E u_{m \delta} = \phi^E_E m_E + \sum_{B \leq dg E, B \neq C} \phi^B_E m_B \in \mathfrak{H}_\delta(n)^{(m-1)},
\]

which shows the claim for \( \mathfrak{H}_\delta(n)^{(m)} \). This finishes the proof. \( \square \)

By the proof of the above proposition, we see that for \( m \geq 1 \), each of the following three sets

\[
\{u_i, c_s \mid i \in I, 1 \leq s \leq m\}, \quad \{u_i, u_{s \delta} \mid i \in I, 1 \leq s \leq m\}, \quad \{u_i, u_{E_{i_s,i_s+s}} \mid i \in I, 1 \leq s \leq m\}
\]

...
generates $\mathfrak{H}_\delta(n)^{(m)}$. Hence, for each $m \geq 1$, there are nonzero elements $x_m, y_m \in \mathbb{Q}(v)$ such that
\[ c_m \equiv x_m u_{m\delta} \mod \mathfrak{H}_\delta(n)^{(m-1)}, \quad c_m \equiv y_m u_{E_{i_s,i_s+sn}} \mod \mathfrak{H}_\delta(n)^{(m-1)}. \]
This together with Corollary [1.4.2] gives the following result.

**Corollary 1.4.6.** The set
\[ \{ u^{(A')} \prod_{s \geq 1} (u_{r\delta})^{m_s(A)} | A \in \Theta_\delta^+(n) \} \]
is a $\mathbb{Q}(v)$-basis of $\mathfrak{H}_\delta(n)$, where $A'$ is defined in (1.4.1.1). For each $s \geq 1$, choose $i_s \in \mathbb{Z}^+$. Then the set
\[ \{ u^{(A')} \prod_{s \geq 1} (u_{E_{i_s,i_s+sn}})^{m_s(A)} | A \in \Theta_\delta^+(n) \} \]
is also a $\mathbb{Q}(v)$-basis of $\mathfrak{H}_\delta(n)$.

### 1.5. Hopf structure on extended Ringel–Hall algebras

It is known that generic Ringel–Hall algebras exist only for Dynkin or cyclic quivers. In the finite type case, these algebras give a realization for the $\pm$-part of quantum groups. It is natural to expect that this is also true for cyclic quivers. We will see in Chapter 2 that this quantum group is the quantum loop algebra of $\mathfrak{gl}_n$ in the sense of Drinfeld [19], which in fact is isomorphic to the so-called double Ringel–Hall algebra defined as the Drinfeld double of two Hopf algebras $\mathfrak{H}_\delta(n)^{>0}$ and $\mathfrak{H}_\delta(n)^{\leq 0}$ together with a skew-Hopf paring. In this section, we first introduce the pair $\mathfrak{H}_\delta(n)^{>0}$ and $\mathfrak{H}_\delta(n)^{\leq 0}$.

We need some preparation. If we define the *symmetrization* of the Euler form (1.2.0.10) by
\[ (\alpha, \beta) = \langle \alpha, \beta \rangle + \langle \beta, \alpha \rangle, \]
then $I$ together with $(\ , \ )$ becomes a Cartan datum in the sense of [56 1.1.1]. To a Cartan datum, there are associated *root data* in the sense of [56 2.2.1] which play an important role in the theory of quantum groups. We shall fix the following root datum throughout the paper.

**Definition 1.5.1.** Let $X = \mathbb{Z}^n$, $Y = \text{Hom}(X, \mathbb{Z})$ and let $(\ , \ )^{rd} : Y \times X \to \mathbb{Z}$ be the natural perfect pairing. If we denote the standard basis of $X$ by $\varepsilon_1, \ldots, \varepsilon_n$ and the dual basis by $\kappa_1, \ldots, \kappa_n$, then $\langle \kappa_i, \varepsilon_j \rangle^{rd} = \delta_{i,j}$. Thus, the embeddings
\[ I \longrightarrow Y, i \longmapsto i' := \kappa_i - \kappa_{i+1} \quad \text{and} \quad I \longrightarrow X, i \longmapsto \varepsilon_i' = \varepsilon_i - \varepsilon_{i+1} \quad (1.5.1.1) \]
with $\varepsilon_{n+1} = \varepsilon_1$ and $\kappa_{n+1} = \kappa_1$ define a root datum $(Y, X, (\ , \ )^{rd}, \ldots)$.

For notational simplicity, we shall identify both $X$ and $Y$ with $\mathbb{Z}I$ by setting $\varepsilon_i = i = \kappa_i$ for all $i \in I$. Under this identification, the form $(\ , \ )^{rd} : \mathbb{Z}I \times \mathbb{Z}I \to \mathbb{Z}$ becomes a symmetric bilinear form, which is different from the Euler forms $(\ , \ )$ and its symmetrization $(\ , \ )$. However, they are related as follows.
Lemma 1.5.2. For \(a = \sum a_i i \in \mathbb{Z}I\), if we put \(\tilde{a} = \sum a_i \tilde{i}\) and \(a' = \sum a_i'\), then

\[(1) \quad (a, b) = (\tilde{a}, b)'^{rd}, \quad \text{and} \quad (2) \quad (a, b) = (a', b)'^{rd}, \quad \text{for all} \quad a, b \in \mathbb{Z}I.\]

**Proof.** Since all forms are bilinear, (1) follows from \((i, j) = (\tilde{i}, j')^{rd}\) for all \(i, j \in I\) and (2) from \((i, j) = \delta_{i,j} - \delta_{i+1,j} = (i', j)^{rd}\)

We may use the following commutative diagrams to describe the two relations:

\[
\begin{array}{c}
\mathbb{Z}I \times \mathbb{Z}I \xrightarrow{(, )} \mathbb{Z}, \\
\tilde{() \times (')^r} \downarrow \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \ quad
with counit \( \varepsilon \) satisfying \( \varepsilon(u_C^+) = 0 \) for all \( C \in \Theta_\alpha^+(n) \) and \( \varepsilon(K_\alpha) = 1 \) for all \( \alpha \in ZI \). Here, for each \( \alpha = (a_i) \in ZI \), \( \tilde{K}_\alpha \) denotes \((\tilde{K}_1)^{a_1} \cdots (\tilde{K}_n)^{a_n}\) with \( \tilde{K}_i = K_i K_i^{-1} \).

(c) Antipode (Xiao\textsuperscript{82}):  
\[ \sigma(u_C^+) = \delta_{C,0} + \sum_{m \geq 1} (-1)^m \sum_{D \in \Theta_\alpha^+(n)} \frac{a_{C_1} \cdots a_{C_m}}{a_C} \varphi_{C_1, \ldots, C_m} \varphi_{D}^{\tilde{K}_i} u_D^+ \tilde{K}^{-d(C)}, \]

for all \( C \in \Theta_\alpha^+(n) \), and \( \sigma(K_\alpha) = K_{-\alpha} \), for all \( \alpha \in ZI \).

Moreover, the inverse of \( \sigma \) is given by
\[ \sigma^{-1}(u_C^+) = \delta_{C,0} + \sum_{m \geq 1} (-1)^m \sum_{D \in \Theta_\alpha^+(n)} \frac{u^2 \sum_{i < j} (d(C_i), d(C_j)) a_{C_1} \cdots a_{C_m}}{a_C} \varphi_{C_1, \ldots, C_m} \varphi_{D}^{\tilde{K}_i} u_D^+ \tilde{K}^{-d(C)} \]
\[ \text{for } C \in \Theta_\alpha^+(n), \]
\[ \sigma^{-1}(K_\alpha) = K_{-\alpha} \text{ for all } \alpha \in ZI. \]

**Proof.** The Hopf structure on \( \mathfrak{H}_\alpha(n)_{\geq 0} \) is almost identical to the Hopf algebra \( H' \) defined in the proof of \textsuperscript{82} Prop. 4.8 except that we used \( \tilde{K}_\alpha \) instead of \( K_\alpha \) in the comultiplication and antipode. Thus, the comultiplication of \( \mathfrak{H}_\alpha(n)_{\geq 0} \) defined here is opposite to that defined in \textsuperscript{82} Th. 4.5, while the antipode is the inverse. Hence, by Lemma \textsuperscript{5.3} \( \mathfrak{H}_\alpha(n)_{\geq 0} \) is the Hopf algebra semi-opposite to a variant of the Hopf algebras considered in \textsuperscript{82} loc cit. (Of course, one can directly check by mimicking the proof of \textsuperscript{82} Th. 4.5 that \( \mathfrak{H}_\alpha(n)_{\geq 0} \) with the operations defined above satisfies the axioms of a Hopf algebra.) \( \square \)

**Remarks 1.5.5.** (1) Because of Lemma \textsuperscript{1.5.2} we are able to make the root datum used in the second relation in (a) invisible in the definition of \( \mathfrak{H}_\alpha(n)_{\geq 0} \).

(2) Besides the modification of changing \( K_\alpha \) to \( \tilde{K}_\alpha \) in comultiplication and antipode, we also used the Euler form \( (\cdot, \cdot) \) (or rather the form \( (\cdot, \cdot)_d \) for the root datum given in Definition \textsuperscript{1.5.1} instead of the symmetric Euler form \( (\cdot, \cdot) \) used in Xiao’s definition of \( H' \) ([82] p. 129]) for the commutator formulas between \( K_\alpha \) and \( u_A^+ \). This means that \( H' \) is not isomorphic to \( \mathfrak{H}_\alpha(n)_{\geq 0} \). However, there is a Hopf algebra homomorphism from \( H' \) to \( \mathfrak{H}_\alpha(n)_{\geq 0} \) by sending \( u_A^+ K_\alpha \) to \( u_A^+ \tilde{K}_\alpha \) whose image is the (Hopf) subalgebra \( \mathfrak{H}_\alpha(n)_{\geq 0} \) generated by \( \tilde{K}_i \) and \( u_A^+ \) for all \( i \in I \) and \( A \in \Theta_\alpha^+(n) \). Note that it sends the central element \( K_1 \cdots K_n \neq 1 \) in \( H' \) to \( \tilde{K}_1 \cdots \tilde{K}_n = 1 \) in \( \mathfrak{H}_\alpha(n)_{\geq 0} \).

(3) The above modifications are necessary for the compatibility with Lusztig’s construction for quantum groups in \textsuperscript{56} and with the corresponding relations in affine quantum Schur algebras.

It is clear that the subalgebra of \( \mathfrak{H}_\alpha(n)_{\geq 0} \) generated by \( u_A^+ (A \in \Theta_\alpha^+(n)) \) is isomorphic to \( \mathfrak{H}_\alpha(n) \). The subalgebra generated by \( K_\alpha, \alpha \in ZI \), is isomorphic to the Laurent polynomial ring \( \mathbb{Q}(v)[K_i^{-1}, \ldots, K_i^{\pm n}] \).

**Corollary 1.5.6.** The \( \mathbb{Q}(v) \)-space \( \mathfrak{H}_\alpha(n)_{\leq 0} \) with basis \( \{ K_\alpha u^-_A \mid \alpha \in ZI, A \in \Theta_\alpha^+(n) \} \) becomes a Hopf algebra with the following algebra, coalgebra and antipode structures.
(a') Multiplication and unit:

\[ u_A^{-1}u_B = \sum_{C \in \Theta_\alpha^+(n)} v^{(d(B),d(A))} \varphi_{C, \alpha, \beta}^C \varphi_{A, \beta, \gamma}^B \text{ for all } A, B \in \Theta_\alpha^+(n), \]

\[ u_A^{-1}K_{\alpha} = v^{(d(A),\alpha)} K_{\alpha}^{-1} \text{ for all } \alpha \in \mathbb{Z}I, A \in \Theta_\alpha^+(n), \]

\[ K_{\alpha}K_{\beta} = K_{\alpha+\beta} \text{ for all } \alpha, \beta \in \mathbb{Z}I. \]

with unit 1 = \( K_0 \).

(b') Comultiplication and counit:

\[ \Delta(u_C) = \sum_{A,B \in \Theta_\alpha^+(n)} v^{-(d(B),d(A))} \varphi_{A, B, \alpha}^C \varphi_{B, \alpha, \beta}^C K_{-d(B)}^{-1} \otimes u_B^{-1} \text{ for all } C \in \Theta_\alpha^+(n), \]

\[ \Delta(K_{\alpha}) = K_{\alpha} \otimes K_{\alpha} \text{ for all } \alpha \in \mathbb{Z}I, \]

with counit \( \varepsilon \) satisfying \( \varepsilon(u_C^{-1}) = 0 \) for all \( C \in \Theta_\alpha^+(n) \) and \( \varepsilon(K_{\alpha}) = 1 \) for all \( \alpha \in \mathbb{Z}I \).

(c') Antipode:

\[ \sigma(u_C^{-1}) = \delta_{C,0} + \sum_{m \geq 1} (-1)^m \sum_{D \in \Theta_\alpha^+(n)} v^{2 \Sigma_{i<j}(d(C_1),d(C_j))} \varphi_{C_{i,j}, \alpha, \beta}^D K_{d(C_1)} u_{D_1}^{-1} \times \varphi_{C, \alpha, \beta}^D \varphi_{C, \alpha, \beta}^D \]

for all \( C \in \Theta_\alpha^+(n) \) and \( \sigma(K_{\alpha}) = K_{-\alpha} \) for all \( \alpha \in \mathbb{Z}I \).

**Proof.** Let \( S \) be the \( \mathbb{Q}(u) \)-space with basis \( \{ K_{\alpha}(u_A)^{-1} \mid \alpha \in \mathbb{Z}I, A \in \Theta_\alpha^+(n) \} \) and define the following operations on \( S \):

\[ (u_A)^{-1}(u_B)^{-1} = \sum_{C \in \Theta_\alpha^+(n)} v^{(d(B),d(A))} \varphi_{B, \alpha, \beta}^C \text{ for all } A, B \in \Theta_\alpha^+(n), \]

\[ (u_A)^{-1}K_{\alpha}^{-1} = v^{-(d(A),\alpha)} K_{\alpha}^{-1} \text{ for all } \alpha \in \mathbb{Z}I, A \in \Theta_\alpha^+(n), \]

\[ K_{\alpha}^{-1}K_{\beta}^{-1} = K_{\alpha+\beta}^{-1} \text{ for all } \alpha, \beta \in \mathbb{Z}I. \]

with unit 1 = \( (u_0)^{-1} = K_0 \).

\[ \Delta((u_C)^{-1}) = \sum_{A,B \in \Theta_\alpha^+(n)} v^{(d(A),d(B))} \varphi_{A, B, \alpha}^C \varphi_{B, \alpha, \beta}^C u_B^{-1} \otimes (u_A)^{-1} \text{ for all } C \in \Theta_\alpha^+(n), \]

\[ \Delta(K_{\alpha}^{-1}) = K_{\alpha}^{-1} \otimes K_{\alpha}^{-1} \text{ for all } \alpha \in \mathbb{Z}I \]

with counit \( \varepsilon((u_C)^{-1}) = 0 \) for all \( A \in \Theta_\alpha^+(n) \) and \( \varepsilon(K_{\alpha}^{-1}) = 1 \) for all \( \alpha \in \mathbb{Z}I \), where \( K_{\alpha}^{-1} = K_{\alpha}^{-1}K_{\alpha+1}^{-1} \).

\[ \sigma((u_C)^{-1}) = \delta_{C,0} + \sum_{m \geq 1} (-1)^m \sum_{D \in \Theta_\alpha^+(n)} v^{2 \Sigma_{i<j}(d(C_1),d(C_j))} \varphi_{C_{i,j}, \alpha, \beta}^D \varphi_{C, \alpha, \beta}^D \]

for all \( C \in \Theta_\alpha^+(n) \), \( \sigma(K_{\alpha}^{-1}) = K_{\alpha}^{-1} \) for all \( \alpha \in \mathbb{Z}I. \)
By Lemma 1.5.3 if we replace the multiplication of \( S_\Delta(n)^{\geq 0} \) by its opposite one and \( \sigma \) by \( \sigma^{-1} \) and keep other structure maps unchanged, then we obtain the semi-opposite Hopf algebra \( S_\Delta(n)^{\leq 0} \) of \( S_\Delta(n)^{\geq 0} \). It is clear that the \( \mathbb{Q}(v) \)-linear isomorphism \( S_\Delta(n)^{\geq 0} \to S_\Delta' \) taking \( u_A K_\alpha \mapsto (u_A') K_\alpha' \) preserves all the operations. Thus, \( S_\Delta' \) is a Hopf algebra with the operations \((a'') -(c'')\).

Now, for \( \alpha \in \mathbb{Z} I \) and \( A \in \Theta_\Delta^+(n) \), set in \( S_\Delta' \),
\[
K_\alpha := K_{-\alpha}' \quad \text{and} \quad u_A^- := v^{-\langle d(A), d(A) \rangle} \tilde{K}'_{d(A)}(u_A^-)'.
\]
(1.5.6.1)
Then \( \{ K_\alpha u_A^- | \alpha \in \mathbb{Z} I, A \in \Theta_\Delta^+(n) \} \) is a new basis of \( S_\Delta' \). It is easy to check that applying the operations \((a'')-(c'')\) to the basis elements \( K_\alpha u_A^- \) gives \((a'')-(c')\). Consequently, \( S_\Delta(n)^{\leq 0} \) with the operations \((a'')-(c'')\) is a Hopf algebra.

The proof above shows that \( S_\Delta(n)^{\leq 0} \) is the semi-opposite Hopf algebra of \( S_\Delta(n)^{\geq 0} \) in the sense that multiplication and antipode are replaced by the opposite and inverse ones, respectively. Note that the inverse \( \sigma^{-1} \) of \( \sigma \) in \( S_\Delta(n)^{\leq 0} \) is defined by

\[
\sigma^{-1}(u_C^-) = \delta_{C,0} + \sum_{m \geq 1} (-1)^m \sum_{D \in \Theta_\Delta^+(n)_1} \frac{a_{c_1} \cdots a_{c_m} \varphi_{c_1, \ldots, c_m} D}{a_C} u_D \tilde{K}'_{d(D)}. 
\]

By \((a')\), the subalgebra of \( S_\Delta(n)^{\leq 0} \) generated by \( u_A^- \) \((A \in \Theta_\Delta^+(n)) \) is isomorphic to \( S_\Delta(n)^{\text{op}} \). Moreover, there is a \( \mathbb{Q}(v) \)-vector space isomorphism

\[
S_\Delta(n)^{\leq 0} = \mathbb{Q}(v)[K_1^{\pm 1}, \ldots, K_n^{\pm n}] \otimes_{\mathbb{Q}(v)} S_\Delta(n)^{\text{op}}. 
\]
(1.5.6.2)

**Remark 1.5.7.** If we put \( A = \mathcal{Z}((vm - 1)^{-1})_{m \geq 1} \), then \((1.2.0.9)\) guarantees that extended Ringel–Hall algebras \( S_\Delta(n)^{\geq 0}_A \) and \( S_\Delta(n)^{\leq 0}_A \) over \( A \) are well-defined. Thus, if \( v \) is specialized to \( z \) in a field (or a ring) \( F \) which is not a root of unity, then extended Ringel–Hall algebras \( S_\Delta(n)^{\geq 0}_F := S_\Delta(n)^{\geq 0}_A \otimes F \) and \( S_\Delta(n)^{\leq 0}_F \) over \( F \) are defined.
Double Ringel–Hall algebras of cyclic quivers

A Drinfeld double refers to a construction of gluing two Hopf algebras via a skew-Hopf pairing between them to obtain a new Hopf algebra. We apply this construction in §2.1 to the extended Ringel–Hall algebras $H_{\lambda}(n)^{>0}$ and $H_{\lambda}(n)^{<0}$ discussed in §1.5 to obtain double Ringel–Hall algebras $D_{\lambda}(n)$ of cyclic quivers.

The algebras $D_{\lambda}(n)$ possess a rich structure. First, by using the Schiffmann–Hubery generators and the connection with the quantum enveloping algebra associated with a Borcherds–Cartan matrix, we obtain a presentation for $H_{\lambda}(n)$ (Theorem 2.2.3). Second, by using Drinfeld’s new presentation for the quantum loop algebra $U(\hat{gl}_n)$, we extend Beck (and Jing)’s embedding of quantum affine $\hat{sl}_n$ into $U(\hat{gl}_n)$ to obtain an isomorphism between $D_{\lambda}(n)$ and $U(\hat{gl}_n)$ (Theorem 2.3.5). Finally, applying the skew-Hopf pairing to semisimple generators yields certain commutator relations (Theorem 2.4.3). Thus, we propose a possible presentation using semisimple generators; see Problem 2.4.5.

2.1. Drinfeld doubles and the Hopf algebra $D_{\lambda}(n)$

In this section, we first recall from [46] the notion of a skew-Hopf pairing and define the associated Drinfeld double. We then apply this general construction to obtain the Drinfeld double $D_{\lambda}(n)$ of the Ringel–Hall algebra $H_{\lambda}(n)$; see [82] for a general construction.

Let $\mathcal{A} = (\mathcal{A}, \mu_{\mathcal{A}}, \eta_{\mathcal{A}}, \Delta_{\mathcal{A}}, \varepsilon_{\mathcal{A}}, \sigma_{\mathcal{A}})$ and $\mathcal{B} = (\mathcal{B}, \mu_{\mathcal{B}}, \eta_{\mathcal{B}}, \Delta_{\mathcal{B}}, \varepsilon_{\mathcal{B}}, \sigma_{\mathcal{B}})$ be two Hopf algebras over a field $\mathbb{F}$. A skew-Hopf pairing of $\mathcal{A}$ and $\mathcal{B}$ is an $\mathbb{F}$-bilinear form $\psi: \mathcal{A} \times \mathcal{B} \to \mathbb{F}$ satisfying:

1. \( \psi(1, b) = \varepsilon_{\mathcal{B}}(b), \) \( \psi(a, 1) = \varepsilon_{\mathcal{A}}(a), \) for all $a \in \mathcal{A}, b \in \mathcal{B}$,
2. \( \psi(\mu_{\mathcal{A}}(a, b'), \mu_{\mathcal{B}}(b, b')) = \psi(\Delta_{\mathcal{A}}(a), b \otimes b'), \) for all $a \in \mathcal{A}, b, b' \in \mathcal{B}$,
3. \( \psi(\mu_{\mathcal{B}}(aa', b), \mu_{\mathcal{A}}(b, b')) = \psi(a \otimes a', \Delta_{\mathcal{B}}^op(b)), \) for all $a, a' \in \mathcal{A}, b, b' \in \mathcal{B}$,
4. \( \psi(\sigma_{\mathcal{A}}(a), b) = \psi(a, \sigma_{\mathcal{B}}^{-1}(b)), \) for all $a \in \mathcal{A}, b, b' \in \mathcal{B}$,

where $\psi(a \otimes a', b \otimes b') = \psi(a, b)\psi(a', b')$, and $\Delta_{\mathcal{B}}^op$ is defined by $\Delta_{\mathcal{B}}^op(b) = \sum b_2 \otimes b_1$ if $\Delta_{\mathcal{B}}(b) = \sum b_1 \otimes b_2$. Note that we have assumed here that $\sigma_{\mathcal{B}}$ is invertible.

Let $\mathcal{A} \ast \mathcal{B}$ be the free product of $\mathbb{F}$-algebras $\mathcal{A}$ and $\mathcal{B}$ with identity. Thus, for any fixed bases $B_{\mathcal{A}}$ and $B_{\mathcal{B}}$ for $\mathcal{A}$, $\mathcal{B}$, respectively, where both $B_{\mathcal{A}}$ and $B_{\mathcal{B}}$ contain the identity element, $\mathcal{A} \ast \mathcal{B}$ is the $\mathbb{F}$-space spanned by the basis consisting of all words $b_1 b_2 \cdots b_m$ ($b_i \in (B_{\mathcal{A}} \setminus \{1\}) \cup (B_{\mathcal{B}} \setminus \{1\})$) of any length $m \geq 0$ such that $b_i b_{i+1}$ is not defined (in other words, $b_i, b_{i+1}$ are not in the same $\mathcal{A}$ or $\mathcal{B}$) with multiplication...
given by “contracted juxtaposition”

\[(b_1 \cdots b_m) * (b'_1 \cdots b'_{m'}) = \begin{cases} 
    b_1 \cdots b_m b'_1 \cdots b'_{m'}, & \text{if } b_m b'_1 \text{ is not defined;} \\
    b_1 \cdots b_{m-1} b'_{m'} b'_m, & \text{if } b_m b'_1 \text{ is defined, } b_m b'_1 \neq 0; \\
    0, & \text{otherwise.}
\end{cases}\]

Note that, since \(c = \sum a_i \lambda_i \) (\(a \in \{b, b'\}\)) is a linear combination of basis elements, the element \(b_1 \cdots b_{m-1} b'_2 \cdots b'_{m'}\) is a linear combination of words and is defined inductively. Thus, 1 is replaced by the empty word.

Let \(\mathcal{I} = \mathcal{I}_{\mathcal{A} \mathcal{B}}\) be the ideal of \(\mathcal{A} \mathcal{B}\) generated by

\[\sum (b_2 * a_2)\psi(a_1, b_1) - \sum (a_1 * b_1)\psi(a_2, b_2) \quad (a \in \mathcal{A}, b \in \mathcal{B}), \tag{2.1.0.1}\]

where \(\Delta(\mathcal{A}) = \sum a_1 \otimes a_2\) and \(\Delta(\mathcal{B}) = \sum b_1 \otimes b_2\). Moreover, \(\mathcal{I}\) is also generated by

\[b * a - \sum \psi(a_1, \sigma_{\mathcal{B}}(b_1))(a_2 * b_2)\psi(a_3, b_3) \quad (a \in \mathcal{A}, b \in \mathcal{B}), \tag{2.1.0.2}\]

where \(\Delta_{\mathcal{A}}(a) = \sum a_1 \otimes a_2 \otimes a_3\) and \(\Delta_{\mathcal{B}}(b) = \sum b_1 \otimes b_2 \otimes b_3\) (see, for example, \[74\] p. 72]).

The Drinfeld double of the pair \(\mathcal{A}\) and \(\mathcal{B}\) is by definition the quotient algebra

\[D(\mathcal{A}, \mathcal{B}) := \mathcal{A} \mathcal{B} / \mathcal{I}.\]

By (2.1.0.2), each element in \(D(\mathcal{A}, \mathcal{B})\) can be expressed as a linear combination of elements of the form \(a * b + \mathcal{I}\) for \(a \in \mathcal{A}\) and \(b \in \mathcal{B}\). Note that there is an \(\mathbb{F}\)-vector space isomorphism

\[D(\mathcal{A}, \mathcal{B}) \longrightarrow \mathcal{A} \otimes_{\mathbb{F}} \mathcal{B}, \ a * b + \mathcal{I} \mapsto a \otimes b;\]

see \[74\] Lem. 3.1]. For notational simplicity, we write \(a * b + \mathcal{I}\) as \(a * b\). Both \(\mathcal{A}\) and \(\mathcal{B}\) can be viewed as subalgebras of \(D(\mathcal{A}, \mathcal{B})\) via \(a \mapsto a * 1\) and \(b \mapsto 1 * b\), respectively. Thus, if \(x\) and \(y\) lie in \(\mathcal{A}\) or \(\mathcal{B}\), we write \(xy\) instead of \(x * y\).

The algebra \(D(\mathcal{A}, \mathcal{B})\) admits a Hopf algebra structure induced by those of \(\mathcal{A}\) and \(\mathcal{B}\); see \[46\] 3.2.3. More precisely, comultiplication, counit and antipode in \(D(\mathcal{A}, \mathcal{B})\) are defined by

\[
\begin{align*}
\Delta(a * b) &= \sum (a_1 * b_1) \otimes (a_2 * b_2), \\
\varepsilon(a * b) &= \varepsilon_{\mathcal{A}}(a) \varepsilon_{\mathcal{B}}(b), \\
\sigma(a * b) &= \sigma_{\mathcal{B}}(b) * \sigma_{\mathcal{A}}(a),
\end{align*}
\tag{2.1.0.3}
\]

where \(a \in \mathcal{A}, b \in \mathcal{B}\), \(\Delta_{\mathcal{A}}(a) = \sum a_1 \otimes a_2\) and \(\Delta_{\mathcal{B}}(b) = \sum b_1 \otimes b_2\).

By modifying \[74\] Lem. 3.2], we obtain that the above ideal \(\mathcal{I}\) can be generated by the elements in certain generating sets of \(\mathcal{A}\) and \(\mathcal{B}\) as described in the following result.

**Lemma 2.1.1.** Let \(\mathcal{A}, \mathcal{B}\) be Hopf algebras over \(\mathbb{F}\) and let \(\psi : \mathcal{A} \times \mathcal{B} \to \mathbb{F}\) be a skew-Hopf pairing. Assume that \(X_{\mathcal{A}} \subseteq \mathcal{A}\) and \(X_{\mathcal{B}} \subseteq \mathcal{B}\) are generating sets of \(\mathcal{A}\) and \(\mathcal{B}\), respectively. If \(\Delta_{\mathcal{A}}(X_{\mathcal{A}}) \subseteq \text{span}_{\mathbb{F}} X_{\mathcal{A}} \otimes \text{span}_{\mathbb{F}} X_{\mathcal{A}}\) and \(\Delta_{\mathcal{B}}(X_{\mathcal{B}}) \subseteq \text{span}_{\mathbb{F}} \{X_{\mathcal{B}}\} \otimes \text{span}_{\mathbb{F}} \{X_{\mathcal{B}}\}\), then the ideal \(\mathcal{I} = \mathcal{I}_{\mathcal{A} \mathcal{B}}\) is generated by the following elements

\[\sum (b_2 * a_2)\psi(a_1, b_1) - \sum (a_1 * b_1)\psi(a_2, b_2) \quad \text{for all } a \in X_{\mathcal{A}}, b \in X_{\mathcal{B}}. \tag{2.1.1.1}\]
2.1. DRINFELD DOUBLES AND THE HOPF ALGEBRA $\mathfrak{D}_e(n)$

PROOF. For $a \in A$ and $b \in B$, put

$$h_{a,b} := \sum (b_2 * a_2) \psi(a_1, b_1) - \sum (a_1 * b_1) \psi(a_2, b_2).$$

Let $I'$ be the ideal of $A * B$ generated by $h_{a,b}$ for all $a \in X_{\mathfrak{A}}$, $b \in X_{\mathfrak{B}}$, and set $\mathcal{H} = A * B / I'$. We need to show $I = I'$. Since $I' \subseteq I$, it remains to show that for all $a \in \mathfrak{A}$ and $b \in \mathfrak{B}$, $h_{a,b} \in I'$, or equivalently, $h_{a,b} = 0$ in $\mathcal{H}$.

First, suppose $a \in X_{\mathfrak{A}}$ and $b = y_1 \cdots y_t$ with $y_j \in X_{\mathfrak{B}}$. We proceed by induction on $t$ to show that $h_{a,b} \in I'$. Let $b' = y_1 \cdots y_{t-1}$ and $b'' = y_t$. Write $\Delta_{\mathfrak{A}}(a) = \sum a_{1,1} \otimes a_{1,2}$ and $\Delta_{\mathfrak{A}}(a_2) = \sum a_{2,1} \otimes a_{2,2}$. The coassociativity of $\Delta_{\mathfrak{A}}$ implies that

$$\sum a_{1,1} \otimes a_{1,2} \otimes a_2 = \sum a_{1} \otimes \Delta_{\mathfrak{A}}(a_2) = \sum a_1 \otimes a_{2,1} \otimes a_{2,2}. $$

Further, write $\Delta_{\mathfrak{B}}(b') = \sum b'_{1} \otimes b'_{2}$ and $\Delta_{\mathfrak{B}}(b'') = \sum b''_{1} \otimes b''_{2}$. Then $\Delta_{\mathfrak{B}}(b) = \sum b'_1 b'_2 \otimes b''_1 b''_2$. Thus, we obtain in $\mathcal{H}$ that

$$\sum (b'_2 b''_2 * a_2) \psi(a_1, b'_1 b''_1) = \sum b'_2 (b''_2 * a_2) \psi(a_{1,1}, b'_1) \psi(a_{1,2}, b''_1) = \sum b'_2 (b''_2 * a_{2,2}) \psi(a_{1,1}, b'_1) \psi(a_{2,1}, b''_1) = \sum (b'_2 * a_{2,1}) \psi(a_{1,1}, b'_1) \psi(a_{2,2}, b''_1) \quad \text{(since $a_2 \in \text{span}_F X_{\mathfrak{A}}$ and $b'' \in X_{\mathfrak{B}}$)}$$

$$= \sum (a_{1,1} * b'_1) \psi(a_{1,2}, b''_1) \psi(a_{2,2}, b''_1) \quad \text{(by induction for $a_1$ and $b'$)}$$

$$= \sum (a_1 * b'_1) \psi(a_{2,1}, b'_2) \psi(a_{2,2}, b''_2) = \sum (a_1 * b'_1) \psi(a_{2,1}, b'_2) \psi(a_{2,2}, b''_2)$$

that is, $h_{a,b} \in I'$.

Now suppose $a = x_1 \cdots x_s \in \mathfrak{A}$ with $x_i \in X_{\mathfrak{A}}$ and $b \in \mathfrak{B}$. We proceed by induction on $s$. The case $s = 1$ has been already treated above. So assume $s > 1$. Let $a' = x_1 \cdots x_{s-1}$ and $a'' = x_s$. Then

$$\sum (b_2 * a'_2 a''_2) \psi(a'_1 a''_1, b_1)$$

$$= \sum (b'_2 * a'_2) a''_2 \psi(a'_1, b''_2) \psi(a''_1, b'_2)$$

$$= \sum a'_1 * (b'_2 * a''_2) \psi(a'_1, b''_2) \psi(a''_1, b'_2) \quad \text{(by induction)}$$

$$= \sum a'_1 a''_1 * b''_2 \psi(a'_2, b''_2) \psi(a''_2, b'_2) \quad \text{(since $a'' \in X_{\mathfrak{A}}$)}$$

$$= \sum a'_1 a''_1 * b_1 \psi(a'_2 a''_2, b_2),$$

where $\Delta_{\mathfrak{B}}^2(b) = \sum b'^{(2)}_1 \otimes b''_2 \otimes b''_3$. Hence, $h_{a,b} \in I'$. This completes the proof. \hfill \square

A skew-Hopf pairing can be passed on to opposite Hopf algebras (see Lemma 1.5.3). The following lemma can be checked directly.
Lemma 2.1.2. Let $\mathcal{A} = (\mathcal{A}, \mu_\mathcal{A}, \eta_\mathcal{A}, \Delta_\mathcal{A}, \varepsilon_\mathcal{A}, \sigma_\mathcal{A})$, $\mathcal{B} = (\mathcal{B}, \mu_\mathcal{B}, \eta_\mathcal{B}, \Delta_\mathcal{B}, \varepsilon_\mathcal{B}, \sigma_\mathcal{B})$ be two Hopf algebras over a field $\mathbb{F}$ together with a skew-Hopf pairing $\psi : \mathcal{A} \times \mathcal{B} \to \mathbb{F}$. Assume that $\sigma_\mathcal{A}$ and $\sigma_\mathcal{B}$ are both invertible. Then $\psi$ is also a skew-Hopf pairing of the semi-opposite Hopf algebras $(\mathcal{A}, \mu_\mathcal{A}, \eta_\mathcal{A}, \Delta_\mathcal{A}^\text{op}, \varepsilon_\mathcal{A}, \sigma_\mathcal{A}^{-1})$ and $(\mathcal{B}, \mu_\mathcal{B}, \eta_\mathcal{B}, \Delta_\mathcal{B}^\text{op}, \varepsilon_\mathcal{B}, \sigma_\mathcal{B}^{-1})$ (resp. $(\mathcal{A}, \mu_\mathcal{A}, \eta_\mathcal{A}, \Delta_\mathcal{A}^\text{op}, \varepsilon_\mathcal{A}, \sigma_\mathcal{A}^{-1})$ and $(\mathcal{B}, \mu_\mathcal{B}, \eta_\mathcal{B}, \Delta_\mathcal{B}, \varepsilon_\mathcal{B}, \sigma_\mathcal{B}^{-1})$).

We end this section with the construction of the Drinfeld double associated with the Ringel–Hall algebras $\mathfrak{SH}(n)^{>0}$ and $\mathfrak{SH}(n)^{<0}$ introduced in §1.5.

First, we need a skew-Hopf pairing. Applying Lemma 2.1.2 to [82] Prop. 5.3 yields the following result. For completeness, we sketch a proof. We introduce some notation which is used in the proof. For each $\alpha = \sum_{i \in I} a_i \in \mathbb{Z}I$, write $\tau\alpha = \sum_{i \in I} a_{i-1}i$. In particular, for each $A \in \Theta_+^+(n)$, we have $\tau d(A) = d(\tau(A))$. Then for $\alpha, \beta \in \mathbb{Z}I$,

$$\langle \alpha, \beta \rangle = (\alpha - \tau\alpha) \ast \beta = -(\beta, \tau\alpha) \text{ and } K_\alpha = K_{\alpha - \tau\alpha}.$$ 

Proposition 2.1.3. The $\mathbb{Q}(v)$-bilinear form $\psi : \mathfrak{SH}(n)^{>0} \times \mathfrak{SH}(n)^{<0} \to \mathbb{Q}(v)$ defined by

$$\psi(u_A^+, K_\beta u_B^-) = v^{\alpha_\beta - (d(A), d(A) + \alpha) + 2d(A)} a_A^{-1} \delta_{AB}$$

(2.1.3.1)

where $\alpha, \beta \in \mathbb{Z}I$ and $A, B \in \Theta_+^+(n)$, is a skew-Hopf pairing. Here $(\alpha, \beta) = \langle \alpha, \beta \rangle$ and $\langle \beta, \alpha \rangle$ is the symmetric Euler form.

Proof. Condition (HP1) is obvious. We now check condition (HP2). Without loss of generality, we take $a = u_A^+ K_\alpha$, $b = K_\beta u_B^-$ and $b' = K_\gamma u_C^-$ for $\alpha, \beta, \gamma \in \mathbb{Z}I$ and $A, B, C \in \Theta_+^+(n)$. Then

$$\psi(u_A^+, K_\beta u_B^- K_\gamma u_C^-) = \psi(u_A^+, v^{d(B), \gamma} K_{\beta + \gamma} u_B^- u_C^-) = \psi(u_A^+, v^{d(B), \gamma} v^{d(C), d(B)} \varphi_{C, B}^D u_D^-)$$

$$= v^{x_1} \varphi_A^{A, B} a_A^{-1},$$

where $x_1 = \langle d(B), \gamma \rangle + \langle d(C), d(B) \rangle + \alpha \ast (\beta + \gamma) - \langle d(A), d(A) + \alpha \rangle + 2d(A)$.

On the other hand,

$$\psi(\Delta(u_A^+ K_\alpha), K_\beta u_B \otimes K_\gamma u_C^-)$$

$$= \psi\left(\sum_{B', C'} v^{d(B'), d(C')} a_{B'} a_{C'} \varphi_{B', C'}^{A} u_{B'}^+ K_{\alpha} \otimes u_B^- \tilde{K}_{d(C')} K_\alpha, K_\beta u_B^- \otimes K_\gamma u_C^-\right)$$

$$= \sum_{B', C'} v^{d(B'), d(C')} a_{B'} a_{C'} \varphi_{B', C'}^{A} \psi(u_{C'}^+, K_\alpha, K_\beta u_B^-)\psi(u_B^+, \tilde{K}_{d(C')} K_\alpha, K_\gamma u_C^-)$$

$$= v^{x_2} \varphi_A^{A, B} a_A^{-1},$$

where $x_2 = \langle d(C), d(B) \rangle + \alpha \ast \beta - \langle d(B), d(B) + \alpha \rangle + \langle d(B) - \tau d(B) + \alpha \rangle \ast \gamma - \langle d(C), d(C) + d(B) - \tau d(B) + \alpha \rangle + 2d(A)$. Here we have assumed $d(A) = d(B) + d(C)$ since $\varphi_A^{A, B} = 0$ otherwise. A direct calculation shows $x_1 = x_2$. Hence, (HP2) holds.
Condition (HP3) can be checked similarly as (HP2). It remains to check (HP4). Take \( a = u_A^+ K_\alpha \) and \( b = K_\beta u_B^- \). We may suppose \( A \neq 0 \neq B \). Then

\[
\psi(\sigma(u_A^+ K_\alpha), K_\beta u_B^-) = \sum_{m \geq 1} (-1)^m y_1 m \sum_{C_1, \ldots, C_m \in \Theta_n^+} \frac{a_{C_1} \cdots a_{C_m}}{a_A a_B} \varphi^A_{C_1, \ldots, C_m} \varphi^B_{C_m, \ldots, C_1}
\]

and

\[
\psi(u_A^+ K_\alpha, \sigma^{-1}(K_\beta u_B^-)) = \sum_{m \geq 1} (-1)^m y_2 m \sum_{C_1, \ldots, C_m \in \Theta_n^+} \frac{a_{C_1} \cdots a_{C_m}}{a_A a_B} \varphi^A_{C_1, \ldots, C_m} \varphi^B_{C_m, \ldots, C_1},
\]

where

\[
y_1 = -\langle d(B), \alpha \rangle - (\alpha - d(A) + \tau d(A)), \beta - \langle d(B), d(B) - \alpha - d(A) + \tau d(A) \rangle \text{ and}
\]

\[
y_2 = \langle d(A), d(B) - \tau d(B) - \beta \rangle + \alpha \cdot (d(B) - \tau d(B) - \beta) - \langle d(A), d(A) + \alpha \rangle.
\]

Clearly, if \( d(A) \neq d(B) \), then \( \varphi^A_{C_1, \ldots, C_m} \varphi^B_{C_m, \ldots, C_1} = 0 \). Hence, we may suppose \( d(A) = d(B) \). Then

\[
y_1 = -\alpha \cdot \beta - \langle d(A), \beta \rangle + \langle d(A), d(A) \rangle = y_2.
\]

Therefore, \( \psi(u_A^+ K_\alpha, K_\beta u_B^-) = \psi(u_A^+ K_\alpha, \sigma^{-1}(K_\beta u_B^-)) \), that is, (HP4) holds. \( \square \)

Second, the Hopf algebras \( H_a(n)^{\geq 0} \) and \( H_b(n)^{\leq 0} \) together with the skew-Hopf pairing \( \psi \) gives rise to the Drinfeld double

\[
\widehat{D}_\Delta(n) := D(H_a(n)^{\geq 0}, H_b(n)^{\leq 0}).
\]

Since as \( \mathbb{Q}(v) \)-vector spaces, we have

\[
\widehat{D}_\Delta(n) = D(H_a(n)^{\geq 0}, H_b(n)^{\leq 0}) \cong H_a(n)^{\geq 0} \otimes H_b(n)^{\leq 0},
\]

we sometimes write the elements in \( \widehat{D}_\Delta(n) \) as linear combinations of \( a \otimes b \) for \( a \in H_a(n)^{\geq 0} \) and \( b \in H_b(n)^{\leq 0} \). Moreover, it follows from \( \{1.5.3.1\} \) and \( \{1.5.6.2\} \) that there is a \( \mathbb{Q}(v) \)-vector space isomorphism

\[
\widehat{D}_\Delta(n) \cong H_a(n) \otimes_{\mathbb{Q}(v)} \mathbb{Q}(v)[K_1^{\pm 1}, \ldots, K_n^{\pm 1}] \otimes_{\mathbb{Q}(v)} \mathbb{Q}(v)[K_1^{\pm 1}, \ldots, K_n^{\pm 1}] \otimes_{\mathbb{Q}(v)} H_b(n)^{op}.
\]

Finally, we define the reduced Drinfeld double

\[
D_\Delta(n) = \widehat{D}_\Delta(n)/\mathcal{I}
\]

where \( \mathcal{I} \) denotes the ideal generated by \( 1 \otimes K_\alpha - K_\alpha \otimes 1 \) for all \( \alpha \in \mathbb{Z} I \). By the construction, \( \mathcal{I} \) is indeed a Hopf ideal of \( \widehat{D}_\Delta(n) \). Thus, \( D_\Delta(n) \) is again a Hopf algebra. We call \( D_\Delta(n) \) the double Ringel–Hall algebra of the cyclic quiver \( \Delta(n) \).

Let \( D_\Delta(n)^{+} \) (resp., \( D_\Delta(n)^{-} \)) be the \( \mathbb{Q}(v) \)-subalgebra of \( D_\Delta(n) \) generated by \( u_A^+ \) (resp., \( u_A^- \)) for all \( A \in \Theta_n^+ \). Let \( D_\Delta(n)^0 \) be the \( \mathbb{Q}(v) \)-subalgebra of \( D_\Delta(n) \) generated by \( K_\alpha \) for all \( \alpha \in \mathbb{Z} I \). Then

\[
D_\Delta(n)^{+} \cong H_a(n), \quad D_\Delta(n)^{-} \cong H_b(n)^{op}, \quad D_\Delta(n)^0 \cong \mathbb{Q}(v)[K_1^{\pm 1}, \ldots, K_n^{\pm 1}].
\]
Moreover, the multiplication map
\[ \mathcal{D}_\lambda(n)^+ \otimes \mathcal{D}_\lambda(n)^0 \otimes \mathcal{D}_\lambda(n)^- \rightarrow \mathcal{D}_\lambda(n) \]
is an isomorphism of \( \mathbb{Q}(v) \)-vector spaces. Also, we have
\[ \mathcal{D}_\lambda(n)^{>0} := \mathcal{D}_\lambda(n)^+ \otimes \mathcal{D}_\lambda(n)^0 \cong \mathcal{H}_\lambda(n)^{>0} \]
\[ \mathcal{D}_\lambda(n)^{<0} := \mathcal{D}_\lambda(n)^0 \otimes \mathcal{D}_\lambda(n)^- \cong \mathcal{H}_\lambda(n)^{<0}. \]
We will identify \( \mathcal{D}_\lambda(n)^{>0} \) and \( \mathcal{D}_\lambda(n)^{<0} \) with \( \mathcal{H}_\lambda(n)^{>0} \) and \( \mathcal{H}_\lambda(n)^{<0} \), respectively, in the sequel. In particular, we may use the PBW type basis for \( \mathcal{H}_\lambda(n) \) to display a PBW type basis for \( \mathcal{D}_\lambda(n) \):
\[ \{ \widetilde{u}_A^+ K_\alpha \widetilde{u}_B^- \mid A, B \in \Theta_\lambda^+(n), \alpha \in \mathbb{Z}I \}. \]

**Remark 2.1.4.** By specializing \( v \) to \( z \in \mathbb{C} \) which is not a root of unity, (1.2.0.9) implies that the skew-Hopf pairing \( \psi \) given in (2.1.3.1) is well-defined over \( \mathbb{C} \). Hence the construction above works over \( \mathbb{C} \) with \( \mathcal{H}_\lambda(n)^{>0} \) etc. replaced by the corresponding specialization \( \mathcal{H}_\lambda(n)^{>0}_\mathbb{C} \), etc. (see Remark 1.5.7). Thus, we obtain double Ringel–Hall algebras \( \mathcal{D}_\lambda \mathcal{C}(n) \). In fact, if we use the ring \( \mathcal{A} \) defined in Remark 1.5.7 a same reason shows that the skew-Hopf paring in (2.1.3.1) is defined over \( \mathcal{A} \). Hence, we can form a double Ringel–Hall algebra \( \mathcal{D}_\lambda(n)_\mathcal{A} \). Then \( \mathcal{D}_\lambda \mathcal{C}(n) \cong \mathcal{D}_\lambda(n)_\mathcal{A} \otimes \mathbb{C} \) and \( \mathcal{D}_\lambda(n) = \mathcal{D}_\lambda(n)_\mathcal{A} \otimes \mathbb{Q}(v) \).

### 2.2. Schifffmann–Hubery generators and presentation of \( \mathcal{D}_\lambda(n) \)

We now relate \( \mathcal{D}_\lambda(n) \) with the quantum enveloping algebra of a generalized Kac–Moody algebra based on [70, 39]; see also [38, 13].

We first describe the structure of \( \mathcal{D}_\lambda(n) \). As in (1.4.0.1), define for each \( m \geq 1 \),
\[ c_m^\pm = (-1)^m v^{-2mn} \sum_A (-1)^{\dim \text{End}(M(A))} a_A u_A^\pm \in \mathcal{D}_\lambda(n)^\pm, \]
where the sum is taken over all \( A \in \Theta_\lambda^+(n) \) such that \( d(A) = m \delta \) and \( \text{soc} \, M(A) \) is square-free. We also define \( c_0^\pm = 1 \) by convention. By Theorem 1.4.1, the elements \( c_m^+ \) and \( c_m^- \) are central in \( \mathcal{D}_\lambda(n)^+ \) and \( \mathcal{D}_\lambda(n)^- \), respectively. Following [40], we set \( \pi_0^\pm = 0 \) and define recursively \( \pi_m^\pm \) in \( \mathcal{D}_\lambda(n)^\pm \) by
\[ \pi_m^\pm = \begin{cases} \frac{v^n}{v^{-n}} c_1^\pm, & \text{if } m = 1; \\ \frac{v^{-n}}{v^n} c_m^\pm - \frac{1}{m} \sum_{s=1}^{m-1} s v^{(m-s)n} \pi_s^\pm c_{m-s}^\pm, & \text{if } m \geq 2. \end{cases} \tag{2.2.0.1} \]
Note that \( \pi_m^\pm \) is the element \( \pi_{n,m} \) defined in [40]. Hence, \( \pi_m^+ \) and \( \pi_m^- \) are also central in \( \mathcal{D}_\lambda(n)^+ \) and \( \mathcal{D}_\lambda(n)^- \), respectively. Moreover, if \( \mathcal{C}_\lambda(n)^+ \) and \( \mathcal{C}_\lambda(n)^- \) denote the \( \mathbb{Q}(v) \)-subalgebras of \( \mathcal{D}_\lambda(n) \) generated by \( u_i^+ \) and \( u_i^- \) \( i \in I \), respectively, then by Theorem 1.4.1
\[ \mathcal{D}_\lambda(n)^\pm = \mathcal{C}_\lambda(n)^\pm \otimes \mathbb{Q}(v)[\pi_1^\pm, \pi_2^\pm, \ldots]. \tag{2.2.0.2} \]
Furthermore, by [40] Lem. 12,
\[ \pi_m^\pm = v^{m(1-n)} \frac{m}{m} \sum_{l=1}^{n} u_{E_l,t_{l+m}}^\pm + x^\pm = \frac{m}{m} \sum_{l=1}^{n} \widetilde{u}_{E_l,t_{l+m}}^\pm + x^\pm, \]
where $x^\pm$ is a linear combination of certain $u^\pm_A$ such that $d(A) = m\delta$ and $M(A)$ are decomposable, and $\tilde{u}_A$ is defined in Proposition [1.2.0.12]. Moreover, $\pi^\pm_m$ are primitive, i.e.,

$$\Delta(\pi^\pm_m) = \pi^\pm_m \otimes 1 + 1 \otimes \pi^\pm_m,$$

where $\Delta$ is the comultiplication on $\mathcal{D}_\delta(n)$ induced by Green’s comultiplication given in Proposition [1.5.4(b)] and Corollary [1.5.6(b’)].

For each $m \geq 1$, let

$$z^+_m = \frac{m}{[m]} \pi^+_m = \sum_{l=1}^n \tilde{u}^+_l \mathcal{E}_{i+l,m} + \frac{m}{[m]} x^\pm,$$

and let $\sigma$ be the antipode of $\mathcal{D}_\delta(n)$ induced by Xiao’s antipode as given in Proposition [1.5.4(c)] and Corollary [1.5.6(c’)].

**Lemma 2.2.1.** For each $m \geq 1$, the elements $z^+_m$ and $z^-_m$ are central in $\mathcal{D}_\delta(n)^+$ and $\mathcal{D}_\delta(n)^-$, respectively, and satisfy

1. $\Delta(z^+_m) = z^+_m \otimes 1 + 1 \otimes z^+_m$,
2. $\sigma(z^+_m) = -z^+_m$.

Moreover, for all $i \in I$ and $m, m' \geq 1$, we have

$$[z^+_m, z^-_{m'}] = 0, \ [z^+_m, u_i^-] = 0, \ [u_i^+, z^-_{m'}] = 0, \ [z^+_{m'}, K_i] = 0.$$

In other words, $z^+_m$ are central elements in $\mathcal{D}_\delta(n)$.

**Proof.** Since $\mathcal{D}_\delta(n)$ is a Hopf algebra, we have $\mu(\sigma \otimes 1)\Delta(z^+_m) = \eta \varepsilon(z^+_m) = 0$ for each $m \geq 1$. Thus,

$$0 = \mu(\sigma \otimes 1)(z^+_m \otimes 1 + 1 \otimes z^+_m) = \sigma(z^+_m) + z^+_m,$$

i.e., $\sigma(z^+_m) = -z^+_m$. Since $\Delta(z^+_m) = z^+_m \otimes 1 + 1 \otimes z^+_m$ and $\Delta(z^-_m) = z^-_{m'} \otimes 1 + 1 \otimes z^-_{m'}$, applying (2.1.0.1) to $z^+_m$ and $z^-_{m'}$ gives

$$\psi(z^+_m, z^-_{m'}) + z^+_m \psi(1, z^-_{m'}) + z^-_{m'} \psi(z^+_m, 1) + z^-_{m'} z^+_m \psi(1, 1) = z^+_m z^-_{m'} \psi(1, 1) + z^-_{m'} z^+_m \psi(1, 1) + z^-_{m'} z^+_m \psi(1, 1).$$

It follows from $\psi(1, 1) = 1$ that $z^+_m z^-_{m'} = z^+_m z^-_{m'}$, i.e., $[z^+_m, z^-_{m'}] = 0$.

Similarly, we have $[z^+_m, u_i^-] = [u_i^+, z^-_{m'}] = [z^+_m, K_i] = 0$. The last assertion follows from (2.2.0.2).

By Theorem [1.3.4] there are isomorphisms

$$\mathcal{C}_\delta(n)^+ \xrightarrow{\sim} U(\widehat{\mathfrak{sl}_n})^+, \ u_i^+ \mapsto E_i; \ \mathcal{C}_\delta(n)^- \xrightarrow{\sim} U(\widehat{\mathfrak{sl}_n})^-, \ u_i^- \mapsto F_i.$$

Here we have applied the anti-involution $U(\widehat{\mathfrak{sl}_n})^+ \to U(\widehat{\mathfrak{sl}_n})^-, \ E_i \mapsto F_i$.

By (2.2.0.2) (see also [40] Th. 1), there are decompositions

$$\mathcal{D}_\delta(n)^+ = \mathcal{C}_\delta(n)^+ \otimes_{\mathbb{Q}(v)} \mathcal{Z}_\delta(n)^+ \quad \text{and} \quad \mathcal{D}_\delta(n)^- = \mathcal{C}_\delta(n)^- \otimes_{\mathbb{Q}(v)} \mathcal{Z}_\delta(n)^-,$$

where $\mathcal{Z}_\delta(n)^\pm := \mathbb{Q}(v)[z^\pm_1, z^\pm_2, \ldots]$ is the polynomial algebra in $z^\pm_m$ for $m \geq 1$. 

Remark 2.2.2. If \( z \in \mathbb{C} \) is not a root of unity and \( \mathfrak{H}(n) \subset \mathfrak{H}(n) \otimes \mathbb{C} \) is the \( \mathbb{C} \)-algebra obtained by specializing \( v \) to \( z \), then, by (1.2.0.9), we may use (2.2.0.1) to recursively define the central elements \( z_m \) in \( \mathfrak{H}(n) \subset \mathfrak{H}(n) \otimes \mathbb{C} \), and hence, elements \( z_m^\pm \) in \( \mathfrak{D}_{\Delta \subset \mathbb{C}}(n)^\pm \); see Remark 2.1.4. Thus, a \( \mathbb{C} \)-basis similar to the one given in Corollary 1.4.2 can be constructed for \( \mathfrak{D}_{\Delta \subset \mathbb{C}}(n)^\pm \). In particular, we obtain decompositions
\[
\mathfrak{D}_{\Delta \subset \mathbb{C}}(n)^\pm = \mathfrak{C}(n)_\mathbb{C}^\pm \otimes \mathbb{C}[z_1^\pm, z_2^\pm, \ldots],
\]
and hence, the \( \mathbb{C} \)-algebra \( \mathfrak{D}_{\Delta \subset \mathbb{C}}(n) \) can be presented by generators \( E_i, F_i, K_i, K_i^{-1}, z_s^+, z_s^- \), \( i \in I \), \( s \in \mathbb{Z}^+ \) and relations (QGL1)–(QGL8) as given in the last statement of Theorem 2.2.3 below.

Let \( C = (c_{i,j}) \) be the Cartan matrix of affine type \( A_{n-1} \) defined in (1.3.2.1). By identifying \( \mathfrak{C}(n)_\mathbb{C}^\pm \) with \( \mathfrak{U}(\mathfrak{H}(n))_\mathbb{C}^\pm \), we can describe a presentation for \( \mathfrak{D}_{\Delta}(n) \) as follows.

**Theorem 2.2.3.** The double Ringel–Hall algebra \( \mathfrak{D}_{\Delta}(n) \) of the cyclic quiver \( \Delta(n) \) is the \( \mathbb{Q}(v) \)-algebra generated by \( E_i, F_i, K_i, K_i^{-1}, z_s^+, z_s^- \), \( i \in I \), \( s \in \mathbb{Z}^+ \) with relations (i, j ∈ I and s, t ∈ \( \mathbb{Z}^+ \)):
\[(QGL1) \ K_i K_j = K_j K_i, \quad K_i K_i^{-1} = 1; \]
\[(QGL2) \ K_i E_j = v^{\delta_{i,j} - \delta_{i,j+1}} E_j K_i, \quad K_i F_j = v^{-\delta_{i,j} + \delta_{i,j+1}} F_j K_i; \]
\[(QGL3) \ E_i F_j - F_j E_i = \delta_{i,j} \frac{K_i K_{i+1} - K_{i+1}^{-1} K_i}{v - v^{-1}}; \]
\[(QGL4) \ \sum_{a+b=1} (-1)^a \left[ \frac{1}{a} - c_{i,j} \right] E_i^a E_j^b = 0 \text{ for } i \neq j; \]
\[(QGL5) \ \sum_{a+b=1} (-1)^a \left[ \frac{1}{a} - c_{i,j} \right] F_i^a F_j^b = 0 \text{ for } i \neq j; \]
\[(QGL6) \ z_s^+ z_s^- = z_s^- z_s^+, z_s^+ z_s = z_s z_s^+, z_s^+ z_s^- = z_s^- z_s^+; \]
\[(QGL7) \ K_i z_s^+ K_i = z_s^+ K_i, \quad K_i z_s^- K_i = z_s^- K_i; \]
\[(QGL8) \ E_i z_s^+ = z_s^+ E_i, \quad E_i z_s^- = z_s^- E_i, \quad F_i z_s^+ = z_s^+ F_i, \quad F_i z_s^- = z_s^- F_i, \quad \text{and } z_s^+ F_i = F_i z_s^+. \]

Replacing \( \mathbb{Q}(v) \) by \( \mathbb{C} \) and \( v \) by a non-root of unity \( z \), a similar result holds for \( \mathfrak{D}_{\Delta \subset \mathbb{C}}(n) \).

We will prove this result by a “standardly” defined quantum enveloping algebra associated with a Borcherds–Cartan matrix. See Proposition 2.2.0 below for the proof.

For each \( m \in \mathbb{Z}^+ \), let \( J_m = [1, m] \) and set \( J_\infty = [1, \infty] = \mathbb{Z}^+ \). We then set \( \tilde{I}_m = I \cup J_m \) for \( m \in \mathbb{Z}^+ \cup \{ \infty \} \). Define a matrix \( \tilde{C}_m = (\tilde{c}_{i,j})_{i,j \in \tilde{I}_m} \) by setting
\[
\tilde{c}_{i,j} = \begin{cases} c_{i,j}, & \text{if } i, j \in I; \\ 0, & \text{otherwise}. \end{cases}
\]

The \( \tilde{C}_m \) is a Borcherds–Cartan matrix which defines a generalized Kac–Moody algebra; see [4]. Thus, with \( \tilde{C}_m \) we can associate a quantum enveloping algebra \( \mathfrak{U}(\tilde{C}_m) \) as follows; see [48].

\[\text{We will see in Corollary 2.2.10 that } \mathfrak{D}_{\Delta \subset \mathbb{C}}(n) \text{ can be obtained as a specialization from the } \mathfrak{Z}\text{-algebra } \mathfrak{D}_{\Delta}(n) \text{ by base change } \mathfrak{Z} \to \mathfrak{C}, v \mapsto z. \text{ Thus, we can use the notation } \mathfrak{D}_{\Delta}(n)_{\mathfrak{C}} \text{ for this algebra.}\]
2.2. SCHIFFMANN–HUBERY GENERATORS AND PRESENTATION OF $\mathcal{D}_n$ (n)

**Definition 2.2.4.** Let $m \in \mathbb{Z}^+ \cup \{\infty\}$ and $\tilde{C}_m$ be defined as above. The quantum enveloping algebra $\mathbf{U}(\tilde{C}_m)$ associated with $\tilde{C}_m$ is the $\mathbb{Q}(v)$-algebra presented by generators

$$E_i, F_i, K_i, K_i^{-1}, x_s, y_s, k_s, k_s^{-1}, i \in I, s \in J_m,$$

and relations: for $i, j \in I$ and $s, t \in J_m$,

(R1) $K_i K_j = K_j K_i$, $K_i K_i^{-1} = 1$, $k_s k_t = k_t k_s$, $k_s k_s^{-1} = 1$, $K_i k_s = k_s K_i$;

(R2) $K_i E_j = v^{\delta_{i,j} - \delta_{i,j+1}} E_j K_i$, $K_i x_s = x_s K_i$, $k_s x_t = x_t k_s$, $k_s E_i = E_i k_s$;

(R3) $K_i F_j = v^{-\delta_{i,j} + \delta_{i,j+1}} F_j K_i$, $K_i y_s = y_s K_i$, $k_s y_t = y_t k_s$, $k_s F_i = F_i k_s$;

(R4) $E_i F_j - F_j E_i = \delta_{i,j} \frac{K_i - K_i^{-1}}{v - \frac{1}{v}}$, $x_s y_t - y_t x_s = \delta_{s,t} \frac{k_s - k_s^{-1}}{v - \frac{1}{v}}$, $E_i y_s = y_s E_i$, $x_s F_i = F_i x_s$,

where $\tilde{K}_i = K_i K_i^{-1}$;

(R5) $\sum_{a+b=1, c_{i,j}} (-1)^a \left[ \frac{1 - c_{i,j}}{a} \right] E_i^a E_j^b = 0$ for $i \neq j$;

(R6) $\sum_{a+b=1, c_{i,j}} (-1)^a \left[ \frac{1 - c_{i,j}}{a} \right] F_i^a F_j^b = 0$ for $i \neq j$;

(R7) $E_i x_s = x_s E_i$ and $x_s x_t = x_t x_s$;

(R8) $F_i y_s = y_s F_i$ and $y_s y_t = y_t y_s$.

Moreover, $\mathbf{U}(\tilde{C}_m)$ is a Hopf algebra with comultiplication $\Delta$, counit $\varepsilon$, and antipode $\sigma$ defined by

$$\Delta(E_i) = E_i \otimes \tilde{K}_i + 1 \otimes E_i, \quad \Delta(F_i) = F_i \otimes 1 + \tilde{K}_i^{-1} \otimes F_i,$$

$$\Delta(x_s) = x_s \otimes k_s + 1 \otimes x_s, \quad \Delta(y_s) = y_s \otimes 1 + k_s^{-1} \otimes y_s,$$

$$\Delta(K_i^\pm) = K_i^\pm \otimes K_i^\pm, \quad \Delta(k_s^\pm) = k_s^\pm \otimes k_s^\pm,$$

$$\varepsilon(E_i) = \varepsilon(x_s) = 0 = \varepsilon(F_i) = \varepsilon(y_s), \quad \varepsilon(K_i) = \varepsilon(k_s) = 1;$$

$$\sigma(E_i) = -E_i \tilde{K}_i^{-1}, \quad \sigma(F_i) = -\tilde{K}_i F_i, \quad \sigma(K_i^\pm) = K_i^{\mp 1},$$

$$\sigma(x_s) = -x_s k_s^{-1}, \quad \sigma(y_s) = -k_s y_s, \quad \sigma(k_s^\pm) = k_s^{\mp 1},$$

where $i \in I$ and $s \in J_m$.

**Remark 2.2.5.** The comultiplication here is opposite to the one given in [56, 3.1.10]. Consequently, the antipode is the inverse of the antipode given in [56, 3.3.1]. This change is necessary for its action on tensor space, commuting with the Hecke algebra action; cf. [11, §14.6].

Let $\tilde{U}^+ = \mathbf{U}(\tilde{C}_m)^+$ (resp., $\tilde{U}^- = \mathbf{U}(\tilde{C}_m)^-$, $\tilde{U}^0 = \mathbf{U}(\tilde{C}_m)^0$) be the $\mathbb{Q}(v)$-subalgebra of $\mathbf{U}(\tilde{C}_m)$ generated by $E_i$ (resp., $F_i$, $K_i^\pm$) for all $i \in I$ and $x_s$ (resp. $y_s, k_s$) for all $s \in J_m$. Then by [48, Th. 2.23], $\mathbf{U}(\tilde{C}_m)$ admits a triangular decomposition

$$\mathbf{U}(\tilde{C}_m) = \tilde{U}^+ \otimes \tilde{U}^0 \otimes \tilde{U}^-.$$

It is clear that the subalgebra of $\mathbf{U}(\tilde{C}_m)$ generated by $E_i, F_i, K_i, K_i^{-1}$ ($i \in I$) is the quantum enveloping algebra $\mathbf{U}(\mathfrak{sl}_n)$ as defined in §1.3. Also, we denote by $\mathbf{U}_\Delta(n)$
the subalgebra of $\mathbf{U}(\tilde{C}_n)$ generated by $E_i, F_i, K_i, K_i^{-1}$ ($i \in I$). We will call $U_\triangle(n)$ the extended quantum affine $\mathfrak{sl}_n$.

Now Theorem 2.2.3 follows immediately from the following result which describes the structure of $\mathfrak{D}_\triangle(n)$. It is a generalization of a result for the double Ringel–Hall algebra of a finite dimension tame hereditary algebra in [38] to the cyclic quiver case. Its proof is based on Theorem 1.4.1

**Proposition 2.2.6.** There is a unique surjective Hopf algebra homomorphism $\Phi : \mathbf{U}(\tilde{C}_\infty) \rightarrow \mathfrak{D}_\triangle(n)$ satisfying for each $i \in I$ and $s \in J_\infty$,

$$E_i \mapsto u_i^+, \ x_s \mapsto z_s^+, \ F_i \mapsto u_i^-, \ y_s \mapsto z_s^-, \ K_i^{\pm 1} \mapsto K_i^{\pm}, \ k_s^{\pm} \mapsto 1.$$

Moreover, Ker $\Phi$ is the ideal of $\mathbf{U}(\tilde{C}_\infty)$ generated by $k_s^{\pm 1} - 1$ for $s \in J_\infty$.

**Proof.** The existence and uniqueness of $\Phi$ clearly follow from Definition 2.2.4, Theorem 1.3.4, Theorem 1.4.1 and Lemma 2.2.1. Further, $\Phi$ induces surjective algebra homomorphisms

$$\Phi^\pm : \tilde{U}^\pm = \mathbf{U}(\tilde{C}_\infty)^\pm \rightarrow \mathfrak{D}_\triangle(n)^\pm.$$

By (R7), the multiplication map

$$\mu : \mathbf{U}(\tilde{sl}_n)^+ \otimes \mathbb{Q}(\{x_1, x_2, \ldots\}) \rightarrow \tilde{U}^+$$

is surjective. Hence, the composite $\Phi^+\mu$ is surjective. By Theorem 1.4.1

$$\mathfrak{D}_\triangle(n)^+ = \mathfrak{C}_\triangle(n)^+ \otimes \mathbb{Q}(\{z_1^+, z_2^+, \ldots\}).$$

Since $\Phi^+\mu(\mathbf{U}(\tilde{sl}_n)^+)$, it follows that $\Phi^+\mu$ is an isomorphism. Hence, $\Phi^+$ is an isomorphism, too.

Let $\mathcal{K}$ be the ideal of $\mathbf{U}(\tilde{C}_\infty)$ generated by $k_s^{\pm 1} - 1$ for $s \in J_\infty$. It is clear that $\mathcal{K} \subseteq \text{Ker } \Phi$. The triangular decomposition $\mathbf{U}(\tilde{C}_\infty) = \tilde{U}^+ \otimes \tilde{U}^0 \otimes \tilde{U}^-$ implies that

$$\mathbf{U}(\tilde{C}_\infty)/\mathcal{K} = (\tilde{U}^+ \otimes \mathbb{Q}(\{K_1^{\pm 1}, \ldots, K_n^{\pm 1}\}) \otimes \tilde{U}^- + \mathcal{K})/\mathcal{K}.$$

Since

$$\mathfrak{D}_\triangle(n) = \mathfrak{D}_\triangle(n)^+ \boxtimes \mathfrak{D}_\triangle(n)^0 \otimes \mathfrak{D}_\triangle(n)^- = \mathfrak{D}_\triangle(n)^+ \otimes \mathbb{Q}(\{K_1^{\pm 1}, \ldots, K_n^{\pm 1}\}) \otimes \mathfrak{D}_\triangle(n)^-,$$

we conclude that Ker $\Phi = \mathcal{K}$, as required.

Finally, it is straightforward to check that $\mathcal{K}$ is a Hopf ideal.

**Corollary 2.2.7.** The double Ringel–Hall algebra $\mathfrak{D}_\triangle(n)$ is a Hopf algebra with comultiplication $\Delta$, counit $\varepsilon$, and antipode $\sigma$ defined by

$$\Delta(E_i) = E_i \otimes K_i + 1 \otimes E_i, \ \Delta(F_i) = F_i \otimes 1 + \tilde{K}_i^{-1} \otimes F_i, \ \Delta(K_i^{\pm 1}) = K_i^{\pm 1} \otimes K_i^{\mp 1}, \ \Delta(z_i^{\pm}) = z_i^{\pm} \otimes 1 + 1 \otimes z_i^{\mp};$$

$$\varepsilon(E_i) = \varepsilon(F_i) = 0 = \varepsilon(z_i^{\pm}), \ \varepsilon(K_i) = 1;$$

$$\sigma(E_i) = -E_i \tilde{K}_i^{-1}, \ \sigma(F_i) = -\tilde{K}_i F_i, \ \sigma(K_i^{\pm 1}) = K_i^{\mp 1}, \ \sigma(z_i^{\pm}) = -z_i^{\mp};$$

---

2This is called quantum affine $\mathfrak{gl}_n$ by Lusztig [58], which is an extension of quantum affine $\mathfrak{sl}_n$ by adding an extra generator to the 0-part. This extension is similar to the extension of quantum $\mathfrak{gl}_n$ from quantum $\mathfrak{sl}_n$. In the literature, quantum affine $\mathfrak{sl}_n$ refers also to the quantum loop algebra associated with $\mathfrak{sl}_n$; see §2.3 below.
where $i \in I$ and $s \in J_\infty$.

**Remarks 2.2.8.** (1) For notational simplicity, we sometimes continue to use $u_i^\pm$ as generators of $\mathfrak{D}_\alpha(n)$. By Theorem [2.2.3] we see that there is a $\mathbb{Q}(v)$-algebra involution $\varsigma$ of $\mathfrak{D}_\alpha(n)$ satisfying

\[ K_i^{\pm 1} \mapsto K_i^{\pm 1}, \quad u_i^\pm \mapsto u_i^\pm, \quad z_s^{\pm 1} \mapsto z_s^{\pm 1}, \]

for $i \in I$ and $s \geq 1$. Thus, $\mathfrak{D}_\alpha(n)$ also admits a decomposition

\[ \mathfrak{D}_\alpha(n) = \mathfrak{D}_\alpha(n)^- \otimes \mathfrak{D}_\alpha(n)^0 \otimes \mathfrak{D}_\alpha(n)^+. \]

Moreover, two other types of generators for Ringel–Hall algebras discussed in §1.4 result in the corresponding generators for double Ringel–Hall algebras. Thus, we may speak of semisimple generators, etc. See more discussion in §2.4.

(2) The subalgebra of $\mathfrak{D}_\alpha(n)$ generated by $E_i, F_i, K_i, K_i^{-1}$ $(i \in I)$ is isomorphic to $\mathfrak{U}_\alpha(n)$. We will always identify these two algebras and thus, view $\mathfrak{U}_\alpha(n)$ as a subalgebra of $\mathfrak{D}_\alpha(n)$. In particular, we have

\[ \mathfrak{U}_\alpha(n) = \mathfrak{C}_\alpha(n)^- \otimes \mathfrak{D}_\alpha(n)^0 \otimes \mathfrak{C}_\alpha(n)^+. \]

Moreover, if $Z_\alpha(n) = \mathbb{Q}(v)[z_m^+, z_m^-]_{m \geq 1}$ denotes the central subalgebra of $\mathfrak{D}_\alpha(n)$ generated by $\ldots, z_2^+, z_1^-, z_1^+, z_2^-, \ldots$, then (1) together with (2.2.1.1) gives

\[ \mathfrak{D}_\alpha(n) \cong \mathfrak{U}_\alpha(n) \otimes Z_\alpha(n). \]

(3) The subalgebra $'\mathfrak{D}_\alpha(n)$ of $\mathfrak{D}_\alpha(n)$ generated by $u_i^+, u_i^-, \tilde{K}_i, K_i^{-1}$ $(A \in \Theta_\alpha^+(n), i \in I)$ is isomorphic to the reduced Drinfeld double of $'\mathfrak{H}_\alpha(n)^{>0}$ and $'\mathfrak{H}_\alpha(n)^{<0}$; see Remark [1.3.5](2). This subalgebra will be considered in §5.5 regarding a compatibility condition on the transfer maps.

(4) For each $m \geq 1$, $\mathfrak{U}(\tilde{C}_m)$ can be naturally viewed as a subalgebra of $\mathfrak{U}(\tilde{C}_\infty)$. If we let $\mathfrak{D}_\alpha(n)^{(m)}$ be the subalgebra of $\mathfrak{D}_\alpha(n)$ generated by $E_i, F_i, K_i, K_i^{-1}, z_s^+, z_s^-$ for $i \in I$ and $s \in J_m$, then the homomorphism $\Phi$ in Theorem 2.2.6 induces a surjective Hopf algebra homomorphism $\mathfrak{U}(\tilde{C}_m) \to \mathfrak{D}_\alpha(n)^{(m)}$. Applying Proposition [1.4.3] shows that $\mathfrak{D}_\alpha(n)^{(m)}$ is also generated by $E_i, F_i, K_i, K_i^{-1}, u_{i,s}^+, u_{i,s}^-$ for $i \in I$ and $s \in J_m$.

We end this section with a brief discussion on the double Hall algebras $\mathfrak{D}_{\alpha\mathfrak{C}}(n)$ given in Remark 2.1.4 in terms of specialization.

Consider the $\mathbb{Z}$-subalgebra $\tilde{U} = \tilde{U}_\mathbb{Z}$ of $\mathfrak{U}(\tilde{C}_\infty)$ generated by $K_i^{\pm 1}$, $[K_i^{\pm 1}]$, $k_{i,s}^{\pm 1}$, $x_s$, $y_s$ together with the divided powers $E_i^{(m)} = E_i^m/[m]^!$ and $F_i^{(m)} = F_i^m/[m]^!$ for $i \in I$ and $s, m \geq 1$; see for example [49, 42]. Further, we set

\[ \tilde{U}^+ = \tilde{U}^+ \cap \tilde{U}, \quad \tilde{U}^- = \tilde{U}^- \cap \tilde{U}, \quad \tilde{U}^0 = \tilde{U}^0 \cap \tilde{U}. \]

Then $\tilde{U}^+$ (resp., $\tilde{U}^-$) is the $\mathbb{Z}$-subalgebra of $\mathfrak{U}(\tilde{C}_\infty)$ generated by $x_s$ and $E_i^{(m)}$ (resp., $y_s$ and $F_i^{(m)}$) for $i \in I$ and $s, m \geq 1$. Consequently, we obtain

\[ \tilde{U}^+ = U(\hat{\mathfrak{sl}}_n)^+ \otimes \mathbb{Z}[x_1, x_2, \ldots] \quad \text{and} \quad \tilde{U}^- = U(\hat{\mathfrak{sl}}_n)^- \otimes \mathbb{Z}[y_1, y_2, \ldots], \]

where $U(\hat{\mathfrak{sl}}_n)^+$ and $U(\hat{\mathfrak{sl}}_n)^-$ are the $\mathbb{Z}$-subalgebras of $U(\hat{\mathfrak{sl}}_n)$ generated by the divided powers $E_i^{(m)}$ and $F_i^{(m)}$, respectively. This implies particularly that both $\tilde{U}^+$ and $\tilde{U}^-$ are free $\mathbb{Z}$-modules.
Remark 2.2.9. We do not know whether \( \tilde{U}^0 \) is free over \( \mathcal{Z} \). In case \( \tilde{U}^0 \) is free, it would be interesting to find a \( \mathcal{Z} \)-basis for it.

Similarly, we define the \textit{integral form} \( \mathcal{D}_\delta(n) \) of \( \mathcal{D}_\delta(n) \) to be the \( \mathcal{Z} \)-subalgebra generated by \( K_i^{\pm 1}, [K_i^t], z_i^+, z_i^-, (u_i^+)^{(m)} \) and \( (u_i^-)^{(m)} \) for \( i \in I \) and \( s, t, m \geq 1 \). It is easy to see that the surjective \( \mathbb{Q}(v) \)-algebra homomorphism \( \Phi : U(\mathcal{C}_\infty) \to \mathcal{D}_\delta(n) \) (see Proposition 2.2.6) induces a surjective \( \mathcal{Z} \)-algebra homomorphism \( \Phi : \tilde{U} \to \mathcal{D}_\delta(n) \). We also set

\[
\mathcal{D}_\delta(n)^\epsilon = \mathcal{D}_\delta(n)^\epsilon \cap \mathcal{D}_\delta(n) \text{ for } \epsilon \in \{+, -, 0\}.
\]

Then \( \mathcal{D}_\delta(n)^+ \) (resp., \( \mathcal{D}_\delta(n)^- \)) is isomorphic to \( \tilde{U}^+ \) (resp., \( \tilde{U}^- \)). Hence,

\[
\mathcal{D}_\delta(n)^+ = \mathcal{C}_\delta(n)^+ \otimes \mathcal{Z} [z_1^+, z_2^+, \ldots] \text{ and } \mathcal{D}_\delta(n)^- = \mathcal{C}_\delta(n)^- \otimes \mathcal{Z} [z_1^-, z_2^-, \ldots],
\]

where \( \mathcal{C}_\delta(n)^+ \cong U(sl_n)^+ \) (resp., \( \mathcal{C}_\delta(n)^- \cong U(\hat{sl}_n)^- \)) is the \( \mathcal{Z} \)-subalgebra of \( \mathcal{D}_\delta(n) \) generated by \( (u_i^+)^{(m)} \) (resp., \( (u_i^-)^{(m)} \)). Moreover, by [11 Th. 14.20], \( \mathcal{D}_\delta(n)^0 \) is a free \( \mathcal{Z} \)-module with a basis

\[
\left\{ \tilde{K}_1^{a_1} \cdots \tilde{K}_{n-1}^{a_{n-1}} \begin{bmatrix} K_1; 0 \\ t_1 \end{bmatrix} \cdots \begin{bmatrix} K_{n-1}; 0 \\ t_{n-1} \end{bmatrix} K_n \begin{bmatrix} 0 \\ t_n \end{bmatrix} \mid a_i = 0, 1, t_i \in \mathbb{N} \forall i \in I \right\}.
\]

Hence, the multiplication map

\[
\mathcal{D}_\delta(n)^+ \otimes \mathcal{Z} \mathcal{D}_\delta(n)^0 \otimes \mathcal{Z} \mathcal{D}_\delta(n)^- \xrightarrow{\sim} \mathcal{D}_\delta(n)
\]

is a \( \mathcal{Z} \)-module isomorphism; see [11 Cor. 6.50]. In particular, \( \mathcal{D}_\delta(n) \) is a free \( \mathcal{Z} \)-module.

The \( \mathcal{Z} \)-algebra \( \mathcal{D}_\delta(n) \) gives rise to a \( \mathcal{Z} \)-form \( U_\delta(n) \) of the extended quantum affine \( sl_n, U_\delta(n) \):

\[
U_\delta(n) = \mathcal{D}_\delta(n) \cap U_\delta(n) = \mathcal{C}_\delta(n)^+ \mathcal{D}_\delta(n)^0 \mathcal{C}_\delta(n)^-.
\]

Corollary 2.2.10. If \( z \in \mathbb{C} \) is a complex number which is not a root of 1, then the specialization \( \mathcal{D}_\delta(n)_\mathbb{C} = \mathcal{D}_\delta(n) \otimes \mathbb{C} \) at \( v = z \) is isomorphic to the \( \mathbb{C} \)-algebra \( \mathcal{D}_\delta_\mathbb{C}(n) \).

\textbf{Proof.} If we assign to each \( u_A^+ \) (resp., \( u_A^- \), \( K_i \)) degree \( \delta(A) = \dim M(A) \) (resp., \( -\delta(A), 0 \)), then \( \mathcal{D}_\delta(n) \) admits a \( \mathcal{Z} \)-grading \( \mathcal{D}_\delta(n) = \oplus_{m \in \mathcal{Z}} \mathcal{D}_\delta(n)_m \), and \( \mathcal{D}_\delta(n) \) inherits a \( \mathcal{Z} \)-grading \( \mathcal{D}_\delta(n) = \oplus_{m \in \mathcal{Z}} \mathcal{D}_\delta(n)_m \), where \( \mathcal{D}_\delta(n)_m = \mathcal{D}_\delta(n) \cap \mathcal{D}_\delta(n)_m \). By the presentation of \( \mathcal{D}_\delta_\mathbb{C}(n) \) as given in Remark 2.1.4, it is clear that there is a graded algebra homomorphism \( \mathcal{D}_\delta_\mathbb{C}(n) \to \mathcal{D}_\delta(n)_\mathbb{C} \). This map is injective since it is so on every triangular component. Now, a dimensional comparison on homogeneous components shows it is an isomorphism.

\textbf{Remark 2.2.11.} Let \( \mathcal{H}_\delta(n)^+ \) be the \( \mathcal{Z} \)-submodule of \( \mathcal{D}_\delta(n) \) spanned by \( u_A^+ \) for \( A \in \Theta_\delta^+(n) \). Then \( \mathcal{H}_\delta(n)^+ \) is a \( \mathcal{Z} \)-algebra which is isomorphic to \( \mathcal{H}_\delta(n) \). We point out that in general, \( \mathcal{D}_\delta(n)^+ \) does not coincide with \( \mathcal{H}_\delta(n)^+ \). For example, let \( n = 2 \). An easy calculation shows that

\[
z_1^+ = u_1^+ u_2^+ + u_2^+ u_1^+ - (v + v^{-1}) u_\delta^+.
\]
Since \( \{u_1^+ u_2^+, u_3^+ u_1^+, z_1^+\} \) is a \( \mathbb{Z} \)-basis for the homogeneous space \( D_\dagger(2)_\dagger^+ \), we conclude that \( u_3^+ \notin D_\dagger(2)_\dagger^+ \). If \( n = 3 \), then
\[
\begin{align*}
  z_1^+ &= u_1^+ u_2^+ u_3^+ + u_2^+ u_3^+ u_1^+ + u_3^+ u_1^+ u_2^+ \\
  &- (v + v^{-1})(u_1^+ u_2^+ u_3^+ + u_2^+ u_3^+ u_1^+ + u_3^+ u_1^+ u_2^+) + (v^2 + 1 + v^{-2})u_3^+.
\end{align*}
\]
Analogously, we have \( u_3^+ \notin D_\dagger(3)_\dagger^+ \).

It seems difficult to prove directly that all central elements \( z_n^+ \) lie in \( \mathfrak{g}_0(n)^+ \). However, we will provide a proof of this fact in Corollary 3.7.5 via the integral quantum Schur algebras. Hence, \( D_\dagger(n)^+ \) is indeed a subalgebra of \( \mathfrak{g}_0(n)^+ \).

### 2.3. The quantum loop algebra \( \mathfrak{u}(\widehat{gl}_n) \)

In this section, we give an application of the presentation for \( D_\dagger(n) \) given in the previous section. More precisely, we will use Hubery’s work \cite{hubery} to extend Beck’s algebra embedding of the quantum affine \( \mathfrak{g}_n \) into the quantum loop algebra \( \mathfrak{u}(\widehat{gl}_n) \) defined by Drinfeld’s new presentation \cite{drinfeld} to an explicit isomorphism from \( D_\dagger(n) \) to \( \mathfrak{u}(\widehat{gl}_n) \).

As discussed in §1.1, consider the loop algebra
\[
\widehat{gl}_n = \mathfrak{g}_n \otimes \mathbb{Q}[t, t^{-1}],
\]
which is generated by \( E_{i,i+1} \otimes t^s, E_{i+1,i} \otimes t^s, E_{j,j} \otimes t^s \) for \( s \in \mathbb{Z} \), \( 1 \leq i \leq n - 1 \) and \( 1 \leq j \leq n \). We have the following quantum enveloping algebra associated with \( \widehat{gl}_n \); see \cite{drinfeld} (and also \cite{molev2, hubery}).

**Definition 2.3.1.** (1) The quantum loop algebra \( \mathfrak{u}(\widehat{gl}_n) \) (or quantum affine \( \mathfrak{g}_n \)) is the \( \mathbb{Q}(v) \)-algebra generated by \( x_{i,s}^\pm (1 \leq i < n, s \in \mathbb{Z}) \), \( k_i \) and \( g_{i,t} \) \( (1 \leq i \leq n, t \in \mathbb{Z}\{0\}) \) with the following relations:

- **(QLA1)** \( k_i k_i^{-1} = 1 = k_i^{-1} k_i \), \( [k_i, k_j] = 0 \);
- **(QLA2)** \( k_i x_{j,s}^\pm = v^\pm(\delta_{i,j} - \delta_{i,j+1}) x_{j,s}^\pm k_i \), \( [k_i, g_{j,s}] = 0 \);
- **(QLA3)** \( [g_{i,s}, x_{j,t}^\pm] = \begin{cases}
  0 & \text{if } i \neq j, j + 1, \\
  \pm v^{-i-s}[a] x_{i,s+t}^\pm & \text{if } i = j,
  + v^{(1-i-s)[a]} x_{i-1,s+t}^\pm & \text{if } i = j + 1;
\end{cases} \)
- **(QLA4)** \( [g_{i,s}, g_{j,t}] = 0 \);
- **(QLA5)** \( x_{i,s}, x_{j,t}^\pm = \delta_{ij} \phi_{i,s+t}^\pm - \phi_{j,i}^{-1} \);
- **(QLA6)** \( x_{i,s}^j x_{j,t}^\pm = x_{j,t}^j x_{i,s}^\pm \), for \( |i - j| > 1 \), and \( [x_{i,s+1}^+, x_{j,t}^\pm v^{\pm c_{ij}}] = \left[-[x_{j,t+1}^+, x_{i,s}^\pm v^{\pm c_{ij}}] \right] \);
- **(QLA7)** \( x_{i}, x_{j,t}^\pm, x_{i,s}^\pm v = -[x_{i}, x_{j,t}^\pm, x_{i,s}^\pm v] \), for \( |i - j| = 1 \),

where \( [x, y]_a = xy - ayx \), and \( \phi_{i,s}^\pm \) are defined via the generating functions in indeterminate \( u \) by
\[
\Phi_i^\pm(u) := \tilde{k_i}^\pm \exp(\pm(v - v^{-1}) \sum_{m \geq 1} \hbar_{i,\pm m} u^{\pm m}) = \sum_{s \geq 0} \phi_{i,\pm s}^\pm u^{\pm s}
\]
with \( \tilde{k_i} = k_i / k_{i+1} \) \( (k_{n+1} = k_1) \) and \( \hbar_{i,m} = v^{(i-1)m} g_{i,m} - v^{(i+1)m} g_{i+1,m} \) \( (1 \leq i < n) \).
Let $U_C(\widehat{\mathfrak{gl}}_n)$ be the quantum loop algebra defined by the same generators and relations (QLA1)–(QLA7) with $\mathbb{Q}(v)$ replaced by $\mathbb{C}$ and $v$ by a non-root of unity $z \in \mathbb{C}$.

Observe that, if we put $\Theta^+_i(u) = k^+_i \exp(\pm (v - v^{-1}) \sum_{m \geq 1} g_i, \pm m u^{\pm m})$, then

$$\Phi^+_i(u) = \frac{\Theta^+_i(uv^{i-1})}{\Theta^+_i(uv^{i+1})}.$$  

Also, $\phi^+_i = 0$ for all $i \geq 1$. Hence, (QLA5) becomes

$$[x^+_i, x^-_i] = \begin{cases} \frac{k_i - k_i^{-1}}{v - v^{-1}}, & \text{if } s + t = 0; \\ \frac{\phi^+_i}{v - v^{-1}}, & \text{if } s + t > 0; \\ \frac{-\phi^+_i}{v - v^{-1}}, & \text{if } s + t < 0. \end{cases}$$

By \cite{[2]} (see also \cite{[44] Th. 2.2], \cite{[28] §3.1}, and \cite{[40] Th. 3}), there is a monomorphism of Hopf algebras $E_B : U(\mathfrak{sl}_n) \to U(\widehat{\mathfrak{gl}}_n)$ such that

$$\tilde{K}_i \mapsto k_i, E_i \mapsto x^+_i, F_i \mapsto x^-_i (1 \leq i < n), E_n \mapsto e^+_n, F_n \mapsto e^-_n,$$

where $e^+_n = (-1)^n [x^+_{n-1,0}, \cdots, [x^+_{3,0}, [x^+_{2,0}, x^+_{1,0}]]_{v^{-1}} \cdots]_{v^{-1}} k_n$ and

$$e^-_n = (-1)^n [k_n^{-1} \cdots [x^+_{n-1,0}, x^+_{2,0}, x^+_{3,0}]_{v}, \cdots, x^+_{n-1,0}]_{v}.$$  

The image $\text{Im}(E_B)$, known as quantum loop algebra of $\mathfrak{sl}_n$, is the $\mathbb{Q}(v)$-subalgebra of $U(\widehat{\mathfrak{gl}}_n)$ generated by $k_i^\pm$, $\tilde{x}_i^\pm$, and $h_i$ for $1 \leq i < n$, $s, t \in \mathbb{Z}$ with $t \neq 0$. Moreover, it can be proved (see, e.g., \cite{[28] §§2.1&3.1}) that the defining relations of this subalgebra are the relations (QLA5)–(QLA7) together with the relations:

\begin{itemize}
  \item[(GLA8)] $k_i k_j = k_j k_i, k_i k_2 \cdots k_n = 1, [k_i, h_{j,s}] = 0, [h_{i,s}, h_{j,t}] = 0$;
  \item[(GLA9)] $k_i x^+_j, s = v^{c_{i,j}} x^+_{j+s, i}, [h_{i,s}, x^+_j, t] = \pm \frac{c_{i,j}}{s} x^+_j, s + t$.
\end{itemize}

where $C = (c_{i,j})$ is the generalized Cartan matrix of type $\widetilde{A}_{n-1}$ as given in \cite{[13,2.2.1]}. This is the Drinfeld’s new presentation for $U(\mathfrak{sl}_n)$. Define $U_C(\widehat{\mathfrak{gl}}_n)$ similarly.

We now describe the main result of \cite{[40]}. For each $s \in \mathbb{Z}\setminus\{0\}$,

$$\theta_s = v^{ns} (g_1 + \cdots + g_{n,s}). \quad (2.3.1.1)$$

It can be directly checked by the definition that the $\theta_s$ are central in $U(\widehat{\mathfrak{gl}}_n)$.

**Remark 2.3.2.** In \cite{[28] §4.2], the authors introduced central elements $g_s$ ($s \in \mathbb{Z}$) in $U(\widehat{\mathfrak{gl}}_n)$ defined by the generating function

$$\sum_{s \geq 0} g_{s} u^{\pm s} = \prod_{i=1}^{n} \exp \left( \mp \sum_{m > 0} \frac{g_{i, \pm m}}{m} u^{\pm m} \right),$$

that is,

$$\sum_{s \geq 0} g_{s} u^{\pm s} = \exp \left( \mp \sum_{m > 0} \frac{\theta_{\pm m}}{m} u^{\pm m} \right)$$.
Therefore, for each \( s \geq 1 \),
\[
\mathcal{Q}(v)[\theta_{\pm 1}, \ldots, \theta_{\pm s}] = \mathcal{Q}(v)[g_{\pm 1}, \ldots, g_{\pm s}] \quad \text{and}
\theta_{\pm(s+1)} \equiv v^{s+1(n+1)}[s+1]g_{\pm(s+1)} \mod \mathcal{Q}(v)[g_{\pm 1}, \ldots, g_{\pm s}].
\]

By \( U(\hat{gl}_n)^{\geq 0} \) we denote the subalgebra of \( U(\hat{gl}_n) \) generated by \( k_i^{\pm 1}, g_{i,s} \) \((1 \leq i \leq n, s \geq 1)\), \( x_{i,0}^+ \) and \( x_{i,s}^+ \) \((1 \leq i < n, s \geq 1)\). Dually, let \( U(\hat{gl}_n)^{< 0} \) be the subalgebra of \( U(\hat{gl}_n) \) generated by \( k_i^{\pm 1}, g_{i,s} \) \((1 \leq i < n, s \leq -1)\), \( x_{i,0}^- \) and \( x_{i,s}^- \) \((1 \leq i < n, s \leq -1)\).

**Proposition 2.3.3 (Main Theorem of [20]).** There is an isomorphism of Hopf algebras \( \mathcal{E}^{\geq 0}_h : \mathcal{D}_\alpha(n)^{\geq 0} \rightarrow U(\hat{gl}_n)^{\geq 0} \) taking
\[
K_i^{\pm 1} \mapsto k_i^{\pm 1}, \ u_i^{+} \mapsto x_{i,0}^{+} \quad (1 \leq i < n), \ u_n^{+} \mapsto \varepsilon_n^{+}, \ z_n^{s} \mapsto -\frac{s}{[s]}\theta^{s} \quad (s \geq 1).
\]

Moreover, the restriction of \( \mathcal{E}^{\geq 0}_h \) and the Beck’s embedding \( \mathcal{E}_B \) to \( \mathcal{E}^{\leq 0}_h = U(\hat{gl}_n)^{\leq 0} \) coincide.

Dually, there is an isomorphism of Hopf algebras \( \mathcal{E}^{\leq 0}_h : \mathcal{D}_\alpha(n)^{\leq 0} \rightarrow U(\hat{gl}_n)^{\leq 0} \) taking
\[
K_i^{\pm 1} \mapsto k_i^{\pm 1}, \ u_i^{-} \mapsto x_{i,0}^{-} \quad (1 \leq i < n), \ u_n^{-} \mapsto \varepsilon_n^{-}, \ z_n^{s} \mapsto -\frac{s}{[s]}\theta^{-s} \quad (s \geq 1),
\]

and the restrictions of \( \mathcal{E}^{\leq 0}_h \) to \( \mathcal{E}^{\leq 0}_h = U(\hat{gl}_n)^{\leq 0} \) is Beck’s embedding \( \mathcal{E}_B \).

In view of the isomorphisms \( \mathcal{E}^{\geq 0}_h \) and \( \mathcal{E}^{\leq 0}_h \), we see that \( U(\hat{gl}_n) \) is generated by \( x_{i,0}^{\pm} \quad (1 \leq i < n), \ v_{\geq 0}^{\pm} \quad \theta_{\geq 0}^{s} \quad (s \geq 1) \), and \( k_i^{\pm 1} \quad (1 \leq i \leq n) \). It is easy, using Beck’s embedding, to check that these generators satisfy the relations similar to (QLA1)–(QLA8) in Theorem 2.2.3 Consequently, we obtain the following result.

**Corollary 2.3.4.** There is a surjective \( \mathcal{Q}(v) \)-algebra homomorphism \( \mathcal{E}_h : \mathcal{D}_\alpha(n) \rightarrow U(\hat{gl}_n) \) taking
\[
K_i^{\pm 1} \mapsto k_i^{\pm 1}, \ u_i^{\pm} \mapsto x_{i,0}^{\pm} \quad (1 \leq i < n), \ u_n^{\pm} \mapsto \varepsilon_n^{\pm}, \ z_n^{s} \mapsto -\frac{s}{[s]}\theta^{s} \quad (s \geq 1).
\]

Now we define the following elements in \( \mathcal{D}_\alpha(n) \):
\[
\hat{k}_i^{\pm 1} = K_i^{\pm 1} = (\mathcal{E}^{\geq 0}_h)^{-1}(k_i^{\pm 1}) = (\mathcal{E}^{\leq 0}_h)^{-1}(k_i^{\pm 1}),
\hat{x}_{i,0}^{\pm} = u_i^{\pm} = (\mathcal{E}^{\geq 0}_h)^{-1}(x_{i,0}^{\pm}), \ \hat{x}_{i,0}^{-} = u_i^{-} = (\mathcal{E}^{\leq 0}_h)^{-1}(x_{i,0}^{-}),
\hat{x}_{i,s}^{\pm} = (\mathcal{E}^{\geq 0}_h)^{-1}(x_{i,s}^{\pm}), \ \hat{g}_{i,s} = (\mathcal{E}^{\geq 0}_h)^{-1}(g_{i,s}) \quad (s \geq 1),
\hat{x}_{i,s}^{-} = (\mathcal{E}^{\leq 0}_h)^{-1}(x_{i,s}^{-}), \ \hat{g}_{i,s} = (\mathcal{E}^{\leq 0}_h)^{-1}(g_{i,s}) \quad (s \leq -1).
\]

Then the set
\[
X := \{ \hat{k}_i^{\pm 1}, \hat{g}_{i,s} \mid 1 \leq i \leq n, s \neq 0 \in \mathbb{Z} \} \cup \{ \hat{x}_{i,s}^{\pm} \mid 1 \leq i < n, s \in \mathbb{Z} \}
\]
is a generating set for \( \mathcal{D}_\alpha(n) \). Since all \( x_{i,0}^{\pm} \) belong to \( U(\hat{gl}_n) \), it follows that \( \mathcal{E}_h(\hat{x}_{i,s}^{\pm}) = \mathcal{E}_B(\hat{x}_{i,s}^{\pm}) \). Thus, the \( \hat{x}_{i,s}^{\pm} \) satisfy the relations (QLA5)–(QLA7). Furthermore, set for \( 1 \leq i < n \) and \( s \in \mathbb{Z} \),
\[
\hat{h}_{i,s} = v^{(s-1)}g_{i,s} - v^{(s+1)}g_{i+1,s}.
\]
Then $h_{i,s} = E_h(h_{i,s}) \in U(\hat{gl}_n)$. Hence, $h_{i,s}$ together with $\hat{k}_{i}^{\pm 1}$ and $\hat{x}_{i,s}^{\pm}$ satisfy the relations (QLA8)--(QLA9). On the other hand, the elements
\[
\hat{\theta}_s := v^{ns}(\hat{g}_{1,s} + \cdots + \hat{g}_{n,s}) = \begin{cases} (E_H^{\geq 0})^{-1}(\theta_s) = -\frac{[s]}{s}z_i^+, & \text{if } s \geq 1; \\
(E_H^{\leq 0})^{-1}(\theta_s) = -\frac{[s]}{s}z_i^-, & \text{if } s \leq -1.
\end{cases}
\]
are central in $\mathfrak{D}_{\Delta}(n)$. We finally get that the $\hat{g}_{i,s}$ satisfy the relations (QLA2)--(QLA4). Therefore, the generators in $X$ satisfy all the relations (QLA1)--(QLA7). We conclude that there is a surjective $\mathbb{Q}(v)$-algebra homomorphism $\mathcal{F} : U(\hat{gl}_n) \twoheadrightarrow \mathfrak{D}_{\Delta}(n)$ taking
\[
\hat{k}_{i}^{\pm 1} \mapsto k_{i}^{\pm 1}, \quad \hat{g}_{i,s} \mapsto g_{i,s}, \quad \hat{x}_{i,s}^{\pm} \mapsto x_{i,s}^{\pm}.
\]
Obviously, both the composites $\mathcal{E}_H \mathcal{F}$ and $\mathcal{F} \mathcal{E}_H$ are the identity maps. This gives the following result.

**Theorem 2.3.5.** The algebra homomorphism $\mathcal{E}_H : \mathfrak{D}_{\Delta}(n) \rightarrow U(\hat{gl}_n)$ defined in Corollary 2.3.4 is an isomorphism. In particular, Theorem 2.2.3 gives another presentation for $U(\hat{gl}_n)$.

Let $U(\hat{gl}_n)^+$ (resp., $U(\hat{gl}_n)^-$) be the subalgebra of $U(\hat{gl}_n)$ generated by $x_{i,0}^+, \varepsilon_n^+, \theta_s$ (resp., $x_{i,0}^-, \varepsilon_n^-, \theta_s$) for $1 \leq i < n$, $s \geq 1$. Also, let $U(\hat{gl}_n)^0$ be the subalgebra of $U(\hat{gl}_n)$ generated by the $k_i^{\pm 1}$. The triangular decomposition of $\mathfrak{D}_{\Delta}(n)$ induces that of $U(\hat{gl}_n)$.

**Corollary 2.3.6.** The multiplication map
\[
U(\hat{gl}_n)^+ \otimes U(\hat{gl}_n)^0 \otimes U(\hat{gl}_n)^- \rightarrow U(\hat{gl}_n)
\]
is a $\mathbb{Q}(v)$-space isomorphism.

**Remarks 2.3.7.** (1) In [40] Hubery deals with the extended Ringel–Hall algebra $\mathcal{H}_v^>(\Delta')$ of the cyclic quiver $\Delta' = \Delta'(n)$ which has the opposite orientation of $\Delta(n)$. By [40] Th. 1], there is a decomposition
\[
\mathcal{H}_v^>(\Delta') \cong U(\hat{gl}_n)^+ \otimes_{\mathbb{Q}(v)} \mathbb{Q}(v)[c_1, c_2, \ldots] \otimes_{\mathbb{Q}(v)} \mathbb{Q}(v)[K_1^{\pm 1}, \ldots, K_n^{\pm 1}].
\]
Hence, $\mathcal{H}_v^>(\Delta')$ is isomorphic to $\mathfrak{D}_{\Delta}(n)^{>0}$ defined in §1.5.

(2) The proof above can be easily modified to construct a $\mathbb{C}$-algebra homomorphism $\mathcal{E}_{H,C} : \mathfrak{D}_{\Delta,C}(n) \rightarrow U_C(\hat{gl}_n)$, where the algebras are defined over $\mathbb{C}$ with respect to a non-root of unity $z \in \mathbb{C}$.

(3) With the above isomorphism, the double Ringel–Hall algebras $\mathfrak{D}_{\Delta}(n), \mathfrak{D}_{\Delta,C}(n)$ will also be called a quantum affine $gl_n$. Moreover, the notation $\mathfrak{D}_{\Delta}(n), \mathfrak{D}_{\Delta,C}(n)$ will not be changed to $U(\hat{gl}_n), U_C(\hat{gl}_n)$ throughout the paper except the last chapter in order to emphasize the approach used in this paper.

(4) There is another geometric realization for the $+$-part of the quantum loop algebra $U(\hat{gl}_n)$ in terms of the Hall algebra of a Serre subcategory of the category of coherent sheaves over a weighted projective line; see [71] 4.3, 5.2 and [40].
2.4. Semisimple generators and commutator formulas

By [12] Th. 5.2, the Ringel–Hall algebra $\mathcal{H}_\lambda(n)$ can be generated by semisimple modules over $\mathcal{Z}$. Thus, semisimple generators would be crucial to the study of integral forms of $\mathcal{D}_\lambda(n)$. In this section we derive commutator formulas between semisimple generators of $\mathcal{D}_\lambda(n)$ (cf. [82] Prop. 5.5).

Recall from §1.2 that for the module $M(A)$ associated with $A \in \Theta_{\Delta}^+(n)$, we write $d(A) = \dim M(A)$ for the dimension vector of $M(A)$.

Define a subset $\Theta_{\Delta}^+(n)^{ss}$ of $\Theta_{\Delta}^+(n)$ by setting

$$\Theta_{\Delta}^+(n)^{ss} = \{ A = (a_{i,j}) \in \Theta_{\Delta}^+(n) \mid a_{i,j} = 0 \text{ for all } j \neq i+1 \}.$$

In other words, $A \in \Theta_{\Delta}^+(n)^{ss} \iff M(A)$ is semisimple. Then, by Proposition 1.3.3, $\mathcal{D}_\lambda(n)^{+}$ (resp., $\mathcal{D}_\lambda(n)^{-}$) is generated by $u^+_A$ (resp., $u^-_A$) for all $A \in \Theta_{\Delta}^+(n)^{ss}$. We sometimes identify $\Theta_{\Delta}^+(n)^{ss}$ with $\mathbb{N}^n_{\lambda}$ via the map $\mathbb{N}^n_{\lambda} \to \Theta_{\Delta}^+(n)^{ss}$ sending $\lambda$ to $A = A_{\lambda}$ with $\lambda_i = a_{i,i+1}$ for all $i \in \mathbb{Z}$.

Lemma 2.4.1. Let $X^+ := \text{span}\{u^+_A \mid A \in \Theta_{\Delta}^+(n)^{ss}\}$ and $X^- := \text{span}\{u^-_A \mid A \in \Theta_{\Delta}^+(n)^{ss}\}$. Then

$$\mathcal{D}_\lambda(n) \cong \mathcal{H}_\lambda(n)^{>0} \ast \mathcal{H}_\lambda(n)^{\leq 0}/\mathcal{J},$$

where $\mathcal{J}$ is the ideal of the free product $\mathcal{H}_\lambda(n)^{>0} \ast \mathcal{H}_\lambda(n)^{\leq 0}$ generated by

1. $\sum (a_2 \ast a_2) \psi(a_1, b_1) - \sum (a_1 \ast b_1) \psi(a_2, b_2)$ for all $a \in X^+, b \in X^-$,
2. $K_{\alpha} \ast 1 - 1 \ast K_{\alpha}$ for all $\alpha \in \mathbb{Z}I$,

where $\Delta(a) = \sum a_1 \otimes a_2$ and $\Delta(b) = \sum b_1 \otimes b_2$.

Proof. For $a \in \mathcal{H}_\lambda(n)^{>0}$ and $b \in \mathcal{H}_\lambda(n)^{\leq 0}$, we write

$$L(a, b) = \sum (b_2 \ast a_2) \psi(a_1, b_1) \quad \text{and} \quad R(a, b) = \sum (a_1 \ast b_1) \psi(a_2, b_2).$$

Define

$$X^{>0} := \text{span}\{u^+_A K_{\alpha} \mid \alpha \in \mathbb{Z}I, A \in \Theta_{\Delta}^+(n)^{ss}\} \quad \text{and} \quad X^{\leq 0} := \text{span}\{K_{\alpha} u^-_A \mid \alpha \in \mathbb{Z}I, A \in \Theta_{\Delta}^+(n)^{ss}\}. $$

Then $X^{>0}$ (resp., $X^{\leq 0}$) generates $\mathcal{H}_\lambda(n)^{>0}$ (resp., $\mathcal{H}_\lambda(n)^{\leq 0}$) and satisfies

$$\Delta(X^{>0}) \subseteq X^{>0} \otimes X^{>0} \quad \text{(resp., } \Delta(X^{\leq 0}) \subseteq X^{\leq 0} \otimes X^{\leq 0}). $$

Thus, by Lemma 2.1.1,

$$\mathcal{D}_\lambda(n) = \mathcal{H}_\lambda(n)^{>0} \ast \mathcal{H}_\lambda(n)^{\leq 0}/\hat{\mathcal{J}},$$

where $\hat{\mathcal{J}}$ is the ideal of $\mathcal{H}_\lambda(n)^{>0} \ast \mathcal{H}_\lambda(n)^{\leq 0}$ generated by

1. $\sum (b_2 \ast a_2) \psi(a_1, b_1) - \sum (a_1 \ast b_1) \psi(a_2, b_2)$ (a $\in X^{>0}, b \in X^{\leq 0}$),
2. $K_{\alpha} \ast 1 - 1 \ast K_{\alpha}$ ($\alpha \in \mathbb{Z}I$).

Clearly, $\mathcal{J} \subseteq \hat{\mathcal{J}}$. It remains to show the reverse inclusion $\hat{\mathcal{J}} \subseteq \mathcal{J}$. To show this, it suffices to prove that for $u^+_A K_{\alpha} \in X^+$ and $K_{\beta} u^-_B \in X^-$,

$$L(u^+_A K_{\alpha}, K_{\beta} u^-_B) \equiv R(u^+_A K_{\alpha}, K_{\beta} u^-_B) \mod \mathcal{J}. $$
By the definition of comultiplications in $\mathcal{S}_d(n)^{>0}$ and $\mathcal{S}_d(n)^{<0}$,

\[
\Delta(u_A^+) = \sum_{A_1,A_2 \in \Theta^+_d(n)} f_{A_1,A_2}^A u_{A_2}^+ \otimes u_{A_1}^+ K_d(A_2) \quad \text{and} \quad \Delta(u_B^-) = \sum_{B_1,B_2 \in \Theta^+_d(n)} g_{B_1,B_2}^B \tilde{K}_{-d(B_1)} u_{B_2}^- \otimes u_{B_1}^-,
\]

where $f_{A_1,A_2}^A = v^d(A_1,d(A_2)) \frac{\beta_{A_1,A_2}}{\beta_{A_1}} \varphi_{A_1,A_2}$ and $g_{B_1,B_2}^B = v^{-d(B_2),d(B_1)) \frac{\alpha_{B_1,B_2}}{\alpha_{B_1}} \varphi_{B_1,B_2}$. By the definition of $J$,

\[
L(u_A^+, u_B^-) \equiv R(u_A^+, u_B^-) \mod J, \tag{2.4.1.1}
\]

where

\[
L(u_A^+, u_B^-) = \sum_{A_1,A_2,B_1,B_2} f_{A_1,A_2}^A g_{B_1,B_2}^B (u_{B_1}^- * (u_{A_1}^+ K_d(A_2))) \psi(u_{A_2}^+, \tilde{K}_{-d(B_1)} u_{B_2}^-),
\]

\[
R(u_A^+, u_B^-) = \sum_{A_1,A_2,B_1,B_2} f_{A_1,A_2}^A g_{B_1,B_2}^B (u_{A_2}^+ * (\tilde{K}_{-d(B_1)} u_{B_2}^-)) \psi(u_{A_1}^+, \tilde{K}_d(A_2), u_{B_1}^-).
\]

This together with Proposition [2.1.3] implies that

\[
L(u_A^+ K_\alpha, K_\beta u_B^-) = \sum_{A_1,A_2,B_1,B_2} f_{A_1,A_2}^A g_{B_1,B_2}^B ((K_\beta u_B^-) * (u_{A_1}^+ \tilde{K}_d(A_2) K_\alpha)) \psi(u_{A_2}^+, K_\beta \tilde{K}_{-d(B_1)} u_{B_2}^-)
\]

\[
\equiv v^a K_{\alpha + \beta} \sum_{A_1,A_2,B_1,B_2} f_{A_1,A_2}^A g_{B_1,B_2}^B (u_{B_1}^- * (u_{A_1}^+ \tilde{K}_d(A_2))) \psi(u_{A_2}^+, \tilde{K}_{-d(B_1)} u_{B_2}^-) \quad \text{(by 2.4.1.2)}
\]

\[
\equiv v^a K_{\alpha + \beta} \sum_{A_1,A_2,B_1,B_2} f_{A_1,A_2}^A g_{B_1,B_2}^B (u_{A_2}^+ * (\tilde{K}_{-d(B_1)} u_{B_2}^-)) \psi(u_{A_1}^+, \tilde{K}_d(A_2), u_{B_1}^-) \quad \text{(by 2.4.1.1)}
\]

\[
\equiv \sum_{A_1,A_2,B_1,B_2} f_{A_1,A_2}^A g_{B_1,B_2}^B ((u_{A_1}^+ K_\alpha) * (K_\beta \tilde{K}_{-d(B_1)} u_{B_2}^-)) \psi(u_{A_1}^+, \tilde{K}_d(A_2), K_\beta u_{B_1}^-)
\]

\[
= R(u_A^+ K_\alpha, K_\beta u_B^-) \mod J,
\]

where $a = \alpha \cdot \beta + \langle d(A_1) + d(A_2), \alpha \rangle = \alpha \cdot \beta + \langle d(A), \alpha \rangle$, as desired. \hfill \Box

Recall the order relation $\leq$ defined in (1.1.0.3).

Lemma 2.4.2. For $\alpha = (\alpha_i), \beta = (\beta_i) \in \mathbb{N}_0^n$, let $\gamma = \gamma(\alpha, \beta) = (\gamma_i) \in \mathbb{N}_0^n$ be defined by $\gamma_i = \min \{\alpha_i, \beta_{i+1}\}$. For each $\lambda \leq \gamma$, define $C_\lambda \in \Theta^+_d(n)$ by

\[
M(C_\lambda) = \bigoplus_{i \in I} \left( (\alpha_i + \beta_i - \lambda_i - \lambda_{i-1}) S_i \oplus \lambda_i S_i[2] \right).
\]

Then

\[
u_\alpha \nu_\beta = v^\sum_i \alpha_i (\beta_i - \beta_{i+1}) \sum_{\lambda \leq \gamma} \prod_{i \in I} \left[ \begin{array}{c} \alpha_i + \beta_i - \lambda_i - \lambda_{i-1} \\ \beta_i - \lambda_{i-1} \end{array} \right] u_{C_\lambda}.
\]

Proof. Clearly, each $M(C_\lambda)$ with $\lambda \leq \gamma$ is an extension of $M(A_\beta)$ by $M(A_\alpha)$, where $A_\alpha = \sum_{i=1}^n \alpha_i E_{i,i+1}$ and $A_\beta = \sum_{i=1}^n \beta_i E_{i,i+1}$. Conversely, each extension of
$M(A_{\beta})$ by $M(A_{\alpha})$ is isomorphic to $M(C_{\lambda})$ for some $\lambda \leq \gamma$. Hence,

$$u_\alpha u_\beta = v^{(\alpha,\beta)} \sum_{\lambda \leq \gamma} \varphi^{C_{\lambda}}_{A_\alpha, A_\beta} u_{A_\lambda} = v^{\sum_i \alpha_i (\beta_i - \beta_{i+1})} \sum_{\lambda \leq \gamma} \varphi^{A_{\lambda}}_{A_\alpha, A_\beta} u_{C_{\lambda}}.$$

The lemma then follows from the fact that

$$\varphi^{C_{\lambda}}_{A_\alpha, A_\beta} = \prod_{i \in I} \left[ \frac{\alpha_i + \beta_i - \lambda_i - \lambda_{i-1}}{\beta_i - \lambda_{i-1}} \right].$$

$\square$

**Theorem 2.4.3.** The algebra $\mathfrak{D}_\Delta(n)$ has generators $u^+_{A_\alpha}, K_\nu, u^+_{A_\beta}$ ($A \in \Theta^+_\Delta(n)^{ss}, \nu \in \mathbb{Z}I$) which satisfy the following relations: for $\nu, \nu' \in \mathbb{Z}I$, $A, B \in \Theta^+_\Delta(n)^{ss}$,

1. $K_0 = u^+_0 = u^-_0 = 1, \quad K_\nu K_{\nu'} = K_{\nu + \nu'}$;
2. $K_\nu u^+_A = u^{(d(A), \nu)}_A K_\nu, \quad u^-_A K_\nu = u^{(d(A), \nu')} K_\nu u^+_A$;
3. $u^+_A u^-_B = v^{\sum_i \alpha_i (\beta_i - \beta_{i+1})} \sum_{\lambda \leq \gamma} \prod_{i \in I} \left[ \frac{\alpha_i + \beta_i - \lambda_i - \lambda_{i-1}}{\beta_i - \lambda_{i-1}} \right] u_{M(C_{\lambda})}$, if $A = A_{\alpha}, B = B_{\beta}$ and $\gamma = \gamma(\alpha, \beta)$;
4. $u^-_A u^+_B = v^{\sum_i \beta_i (\alpha_i - \alpha_{i+1})} \sum_{\lambda \leq \gamma} \prod_{i \in I} \left[ \frac{\alpha_i + \beta_i - \lambda_i - \lambda_{i-1}}{\alpha_i - \lambda_{i-1}} \right] u_{M(C_{\lambda})}$, if $A = A_{\alpha}, B = B_{\beta}$ and $\gamma' = \gamma(\beta, \alpha)$;
5. commutator relations: for all $A, B \in \Theta^+_\Delta(n)^{ss}$,

$$v^{(d(B), d(B))} \sum_{A_1, B_1} \varphi^{A_1, B_1}_{A, B} v^{(d(B_1), d(A) + d(B) - d(B_1))} \tilde{K}^{d(B) - d(B_1)} u^-_{B_1} u^+_{A_1}$$

$$= v^{(d(B), d(A))} \sum_{A_1, B_1} \varphi^{A_1, B_1}_{A, B} v^{(d(B) - d(B_1), d(A_1) + d(B), d(B_1))} \tilde{K}^{d(B_1) - d(B)} u^+_{A_1} u^-_{B_1},$$

where

$$\varphi^{A_1, B_1}_{A, B} = \frac{a_{A_1} a_{B_1}}{a_A a_B} \sum_{A_2 \in \Theta^+_\Delta(n)} v^{20(A_2)} a_{A_2} \varphi^{A}_{A_1, A_2} \varphi^{B}_{B_1, A_2},$$

$$\varphi^{A_1, B_1}_{A, B} = \frac{a_{A_1} a_{B_1}}{a_A a_B} \sum_{A_2 \in \Theta^+_\Delta(n)} v^{20(A_2)} a_{A_2} \varphi^{A}_{A_1, A_2} \varphi^{B}_{B_1, A_2}.$$

(2.4.3.1)
Remark 2.4.4. The commutator relations in (5) hold for all \( A, B \in \Theta_+^+(n) \).

Theorem 2.4.3 does not give a presentation for \( \mathcal{D}_\lambda(n) \) since the modules \( M(C_\lambda) \) are not necessarily semisimple. It would be natural to raise the following question.

Problem 2.4.5. Find the “quantum Serre relations” associated with semisimple generators to replace relations 2.4.3(3)–(4), and prove that, the relations given in 2.4.3 are defining relations for \( \mathcal{D}_\lambda(n) \). In this way, we obtain a presentation with semisimple generators for \( \mathcal{D}_\lambda(n) \).

The relations in (5) above are usually called the commutator relations. We now derive a finer version of the commutator relations for semisimple generators. The next lemma follows directly from the definition of comultiplication.
Lemma 2.4.6. For $A \in \Theta^+_\Delta(n)$, we have
\[
\Delta^{(2)}(u_A^+) = \sum_{A(1), A(2), A(3)} \psi \sum_{i > j}^n \left[ d(A(i)), d(A(j)) \right] \varphi_{A(3), A(2), A(1)}^A \frac{a_{A(i)} a_{A(j)} a_{A(3)}}{a_A} \times u_{A(i)}^+ \otimes u_{A(j)}^+ \tilde{K}_d(A(i)) \otimes u_{A(3)}^+ \tilde{K}_d(A(3)) + d(A(2)) \right),
\]
\[
\Delta^{(2)}(u_A^-) = \sum_{A(1), A(2), A(3)} \psi \sum_{i < j}^n \left[ d(A(i)), d(A(j)) \right] \varphi_{A(3), A(2), A(1)}^A \frac{a_{A(i)} a_{A(j)} a_{A(3)}}{a_A} \times \tilde{K}_d(A(2)) + d(A(3)) \right) u_{A(i)}^- \otimes u_{A(3)}^- \otimes u_{A(2)}^-.
\]

Proposition 2.4.7. Let $X, Y \in \Theta^+_\Delta(n)$. Then in $D_\Delta(n)$,
\[
u_Y u_X^+ - u_X^+ u_Y^-
= \sum_{A, B, B' \in \Theta^+_\Delta(n)} \nu_{1, \varphi_{A, B, B'}^X} \frac{a_{A} a_{B} a_{B'}}{a_{X} a_{Y}} \tilde{K}_d(A) u_B^+ u_B^-,
\]
\[
+ \sum_{A, B, B', C, C' \in \Theta^+_\Delta(n)} \nu_{2, \varphi_{A, B, B', C, C'}^X} \frac{a_{A} a_{B} a_{B'} a_{C} a_{C'}}{a_{X} a_{Y}} \left( \sum_{m \geq 1} (-1)^m \right)
\]
\[
\nu_{2, \sum_{i < j}^n [d(X_i), d(X_j)]} a_{X_1} \cdots a_{X_m} \varphi_{X_1, \ldots, X_m}^C \varphi_{X_1, \ldots, X_m}^{C'} \tilde{K}_d(C) - d(A) u_B^+ u_B^-. \]

where $\ell_1 = \langle d(A), d(B) \rangle - \langle d(Y), d(A) \rangle + 2 \vartheta(A)$ and $\ell_2 = \langle d(A), d(B) \rangle + \langle d(Y), d(C) - d(A) \rangle - \langle d(C), 2d(C) + d(B) \rangle + 2 \vartheta(A) + 2 \vartheta(C)$.

Proof. By [46] Lem. 3.2.2(iii)], for $x \in \mathbf{H}_\Delta(n)^{\geq 0}$ and $y \in \mathbf{H}_\Delta(n)^{\leq 0}$, we have in $D_\Delta(n)$,
\[
yx = \sum \psi(x_1, \sigma(y_1)) (x_2 y_2) \psi(x_3, y_3),
\]
where $\Delta^{(2)}(x) = \sum x_1 \otimes x_2 \otimes x_3$ and $\Delta^{(2)}(y) = \sum y_1 \otimes y_2 \otimes y_3$. This together with Lemma 2.4.6 gives the required equality.

The following result is a direct consequence of the above proposition together with the fact that for $\beta = (\beta_i), \beta^{(1)} = (\beta^{(1)}_i), \ldots, \beta^{(m)} = (\beta^{(m)}_i) \in \mathbb{N}_\Delta^n$,
\[
\varphi_{\beta^{(1)}, \ldots, \beta^{(m)}} = \prod_{i=1}^n \left[ \frac{\beta_i^{(1)}}{\beta_i} \right] \cdots \left[ \frac{\beta_i^{(m)}}{\beta_i} \right] =: \left[ \beta^{(1)}, \ldots, \beta^{(m)} \right],
\]
where $\left[ \beta^{(1)}_i, \ldots, \beta^{(m)}_i \right] = \left[ \frac{\beta^{(1)}_i}{\beta^{(1)}_i} \right] \cdots \left[ \frac{\beta^{(m)}_i}{\beta^{(m)}_i} \right]$.

Corollary 2.4.8. For $\lambda, \mu \in \mathbb{N}_\Delta^n$, we have
\[
u_\mu u_\lambda^+ - u_\lambda^+ u_\mu^- = \sum_{\alpha \neq 0} \sum_{0 \leq \gamma \leq \alpha} x_{\alpha, \gamma} K_{2\gamma - \alpha} u_{\lambda - \alpha}^+ u_{\mu - \alpha}^-.
\]
where

\[ x_{\alpha, \gamma} = b^{(\alpha, \lambda - \gamma)} + (\mu, 2\gamma - \alpha) + 2(\gamma, \alpha - \gamma - \lambda) + 2\sigma(\alpha) \]

\[ \times \left[ \begin{array}{c} \lambda \\ \alpha - \gamma, \lambda - \alpha, \gamma \end{array} \right] \cdot \left[ \begin{array}{c} \mu \\ \alpha - \gamma, \mu - \alpha, \gamma \end{array} \right] \frac{a_{\alpha - \gamma}a_{\lambda - \gamma}a_{\mu - \alpha}}{a_{\lambda}a_{\mu}} \]

\[ \times \sum_{m \geq 1, \gamma(i) \neq 0 \forall i, \gamma(1) + \cdots + \gamma(m) = \gamma} (-1)^m v^2 \sum_{i < j} \langle \gamma(i), \gamma(j) \rangle \prod_{i} a_{\gamma(i)} \cdots a_{\gamma(m)} \left[ \begin{array}{c} \gamma \\ \gamma(1), \ldots, \gamma(m) \end{array} \right]^2. \]

This is the commutator formula for semisimple generators.
CHAPTER 3

Affine quantum Schur algebras and the Schur–Weyl reciprocity

Like the quantum Schur algebra, the affine quantum Schur algebra has several equivalent definitions. We first present the geometric definition, given by Ginzburg–Vasserot and Lusztig, which uses cyclic flags and convolution product. We then discuss the two Hecke algebra definitions given by R. Green and by Varagnolo–Vasserot. The former uses \( q \)-permutation modules, while the latter uses tensor spaces. Both versions are related by the Bernstein presentation for Hecke algebras of affine type \( A \).

In §3.4, we review the construction of BLM type bases for affine quantum Schur algebras and the multiplication formulas between simple generators and BLM basis elements (Theorem 3.4.2) developed by the last two authors [23]. Through the central element presentation for \( \mathcal{D}_\lambda(n) \) as given in Theorem 2.2.3, we introduce a \( \mathcal{D}_\lambda(n) \)-\( \mathcal{H}_\lambda(r) \)-bimodule structure on the tensor space in §3.5. This gives a homomorphism \( \xi_r \) from \( \mathcal{D}_\lambda(n) \) to \( \mathcal{S}_\lambda(n,r) \). We then prove in §3.6 that the restriction of this bimodule action coincides with the \( \mathcal{S}_\lambda(n)^{\text{op}} \)-\( \mathcal{H}_\lambda(r) \)-bimodule structure defined by Varagnolo–Vasserot in [77]. Thus, we obtain an explicit description of the map \( \xi_r \) (Theorem 3.6.3).

In §3.7, we develop a certain triangular relation (Proposition 3.7.3) among the structure constants relative to the BLM basis elements. With this relation, we display an integral PBW type basis and, hence, a triangular decomposition for an affine quantum Schur algebra (Theorem 3.7.7). Using the triangular decomposition, we easily establish the surjectivity of the homomorphism \( \xi_r \) from \( \mathcal{D}_\lambda(n) \) to \( \mathcal{S}_\lambda(n,r) \) in §3.8 (Theorem 3.8.1).

There are several important applications of this result which will be discussed in the next three chapters. As a first application, we end this chapter by establishing certain polynomial identities (Corollary 3.9.6) arising from the commutator formulas for semisimple generators discussed in §2.4.

3.1. Cyclic flags: the geometric definition

In this section we recall the geometric definition of affine quantum Schur algebras introduced by Ginzburg–Vasserot [32] and Lusztig [58].

Let \( \mathbb{F} \) be a field and fix an \( \mathbb{F}[\varepsilon, \varepsilon^{-1}] \)-free module \( V \) of rank \( r \geq 1 \), where \( \varepsilon \) is an indeterminate. A lattice in \( V \) is, by definition, a free \( \mathbb{F}[\varepsilon] \)-submodule \( L \) of \( V \) satisfying \( V = L \otimes_{\mathbb{F}[\varepsilon]} \mathbb{F}[\varepsilon, \varepsilon^{-1}] \). For two lattices \( L', L \) of \( V \), \( L + L' \) is again a lattice. If, in addition, \( L' \subseteq L \), \( L/L' \) is a finite generated torsion \( \mathbb{F}[\varepsilon] \)-module. Thus, as an \( \mathbb{F} \)-vector space, \( L/L' \) is finite dimensional.

Let \( \mathcal{F}_\lambda = \mathcal{F}_{\lambda,n} \) be the set of all cyclic flags \( L = (L_i)_{i \in \mathbb{Z}} \) of lattices of period \( n \), where each \( L_i \) is a lattice in \( V \) such that \( L_{i-1} \subseteq L_i \) and \( L_{i-n} = \varepsilon L_i \) for all \( i \in \mathbb{Z} \). The
group $G$ of automorphisms of the $\mathbb{F}[\varepsilon, \varepsilon^{-1}]$-module $V$ acts on $\mathcal{F}_\Delta$ by $g \cdot L = (g(L_i))_{i \in \mathbb{Z}}$ for $g \in G$ and $L \in \mathcal{F}_\Delta$. Thus, the map

$$\phi : \mathcal{F}_\Delta \longrightarrow \Lambda_\Delta(n, r), \quad L \longmapsto (\dim_{\mathbb{F}} L_i/L_{i-1})_{i \in \mathbb{Z}}$$

induces a bijection between the set $\{\mathcal{F}_\Delta, \lambda\}_{\lambda \in \Lambda_\Delta(n, r)}$ of $G$-orbits in $\mathcal{F}_\Delta$ and $\Lambda_\Delta(n, r)$.

Similarly, let $\mathcal{B}_\Delta = \mathcal{B}_\Delta, r$ be the set of all complete cyclic flags $L = (L_i)_{i \in \mathbb{Z}}$ of lattices, where each $L_i$ is a lattice in $V$ such that $L_{i-1} \subseteq L_i$, $L_{i-r} = \varepsilon L_i$ and $\dim_{\mathbb{F}}(L_i/L_{i-1}) = 1$, for all $i \in \mathbb{Z}$.

The group $G$ acts on $\mathcal{F}_\Delta \times \mathcal{F}_\Delta, \mathcal{B}_\Delta \times \mathcal{B}_\Delta$ and $\mathcal{B}_\Delta \times \mathcal{B}_\Delta$ by $g \cdot (L, L') = (g \cdot L, g \cdot L')$. For $L = (L_i)_{i \in \mathbb{Z}}$ and $L' = (L'_i)_{i \in \mathbb{Z}} \in \mathcal{B}_\Delta$, let $X_{i,j} := X_{i,j}(L, L') = L_{i-1} + L_i \cap L'_j$. By lexicographically ordering the indices $i, j$, we obtain a filtration $(X_{i,j})$ of lattices of $V$. For $i, j \in \mathbb{Z}$, let $a_{i,j} = \dim_{\mathbb{F}}(X_{i,j}/X_{i,j-1}) = \dim_{\mathbb{F}} L_i/L_j/L_{j-1}$. By [58, 1.5] there is a bijection between the set of $G$-orbits in $\mathcal{F}_\Delta \times \mathcal{F}_\Delta$ and the set $\Theta_\Delta(n, r)$ by sending $(L, L')$ to $A = (a_{i,j})_{i,j \in \mathbb{Z}}$. Let $\mathcal{O}_A \subseteq \mathcal{F}_\Delta \times \mathcal{F}_\Delta$ be the $G$-orbit corresponding to the matrix $A \in \Theta_\Delta(n, r)$. By [58, 1.7], for $L, L' \in \mathcal{F}_\Delta$,

$$(L, L') \in \mathcal{O}_A \iff (L', L) \in \mathcal{O}_{A^t}, \quad (3.1.0.1)$$

where $A^t$ is the transpose matrix of $A$.

Similarly, putting $\omega = (\ldots, 1, 1, \ldots) \in \Lambda_\Delta(n, r)$ and

$$\Theta_\Delta(r, r) = \{A \in \Theta_\Delta(r, r) \mid \text{ro}(A) = \text{co}(A) = \omega\}, \quad (3.1.0.2)$$

the $G$-orbits $\mathcal{O}_A$ on $\mathcal{F}_\Delta \times \mathcal{F}_\Delta$ are indexed by the matrices $A \in \Theta_\Delta(r, r)\omega$, while the $G$-orbits $\mathcal{O}_A$ on $\mathcal{F}_\Delta \times \mathcal{F}_\Delta$ are indexed by the set

$$\Theta_\Delta^n(r, r) = \{A \in \Theta_\Delta^n(r) \mid \text{ro}(A) = \Lambda_\Delta(n, r), \text{co}(A) = \omega\},$$

where, like $\Theta_\Delta(n)$,

$$\Theta_\Delta^n(r) = \{(a_{i,j})_{i,j \in \mathbb{Z}} \mid a_{i,j} \in \mathbb{N}, a_{i,j} = a_{i-n,j-r}, \forall i, j \in \mathbb{Z}, \sum_{i=1}^{n} \sum_{j \in \mathbb{Z}} a_{i,j} \in \mathbb{N}\}. \quad (3.1.0.3)$$

Clearly, with this notation,

$$\Theta_\Delta(r, r) = \{A \in \Theta_\Delta^n(r) \mid \text{ro}(A) = \text{co}(A) = \omega\}. \quad (3.1.0.4)$$

Assume now that $\mathbb{F} = \mathbb{F}_q$ is the finite field of $q$ elements and write $\mathcal{F}_\Delta(q)$ for $\mathcal{F}_\Delta$ and $\mathcal{B}_\Delta(q)$ for $\mathcal{B}_\Delta$, etc. By regarding $\mathbb{C}\mathcal{F}_\Delta(q)$ (resp., $\mathbb{C}\mathcal{B}_\Delta(q)$) as a permutation $G$-module, the endomorphism algebra $S_{\mathcal{O}_q} := \text{End}_{\mathcal{C}G}(\mathbb{C}\mathcal{F}_\Delta(q))^{\text{op}}$ (resp., $\mathcal{H}_{\mathcal{O}_q} := \text{End}_{\mathcal{C}G}(\mathbb{C}\mathcal{B}_\Delta(q))^{\text{op}}$) has a basis $\{e_{A, q} \}_{A \in \Theta_\Delta(n, r)}$ (resp., $\{e_{A, q} \}_{A \in \Theta_\Delta(r, r)\omega}$) with the following multiplication:

$$e_{A, q} e_{A', q} = \begin{cases} \sum_{A'' \in G} n_{A, A', A''; q } e_{A'', q} & \text{if co}(A) = \text{ro}(A') \\ 0 & \text{otherwise}, \end{cases} \quad (3.1.0.5)$$

where $\Theta = \Theta_\Delta(n, r)$ (resp., $\Theta = \Theta_\Delta(r, r)\omega$) and

$$n_{A, A', A''; q} = |\{ L' \in \mathcal{F}_\Delta : (L, L') \in \mathcal{O}_A, (L', L'') \in \mathcal{O}_{A'}\}| \quad (3.1.0.6)$$

for any fixed $(L, L') \in \mathcal{O}_A$.

---

1The set is denoted by $\Theta_\Delta(n, r)$ in [23].
By [58, 1.8], there exists a polynomial $p_{A,A',A''} \in \mathcal{Z}$ in $v^2$ such that for each finite field $\mathbb{F}$ with $q$ elements, $n_{A,A',A'';q} = p_{A,A',A''}|_{v^2=q}$. Thus, we have the following definition; see [58, 1.11].

**Definition 3.1.1.** The (generic) affine quantum Schur algebra $S_\odot(n,r)$ (resp., affine Hecke algebra $H_\odot(r)$) is the free $\mathcal{Z}$-module with basis $\{e_A \mid A \in \Theta_\odot(n,r)\}$ (resp., $\{e_A \mid A \in \Theta_\odot(r)\}$), and multiplication defined by

$$e_A e_{A'} = \begin{cases} 
\sum_{A'' \in \Theta} p_{A,A',A''} e_{A''}, & \text{if } \text{co}(A) = \text{ro}(A'); \\
0, & \text{otherwise}.
\end{cases} \quad (3.1.1.1)$$

Both $S_\odot(n,r)$ and $H_\odot(r)$ are associative algebras over $\mathcal{Z}$ with an anti-automorphism $e_A \mapsto e_{A'}$ (see §3.1.3.4 below for a modified version).

Alternatively, we can interpret affine quantum Schur algebras in terms of convolution algebras defined by $G$-invariant functions and convolution product. Again, assume that $\mathbb{F}$ is the finite field of $q$ elements, and for notational simplicity, let

$$\mathcal{Y} = \mathcal{F}_\odot(q), \quad \mathcal{X} = \mathcal{B}_\odot(q) \quad \text{(and } G = G(q)).$$

Define $C_G(\mathcal{Y} \times \mathcal{Y})$, $C_G(\mathcal{Y} \times \mathcal{X})$ and $C_G(\mathcal{X} \times \mathcal{X})$ to be the $\mathbb{C}$-span of the characteristic functions $\chi_\mathcal{O}$ of the $G$-orbits $\mathcal{O}$ on $\mathcal{Y} \times \mathcal{Y}$, $\mathcal{Y} \times \mathcal{X}$ and $\mathcal{X} \times \mathcal{X}$, respectively. With the convolution product

$$(\chi_\mathcal{O} \ast \chi_{\mathcal{O}'}) (L, L'') = \sum_{L' \in \mathcal{X}'} \chi_\mathcal{O}(L, L') \chi_{\mathcal{O}'}(L', L''), \quad (3.1.1.2)$$

where $\mathcal{O} \subset \mathcal{F} \times \mathcal{F}'$ and $\mathcal{O}' \subset \mathcal{F}' \times \mathcal{F}''$ for various selections of $\mathcal{F}$, $\mathcal{F}'$ and $\mathcal{F}''$, we obtain convolution algebras $C_G(\mathcal{Y} \times \mathcal{Y})$ and $C_G(\mathcal{Y} \times \mathcal{X})$, and $C_G(\mathcal{X} \times \mathcal{X})$. It is clear that $S_\odot \equiv C_G(\mathcal{Y} \times \mathcal{Y})$ and $H_\odot \equiv C_G(\mathcal{X} \times \mathcal{X})$, and specializing $v$ to $\sqrt{q}$ gives an isomorphism

$$S_\odot(n,r)_{C} \rightarrow C_G(\mathcal{Y} \times \mathcal{Y}) \quad \text{(resp., } H_\odot(r) \otimes \mathbb{Z} \mathbb{C} \rightarrow C_G(\mathcal{X} \times \mathcal{X})). \quad (3.1.1.3)$$

sending $e_A \otimes 1 \mapsto \chi_A$, where $\chi_A$ denotes the characteristic function of the orbit $\mathcal{O}_{A}$.

In the sequel, we shall identify $S_\odot(n,r)_{C}$ with $C_G(\mathcal{Y} \times \mathcal{Y})$.

Via convolution product, $C_G(\mathcal{Y} \times \mathcal{X})$ becomes a $C_G(\mathcal{Y} \times \mathcal{Y})$-$C_G(\mathcal{X} \times \mathcal{X})$-bimodule. Thus, if we denote by $T_\odot(n,r)$ the generic form of $C_G(\mathcal{Y} \times \mathcal{X})$, then $T_\odot(n,r)$ becomes an $S_\odot(n,r)$-$H_\odot(r)$-bimodule with a $\mathbb{Z}$-basis $\{e_A \mid A \in \Theta_\odot(n,r)\}$. 

**Remark 3.1.2.** It is clear from the definition that this isomorphism continues to hold if $\mathbb{C}$ is replaced by the ring $R = \mathbb{Z}[\sqrt{q}, \sqrt{q}^{-1}]$. In fact, we will frequently use the isomorphism $S_\odot(n,r)_R \cong R_G(\mathcal{Y} \times \mathcal{Y})$ to derive formulas in $S_\odot(n,r)$ by doing computations in $R_G(\mathcal{Y} \times \mathcal{Y})$; see, e.g., §3.3.6–9 below.

Observe that, for $N \geq n$, $\mathcal{F}_{\odot,n}$ is naturally a subset of $\mathcal{F}_{\odot,N}$, since every $L = (L_i) \in \mathcal{F}_{\odot,n}$ can be regarded as $\overline{L} = (\overline{L}_i) \in \mathcal{F}_{\odot,N}$, where, for all $a \in \mathbb{Z}$, $\overline{L}_{i+a} = L_{i+a}$ if $1 \leq i \leq n$, and $\overline{L}_i = L_{i+n}$ if $n \leq i \leq N$. Thus, if $N = \max\{n,r\}$, then $\mathcal{F}_{\odot,n} \times \mathcal{F}_{\odot,n}$, $\mathcal{F}_{\odot,n} \times \mathcal{B}_{\odot,r}$ and $\mathcal{B}_{\odot,r} \times \mathcal{B}_{\odot,r}$ can always be regarded as $G$-stable subsets
of $\mathcal{F}_{\Lambda,N} \times \mathcal{F}_{\Lambda,N}$, and the $G$-orbit $O_A$ containing $(L, L')$ is the $G$-orbit $O_{\tilde{A}}$ containing $(\tilde{L}, \tilde{L}')$, where $A = (a_{i,j})$ and $\tilde{A} = (\tilde{a}_{i,j})$ are related by, for all $m \in \mathbb{Z}$,

$$\tilde{a}_{k,l+mN} = \begin{cases} a_{k,l+mn}, & \text{if } 1 \leq k, l \leq n; \\ 0, & \text{if either } n < k \leq N \text{ or } n < l \leq N. \end{cases} \quad (3.1.2.1)$$

**Lemma 3.1.3.** Let $N = \max\{n, r\}$. By sending $e_A$ to $e_{\tilde{A}}$, both $S_\Lambda(n, r)$ and $H_\Lambda(r)$ can be identified as (centralizer) subalgebras of $S_\Lambda(n, r)$, and $\mathcal{T}_\Lambda(n, r)$ as a subbimodule of the $S_\Lambda(n, r)$-$H_\Lambda(r)$-bimodule $S_\Lambda(N, r)$.

**Proof.** Define $\omega \in \Lambda_\Lambda(N, r)$ by setting

$$\omega = \begin{cases} (\ldots, 1^r, 1^r, \ldots), & \text{if } n \leq r \\
(\ldots, 1^r, 0^{n-r}, 1^r, 0^{n-r}, \ldots), & \text{if } n > r. \end{cases} \quad (3.1.3.1)$$

For $\lambda \in \Lambda_\Lambda(n, r)$, let $\text{diag}(\lambda) = (\delta_{i,j}\lambda_i)_{i,j \in \mathbb{Z}} \in \Theta_\Lambda(n, r)$. If we embed $\Lambda_\Lambda(n, r)$ into $\Lambda_\Lambda(N, r)$ via the map $\mu \mapsto \tilde{\mu}$, where

$$\tilde{\mu} = (\ldots, \mu_1, \ldots, \mu_n, 0^{N-n}, \mu_{n+1}, \ldots, \mu_2n, 0^{N-n}, \ldots),$$

and put $e = \sum_{\mu \in \Lambda_\Lambda(n, r)} e_{\text{diag}(\tilde{\mu})}$ and $e_\omega = e_{\text{diag}(\omega)}$, then $S_\Lambda(n, r) \cong eS_\Lambda(N, r)e$ and $H_\Lambda(r) \cong e_{\omega}S_\Lambda(N, r)e_{\omega}$, and $\mathcal{T}_\Lambda(n, r) \cong e_{\omega}S_\Lambda(n, r)e_{\omega}$ as $S_\Lambda(n, r)$-$H_\Lambda(r)$-bimodules. Here all three isomorphisms send $e_A$ to $e_{\tilde{A}}$. \hfill \Box

For $A \in \Theta_\Lambda(n, r)$, let

$$[A] = v^{-d_A}e_A, \quad \text{where} \quad d_A = \sum_{1 \leq i < j \leq n} a_{i,j}a_{k,l}. \quad (3.1.3.2)$$

(See [58, 4.1(b),4.3] for a geometric meaning of $d_A$.) Then for $\lambda \in \Lambda_\Lambda(n, r)$ and $A \in \Theta_\Lambda(n, r)$, we have

$$[[\text{diag}(\lambda)]] \cdot [A] = \begin{cases} [A], & \text{if } \lambda = \text{ro}(A); \\ 0, & \text{otherwise}; \end{cases} \quad \text{and} \quad [A][[\text{diag}(\lambda)]] = \begin{cases} [A], & \text{if } \lambda = \text{co}(A); \\ 0, & \text{otherwise}. \end{cases} \quad (3.1.3.3)$$

Moreover, the $\mathbb{Z}$-linear map

$$\tau_r : S_\Lambda(n, r) \longrightarrow S_\Lambda(n, r), \quad [A] \longmapsto [A]$$

is an algebra anti-involution.

We end this section with a close look at the basis $\{[A] \mid A \in \Theta_\Lambda(n, r)\}$ for $\mathcal{T}_\Lambda(n, r)$ from its specialization $\mathbb{C}_G(\mathcal{Y} \times \mathcal{Z})$. Let

$$I_\Lambda(n, r) = \{i = (i_k)_{k \in \mathbb{Z}} \mid i_k \in \mathbb{Z}, i_{k+r} = i_k + n \text{ for all } k \in \mathbb{Z}\}. \quad (3.1.3.5)$$

We may identify the elements of $I_\Lambda(n, r)$ with functions $i : \mathbb{Z} \rightarrow \mathbb{Z}$ satisfying $i(s + r) = i(s) + n$ for all $s \in \mathbb{Z}$. (Note that a periodic function $i$ can be identified with $(i_1, \ldots, i_r) \in \mathbb{Z}^r$, where $i_s = i(s)$ for all $s$. For more details, see (3.3.0.2) below.) Clearly, there is a bijection

$$I_\Lambda(n, r) \longrightarrow \Theta_\Lambda(n, r)\omega, \quad i \longmapsto A^i \quad (3.1.3.6)$$
3.2. AFFINE HECKE ALGEBRAS OF TYPE A: THE ALGEBRAIC DEFINITION

where $A_i = (a_{k,l})$ with $a_{k,l} = \delta_{k,i}$. Thus, the orbits of the diagonal action of $G$ on $\mathcal{Y} \times \mathcal{X}$ are labeled by the elements of $I_{\triangle}(n,r)$, and $\mathcal{O}_i := O_{A_i}$ is the orbit of the pair $(L_i, L_\emptyset)$, where the $i$th lattices of $L_i, L_\emptyset$ are defined by $L_i, i = \bigoplus_{j \leq i} F v_j$ and $L_\emptyset, i = \bigoplus_{j \leq i} F v_j$. (3.1.3.7)

Here $v_1, \ldots, v_r$ is a fixed $F[\varepsilon, \varepsilon^{-1}]$-basis of $V$ and $v_{i+s} = \varepsilon^{-s} v_i$ for all $s \in \mathbb{Z}$. This is because the difference set

$\{ j \mid i_j \leq k, j \leq l \} \setminus (\{ j \mid i_j \leq k - 1, j \leq l \} \cup \{ j \mid i_j \leq k, j \leq l - 1 \}) = \begin{cases} \{ l \}, & \text{if } k = i_l; \\ \emptyset, & \text{otherwise}. \end{cases}$

Let $d_i = d_{A_i}$ (see (3.1.3.2)). If we set, for each $L \in \mathcal{Y}$, $\mathcal{X}_{i,L} = \{ L' \in \mathcal{X} \mid (L, L') \in \mathcal{O}_i \}$, then, by [58, Lem. 4.3], $d_i$ is the dimension of $\mathcal{X}_{i,L}$ (in case where $F$ is an algebraically closed field). More precisely, a direct calculation gives the following result.

**Lemma 3.1.4.** For each $i = (i_j) \in I_{\triangle}(n,r)$, let

$\text{Inv}(i) = \{ (s,t) \in \mathbb{Z}^2 \mid 1 \leq s \leq r, s < t, i_s \geq i_t \}$. Then $d_i = |\text{Inv}(i)|$.

**Proof.** Applying [58, Lem. 4.3] gives

$d_i = d_{A_i} = \sum_{1 \leq i \leq r} \delta_{s,i} \delta_{k,i} = \sum_{1 \leq i \leq r} \sum_{s \in \mathbb{Z}} \delta_{s,i}(\sum_{s \geq k, t < l} \delta_{k,i}) = \sum_{1 \leq i \leq r} (\sum_{s \geq k, t < l} \delta_{k,i})$

$= |\text{Inv}(i)|$, as required. \(\square\)

With the identification of (3.1.3), we have

$[A_i^1] = q^{-\frac{1}{2}d_i} \chi_i$, where $\chi_i$ is the characteristic function of the orbit $\mathcal{O}_i$.

3.2. Affine Hecke algebras of type A: the algebraic definition

We now follow [35, 77] to interpret affine quantum Schur algebras as endomorphism algebras of certain tensor spaces over the affine Hecke algebras associated with the extended affine Weyl groups of type $A$.

Let $S_{\triangle,r}$ be the affine symmetric group consisting of all permutations $w : \mathbb{Z} \rightarrow \mathbb{Z}$ such that $w(i + r) = w(i) + r$ for $i \in \mathbb{Z}$. This is the subset of all bijections in $I_{\triangle}(r,r)$ which is defined in (3.1.3.5). Hence, $\text{Inv}(w)$ is well-defined. More precisely, for any $a \in \mathbb{Z}$, if we set $\text{Inv}(w, a) = \{ (s,t) \in \mathbb{Z}^2 \mid a + 1 \leq s \leq a + r, s < t, w(s) > w(t) \}$, then $\text{Inv}(w) = \text{Inv}(w, 0)$ and $|\text{Inv}(w)| = |\text{Inv}(w, a)|$ for all $a \in \mathbb{Z}$.
There are several useful subgroups of $\mathfrak{S}_{n,r}$. The subgroup $W$ of $\mathfrak{S}_{n,r}$ consisting of $w \in \mathfrak{S}_{n,r}$ with $\sum_{i=1}^{r} w(i) = \sum_{i=1}^{r} i$ is the affine Weyl group of type $A$ with generators $s_i$ ($1 \leq i \leq r$) defined by setting

$$s_i(j) = \begin{cases} j, & \text{for } j \neq i, i + 1 \mod r; \\ j - 1, & \text{for } j \equiv i + 1 \mod r; \\ j + 1, & \text{for } j \equiv i \mod r. \end{cases}$$

If $S = \{s_i\}_{1 \leq i \leq r}$, then $(W, S)$ is a Coxeter system. For convenience of writing consecutive products of the form $s_is_{i+1}s_{i+2}\cdots$ or $s_is_{i-1}s_{i-2}\cdots$, we set $s_{i+kr} = s_i$ for all $k \in \mathbb{Z}$.

Observe that the cyclic subgroup $\langle \rho \rangle$ of $\mathfrak{S}_{n,r}$ generated by the permutation $\rho$ of $\mathbb{Z}$ sending $j$ to $j + 1$, for all $j$, is in the complement of $W$. Observe also that $s_j\rho = \rho s_j$ for all $j \in \mathbb{Z}$.

The subgroup $A$ of $\mathfrak{S}_{n,r}$ consisting of permutations $y$ of $\mathbb{Z}$ satisfying $y(i) \equiv i \mod r$ is isomorphic to $\mathbb{Z}^r$ via the map $y \mapsto \lambda = (\lambda_1, \lambda_2, \ldots, \lambda_r) \in \mathbb{Z}^r$ where $y(i) = \lambda_r + i$ for all $1 \leq i \leq r$. We will identify $A$ with $\mathbb{Z}^r$ in the sequel. In particular, $A$ is generated by $e_i = (0, \ldots, 0, 1, 0, \ldots, 0)$ for $1 \leq i \leq r$. Moreover, the subgroup of $W$ generated by $s_1, \ldots, s_{r-1}$ is isomorphic to the symmetric group $\mathfrak{S}_r$.

Recall the matrix set $\Theta_{\Delta}(r, r, \omega)$ defined in (3.1.0.2) which is clearly a group with matrix multiplication.

The following result is well-known; see, e.g., [35] Prop. 1.1.3 & 1.1.5] for the last isomorphism.

**Proposition 3.2.1.** Maintain the notation above. There are group isomorphisms:

$$\mathfrak{S}_{n,r} \cong \Theta_{\Delta}(r, r, \omega) \cong \mathfrak{S}_r \times \mathbb{Z}^r \cong \langle \rho \rangle \ltimes W.$$  

**Proof.** The first isomorphism is the restriction of the bijection defined in (3.1.3.6) for $n = r$; see also (3.1.0.4). In particular, every $w \in \mathfrak{S}_{n,r}$ is sent to the matrix $A_w = (a_{k,l})$ with $a_{k,l} = \delta_{k,w(l)}$. The second is seen easily since every $w \in \mathfrak{S}_{n,r}$ can be written as $x\lambda$, where $x \in \mathfrak{S}_r$ and $\lambda \in \mathbb{Z}^r$ are defined uniquely by $w(i) = \lambda_r + x(i)$ for all $1 \leq i \leq r$. If $e_k \in \mathfrak{S}_{n,r}$ ($k \in [1, r]$) denotes the permutation $e_k(i) = i$ for $i \neq k$, $i \in [1, r]$ and $e_k(k) = r + k$, then $e_k = \rho s_{r+k-2}\cdots s_{k+1}s_k$, proving the last isomorphism.

Let $\ell$ be the length function of the Coxeter system $(W, S)$. Then $\ell(w)$ for $w \in W$ is the length $m$ such that $w = s_{i_1}s_{i_2}\cdots s_{i_m}$ is a reduced expression. By [41],

$$\ell(w) = \sum_{1 \leq i < j \leq r} \left\lfloor \frac{w(j) - w(i)}{r} \right\rfloor.$$  

Extend the length function to $\mathfrak{S}_{n,r}$ by setting $\ell(\rho^iw') = \ell(w')$ for all $i \in \mathbb{Z}$ and $w' \in W$. Since $\text{Inv}(\rho^i) = \emptyset$, induction on $\ell(w)$ shows that

$$\ell(w) = \text{Inv}(w), \quad \text{for all } w \in \mathfrak{S}_{n,r}. \quad (3.2.1.1)$$

The group $\mathfrak{S}_{n,r}$ acts on the set $I_{\Delta}(n, r)$ given in (3.1.3.5) by place permutation:

$$iw = (i_{w(k)})_{k \in \mathbb{Z}}, \quad \text{for } i \in I_{\Delta}(n, r) \text{ and } w \in \mathfrak{S}_{n,r}. \quad (3.2.1.2)$$
Clearly, every $\mathfrak{S}_\lambda$-orbit has a unique representative in the fundamental set
\[
I_\lambda(n, r)_0 = \{i \in I_\lambda(n, r) \mid 1 \leq i_1 \leq i_2 \leq \cdots \leq i_r \leq n\} = \{i_\lambda\} = \{i_\lambda \mid \lambda \in \Lambda_\lambda(n, r)\},
\]
where $i_\lambda = (i_s)_{s \in \mathbb{Z}} \in I_\lambda(n, r)_0$ if and only if $i_s = m$ for all $s \in R^\lambda_m$ and $m \in \mathbb{Z}$, or equivalently, $\lambda_j = |\{k \in \mathbb{Z} \mid i_k = j\}|$ for all $j \in \mathbb{Z}$. Written in full, $i_\lambda$ is the sequence
\[
(\ldots, 0, 1, 1, 2, 2, \ldots, n, \ldots, n, 1 + n, \ldots, 1 + n, 2 + n, \ldots, 2 + n, \ldots).
\]
Observe that every number of the form $i + kn$, for $1 \leq i \leq n$, $k \in \mathbb{Z}$, determines a constant subsequence $(i_j)_{j \in \mathbb{Z}} = (i + kn, \ldots, i + kn)$ of $i = i_\lambda$ (of length $\lambda_i$) indexed by the set
\[
R^\lambda_{i+kn} \doteq \{\lambda_{k,i} - 1 + 1, \lambda_{k,i} - 1 + 2, \ldots, \lambda_{k,i} - 1 + \lambda_i = \lambda_{k,i}\},
\]
where $\lambda_{k,i} = kr + \sum_{1 \leq l \leq i - 1} \lambda_l$. These sets form a partition $\bigcup_{j \in \mathbb{Z}} R^\lambda_j$ of $\mathbb{Z}$. Note that the fundamental set $I_\lambda(n, r)_0$ is obtained by shifting the one used in $\{\mathbb{Z}\}$ by $n$.

For $\lambda, \mu \in \Lambda_\lambda(n, r)$, let $\mathfrak{S}_\lambda := \mathfrak{S}_{(\lambda_1, \ldots, \lambda_n)}$ be the corresponding standard Young subgroup of $\mathfrak{S}_r$ (and hence, of $\mathfrak{S}_\lambda$), and let
\[
D^\lambda = \{d \mid d \in \mathfrak{S}_\lambda, \ell(wd) = \ell(w) + \ell(d) \text{ for } w \in \mathfrak{S}_\lambda\}.
\]
By $(3.2.1)$, one sees easily that
\[
d^{-1} \in D^\lambda \iff d(\lambda_{k,i} - 1 + 1) < d(\lambda_{k,i} - 1 + 2) < \cdots < d(\lambda_{k,i} - 1 + \lambda_i), \forall 1 \leq i \leq n, k \in \mathbb{Z}
\]
\[
\iff d(\lambda_{0,i} - 1 + 1) < d(\lambda_{0,i} - 1 + 2) < \cdots < d(\lambda_{0,i} - 1 + \lambda_i), \forall 1 \leq i \leq n.
\]

The following result is the affine version of a well-known result for symmetric groups (see, e.g., Th.4.15, (9.1.4)). It can be deduced from $\{\mathbb{Z}\}$ 7.4. For a proof, see $23$ 9.2).

Lemma 3.2.2. Let $D^\lambda = D^\lambda_{n} \cap D^\lambda_{\mu}$. There is a bijective map
\[
\eta_\lambda : \{(\lambda, w, \mu) \mid w \in D^\lambda_{n, \mu}, \lambda, \mu \in \Lambda_\lambda(n, r)\} \longrightarrow \Theta_\lambda(n, r)
\]
sending $(\lambda, w, \mu)$ to $A = (a_{k,l})$, where, if $i_\lambda = (i_a)_{a \in \mathbb{Z}}$ and $i_\mu = (j_a)_{a \in \mathbb{Z}}$, then
\[
a_{k,l} = |\{t \in \mathbb{Z} \mid i_{w(t)} = k, j_t = l\}| = |R^\lambda_{k} \cap wR^\mu_{l}|.
\]
for all $k, l \in \mathbb{Z}$. In particular, by certain appropriate embedding, restriction gives two bijections
\[
\eta_\lambda : \{(\lambda, w, \omega) \mid w \in D^\lambda_{n, \mu}, \lambda \in \Lambda_\lambda(n, r)\} \longrightarrow \Theta_\lambda(n, r),
\]
and $\eta_\lambda : \{(w, w, \omega) \mid w \in \mathfrak{S}_\lambda\} \longrightarrow \Theta_\lambda(n, r)$. We remark that, for $w' \in \mathfrak{S}_\lambda w \mathfrak{S}_\mu$, the equality $|R^\lambda_{k} \cap w'R^\mu_{l}| = |R^\lambda_{k} \cap wR^\mu_{l}|$ holds. Hence, the matrix $A$ is completely determined by $\lambda, \mu$ and the double coset $\mathfrak{S}_\lambda w \mathfrak{S}_\mu$, and is independent of the selection of the representative. Moreover, if $\eta_\lambda(\lambda, d, \mu) = A$, then $\eta_\lambda(\mu, d^{-1}, \lambda) = {}^tA$, the transpose of $A$.

Corollary 3.2.3. For $\lambda, \mu \in \Lambda_\lambda(n, r)$ and $d \in \mathfrak{S}_\lambda$, with $\eta_\lambda(\lambda, d, \mu) = A \in \Theta_\lambda(n, r)$, let $\nu^{(i)}$ be the composition of $\lambda_i$ obtained by removing all zeros from row $i$ of $A$. Then $\mathfrak{S}_\lambda \cap d \mathfrak{S}_\mu d^{-1} = \mathfrak{S}_\nu$, where $\nu = (\nu^{(1)}, \ldots, \nu^{(n)})$. 

3. AFFINE QUANTUM SCHUR ALGEBRAS AND THE SCHUR–WEYL RECIPROCITY

**Proof.** Let \( \hat{i}_\mu^\lambda = (j_s)_{s \in \mathbb{Z}} \in I_\mu(n, r) \). Then \( j_s = k \) for all \( s \in R_\mu^k \) and \( k \in \mathbb{Z} \). Thus, \( l \in R_\mu^1 \) and \( d^{-1}(l) \in R_\mu^k \iff l \in R_\mu^1 \cap dR_\mu^k \). For \( 1 \leq i \leq n \), if

\[
I_i := (k, \ldots, k)_{k \in \mathbb{Z}} = (\underbrace{1, \ldots, 1}_{a_{i,1}}, \underbrace{2, \ldots, 2}_{a_{i,2}}, \ldots, \underbrace{n, \ldots, n}_{a_{i,n}}) \in \mathbb{Z}^{\lambda_i},
\]

then, with the notation used in (3.2.1.4), (3.2.1.5) together with Lemma 3.2.2 implies \( I_i = (j_{d^{-1}(\lambda_0, i+1)}, \ldots, j_{d^{-1}(\lambda_0, n+1)}) \). Hence, \( (j_{d^{-1}(1)}, \ldots, j_{d^{-1}(n)}) = (I_1, \ldots, I_n) \). Since \( \mathcal{G}_\mu = \text{Stab}_{\mathcal{S}_\mu}(I_\mu) \), it follows that \( \mathcal{G}_\lambda \cap d\mathcal{G}_\mu = \mathcal{G}_\lambda \cap \text{Stab}_{\mathcal{S}_\mu}(I_\mu d^{-1}) = \text{Stab}_{\mathcal{S}_\lambda}(I_\mu d^{-1}) = \mathcal{G}_\nu \). □

**Corollary 3.2.4.** There is a bijective map

\[ j_\lambda^* : I_\lambda(n, r) \rightarrow \{ (\lambda, d, \omega) \mid d \in \mathcal{P}_\lambda, \lambda \in \Lambda_\lambda(n, r) \}, \quad i \mapsto (\lambda, d, \omega), \]

where \( i = \hat{i}_\lambda d \). Moreover, if \( d^+ \) denotes a representative \( \mathcal{S}_\lambda d \) with maximal length, then \( d_1 = |\text{Inv}(i)| = \ell(d^+) \).

**Proof.** Clearly, \( j_\lambda^* \) is the composition of the bijection given in (3.1.3.6) and the inverse of \( \hat{i}_\lambda \) given in (3.2.2.3). We now prove the last statement.

Let \( \mathcal{L} = \{ (s, t) \in \mathbb{Z}^2 \mid 1 \leq s < r, s < t \} \) and \( j = \hat{i}_\lambda \). Then

\[
\text{Inv}(i) = \{ (s, t) \in \mathcal{L} \mid j_{d(s)} > j_{d(t)} \} = X_1 \cup X_2 \quad \text{(a disjoint union),}
\]

where \( X_1 = \{ (s, t) \in \mathcal{L} \mid j_{d(s)} > j_{d(t)} \} \) and \( X_2 = \{ (s, t) \in \mathcal{L} \mid j_{d(s)} = j_{d(t)} \} \). Since \( (s, t) \in X_2 \) if and only if \( d(s), d(t) \in R_\mu^k \) for some \( k \in \mathbb{Z} \), (3.2.1.5) forces \( d(s) < d(t) \).

Hence, if \( \mathcal{S}_\lambda \) acts on \( \mathbb{Z}^2 \) diagonally, then

\[
X_2 = \{ (s, t) \in \mathcal{L} \mid d(s) < d(t), d(s), d(t) \in R_\mu^k \text{ for some } k \in \mathbb{Z} \}
\]

\[
= d^{-1}\{ (s, t) \in \mathbb{Z}^2 \mid 1 \leq d^{-1}(s) \leq r, s < t, s, t \in R_\mu^k \text{ for some } k \in \mathbb{Z} \}.
\]

Thus, \( |X_2| \) is the length of the longest element \( w_{0, \lambda} \) in \( \mathcal{S}_\lambda \) by Lemma 3.10.1. Since, for \( (s, t) \in \mathcal{L} \setminus X_2 \), \( j_{d(s)} > j_{d(t)} \iff d(s) > d(t) \), applying (3.2.1.5) again yields

\[
\text{Inv}(d) = \{ (s, t) \in \mathcal{L} \mid d(s) > d(t) \} = \{ (s, t) \in \mathcal{L} \setminus X_2 \mid d(s) > d(t) \} = X_1.
\]

Consequently, \( d_1 = |X_1| + |X_2| = \ell(d) + \ell(w_{0, \lambda}) = \ell(d^+) \), as required. □

We record the following generalization (to affine symmetric groups) of a well-known result for Coxeter groups.

**Lemma 3.2.5.** Let \( \lambda, \mu \in \Lambda_\lambda(n, r) \) and \( d \in \mathcal{P}_\lambda \). Then \( d^{-1}\mathcal{S}_\lambda d \cap \mathcal{S}_\mu \) is a standard Young subgroup of \( \mathcal{S}_\mu \). Moreover, each element \( w \in \mathcal{S}_\lambda \mathcal{S}_\mu \) can be written uniquely as a product \( w = w_1d w_2 \) with \( w_1 \in \mathcal{S}_\lambda \) and \( w_2 \in \mathcal{P}_\mu \cap \mathcal{S}_\mu \), where \( \nu \in \Lambda_\lambda(n, r) \) is defined by \( \mathcal{S}_\nu = d^{-1}\mathcal{S}_\lambda d \cap \mathcal{S}_\mu \), and the equality \( \ell(w) = \ell(w_1) + \ell(d) + \ell(w_2) \) holds.
Following [45], the extended affine Hecke algebra $H(\mathfrak{S}_\Delta,r)$ over $\mathbb{Z}$ is defined to be the algebra generated by $T_{s_i}$ ($1 \leq i \leq r$), $T_{\rho}^{\pm 1}$ with the following relations:

$$T_{s_i}^2 = (v^2 - 1)T_{s_i} + v^2,$$
$$T_{s_i}T_{s_j} = T_{s_j}T_{s_i} (i - j \not\equiv \pm 1 \mod r),$$
$$T_{s_i}T_{s_j}T_{s_i} = T_{s_j}T_{s_i}T_{s_j} (i - j \equiv \pm 1 \mod r \text{ and } r \geq 3),$$
$$T_{\rho}T_{\rho}^{-1} = T_{\rho}^{-1}T_{\rho} = 1,$$
$$T_{\rho}T_{s_i} = T_{s_{i+1}}T_{\rho},$$

where $T_{s_{r+1}} = T_{s_1}$. This algebra has a $\mathbb{Z}$-basis $\{T_w\}_{w \in S_{\Delta,r}}$, where $T_w = T_{s_{i_1}} \cdots T_{s_{i_m}}$ if $w = s_{i_1} \cdots s_{i_m}$ is reduced.

The following result is well-known due to Iwahori–Matsumoto [41]. Recall the algebra $H_\Delta(r)$ defined in §3.1 and the isomorphism given in [3.1.1.3].

**Lemma 3.2.6.** There is a $\mathbb{Z}$-algebra isomorphism $H(\mathfrak{S}_\Delta,r) \cong H_\Delta(r)$ whose specialization of $v$ to $\sqrt{q}$ gives a $\mathbb{C}$-algebra isomorphism

$$H(\mathfrak{S}_\Delta,r) \otimes \mathbb{C} \cong \mathbb{C}_G(\mathcal{R} \times \mathcal{R}).$$

Thus, we will identify $H(\mathfrak{S}_\Delta,r)$ with $H_\Delta(r)$ in the sequel.

Let $H(r) = H(\mathfrak{S}_r)$ be the subalgebra of $H_\Delta(r)$ generated by $T_{s_i}$ ($1 \leq i < r$). Then $H(r)$ is the Hecke algebra of the symmetric group $\mathfrak{S}_r$. We finally set

$$H_\Delta(r) = H_\Delta(r) \otimes \mathbb{Z} \mathbb{Q}(v) \text{ and } H(r) = H(r) \otimes \mathbb{Z} \mathbb{Q}(v).$$

For each $\lambda \in \Lambda_\Delta(n,r)$, let $x_\lambda = \sum_{w \in \mathfrak{S}_\lambda} T_w \in H(r)$ and define

$$S^r_\Delta(n,r) := \text{End}_{H_\Delta(r)} \left( \bigoplus_{\nu \in \Lambda_\Delta(n,r)} x_\nu H_\Delta(r) \right).$$

For $\lambda, \mu \in \Lambda_\Delta(n,r)$ and $d \in \mathfrak{P}_\Delta$, define $\phi^d_{\lambda,\mu} \in S^r_\Delta(n,r)$ as follows:

$$\phi^d_{\lambda,\mu}(x_\nu h) = \delta_{\mu \nu} \sum_{w \in \mathfrak{S}_\lambda \rho \mathfrak{S}_\mu} T_w h \quad (3.2.6.1)$$

where $\nu \in \Lambda_\Delta(n,r)$ and $h \in H_\Delta(r)$. Then the set $\{\phi^d_{\lambda,\mu}\}$ forms a basis for $S^r_\Delta(n,r)$.

**Remarks 3.2.7.** (1) We point out that, as a natural generalization of the $q$-Schur algebra given in [14, 15], the endomorphism algebra $S^r_\Delta(n,r)$ is called the affine $q$-Schur algebra and the basis $\{\phi^d_{\lambda,\mu}\}$ was constructed by R. Green [35].

(2) Let $R$ be a commutative ring with 1 which is a $\mathbb{Z}$-algebra. Then, by base change to $R$, a similar basis can be defined for

$$S^r_\Delta(n,r;R) = \text{End}_{H_\Delta(r)R} \left( \bigoplus_{\lambda \in \Lambda_\Delta(n,r)} x_\lambda H_\Delta(r)R \right).$$

As a result of this, the endomorphism algebra $S^r_\Delta(n,r)$ satisfies the base change property: $S^r_\Delta(n,r;R) \cong S^r_\Delta(n,r)_R$. This property has already been mentioned for $R = \mathbb{Z}[\sqrt{q}, \sqrt{q}^{-1}]$ in Remark 3.1.2.
Combining the base change property and [77, 7.4] gives the following result which extends the isomorphism given in Lemma 3.2.6 to affine quantum Schur algebras.

**Proposition 3.2.8.** The bijection \( j_\delta \) given in Lemma 3.2.2 induces a \( \mathcal{Z} \)-algebra isomorphism

\[
\mathfrak{h} : \mathcal{S}_\Lambda(n, r) \xrightarrow{\sim} \mathcal{S}_\Lambda^\mu(n, r), \quad e_A \mapsto \phi^d_{\lambda, \mu}
\]

for all \( A \in \Theta_\Lambda(n, r) \) with \( A = j_\delta(\lambda, d, \mu) \), where \( \lambda, \mu \in \Lambda_\Lambda(n, r) \) and \( d \in \mathcal{D}_{\lambda, \mu} \). Moreover, regarding \( \bigoplus_{\lambda \in \Lambda_\Lambda(n, r)} x_\lambda \mathcal{H}_\Lambda(r) \) as an \( \mathcal{S}_\Lambda(n, r) \)-module via \( \mathfrak{h} \), we obtain an \( \mathcal{S}_\Lambda(n, r) \)-\( \mathcal{H}_\Lambda(r) \)-bimodule isomorphism

\[
ev : \mathcal{T}_\Lambda(n, r) \xrightarrow{\sim} \bigoplus_{\lambda \in \Lambda_\Lambda(n, r)} x_\lambda \mathcal{H}_\Lambda(r), \quad e_A \mapsto x_\lambda T_d,
\]

for all \( A \in \Theta_\Lambda(n, r)_\omega \) with \( A = j_\delta(\lambda, d, \omega) \).

Note that if we regard \( \mathcal{T}_\Lambda(n, r) \) as a subset of \( \mathcal{S}_r(N, r) \) as in Lemma 3.1.3, the bimodule isomorphism is simply the evaluation map.

Recall that, by removing the superscript \( ^\Lambda \), the notation \( \mathcal{D}_{\lambda, \mu} \) denotes the shortest \((\mathfrak{S}_\lambda, \mathfrak{S}_\mu)\)-coset representatives in \( \mathfrak{S}_r \). If we identify \( \Lambda_\Lambda(n, r) \) with \( \Lambda(n, r) \) via \([1.1.0.2], \) we obtain the following.

**Corollary 3.2.9.** The subspace spanned by all \( \phi^d_{\lambda, \mu} \) with \( \lambda, \mu \in \Lambda_\Lambda(n, r) \) and \( d \in \mathcal{D}_{\lambda, \mu} \) is a subalgebra which is isomorphic to the quantum Schur algebra \( \mathcal{S}(n, r) \).

Using the evaluation isomorphism, we now describe an explicit action of \( \mathcal{H}_\Lambda(r) \) on \( \mathcal{T}_\Lambda(n, r) \). First, for \( \lambda \in \Lambda_\Lambda(n, r) \), \( d \in \mathcal{D}_\Lambda^\lambda \) and \( 1 \leq k \leq r \),

\[
x_\lambda T_d \cdot T_{sk} = \begin{cases} 
  v^2 x_\lambda T_{ds_k}, & \text{if } ds_k \notin \mathcal{D}_\Lambda^\lambda \text{ (then } \ell(ds_k) > \ell(d)); \\
  x_\lambda T_{ds_k}, & \text{if } \ell(ds_k) > \ell(d) \text{ and } ds_k \in \mathcal{D}_\Lambda^\lambda; \\
  v^2 x_\lambda T_{ds_k} + (v^2 - 1)x_\lambda T_d, & \text{if } \ell(ds_k) < \ell(d) \text{ (then } ds_k \in \mathcal{D}_\Lambda^\lambda). 
\end{cases}
\]

Second, by Corollary 3.2.4 we obtain \( \text{ev}([A^i]) = v^{-\ell(d^+)} x_\lambda T_d \) if \( j_\delta^*(i) = (\lambda, d, \omega) \), where \( d^+ \) is a representative of \( \mathfrak{S}_\lambda d \) with maximal length. For \( w \in \mathfrak{S}_\Lambda(r) \), let \( \tilde{T}_w = v^{-\ell(w)} T_w \). Thus, for \( j = i_k \) and \( d \) as above, (3.2.9.1) becomes

\[
[A^{kd}] \tilde{T}_{sk} = \begin{cases} 
  v[A^{kd}], & \text{if } ds_k \notin \mathcal{D}_\Lambda^\lambda \text{ (then } \ell(ds_k) > \ell(d)); \\
  [A^{kd}ds_k], & \text{if } \ell(ds_k) > \ell(d) \text{ and } ds_k \in \mathcal{D}_\Lambda^\lambda; \\
  [A^{kd}ds_k] + (v - v^{-1})[A^{kd}], & \text{if } \ell(ds_k) < \ell(d) \text{ (then } ds_k \in \mathcal{D}_\Lambda^\lambda). 
\end{cases}
\]

This together with Lemma 3.1.4 gives the first part of the following (and part (2) is clear from definition).

**Proposition 3.2.10.** Let \( i \in I^{(1)}_\Lambda(n, r) \).

1. For any \( 1 \leq k \leq r \), we have

\[
[A^i] \tilde{T}_{sk} = \begin{cases} 
  v[A^i], & \text{if } i_k = i_{k+1}; \\
  [A^{ik}], & \text{if } i_k < i_{k+1}; \\
  [A^{ik}] + (v - v^{-1})[A^i], & \text{if } i_k > i_{k+1}. 
\end{cases}
\]

2. \( [A^i] T_\rho = [A^{i_\rho}] \), where \( \rho \in \mathfrak{S}_\Lambda(r) \) is the permutation sending \( i \) to \( i + 1 \) for all \( i \in \mathbb{Z} \).
3.3. The tensor space interpretation

We now interpret the right \( \mathcal{H}_0(r) \)-module \( T_0(n, r) \) in terms of the tensor space, following [77].

The Hecke algebra \( \mathcal{H}(\mathfrak{S}_{\triangle r}) \) admits the so-called Bernstein presentation which consists of generators

\[
T_i := T_{s_i}, \quad X_j := T_{e_{i+1}} \cdots e_{j-1} T_{e_{i+1}} \cdots e_j (i = 1, \ldots, r-1, j = 1, \ldots, r),
\]

and relations

\[
(T_i + 1)(T_i - v^2) = 0, \quad T_iT_{i+1}T_i = T_{i+1}T_iT_{i+1}, \quad T_iT_j = T_jT_i \quad (|i - j| > 1), \quad X_iX_i^{-1} = 1 = X_iX_j = X_jX_i, \quad T_iX_iT_i = v^2X_i, \quad X_iT_i = T_iX_j \quad (j \neq i, i + 1).
\]

Note that, for any dominant \( \lambda = (\lambda_i) \in \mathbb{Z}^r \) (meaning \( \lambda_1 \geq \cdots \geq \lambda_r \)),

\[
X_\lambda := X_1^{\lambda_1} \cdots X_r^{\lambda_r} = \tilde{T}_\lambda.
\]

In particular, it takes \( T_\rho \) to \( X_1^{-1}T_1 \cdots \tilde{T}_r^{-1} \) since \( e_1 = \rho s_{r-1} \cdots s_2 s_1 \) and \( X_1^{-1} = \tilde{T}_{e_1} \).

By definition, we have, for each \( 1 \leq i \leq r-1 \),

\[
T_iX_{i+1}^{-1} = X_i^{-1}T_i + (1 - v^2)X_i^{-1}, \quad X_{i+1}^{-1}T_i = T_iX_i^{-1} + (1 - v^2)X_i^{-1}, \quad T_iX_i^{-1} = X_i^{-1}T_i + (1 - v^2)X_{i+1}^{-1}, \quad X_i^{-1}T_i^{-1} = T_i^{-1}X_i^{-1} + (1 - v^2)X_{i+1}^{-1}.
\]

So \( X_iT_i = T_iX_{i+1} + (1 - v^2)X_{i+1} \) and \( T_iX_j = X_{i+1}T_i + (1 - v^2)X_{i+1} \), etc.

Let \( \Omega \) be the free \( \mathbb{Z} \)-module with basis \( \{ \omega_i \mid i \in \mathbb{Z} \} \). Consider the \( r \)-fold tensor space \( \Omega^\otimes r \) and, for each \( \mathbf{i} = (i_1, \ldots, i_r) \in \mathbb{Z}^r \), write

\[
\omega_\mathbf{i} = \omega_{i_1} \otimes \omega_{i_2} \otimes \cdots \otimes \omega_{i_r} = \omega_{i_1}\omega_{i_2} \cdots \omega_{i_r} \in \Omega^\otimes r.
\]

We now follow [77] to define a right \( \mathcal{H}_0(r) \)-module structure on \( \Omega^\otimes r \) and to establish an \( \mathcal{H}_0(r) \)-module isomorphism from \( T_0(n, r) \) to \( \Omega^\otimes r \).

Recall the set \( I_0(n, r) \) defined in [3.1.3.5] and the action [3.2.1.2] of \( \mathfrak{S}_{\triangle r} \) on \( I_0(n, r) \). If we identify \( I_0(n, r) \) with \( \mathbb{Z}^r \) by the following bijection

\[
I_0(n, r) \rightarrow \mathbb{Z}^r, \quad \mathbf{i} \mapsto (i_1, \ldots, i_r),
\]

then the action of \( \mathfrak{S}_{\triangle r} \) on \( I_0(n, r) \) induces an action on \( \mathbb{Z}^r \). Also, the usual action of the place permutation of \( \mathfrak{S}_r \) on \( I(n, r) \), where

\[
I(n, r) = \{(i_1, \ldots, i_r) \in \mathbb{Z}^r \mid 1 \leq i_k \leq n \forall k \},
\]

is the restriction to \( \mathfrak{S}_r \) of the action of \( \mathfrak{S}_{\triangle r} \) on \( \mathbb{Z}^r \) (restricted to \( I(n, r) \)). We often identify \( I(n, r) \) as a subset of \( I_0(n, r) \), or \( I_0(n, r)_0 \) as a subset of \( I(n, r) \), depending on the context.

By the Bernstein presentation for \( \mathcal{H}_0(r) \), Varagnolo–Vasserot extended in [77] the action of \( \mathcal{H}(r) \) on the finite tensor space \( \Omega^\otimes n \), where \( \Omega_n = \text{span}\{\omega_1, \ldots, \omega_n\} \), given in
As seen above, since the action of \( \Omega^{\otimes r} \) induces a \( (\mathfrak{U} \otimes \mathfrak{H}) \)-module isomorphism on \( \mathfrak{S}(n, r) \), this result justifies why the set \( \mathcal{I}_0(n, r) \) defined in (3.1.3.6) is called a fundamental set. Recall from (3.1.3.6) the matrix \( A^i \) defined for every \( i \in \mathcal{I}_0(n, r) \).

**Proposition 3.3.1.** There is a unique \( \mathcal{H}(r) \)-module isomorphism

\[
g : \mathcal{T}_0(n, r) \longrightarrow \Omega^{\otimes r}
\]

such that \( [A^i] \longmapsto \omega_i \) for all \( i \in \mathcal{I}_0(n, r) \), which induces a \( \mathbb{Z} \)-algebra isomorphism

\[
t : \mathcal{S}_0(n, r) \longrightarrow \mathcal{S}_0^r(n, r) := \text{End}_{\mathcal{H}(r)}(\Omega^{\otimes r}).
\]

In particular, \( g \) induces an \( \mathcal{S}_0(n, r) \)-\( \mathcal{H}(r) \)-bimodule isomorphism. Moreover, specializing \( v \) to \( \sqrt{q} \) yields a \( \mathbb{C}G(\mathfrak{U} \otimes \mathfrak{H}) \)-\( \mathbb{C}G(\mathfrak{X} \otimes \mathfrak{X}) \)-bimodule isomorphism over \( \mathbb{C} \) from \( \mathbb{C}G(\mathfrak{U} \otimes \mathfrak{X}) \) to \( \Omega^{\otimes r}_G := \Omega^{\otimes r} \otimes \mathbb{C} \) sending \( [A^i] = q^{-\frac{1}{2}d_i} \chi_i \) to \( \omega_i \), for all \( i \in \mathcal{I}_0(n, r) \).

**Proof.** The first assertion follows from [23] Lem. 9.5. By regarding \( \Omega^{\otimes r} \) as an \( \mathcal{S}_0(n, r) \)-\( \mathcal{H}(r) \)-bimodule isomorphism. The last assertion follows from the isomorphism (3.1.3.3) and the definition that \( \mathcal{T}_0(n, r) \) is the generic form of \( \mathbb{C}G(\mathfrak{U} \otimes \mathfrak{X}) \).

**Remark 3.3.2.** As seen above, since the action of \( \mathcal{T}_0(n, r) \) on \( \mathcal{S}_0(n, r) \) follows the same rules as the action on \( [A^i] \), it follows that \( g[A^i] = \omega_i \) for all \( i \in \mathcal{I}(n, r) \). However, the actions of \( \mathcal{T}_0(n, r) \) are different. Hence, if we identify \( \mathcal{T}(n, r) \) with \( \Omega^{\otimes r} \) under \( g \), then \( \{[A^i] \}_{i \in \mathcal{I}(n, r)} \) and \( \{[\omega_i] \}_{i \in \mathcal{I}(n, r)} \) form two different bases with the subset \( \{[A^i] = \omega_i \}_{i \in \mathcal{I}(n, r)} \) in common.
We now identify $\mathbb{C}_G(\mathcal{Y} \times \mathcal{X})$ with $\Omega^{\otimes r}_C$. Consequently, specializing $v$ to $\sqrt{q}$ gives isomorphisms

$$\text{End}_{\mathcal{H}_u(r)_C}(\Omega^{\otimes r}_C) \cong \text{End}_{\mathcal{H}_u(r)_C}(\mathbb{C}_G(\mathcal{Y} \times \mathcal{X})) \cong \mathbb{C}_G(\mathcal{Y} \times \mathcal{Y}) \cong S_n(n, r)_C.$$ 

These algebras will be identified in the sequel.

Also, let $\Omega = \Omega \otimes_{\mathbb{Z}} \mathbb{Q}(v)$, i.e., $\Omega$ is a $\mathbb{Q}(v)$-vector space with basis $\{\omega_i \mid i \in \mathbb{Z}\}$. Then the right action of $\mathcal{H}_u(r)$ on $\Omega^{\otimes r}$ extends to a right action of $\mathcal{H}_u(r) = \mathcal{H}_u(r) \otimes_{\mathbb{Z}} \mathbb{Q}(v)$ on $\Omega^{\otimes r}$. Hence, we have the $\mathbb{Q}(v)$-algebra isomorphism

$$S_\Delta(n, r) := S_n(n, r) \otimes_{\mathbb{Z}} \mathbb{Q}(v) \cong \text{End}_{\mathcal{H}_u(r)}(\Omega^{\otimes r}).$$ 

We will identify $S_\Delta(n, r)$ and $S_\Delta(n, r)$ with $\text{End}_{\mathcal{H}_u(r)}(\Omega^{\otimes r})$ and $\text{End}_{\mathcal{H}_u(r)}(\Omega^{\otimes r})$, respectively.

### 3.4. BLM bases and multiplication formulas

We now follow [3] (cf. [77]) to define BLM bases for the affine quantum Schur algebra $S_\Delta(n, r)$ as discussed in [23]. Let

$$\Theta_\Delta^\pm(n) = \{A \in \Theta_\Delta(n) \mid a_{i,i} = 0 \text{ for all } i\}.$$ 

For $A \in \Theta_\Delta^\pm(n)$ and $j \in \mathbb{Z}_n^a$, define $A(j, r) \in S_\Delta(n, r)$ by

$$A(j, r) = \begin{cases} \sum_{\lambda \in \Delta_0(n, r) - \sigma(A)} v^{\lambda \cdot j} [A + \text{diag}(\lambda)], & \text{if } \sigma(A) \leq r; \\ 0, & \text{otherwise}, \end{cases}$$

(3.4.0.1) where $\lambda \cdot j = \sum_{1 \leq i \leq n} \lambda_i j_i$. For the convenience of later use, we extend the definition to matrices in $M_{n,a}(\mathbb{Z})$ by setting $A(j, r) = 0$ if some off-diagonal entries of $A$ are negative.

The elements $A(j, r)$ are the affine version of the elements defined in [3, 5.2] and have been defined in terms of characteristic functions in [77, 7.6].

The following result is the affine analogue of [24, 6.6(2)]; see [23] Prop. 4.1.

**Proposition 3.4.1.** For a fixed $1 \leq i_0 \leq n$, the set

$$B_{\Delta,i_0,r} := \{A(j, r) \mid A \in \Theta_\Delta^\pm(n), j \in \mathbb{N}_n^a, j_i = 0, \sigma(j) + \sigma(A) \leq r\}$$

forms a $\mathbb{Q}(v)$-basis for $S_\Delta(n, r)$. In particular, the set

$$B_{\Delta,r} := \{A(j, r) \mid A \in \Theta_\Delta^\pm(n), j \in \mathbb{N}_n^a, \sigma(A) \leq r\}$$

is a spanning set for $S_\Delta(n, r)$.

We call $B_{\Delta,i_0,r}$ a BLM basis of $S_\Delta(n, r)$ and call $B_{\Delta,r}$ the BLM spanning set. As in the finite case, one would expect that there is a basis $B_{\Delta}$ for quantum affine $\mathfrak{gl}_n$ such that whose image in $S_\Delta(n, r)$ is $B_{\Delta,r}$ for every $r \geq 0$. See §5.4 for a conjecture.

The affine analogue of the multiplication formulas given in [3, 5.3] has also been established in [23]. As seen in [23, Th. 4.2] these formulas are crucial to a modified approach to the realization problem for quantum affine $\mathfrak{sl}_n$. We shall also see in Chapter 5 that they are useful in finding a presentation for affine quantum Schur algebras of degree $(r, r)$. Let $\alpha_i^\Delta = e_i^\Delta - e_{i+1}^\Delta, \beta_i^\Delta = -e_i^\Delta - e_{i+1}^\Delta \in \mathbb{Z}_n^a$. 

For a fixed
Theorem 3.4.2. Assume $1 \leq h \leq n$. For $i \in \mathbb{Z}, j, j' \in \mathbb{Z}_h^n$ and $A \in \Theta_\Delta(n)$, if we put $f(i) = f(i, A) = \sum_{j \geq i} a_{h,j} - \sum_{j > i} a_{h+1,j}$ and $f'(i) = f'(i, A) = \sum_{j < i} a_{h,j} - \sum_{j \leq i} a_{h+1,j}$, then the following identities hold in $S_\Delta(n, r)$ for all $r \geq 0$:

\[
0(j, r)A(j', r) = v^{rco(A)}A(j + j', r),
\]
\[
A(j', r)(j, r) = v^{lco(A)}A(j + j', r),
\]
where 0 stands for the zero matrix,

\[
E_{\Delta}^\Delta(0, r)A(j, r) = \sum_{i < h; a_{h,i} \geq 1} v^{f(i)} \left[ \begin{array}{c} a_{h,i} + 1 \\ 1 \end{array} \right] (A + E_{\Delta}^\Delta - E_{\Delta}^\Delta)(j + \alpha_h, r)
\]
\[
+ \sum_{i > h+1, a_{h+1,i} \geq 1} v^{f(i)} \left[ \begin{array}{c} a_{h,i} + 1 \\ 1 \end{array} \right] (A + E_{\Delta}^\Delta - E_{\Delta}^\Delta)(j, r)
\]
\[
+ v^{f(h) - j - 1} \frac{(A - E_{\Delta}^\Delta)(j + \alpha_h, r) - (A - E_{\Delta}^\Delta)(j + \beta_h, r)}{1 - v^{-2}}
\]
\[
+ v^{f(h) + j + 1} \left[ \begin{array}{c} a_{h+1,h} + 1 \\ 1 \end{array} \right] (A + E_{\Delta}^\Delta)(j, r),
\]

(3.4.2.2)

\[
E_{\Delta}^\Delta(0, r)A(j, r) = \sum_{i < h; a_{h,i} \geq 1} v^{f'(i)} \left[ \begin{array}{c} a_{h+1,i} + 1 \\ 1 \end{array} \right] (A - E_{\Delta}^\Delta + E_{\Delta}^\Delta)(j, r)
\]
\[
+ \sum_{i > h+1, a_{h,i} \geq 1} v^{f'(i)} \left[ \begin{array}{c} a_{h+1,i} + 1 \\ 1 \end{array} \right] (A - E_{\Delta}^\Delta + E_{\Delta}^\Delta)(j - \alpha_h, r)
\]
\[
+ v^{f'(h) - j - 1} \frac{(A - E_{\Delta}^\Delta)(j - \alpha_h, r) - (A - E_{\Delta}^\Delta)(j + \beta_h, r)}{1 - v^{-2}}
\]
\[
+ v^{f'(h) + j} \left[ \begin{array}{c} a_{h,h+1} + 1 \\ 1 \end{array} \right] (A + E_{\Delta}^\Delta)(j, r).
\]

(3.4.2.3)

According to Proposition 1.4.5 the double Ringel–Hall algebra $\mathfrak{D}_\Delta(n)$ has generators corresponding to simple modules and homogeneous indecomposable modules. It would be natural to raise the following question. In fact, we will see in §5.4 that the solution to this problem is the key to prove the realization conjecture 5.4.2 cf. Problem 6.4.2.

Problem 3.4.3. Find multiplication formulas for $E_{\Delta}^\Delta(0, r)A(j, r)$ for all $s \neq 0$ in $\mathbb{Z}$.

3.5. The $\mathfrak{D}_\Delta(n)$-\(\mathcal{H}_\Delta(r)\)-bimodule structure on tensor spaces

As in the previous section, let $\Omega$ be the $\mathbb{Q}(v)$-vector space with basis $\{\omega_s \mid s \in \mathbb{Z}\}$. Let $U(\tilde{C}_\infty)$ be the quantum enveloping algebra associated with the Borcherds–Cartan matrix $\tilde{C}_\infty$; see Definition 2.2.4. Our idea is to use the natural module structure
on $\Omega$ for the quantum enveloping algebra $U(\tilde{C}_\infty)$ associated with the Borcherds–Cartan matrix $\tilde{C}_\infty$. This induces a left $U(\tilde{C}_\infty)$-module structure on the tensor space $\Omega^{sr}$ which commutes with the right action of the affine Hecke algebra $H_d(r)$, and hence, an algebra homomorphism $\xi_r : U(\tilde{C}_\infty) \to S^r(n, r)$. We then show that this homomorphism factors through $\Phi : U(\tilde{C}_\infty) \to D_d(n)$. In this way, we obtain a $D_d(n)$-module structure on $\Omega^{sr}$, and will then partially establish the affine analogue of the quantum Schur–Weyl duality in §3.7.

For $i \in I$ and $t \in \mathbb{Z}^+$, we define the actions of $K_i^\pm$, $E_i$, $F_i$, $k_i^\pm$, $x_t$, and $y_t$ on $\Omega$ by

\[
\begin{align*}
K_i^\pm \cdot \omega_s &= v^\pm \delta_{i,s} \omega_s, \\
E_i \cdot \omega_s &= \delta_{i+1,s} \omega_{s-1}, \\
F_i \cdot \omega_s &= \delta_{i,s} \omega_{s+1}, \\
k_i^\pm \cdot \omega_s &= \omega_s, \\
x_t \cdot \omega_s &= \omega_{s-tn}, \\
y_t \cdot \omega_s &= \omega_{s+tn}.
\end{align*}
\]

Lemma 3.5.1. With the action defined as above, $\Omega$ becomes a left $U(\tilde{C}_\infty)$-module.

Proof. For $i \in I$ and $t \in \mathbb{Z}^+$, we denote by $k_i^\pm$, $\phi_i^+$, $\phi_i^-$, $\chi_i^\pm$, $\psi_i^+$, and $\psi_i^-$ the $\mathbb{Q}(v)$-linear transformations of $\Omega$ induced by the actions of $K_i^\pm$, $E_i$, $F_i$, $k_i^\pm$, $x_t$, and $y_t$ on $\Omega$ defined above, respectively. The assertion follows from the fact that $k_i^\pm$, $\phi_i^+$, $\phi_i^-$, $\chi_i^\pm$, $\psi_i^+$, and $\psi_i^-$ satisfy the relations similar to (R1)–(R8) in Definition 2.2.4. This is because those relations involving $\chi_i^\pm$, $\psi_i^+$, and $\psi_i^-$ are clear, while the others (involving only $K_i^\pm$, $E_i$, $F_i$) follow from the natural representation of the extended quantum affine $\mathfrak{sl}_n$ on $\Omega$ (see, e.g., [23] (9.5.1)).

Since all $k_i^\pm$ act identically on $\Omega$, it follows from Proposition 2.2.6 that the action of $U(\tilde{C}_\infty)$ on $\Omega$ induces an action of $D_d(n)$ on $\Omega$, i.e., for each $x \in D_d(n)$ and $s \in \mathbb{Z}$, we have

\[x \cdot \omega_s = y \cdot \omega_s, \quad \text{where} \quad y \in \Phi^{-1}(x).\]

Let $\xi_1 : D_d(n) \to \text{End}_{H_d(r)}(\Omega)$ be the algebra homomorphism defined by this action.

As shown in §2.1, there is a PBW type basis for $D_d(n)$. The action of these basis elements on the basis $\{\omega_s \mid s \in \mathbb{Z}\}$ of $\Omega$ can be described as follows.

Proposition 3.5.2. For each $0 \neq A \in \Theta_d^+(n)$ and $s \in \mathbb{Z}$, we have

\[\tilde{u}_A^+ \cdot \omega_s = \sum_{t<s} \delta_{A,E_{t,s}}^{\pm} \omega_t \quad \text{and} \quad \tilde{u}_A^- \cdot \omega_s = \sum_{s<t} \delta_{A,E_{t,s}}^{\pm} \omega_t,\]

where, as in (1.2.0.12), $\tilde{u}_A^+ = v^{d_A} u_A^+ \quad \text{with} \quad d_A' = \text{dim End}(M(A)) - \text{dim } M(A)$. In particular, if $A \neq 0$ and $M(A)$ is decomposable, then $u_A^+ \cdot \omega_s = 0 = u_A^- \cdot \omega_s$.

Proof. Define a $\mathbb{Q}(v)$-linear map $\phi = \phi^+ : D_d(n)^+ \to \text{End}_{\mathbb{Q}(v)}(\Omega), \tilde{u}_A^+ \mapsto \phi_A$ by setting $\phi_0 = \text{id}$ and for $A \neq 0$,

\[\phi_A : \Omega \longrightarrow \Omega, \omega_s \longmapsto \sum_{t<s} \delta_{A,E_{t,s}}^+ \omega_t.\]

Define $\phi^- : D_d(n)^- \to \text{End}_{\mathbb{Q}(v)}(\Omega)$ in a similar way.

We only prove the first equality. The second one can be proved analogously. We first show that $\phi$ is an algebra homomorphism. For $i < j \in \mathbb{Z}$, set $M^{i,j} = M(E_{i,j}^\pm) = \mathbb{Q}(v)$-module structure on $\Omega^{sr}$, and will then partially establish the affine analogue of the quantum Schur–Weyl duality in §3.7.
Let $d = (d_i) = \dim M^{l,s}$. Then
\[
\langle \dim M^{l,s}, \dim M^{s,t} \rangle = d_{T-1} - d_{s-1} = \begin{cases} -1, & \text{if } b_1 + b_2 \leq n; \\ 0, & \text{if } b_1 + b_2 > n. \end{cases}
\]

Therefore, the equality (3.5.2.2) holds.

For $A, B \in \Theta_+^n(n)$, we have
\[
\tilde{u}_A^+ u_B^+ = v^{d_A + d_B} u_A^+ u_B^+ = v^{\langle \dim M(A), \dim M(B) \rangle + d_A' + d_B'} \sum_C v^{-d_C'} \varphi_{A,B}^C \tilde{u}_C^+.
\]

Thus, to prove that $\phi$ is an algebra homomorphism, it suffices to show that for $A, B \in \Theta_+^n(n)$,
\[
\phi_A \phi_B = v^{\langle \dim M(A), \dim M(B) \rangle + d_A' + d_B'} \sum_C v^{-d_C'} \varphi_{A,B}^C \phi_C.
\]

By definition, we have for $s \in \mathbb{Z}$,
\[
\phi_A \phi_B(\omega_s) = 0 = v^{\langle \dim M(A), \dim M(B) \rangle + d_A' + d_B'} \sum_C v^{-d_C'} \varphi_{A,B}^C \phi_C(\omega_s)
\]

unless $B = E_{s,t}^\alpha$ and $A = E_{l,s}^\alpha$ for some $l < s < t$. Now we suppose that $B = E_{s,t}^\alpha$ and $A = E_{l,s}^\alpha$ for some $l < s < t$. Then
\[
\phi_A \phi_B(\omega_s) = \omega_l \quad \text{and} \quad \sum_C v^{-d_C'} \varphi_{A,B}^C \phi_C(\omega_s) = v^{-d_D'} \omega_l,
\]

where $D = E_{l,t}^\alpha$ (and $\varphi_{A,B}^D = 1$). From (3.5.2.2) it follows that
\[
\phi_A \phi_B(\omega_s) = \omega_l = v^{\langle \dim M(A), \dim M(B) \rangle + d_A' + d_B'} \sum_C v^{-d_C'} \varphi_{A,B}^C \phi_C(\omega_s).
\]

Hence, $\phi$ is an algebra homomorphism.
To prove the proposition, it remains to show that $\phi$ coincides with the restriction of $\xi_1$ to $\mathfrak{D}_\alpha(n)^+$. Since $\mathfrak{D}_\alpha(n)^+$ is generated by $u_i^+$ and $z_t^+$ for $i \in I$ and $t \in \mathbb{Z}^+$, we need to check that

$$\phi(u_i^+) = \xi_1(u_i^+) \quad \text{and} \quad \phi(z_t^+) = \xi_1(z_t^+).$$

The equality $\phi(u_i^+) = \xi_1(u_i^+)$ is trivial. For each $s \in \mathbb{Z}$, we have by definition

$$\xi_1(z_t^+)(\omega_s) = z_t^+ \cdot \omega_s = \omega_{s-tn}.$$

On the other hand, by (2.2.0.3),

$$z_t^+ = \sum_{l=1}^n \tilde{u}_{l,tn}^+ + \frac{t}{[t]} x^+,$$

where $x^+$ is a linear combination of certain $u_A^+$ with $M(A)$ decomposable. Hence, $\phi(x^+) = 0$. Thus,

$$\phi(z_t^+)(\omega_s) = \sum_{l=1}^n \phi(\tilde{u}_{l,tn}^+)(\omega_s) = \sum_{l=1}^n \sum_{b<s} \delta_{l,tn}^b \omega_b \omega_s = \omega_{s-tn}.$$

(Note that $E_{a,b}^n = E_{a+n,b+n}^n$ for $a, b \in \mathbb{Z}$.) Hence, $\phi(z_t^+) = \xi_1(z_t^+)$. This completes the proof.

**Remark 3.5.3.** The above proposition implies that the action of $\mathfrak{D}_\alpha(n)^-$ on $\Omega$ induced from $\phi^-$ coincides with the action given in [77, Lem. 8.1] which is defined geometrically through the algebra homomorphism $\zeta^- : \mathfrak{D}_\alpha(n)^- \to \mathfrak{S}_\alpha(n,1)$; see (3.6.2.1) below.

Now, for each $r \geq 1$, the Hopf algebra structure of $U(\tilde{C}_\infty)$ induces a left $U(\tilde{C}_\infty)$-module structure on the tensor space $\Omega^{\otimes r}$ which has a $Q(v)$-basis $\{\omega_i \mid i \in \mathbb{Z}^r\}$. Since $x_t$ and $y_t$ are primitive elements, we have by (3.5.0.1) that for each $t \geq 1$ and $\omega = \omega_{i_1} \otimes \cdots \otimes \omega_{i_r} \in \Omega^{\otimes r}$,

$$x_t \cdot \omega = \sum_{s=1}^r \omega_{i_1} \otimes \cdots \otimes \omega_{i_{s-1}} \otimes \omega_{i_s-tn} \otimes \omega_{i_{s+1}} \otimes \cdots \otimes \omega_{i_r} \quad \text{and} \quad (3.5.3.1)$$

$$y_t \cdot \omega = \sum_{s=1}^r \omega_{i_1} \otimes \cdots \otimes \omega_{i_{s-1}} \otimes \omega_{i_s+tn} \otimes \omega_{i_{s+1}} \otimes \cdots \otimes \omega_{i_r}.$$}

Recall from §3.3 that $\mathcal{H}_\alpha(r)$ has a right action on $\Omega^{\otimes r}$. The following result says that the left action of $U(\tilde{C}_\infty)$ and the right action of $\mathcal{H}_\alpha(r)$ on $\Omega^{\otimes r}$ commute.

**Proposition 3.5.4.** For each $r \geq 1$, the actions of $U(\tilde{C}_\infty)$ and $\mathcal{H}_\alpha(r)$ on $\Omega^{\otimes r}$ commute. In other words, the tensor space $\Omega^{\otimes r}$ is a $U(\tilde{C}_\infty)$-$\mathcal{H}_\alpha(r)$-bimodule.

**Proof.** Since $U(\tilde{C}_\infty)$ is generated by the set $\mathcal{U} := \{K_i, k_i, E_i, F_i, x_t, y_t \mid i \in I, t \in \mathbb{Z}^+\}$ and $\mathcal{H}_\alpha(r)$ is generated by the set $\mathcal{H} := \{T_k, X_s \mid 1 \leq k < r, 1 \leq s \leq r\}$, it suffices to show that

$$u \cdot (\omega_i \cdot h) = (u \cdot \omega_i) \cdot h \quad \text{(3.5.4.1)}$$

for all $u \in \mathcal{U}$, $h \in \mathcal{H}$, and $i \in \mathbb{Z}^r$. It is easy to check from the definition that (3.5.4.1) holds for $u = K_i^\pm$ or $k_i^\pm$ and arbitrary $h \in \mathcal{H}$ (resp. for $h = X_s$ and arbitrary $u \in \mathcal{U}$).
Furthermore, by (3.5.3.1), for \( t \geq 1 \) and \( i \in \mathbb{Z}^r \),
\[
x_t \cdot \omega_1 = \omega_1 \cdot \left( \sum_{1 \leq s \leq r} X_s^t \right) \quad \text{and} \quad y_t \cdot \omega_1 = \omega_1 \cdot \left( \sum_{1 \leq s \leq r} X_s^{-t} \right).
\]
This implies that for any \( h \in \mathcal{H} \),
\[
(x_t \cdot \omega_1) \cdot h = \left( \omega_1 \cdot \left( \sum_{1 \leq s \leq r} X_s^t \right) \right) \cdot h = (\omega_1 \cdot h) \cdot \left( \sum_{1 \leq s \leq r} X_s^t \right) = x_t \cdot (\omega_1 \cdot h),
\]
\[
(y_t \cdot \omega_1) \cdot h = \left( \omega_1 \cdot \left( \sum_{1 \leq s \leq r} X_s^{-t} \right) \right) \cdot h = (\omega_1 \cdot h) \cdot \left( \sum_{1 \leq s \leq r} X_s^{-t} \right) = y_t \cdot (\omega_1 \cdot h)
\]
since \( \sum_{1 \leq s \leq r} X_s^{\pm t} \) are central elements in \( \mathcal{H}_\omega(r) \).
Consequently, it remains to prove that (3.5.4.1) holds for \( i \in \mathbb{Z}^r, u = E_i, F_j \) (\( i \in I \)), and \( h = T_k \) (\( 1 \leq k < r \)).

Clearly, the subalgebra of \( U(\widehat{C}_\infty) \) generated by \( K_i^{\pm 1}, E_j \) and \( F_j \) (\( i \in I \) and \( j \in I \setminus \{n\} \)) is isomorphic to the quantum enveloping algebra \( U_q(\mathfrak{g}_n) \) of \( \mathfrak{g}_n \), and the subalgebra of \( \mathcal{H}_\omega(r) \) generated by \( T_k \) (\( 1 \leq k < r \)) is isomorphic to the Hecke algebra \( \mathcal{H}(r) \) of \( \mathfrak{S}_r \). Thus, by applying the result on quantum Schur algebras (see, e.g., [11] Lem. 14.23), we obtain that (3.5.4.1) holds for \( u = E_i, F_j \) (\( i \in I \setminus \{n\} \)), \( h = T_k \) (\( 1 \leq k < r \)), and \( i \in I(n, r) = \{(i_1, \ldots, i_r) \in \mathbb{Z}^r \mid 1 \leq i_s \leq n \ \forall s \} \).

Suppose now \( i = (i_1, \ldots, i_r) \in I(n, r) \). Then, by definition,
\[
E_n \cdot \omega_1 = \sum_{1 \leq j \leq r} \delta_{i_j, 1} v^{g(i_j)} \omega_1 - e_j
\]
where \( g(i, j) = |\{ s \mid j < s \leq r, \ i_s = n \}| - |\{ s \mid j < s \leq r, \ i_s = 1 \}| \) and \( e_j = (\delta_{s, j})_{1 \leq s \leq r} \in \mathbb{Z}^r \). In the following we show case by case that \( (E_n \cdot \omega_1) \cdot T_k = E_n \cdot (\omega_1 \cdot T_k) \) for \( 1 \leq k < r \).

**Case** \( i_k = i_{k+1} \). In this case,
\[
(E_n \cdot \omega_1) \cdot T_k = v^2 \sum_{1 \leq j \leq r} \delta_{i_j, 1} v^{g(i_j)} \omega_1 - e_j + \delta_{i_k, 1} (v^{g(i_k)} \omega_1 - e_k \cdot T_k + v^{g(i_k, k+1)} \omega_1 - e_{k+1} \cdot T_k).
\]

If \( i_k = i_{k+1} = 1 \), then \( g(i, k) = g(i, k+1) - 1 \). Hence,
\[
\delta_{i_k, 1} (v^{g(i_k)} \omega_1 - e_k \cdot T_k + v^{g(i_k, k+1)} \omega_1 - e_{k+1} \cdot T_k)
= \delta_{i_k, 1} (v^{g(i_k)} \omega_1 - e_k \cdot (X_k T_k) + v^{g(i_k, k+1)} \omega_1 - e_{k+1} \cdot (X_{k+1} T_k))
= \delta_{i_k, 1} (v^{g(i_k) + 2} \omega_1 + v^{g(i_k, k+1)} \omega_1 - e_{k+1} \cdot (T_k X_k + (v^2 - 1) X_{k+1}))
= \delta_{i_k, 1} (v^{g(i_k) + 2} \omega_1 - e_{k+1} + v^{g(i_k, k+1)} \omega_1 - e_{k+1} + (v^2 - 1) \omega_1 - e_{k+1})
= \delta_{i_k, 1} v^{g(i_{k+1})} \omega_1 - e_{k+1} + v^{g(i_k, k+1)} \omega_1 - e_{k+1},
\]
Applying (3.5.4.2) gives that
\[
(E_n \cdot \omega_1) \cdot T_k = v^2 \sum_{1 \leq j \leq r} \delta_{i_j, 1} v^{g(i_j)} \omega_1 - e_j = v^2 E_n \cdot \omega_1 = E_n \cdot (\omega_1 \cdot T_k).
Case $i_k < i_{k+1}$. In particular, $i_{k+1} \neq 1$. By definition, we have
\[
(\mathbf{E}_n \cdot \omega_1) \cdot T_k = \sum_{1 \leq j \leq r, i_j = 1} v^{g(i,j)} \omega_{1+e_j} \cdot (X_j T_k)
\]
\[
= \sum_{1 \leq j \leq r, i_j = 1} v^{g(i,j)} \omega_{1+(n-1)e_j} \cdot (X_j T_k)
\]
\[
= \sum_{1 \leq j \leq r, i_j = 1} v^{g(i,j)} \omega_{1+(n-1)e_j} \cdot (T_k X_j) + \delta_{i_{k+1}} v^{g(i,k)} \omega_{1+(n-1)e_{k+1}} \cdot (v^2 T_k^{-1} X_{k+1})
\]
\[
= \sum_{1 \leq j \leq r, i_j = 1, j \neq k \neq k+1} v^{g(i,j)} \omega_{1+e_j} + \delta_{i_{k+1}} v^{g(i,k)} v^{1-\delta_{i_{k+1}}} \omega_{1+e_{k+1}}
\]
Since $g(is_k, k+1) = g(i, k) - \delta_{i_{k+1}}$ and $g(is_k, j) = g(i, j)$ for $j \neq k, k+1$, we get that
\[
(\mathbf{E}_n \cdot \omega_1) \cdot T_k = v \sum_{1 \leq j \leq r, i_j = 1, j \neq k \neq k+1} v^{g(is_k, j)} \omega_{is_k-e_j} + v^{\delta_{i_{k+1}}} v^{g(is_k, k+1)} \omega_{is_k-e_{k+1}}
\]
\[
= v E_n \cdot \omega_{is_k} = E_n \cdot (\omega_1 \cdot T_k).
\]
Case $i_k > i_{k+1}$. In this case, $i_k \neq 1$. It follows from the definition that
\[
(\mathbf{E}_n \cdot \omega_1) \cdot T_k = \sum_{1 \leq j \leq r, i_j = 1} v^{g(i,j)} \omega_{1+(n-1)e_j} \cdot (X_j T_k)
\]
\[
= \sum_{1 \leq j \leq r, i_j = 1, j \neq k \neq k+1} v^{g(i,j)} \omega_{1+(n-1)e_j} \cdot (T_k X_j) + \delta_{i_{k+1}} v^{g(i,k)} \omega_{1+(n-1)e_{k+1}} \cdot (T_k X_k + (v^2 - 1) X_{k+1})
\]
\[
= \sum_{1 \leq j \leq r, i_j = 1, j \neq k \neq k+1} v^{g(i,j)} (v \omega_{is_k-e_j} + (v^2 - 1) \omega_{1-e_j})
\]
In general, for an arbitrary $j \in \mathbb{Z}^r$, write $\omega_j = \omega_i \cdot (X_{1}^{t_i} \cdots X_{r}^{t_r})$ with $i \in I(n, r)$ for some $t_1, \ldots, t_r \in \mathbb{Z}$. Let $\mathcal{X}$ be the subalgebra of $\mathcal{H}_\delta(r)$ generated by $X_{1}^{\pm}, \ldots, X_{r}^{\pm}$. Then $X_{1}^{t_1} \cdots X_{r}^{t_r}T_k = T_kx + y$ for some $x, y \in \mathcal{X}$. By the above discussion, we infer that for $u = E_i$ or $F_i$ $(i \in I)$,
\begin{equation}
(u \cdot \omega_j) \cdot T_k = \left((u \cdot \omega_i) \cdot (X_{1}^{t_1} \cdots X_{r}^{t_r})\right) \cdot T_k = (u \cdot \omega_i) \cdot (T_kx + y)
= (u \cdot \omega_i \cdot T_k) \cdot x + u \cdot (\omega_i \cdot y) = u \cdot ((\omega_i \cdot T_k) \cdot x) + u \cdot (\omega_i \cdot y)
= u \cdot (\omega_i \cdot (T_kx + y)) = u \cdot (\omega_j \cdot T_k).
\end{equation}
The proof is completed. \hfill \Box

For each $r \geq 1$, the $\lef(\bar{\mathcal{C}}_\infty, \mathcal{H}_\delta(r)\ri)-$bimodule structure on $\Omega^{\otimes r}$ induces a $\mathbb{Q}(v)$-algebra homomorphism
\[\bar{\xi}_r : U(\bar{\mathcal{C}}_\infty) \longrightarrow \text{End}_{\mathcal{H}_\delta(r)}(\Omega^{\otimes r}) = \mathcal{S}_\delta(n, r),\]
which factors through the surjective Hopf algebra homomorphism $\Phi : U(\bar{\mathcal{C}}_\infty) \rightarrow \mathcal{D}_\delta(n)$. Hence, we obtain a $\mathbb{Q}(v)$-algebra homomorphism
\[\xi_r : \mathcal{D}_\delta(n) \longrightarrow \text{End}_{\mathcal{H}_\delta(r)}(\Omega^{\otimes r}) = \mathcal{S}_\delta(n, r). \tag{3.5.4.3}\]
In other words, the following diagram is commutative
\[
\begin{array}{ccc}
U(\bar{\mathcal{C}}_\infty) & \xrightarrow{\Phi} & \text{End}_{\mathcal{H}_\delta(r)}(\Omega^{\otimes r}) = \mathcal{S}_\delta(n, r) \\
\downarrow \bar{\xi}_r & & \downarrow \xi_r \\
\mathcal{D}_\delta(n) & \xrightarrow{\xi_r} & \text{End}_{\mathcal{H}_\delta(r)}(\Omega^{\otimes r}) = \mathcal{S}_\delta(n, r)
\end{array}
\]
Since $\Phi(x_t) = z_t^+$ and $\Phi(y_t) = z_t^-$ for all $t \geq 1$, it follows from (3.5.3.1) that for each $t \geq 1$ and $\omega_i = \omega_{i_1} \otimes \cdots \otimes \omega_{i_r} \in \Omega^{\otimes r}$,
\[
z_t^+ \cdot \omega_i = \sum_{s=1}^{r} \omega_{i_1} \otimes \cdots \otimes \omega_{i_{s-1}} \otimes \omega_{i_{s}+1} \otimes \cdots \otimes \omega_{i_r} \quad \text{and}
\]
\[
z_t^- \cdot \omega_i = \sum_{s=1}^{r} \omega_{i_1} \otimes \cdots \otimes \omega_{i_{s-1}} \otimes \omega_{i_{s}+1} \otimes \cdots \otimes \omega_{i_r}. \tag{3.5.4.4}
\]

Remark 3.5.5. By Remark 3.5.3, the PBW type basis action for the Hall algebra $\mathcal{D}_\delta(n)$ described in Proposition 3.5.2 induces via comultiplication an action on the tensor space $\Omega^{\otimes r}$. Varagnolo and Vasserot have outlined a proof of the fact that this Hall algebra action commutes with the action of $\mathcal{H}_\delta(r)$. Proposition 3.5.2 and Remark 3.5.3 show that this Hall algebra action coincides with the restriction of the double Hall algebra action above, while the proof in Proposition 3.5.3 is a complete and more natural proof via the natural representation of the quantum enveloping algebra $U(\bar{\mathcal{C}}_\infty)$. See §3.6 for an explicit description of the map $\xi_r$ and a further comparison with work of Varagnolo and Vasserot.

We now describe the action of semisimple generators of $\mathcal{D}_\delta(n)$ on $\Omega^{\otimes r}$. Recall that for each $a = (a_i) \in \mathbb{N}^{n} = \mathbb{N}_0^n$,
\[
S_a = \bigoplus_{i \in I} a_iS_i, \quad u_a^+ = u_{[s_a]}^+ \quad \text{and} \quad \bar{u}_a^+ = v^{\sum_{1 \leq i \leq n} a_i(a_i-1)}u_{[s_a]}^+.
\]
The following result is a direct consequence of the definition of the comultiplications in Proposition 3.5.4(b) and Corollary 3.5.6(b'). See [77] 8.3 for the second formula.

**Proposition 3.5.6.** For \( a \in \mathbb{N}^n \), we have

\[
\Delta^{(r-1)}(\tilde{u}_a^+) = \sum_{a=\mathbb{N}^{(i\cdots+i)}}^\ b_{\sum_{s>t}^n (a_s, a_t)} \times \tilde{u}_{a(z)}^+ \tilde{K}_{a(1)}^+ \otimes \cdots \otimes \tilde{u}_{a(r)}^+ \tilde{K}_{a(1)+a(2)+\cdots+a(r-1)},
\]

\[
\Delta^{(r-1)}(\tilde{u}_a^-) = \sum_{a=\mathbb{N}^{(i\cdots+i)}}^\ b_{\sum_{s>t}^n (a_s, a_t)} \times \tilde{u}_{a(z)}^- \tilde{K}_{-(a(1)+\cdots+a(r))}^+ \otimes \cdots \otimes \tilde{u}_{a(r)}^- \tilde{K}_{-(a(1)+\cdots+a(r))}^+.
\]

This proposition together with Proposition 3.5.2 gives the following corollary.

**Corollary 3.5.7.** For \( a = (a_i) \in \mathbb{N}_0^r \) and \( i = (i_1, \ldots, i_r) \in \mathbb{Z}^r \), we have

\[
\tilde{u}_a^+ \cdot \omega_1 = \sum_{a=\mathbb{N}^{(i\cdots+i)}}^\ b_{\sum_{s>t}^n (a_s, a_t)} \times \tilde{u}_{a(z)}^+ \tilde{K}_{a(1)}^+ \otimes \cdots \otimes \tilde{u}_{a(r)}^+ \tilde{K}_{a(1)+a(2)+\cdots+a(r-1)},
\]

\[
\tilde{u}_a^- \cdot \omega_1 = \sum_{a=\mathbb{N}^{(i\cdots+i)}}^\ b_{\sum_{s>t}^n (a_s, a_t)} \times \tilde{u}_{a(z)}^- \tilde{K}_{-(a(1)+\cdots+a(r))}^+ \otimes \cdots \otimes \tilde{u}_{a(r)}^- \tilde{K}_{-(a(1)+\cdots+a(r))}^+.
\]

In particular, if \( \sigma(a) = \sum_{i \in I} a_i > r \), then \( \tilde{u}_a^+ \cdot \omega_1 = 0 = \tilde{u}_a^- \cdot \omega_1 \).

**Corollary 3.5.8.** If \( n > r \), then \( \xi_r(\mathcal{D}_\delta(n)) = \xi_r(\mathcal{U}_\delta(n)) \).

**Proof.** By Proposition 1.4.3, \( \mathcal{D}_\delta(n) \) is generated by \( u_i^+, u_i^-, K_i^{\pm 1}, u_{s^+}, u_{s^-} \) (\( i \in I, s \in \mathbb{Z}^+ \)). If \( n > r \), then \( \dim S_{s^\delta} = sn > r \). By Corollary 3.5.7,

\[
u_{s^+} \cdot \omega_1 = 0 = u_{s^-} \cdot \omega_1, \text{ for all } \omega_1 \in \Omega_{s^\delta}^\otimes r.
\]

Hence, \( \xi_r(u_{s^+}^+) = 0 = \xi_r(u_{s^-}^-) \) for all \( s \geq 1 \), and \( \xi_r(\mathcal{D}_\delta(n)) \) is generated by the images of \( u_i^+, u_i^-, K_i^{\pm 1} \). This proves the equality. \( \square \)

**Remark 3.5.9.** We remark that, if \( z \in \mathbb{C} \) is not a root of unity, and \( \mathcal{D}_{\delta,\mathbb{C}}(n) \) is the specialized double Hall algebra considered in Corollary 2.2.10, there is a \( \mathcal{D}_{\delta,\mathbb{C}}(n) \)-action on the complex space \( \Omega_{s^\delta}^\otimes r \) which gives rise to an algebra homomorphism

\[
\xi_{r,\mathbb{C}} : \mathcal{D}_{\delta,\mathbb{C}}(n) \rightarrow S_{s^\delta}(n, r)^\mathbb{C}.
\]

### 3.6. A comparison with the Varagnolo–Vasserot action

In [77], Varagnolo–Vasserot defined a Hall algebra action on the tensor space via the action on \( \Omega \) (Remark 3.5.3) and the comultiplication \( \Delta \) and proved in [77] 8.3 that this action agrees with the affine quantum Schur algebra action via the algebra homomorphism \( \zeta^- \) described in Proposition 3.6.1(1) below. We will define the algebra homomorphism \( \zeta^+ \) in 3.6.1(2) opposite to \( \zeta^- \) and show that \( \zeta_r \) in (3.5.4.3) is their extension. In other words, \( \zeta_r \) coincides with \( \zeta^+ \) and \( \zeta^- \) upon restriction (Theorem 3.6.3).
3. AFFINE QUANTUM SCHUR ALGEBRAS AND THE SCHUR–WEYL RECIPROCITY

We first follow \[77\] to define an algebra homomorphism from the Ringel–Hall algebra $S_{\Delta}(n)$ of the cyclic quiver $\Delta(n)$ to the affine quantum Schur algebra $S_{\Delta}(n, r)$. This definition relies on an important relation between cyclic flags and representations of cyclic quivers.

Recall from \[3.1.1.3\] the geometric characterization of affine quantum Schur algebras and the flag varieties $\mathcal{Y} = \mathcal{F}_\Delta(q)$, $\mathcal{X} = \mathcal{B}_\Delta(q)$ (and $G = G(q)$) over the finite field $\mathbb{F} = \mathbb{F}_q$. Let $L = (L_i)_{i \in \mathbb{Z}}$, $L' = (L'_i)_{i \in \mathbb{Z}} \in \mathcal{Y}$ satisfy $L' \subseteq L$ i.e., $L'_i \subseteq L_i$ for all $i \in \mathbb{Z}$. By \[32\] §9 and \[58\] 5.1, we can view $L/L'$ as a nilpotent representation $V = (V_i, f_i)$ of $\Delta(n)$ over $\mathbb{F}$ such that $V_i = L_i/L'_i$ and $f_i$ is induced by the inclusion $L_i \subseteq L_{i+1}$ for each $i \in I$. Here we identify $L_{n+1}/L'_n$ with $L_1/L'_1$ via the multiplication by $\varepsilon$. Further, for $L \subseteq L'$, we define the integers

$$a(L, L') = \sum_{1 \leq i \leq n} \dim_{\mathbb{F}}(L'_i/L_i)(\dim_{\mathbb{F}}(L_{i+1}/L_i) - \dim_{\mathbb{F}}(L'_i/L_i))$$

and

$$c(L', L) = \sum_{1 \leq i \leq n} \dim_{\mathbb{F}}(L'_{i+1}/L_{i+1})(\dim_{\mathbb{F}}(L_{i+1}/L_i) - \dim_{\mathbb{F}}(L'_i/L_i)).$$

Recall also from \[1.2.0.15\] the geometric characterization $\mathcal{H}$ of the Ringel–Hall algebra $S_{\Delta}(n)$. Thus, by specializing $v$ to $q^{\frac{1}{2}}$, there is a $\mathbb{C}$-algebra isomorphism

$$S_{\Delta}(n) \otimes_{\mathbb{Z}} \mathbb{C} \rightarrow \mathcal{H}, \quad u_A \mapsto (\mathcal{O}_A) = q^{-\frac{1}{2} \dim A} \chi_{\mathcal{O}_A},$$

where $\mathcal{O}_A$ is the $G_Y$-orbit in the representation variety $E_Y$ corresponding to the isoclass of $M(A)$.

By identifying $S_{\Delta}(n, r) \otimes_{\mathbb{Z}} \mathbb{C}$ with $\mathbb{C}_G(\mathcal{Y} \times \mathcal{Y})$, $S_{\Delta}(n) \otimes_{\mathbb{Z}} \mathbb{C}$ with $\mathcal{H}$ (and hence, $S_{\Delta}(n)^{op} \otimes_{\mathbb{Z}} \mathbb{C}$ with $\mathcal{H}^{op}$), and recalling the elements $A(j, r) \in S_{\Delta}(n, r)$ for each $A \in \Theta_{\Delta}^+(n)$ and $j \in \mathbb{Z}^n$ defined in \[3.4.0.1\], \[77\] Prop. 7.6] can now be stated as the first part of the following (cf. footnote 2 of Chapter 1).

**Proposition 3.6.1.** (1) There is a $\mathcal{Z}$-algebra homomorphism

$$\zeta^- : S_{\Delta}(n)^{op} \rightarrow S_{\Delta}(n, r), \quad u_A \mapsto A(0, r)$$

for all $A \in \Theta_{\Delta}^+(n)$ such that the induced map $\zeta^- \otimes \text{id}_{\mathbb{C}} : \mathcal{H}^{op} \rightarrow \mathbb{C}_G(\mathcal{Y} \times \mathcal{Y})$ is given by

$$(\zeta^- \otimes \text{id}_{\mathbb{C}})(f)(L, L') = \begin{cases} q^{-\frac{1}{2}a(L, L')} f(L'/L), & \text{if } L \subseteq L'; \\ 0, & \text{otherwise}. \end{cases}$$

(2) Dually, there is a $\mathcal{Z}$-algebra homomorphism

$$\zeta^+ : S_{\Delta}(n) \rightarrow S_{\Delta}(n, r), \quad u_A \mapsto A(0, r)$$

for all $A \in \Theta_{\Delta}^+(n)$ with the induced map $\zeta^+ \otimes \text{id}_{\mathbb{C}} : \mathcal{H} \rightarrow \mathbb{C}_G(\mathcal{Y} \times \mathcal{Y})$ given by

$$(\zeta^+ \otimes \text{id}_{\mathbb{C}})(f)(L, L') = \begin{cases} q^{-\frac{1}{2}c(L, L')} f(L'/L), & \text{if } L' \subseteq L; \\ 0, & \text{otherwise}. \end{cases}$$

**Proof.** Statement (1) is given in \[77\] 7.6. We only need to prove (2). We first observe from the proof of \[58\] Lem. 1.11] that

$$d_A - d_{\varepsilon A} = \frac{1}{2} \sum_{1 \leq i \leq n} \left( \sum_{j \in \mathbb{Z}} a_{ij} \right)^2 - \frac{1}{2} \sum_{1 \leq j \leq n} \left( \sum_{i \in \mathbb{Z}} a_{ij} \right)^2.$$
3.6. A COMPARISON WITH THE VARAGNOLO–VASSEROT ACTION

Let \( \zeta^+ \) be the composition of the algebra homomorphisms

\[
S_\delta(n) \xrightarrow{(\zeta^+)^{op}} S_\delta(n, r)^{op} \xrightarrow{\tau_r} S_\delta(n, r),
\]

where \( \tau_r \) is the anti-involution on \( S_\delta(n, r) \) given in (3.1.3.4). Thus, \( \tau_r \) induces a map \( \tau_r \otimes \text{id} : \mathbb{C}_G(\mathcal{V} \times \mathcal{V}) \to \mathbb{C}_G(\mathcal{V} \times \mathcal{V}) \). Applying this to the characteristic function \( \chi_A \) of the orbit \( \mathcal{O}_A \) in \( \mathcal{V} \times \mathcal{V} \) and noting (3.1.0.1) yields

\[
(\tau_r \otimes \text{id})(\chi_A)(L, L') = q^{\frac{1}{2}(d_A-d_{\mathcal{O}_A})}\chi_A(L, L') = q^{\frac{1}{2}(d_A-d_{\mathcal{O}_A})}\chi_A(L', L)
\]

which is nonzero if and only if \( (L', L) \in \mathcal{O}_A \). This implies \( a_{i,j} = \dim_{\mathbb{F}} L_i \cap L'_j L_j L_{j-1} \).

Hence, by the proof of [58, 1.5(a)], \( \dim_{\mathbb{F}}(L_i / L_{i-1}) = \sum_{j \in \mathbb{Z}} a_{i,j} \) and \( \dim_{\mathbb{F}}(L_j / L_{j-1}) = \sum_{i \in \mathbb{Z}} a_{i,j} \).

Putting

\[
b(L, L') = \frac{1}{2} \left( \sum_{1 \leq i \leq n} \left( (\dim_{\mathbb{F}}(L'_i / L'_{i-1}))^2 - \sum_{1 \leq i \leq n} (\dim_{\mathbb{F}}(L_i / L_{i-1}))^2 \right) \right),
\]

we obtain

\[
(\tau_r \otimes \text{id})(\chi_A)(L, L') = q^{\frac{1}{2}b(L, L')}\chi_A(L, L').
\]

Hence, \( g = (\zeta^- \otimes \text{id})(f) \) with \( f \in \mathbb{H} \) and applying (3.6.1.1) gives

\[
(\tau_r \otimes \text{id})(\zeta^-(L, L'))(L, L') = \begin{cases} q^{\frac{1}{2}(b(L, L') - a(L', L))}f(L / L'), & \text{if } L' \subseteq L; \\ 0, & \text{otherwise}. \end{cases}
\]

For \( L' \subseteq L \), we have

\[
\sum_{1 \leq i \leq n} \dim_{\mathbb{F}}(L_{i+1} / L_i)^2
= \sum_{1 \leq i \leq n} (\dim_{\mathbb{F}}(L_{i+1} / L'_{i+1}) + \dim_{\mathbb{F}}(L'_{i+1} / L'_i) - \dim_{\mathbb{F}}(L_i / L'_i))^2
= 2 \sum_{1 \leq i \leq n} (\dim_{\mathbb{F}}(L_i / L'_i))^2 + \sum_{1 \leq i \leq n} (\dim_{\mathbb{F}}(L'_{i+1} / L'_i))^2
+ 2 \sum_{1 \leq i \leq n} \dim_{\mathbb{F}}(L_{i+1} / L'_{i+1}) \dim_{\mathbb{F}}(L'_{i+1} / L'_i)
- 2 \sum_{1 \leq i \leq n} \dim_{\mathbb{F}}(L_{i+1} / L'_i) \dim_{\mathbb{F}}(L_i / L'_i) - 2 \sum_{1 \leq i \leq n} \dim_{\mathbb{F}}(L'_{i+1} / L'_i) \dim_{\mathbb{F}}(L_i / L'_i).
\]

Hence, \( b(L, L') - a(L', L) = -c(L, L') \) and (3.6.1.2) follows now from (3.6.1.3).

For notational simplicity, we write \( A(j, r) \) for \( A(j, r) \otimes 1 \) in \( S_\delta(n, r) \otimes \mathbb{C} \). By taking \( f \) to be \( q^{-\frac{1}{2} \dim_{\mathbb{F}} \chi_{\mathcal{O}_A}} \) in (3.6.1.1) and (3.6.1.2), we obtain the following.

**Corollary 3.6.2.** For \( A \in \Theta^+_\delta(n) \) and \( (L, L') \in \mathcal{V} \times \mathcal{V} \), we have

\[
A(0, r)(L, L') = \begin{cases} q^{-\frac{1}{2}c(L, L')}^{\dim_{\mathbb{F}} \chi_{\mathcal{O}_A}}, & \text{if } L' \subseteq L \text{ and } L / L' \in \mathcal{O}_A; \\ 0, & \text{otherwise}. \end{cases}
\]
and
\[ tA(0,r)(L,L') = \begin{cases} q^{-\frac{1}{2}(a(LL')+\text{dim } A)}, & \text{if } L \subseteq L' \text{ and } L'/L \in \mathcal{D}_A; \\
0, & \text{otherwise}. \end{cases} \]

We now identify \( \mathfrak{S}_{\alpha}(n) \) as \( \mathfrak{D}_\alpha(n)^+ \) and \( \mathfrak{S}_{\alpha}(n)^{\text{op}} \) as \( \mathfrak{D}_\alpha(n)^- \) via (2.1.3.3). Then \( \zeta_r^{\pm} \) induce \( \mathbb{Q}(v) \)-algebra homomorphisms
\[ \zeta_r^{\pm}: \mathfrak{D}_\alpha(n)^{\pm} \rightarrow \mathfrak{S}_{\alpha}(n,r). \quad (3.6.2.1) \]

**Theorem 3.6.3.** For every \( r \geq 0 \), the map \( \xi_r : \mathfrak{D}_\alpha(n) \rightarrow \mathfrak{S}_{\alpha}(n,r) \) defined in (3.5.4.3) is the (unique) algebra homomorphism satisfying
\[ \xi_r(K_1^{\pm \lambda_1} \cdots K_n^{\pm \lambda_n}) = 0(j,r), \quad \xi_r(\tilde{u}_A) = \zeta_r^-(\tilde{u}_A), \quad \text{and} \quad \xi_r(\tilde{u}_A^{+}) = \zeta_r^{+}(\tilde{u}_A^{+}), \]
for all \( j = (j_1, \ldots, j_n) \in \mathbb{Z}^n \) and \( A \in \Theta_\alpha^+(n) \). In particular, we have \( \xi_r|_{\mathfrak{D}_\alpha(n)^{\pm}} = \zeta_r^{\pm} \).

**Proof.** Since \( \mathfrak{D}_\alpha(n) \) is generated by \( K_i^{\pm 1} \), \( 1 \leq i \leq n \), together with semisimple generators \( u_\lambda^{\pm}, \lambda \in \mathbb{N}_\alpha^n \), where \( A_\lambda = \sum_i \lambda_i E_{i,i+1}^\pm \). By Proposition 3.6.1, it suffices to prove
\[ (1) \quad \xi_r(K_i) = 0(e_i, r), \quad (2) \quad \xi_r(\tilde{u}_\lambda^{+}) = (A_\lambda)(0, r), \quad \text{and} \quad (3) \quad \xi_r(\tilde{u}_\lambda^{+}) = A_\lambda(0, r). \]

To prove them, it suffices by Propositions 3.3.1 and 3.5.4 to compare the actions of both sides on \( \omega_i = [A_i^+] \) for all \( i \in I_\alpha(n, r) \).

Suppose \( i = i_\mu \). By (3.5.0.1), \( K_i \cdot \omega_i = v^{\mu_i} \omega_i \). Since \( r_0(A_i^+) = \mu_i \), (3.1.3.3) implies \( 0(e_i, r)[A_i^+] = v^{\mu_i}[A_i] \). Hence, \( 0(e_i, r) \cdot \omega_i = K_i \cdot \omega_i \), proving (1). The proof of (2) is given in [17, 8.3]. We now prove (3) for completeness. So we need to show that
\[ A_\lambda(0, r) \cdot \omega_i = \tilde{u}_\lambda^{+} \cdot \omega_i \quad \text{for all } i \in I_\alpha(n, r) \text{ and } \lambda \in \mathbb{N}_\alpha^n. \quad (3.6.3.1) \]
The equality is trivial if \( \sigma(\lambda) > r \) as both sides are 0. We now assume \( \sigma(\lambda) \leq r \) and prove the equality by writing both sides as a linear combination of the basis \{\([A_i^+]\)\}_{i \in I_\alpha(n, r)}\); cf. Remark 3.3.2.

By Proposition 3.3.1, the left hand side of (3.6.3.1) becomes \( A_\lambda(0, r) \cdot \omega_i = A_\lambda(0, r)[A_i^+] \). We now compute this by regarding \( A_\lambda(0, r)[A_i^+] \) as the convolution product \( q^{\frac{1}{2}h} A_\lambda(0, r) \ast \chi_i \); see Remark 3.1.2 and compare [17, 8.3]. By the definition (3.1.1.2), for \( j \in I_\alpha(n, r) \) and \( \lambda \in \mathbb{N}_\alpha^n \),
\[ (A_\lambda(0, r) \ast \chi_i)(L_j, L_\emptyset) = \sum_{L \in \mathcal{O}_i} (A_\lambda(0, r))(L_j, L) \chi_i(L, L_\emptyset) = \sum_{(L_j, L_\emptyset) \in \mathcal{O}_i} (A_\lambda(0, r))(L_j, L), \]
where \( L_j \) is defined in (3.1.3.7), and \( \mathcal{O}_i = \mathcal{O}_{A_i^+} \) is the orbit containing \((L_j, L_\emptyset)\) (see also (3.1.3.7) for the definition of \( L_\emptyset \)). For \( L = (L_i) \in \mathcal{O}_i \) and \((L_j, L_\emptyset) \in \mathcal{O}_i \), there is \( g \in G \) such that \((L, L_\emptyset) = g(L_i, L_\emptyset) \). In other words, \( L = gL_i \) and \( L_\emptyset = gL_\emptyset \). The fact \( i \in I_\alpha(n, r) \) implies that for each \( t \in \mathbb{Z} \), there exists \( l_t \in \mathbb{Z} \) such that \( L_i,t = L_i,t \). (More precisely, if \( i = i_\mu \) and \( t = s + kn \) with \( 1 \leq s \leq n \), then \( l_t = \mu_1 + \cdots + \mu_s + kr \).)

Thus, \( L_t = g(L_i,t) = g(L_i,t) = L_i,t \) for any \( t \in \mathbb{Z} \). This implies that \( L = L_i \). Hence, by Corollary 3.6.2
\[ (A_\lambda(0, r) \ast \chi_i)(L_j, L_\emptyset) = (A_\lambda(0, r))(L_j, L_i) = q^{-\frac{1}{2}(c(\lambda^i) + \text{dim } A_\lambda)}, \]
if and only if $L_i \subseteq L_j, L_j/L_i \cong M(A_{\lambda})$, where $c(j,i) = c(L_j, L_i)$. The latter is equivalent by definition to the conditions
\[
\{ k \in \mathbb{Z} \mid i_k \leq t \} \subseteq \{ k \in \mathbb{Z} \mid j_k \leq t \} \subseteq \{ k \in \mathbb{Z} \mid i_k \leq t + 1 \}, \text{ and } \dim_{\mathbb{F}} L_{j_t}/L_{i_t} = \lambda_t,
\]
for all $t \in \mathbb{Z}$. Hence,
\[
L_i \subseteq L_j, L_j/L_i \cong M(A_{\lambda})
\]
\[
\iff i_t - 1 \leq j_t \leq i_t \text{ and } \lambda_t = |j^{-1}(t) \cap i^{-1}(t + 1)| \text{ for all } t \in \mathbb{Z}
\]
\[
\iff j = i - m \text{ and } \lambda = m_1 e_{i_1 - 1} + \cdots + m_r e_{i_r - 1} \text{ for some } m_s \in \{0,1\},
\]
since, for all $s \in \mathbb{Z}$,
\[
m_s = 1 \iff j_s = i_s - 1 \iff s \in \cap_{t \in \mathbb{Z}}(j^{-1}(t) \cap i^{-1}(t + 1)).
\]
Here, $m \in \mathbb{Z}_+^r$ is uniquely determined by $(m_1, m_2, \ldots, m_r) \in \mathbb{Z}^r$ and $e_i \in \mathbb{Z}_+^r$ corresponds to $e_i = (\delta_{k,i})_{1 \leq k \leq r}$ under \[(1.1.0.2)\]. (Note that if $i - m \in I_0(n,r)$ if $i \in I_0(n,r)$.)

Since $\dim \Omega_{A_{\lambda}} = 0$ (see, e.g., \[(1.6.2)\]), we obtain, for $i \in I_0(n,r)$ and $\lambda \in \mathbb{N}_0^n$,
\[
A_\lambda(0, r)[A^i] = q^{\frac{1}{2}d} A_\lambda(0, r) * \chi_1 = \sum_{m \in \mathfrak{M}} q^{\frac{1}{2}(c(i-m,\lambda) - d_1)} \chi_{1-m}
\]
where $\mathfrak{M} = \{ m \in \mathbb{Z}_+^r \mid m_i \in \{0,1\}, \lambda = m_1 e_{i_1 - 1} + \cdots + m_r e_{i_r - 1} \}$. Hence,
\[
A_\lambda(0, r) * \omega_1 = \sum_{m \in \mathfrak{M}} q^{c(i-m,\lambda)} \omega_{i_1 - m_1} \otimes \cdots \otimes \omega_{i_r - m_r}.
\]

We now calculate the right hand side of \[(3.6.3.1)\]. By Corollary \[3.5.7\],
\[
\tilde{u}_1 \cdot \omega_1 = \tilde{u}_1^+ \cdot \omega_1 = \tilde{u}_1^+ \cdot (\omega_{i_1} \otimes \cdots \otimes \omega_{i_r}) = \sum_{m \in \mathfrak{M}} q^{-c(i-m,\lambda)} \omega_{i_1 - m_1} \otimes \cdots \otimes \omega_{i_r - m_r}.
\]
where
\[
c'(i,m) := \sum_{t<s} m_t(1 - m_s) \langle e_{i_t}^\delta, e_{i_t}^\delta \rangle = \sum_{1 \leq i_l < s \leq r} m_t(1 - m_s) \delta_{i_l,i_s} - d(i,m),
\]
with $d(i,m) = \sum_{1 \leq i_l < s \leq r} m_t(1 - m_s) \delta_{i_l,i_s} - d(i,m)$. To make a comparison with \[(3.6.3.2)\], we need to write $\omega_{i-m} := \omega_{i_1 - m_1} \otimes \cdots \otimes \omega_{i_r - m_r}$ as a linear combination of the basis \[\{ [A^j] \}_{j \in I_0(n,r)}\]. For $i \in I_0(n,r)$, order the set
\[
\{ t \in \mathbb{Z} \mid 1 \leq t \leq r, i_t = 1, m_t = 1 \} = \{ t_1, t_2, \ldots, t_a \}
\]
by $t_1 < t_2 < \cdots < t_a$. Then, by definition, $\omega_{i-m} X_{t_1}^{-1} X_{t_2}^{-1} \cdots X_{t_a}^{-1} = \omega_j$, where $j = i - m + n(e_{t_1}^\delta + e_{t_2}^\delta + \cdots + e_{t_a}^\delta) \in I(n, r)$. By Proposition \[3.3.1\] (see also Remark \[3.3.2\]), $\omega_j = [A^j]$. Thus,
\[
\omega_{i-m} = \omega_j X_{t_a} X_{t_{a-1}} \cdots X_{t_1} = [A^j] X_{t_a} X_{t_{a-1}} \cdots X_{t_1}
\]
Since $\tilde{T}_k = \tilde{T}_r \cdots \tilde{T}_2 \tilde{T}_1 X_1$, it follows that $X_k = \tilde{T}_k^{-1} \cdots \tilde{T}_2^{-1} \tilde{T}_1^{-1} \tilde{T}_a^{-1} \tilde{T}_{r-1}^{-1} \tilde{T}_{r-2}^{-1} \tilde{T}_1^{-1} \tilde{T}_2 \cdots \tilde{T}_{k-1}^{-1}$, for $1 \leq k \leq r$. Now, by Proposition \[3.2.10\] and noting $\tilde{T}_a^{-1} = \tilde{T}_a - (v - v^{-1})$,
\[
[A^j] \tilde{T}_a^{-1} = \begin{cases} v^{-1} [A^j], & \text{if } n = j_t = j_{t_a+1}; \\ [A^j], & \text{if } n = j_t > j_{t_a+1}. \end{cases}
\]
Thus, a repeatedly application of Proposition 3.2.10 gives

$$[A^j]|\tilde{T}_{t_a}^{-1} \cdots \tilde{T}_{r-2}^{-1} \tilde{T}_{r-1}^{-1} \tilde{T}_{\rho^{-1}} = v^{-b}[A^{j_{s_{t_a}} \cdots s_{r-1} \rho^{-1}}]$$

where $b = |\{ s \in \mathbb{Z} | t_a < s \leq r, i_s = n, m_s = 0 \}|$. Since $1 \leq i_1 \leq \cdots \leq i_r \leq n$, it follows that

$$b = |\{ s \in \mathbb{Z} | 1 \leq s \leq r, i_s = n, m_s = 0 \}|.$$

If $j' = j_{s_{t_a}} \cdots s_{r-1}, j'' = j_{s_{t_a}} \cdots s_{r-1} \rho^{-1}$, then $j'_r = n$ and so $j''_r = j'_0 = 0 < j''_r$ for all $2 \leq k \leq r$. The last inequality is seen from the fact that $\{ j'_k \}_{2 \leq k \leq r} = \{ j''_k \}_{1 \leq k \leq r-1}$ contains only positive integers. Applying Proposition 3.2.10 again yields

$$[A^{j''}]|\tilde{T}_{1}^{-1} \cdots \tilde{T}_{t_a-1} = [A^{j'_{s_{1}} \cdots s_{t_a-1}}] = [A^{j-n e_{t_a}}]$$

Hence, $[A^{j}]X_{t_a} = v^{-b}[A^{j-n \epsilon_{t_a}}]$. Continuing this argument, we obtain eventually $\omega_{1-m} = v^{-ab}[A^{j-m}]$, where

$$ab = |\{ (s, t) \in \mathbb{Z}^2 | 1 \leq s, t \leq r, i_s = n, m_s = 0, i_t = 1, m_t = 1 \}|$$

$$= \sum_{1 \leq s, t \leq r} m_t(1 - m_s) \delta_{i_s, n} \delta_{i_t, 1} = \sum_{1 \leq t < s \leq r} m_t(1 - m_s) \delta_{i_s, n} \delta_{i_t, 1} = d(i, m),$$

since if $1 \leq t < s \leq r$ and $\bar{i}_t = \bar{i}_s + 1$ then $i_s = n$ and $i_t = 1$. Therefore, we obtain

$$\bar{u}_\lambda^+ \cdot \omega_i = \sum_{m \in \mathfrak{m}} v^{-c(i, m) - d(i, m)}[A^{j-m}].$$

Comparing this with (3.6.3.2), it remains to prove that

$$d(i, m) + c'(i, m) = c(i - m, i) + d_i - d_{i-m}.$$
is the intersection $\text{Inv}(i - m) \cap \text{Inv}(i)$, where $\mathcal{L} = \{(s, t) \in \mathbb{Z}^2 \mid 1 \leq s \leq r, s < t \}$. It turns out that $\text{Inv}(i - m) \setminus \mathcal{I} = \{(s, t) \in \mathcal{L} \mid i_s + 1 = i_t, m_s = 0, m_t = 1 \}$ and $\text{Inv}(i) \setminus \mathcal{I} = \{(s, t) \in \mathcal{L} \mid i_s = i_t, m_s = 1, m_t = 0 \}$. Hence,

$$d_{i-m} - d_i = \sum_{1 \leq s < t \leq r} m_t(1 - m_s)\delta_{it, is+1} - \sum_{1 \leq s < r \leq t} m_s(1 - m_t)\delta_{it, is}.$$

Since $m_{a+r} = m_a, i_{a+r} = i_a + n$, for all $a \in \mathbb{Z}$, and $i \in I_\delta(n, r)_0$, it follows that $i_s \neq i_t$, for all $1 \leq s \leq r, t > r$, and $i_t = n + 1 \iff i_t = 1$ for some $1 \leq t' \leq r$ with $t = t' + r$.

Thus, the above sums can be rewritten as

$$d_{i-m} - d_i = \sum_{1 \leq s < t \leq r} m_t(1 - m_s)\delta_{it, is+1}(1 - \delta_{is,n}) + \sum_{1 \leq s < r \leq t} m_t(1 - m_s)\delta_{it, i+1}\delta_{is,n} - \sum_{1 \leq s < t \leq r} m_s(1 - m_t)\delta_{it, is}$$

$$= c(i - m, i) - c'(i, m) - d(i, m),$$

as required.

\[ \Box \]

### 3.7. Triangular decompositions of affine quantum Schur algebras

In this section we study the “triangular parts” of $\mathcal{S}_\delta(n, r)$. We first show that $\mathcal{S}_\delta(n, r)$ admits a triangular relation for certain structure constants relative to the BLM basis. This relation allows us to produce an integral basis from which we obtain a triangular decomposition. We will give an application of this decomposition in the next section by proving that the algebra homomorphism $\xi_r : \mathcal{O}_\delta(n) \rightarrow \mathcal{S}_\delta(n, r)$ defined in §3.4 is surjective.

Keep the notation in the previous sections. We will continue to use convolution product to derive properties or formulas via the isomorphism mentioned in Remark 3.1.2. Thus, when the convolution product $\ast$ is used, we automatically mean the affine quantum Schur algebra is the algebra $\mathcal{S}_\delta(n, r)_R$ with $R = \mathbb{Z}[\sqrt{q}, \sqrt{q}^{-1}]$ obtained by specializing $v$ to $\sqrt{q}$, for a prime power $q$, and is identified with the convolution algebra $R_G(\mathcal{Y} \times \mathcal{Y})$. The following results are taken from [58].

**Lemma 3.7.1.** Let $A = (a_{i,j}) \in \Theta_\delta(n, r)$ and let $(L, L') \in \mathcal{O}_A$ where $L = (L_i)_{i \in \mathbb{Z}}$ and $L' = (L'_i)_{i \in \mathbb{Z}}$.

1. A is upper triangular if and only if $L'_i \subseteq L_i$ for all $i$.
2. A is lower triangular if and only if $L_i \subseteq L'_i$ for all $i$.
3. $\dim(L_i/L_{i-1}) = \sum_{k \in \mathbb{Z}} a_{i,k}$, $\dim(L'_i/L'_{i-1}) = \sum_{k \in \mathbb{Z}} a_{k,i}$.
4. $\dim \left( \frac{L_i}{L_i \cap L'_{i-1}} \right) = \sum_{s \leq i, t \geq j} a_{s,t}$, $\dim \left( \frac{L'_i}{L_{i-1} \cap L'_j} \right) = \sum_{s \geq i, t \leq j} a_{s,t}$.

For $A \in M_{\delta,n}(\mathbb{Z})$, let

$$\sigma_{i,j}(A) = \begin{cases} \sum_{s \leq i, t \geq j} a_{s,t}, & \text{if } i < j; \\ \sum_{s \geq i, t \leq j} a_{s,t}, & \text{if } i > j. \end{cases}$$
Thus, we obtain an alternative interpretation of $\sigma_{i,j}(A)$:

$$
\sigma_{i,j}(A) = \begin{cases} 
\sum_{x_0+1 \leq l \leq x_0+n} a_{s,t} \{b \in \mathbb{Z} \mid s - bn \leq i < j \leq t - bn\}, & \text{if } i < j; \\
\sum_{x_0+1 \leq l \leq x_0+n} a_{s,t} \{b \in \mathbb{Z} \mid t - bn \leq i < j \leq s - bn\}, & \text{if } i > j.
\end{cases}
$$

In particular, $\sigma_{i,j}(A) < \infty$.

Further, for $A, B \in M_{\lambda,n}(\mathbb{Z})$, define (see [23, §6])

$$
B \preceq A \iff \sigma_{i,j}(B) \leq \sigma_{i,j}(A) \text{ for all } i \neq j. \quad (3.7.1.1)
$$

We put $B \prec A$ if $B \preceq A$ and, for some pair $(i, j)$ with $i \neq j$, $\sigma_{i,j}(B) < \sigma_{i,j}(A)$. It is shown in [23 Th. 6.2] that if $A, B \in \Theta_\Delta^+(n)$ satisfy $d(A) = d(B)$, then

$$
B \preceq_{\mathrm{deg}} A \iff B \prec A.
$$

In other words, the ordering $\preceq$ is an extension of the degeneration ordering defined in [12.0.8].

For $A \in \Theta_\Delta^+(n)$, write $A = A^+ + A^0 + A^- = A^\pm + A^0$, where $A^+ \in \Theta_\Delta^+(n)$, $A^- \in \Theta_\Delta^-(n) := \{B \mid B \in \Theta_\Delta^+(n)\}$, $A^\pm = A^+ + A^-$, and $A^0$ is a diagonal matrix.

**Lemma 3.7.2.** Let $A \in \Theta_\Delta^+(n)$ with $\sigma(A) \leq r$.

1. For $\mu \in \Lambda_\Delta(n, r - \sigma(A^+))$, $\nu \in \Lambda_\Delta(n, r - \sigma(A^-))$, if

   $$
   ([A^+ + \mathrm{diag}(\mu)] * [A^- + \mathrm{diag}(\nu)])(L, L'') \neq 0,
   $$

   where $(L, L'') \in \mathcal{O}_B$ for some $B \in \Theta_\Delta(n)$, then $B \preceq A$.

2. For $\lambda \in \Lambda_\Delta(n, r - \sigma(A))$, if $(L, L'') \in \mathcal{O}_{A^+ + \mathrm{diag}(\lambda)}$, then

   $$
   \bigcup_{\mu \in \Lambda_\Delta(n, r - \sigma(A^+)) \atop \nu \in \Lambda_\Delta(n, r - \sigma(A^-))} \{L' \in \mathcal{F}_\Delta \mid (L, L') \in \mathcal{O}_{A^+ + \mathrm{diag}(\mu)}, (L', L'') \in \mathcal{O}_{A^- + \mathrm{diag}(\nu)}\} = \{L \cap L''\}.
   $$

**Proof.** (1) Since $([A^+ + \mathrm{diag}(\mu)] * [A^- + \mathrm{diag}(\nu)])(L, L'') \neq 0$, there exists $L' \in \mathcal{F}_\Delta$ such that $(L, L') \in \mathcal{O}_{A^+ + \mathrm{diag}(\lambda)}$ and $(L', L'') \in \mathcal{O}_{A^- + \mathrm{diag}(\mu)}$. Also, $(L, L'') \in \mathcal{O}_B$. Hence, by Lemma 3.7.1(1) and (2), $L' \subseteq L$ and $L' \subseteq L''$, and by Lemma 3.7.1(4),

$$
\sigma_{i,j}(A) = \begin{cases} 
\dim \left( \frac{L_i \cap L_{i-1}}{L_i \cap L_{i-1}^*} \right), & \text{if } i < j; \\
\dim \left( \frac{L_i \cap L_{i-1}^*}{L_i \cap L_{i-1}^*} \right), & \text{if } i > j,
\end{cases}
$$

$$
\sigma_{i,j}(B) = \begin{cases} 
\dim \left( \frac{L_i \cap L_{i-1}}{L_i \cap L_{i-1}^*} \right), & \text{if } i < j; \\
\dim \left( \frac{L_i \cap L_{i-1}^*}{L_i \cap L_{i-1}^*} \right), & \text{if } i > j.
\end{cases}
$$

Therefore, $L' \subseteq L \cap L''$ and

$$
\sigma_{i,j}(A) - \sigma_{i,j}(B) = \begin{cases} 
\dim \left( \frac{L_i \cap L_{i-1}^*}{L_i \cap L_{i-1}^*} \right) \geq 0, & \text{if } i < j; \\
\dim \left( \frac{L_i \cap L_{i-1}^*}{L_i \cap L_{i-1}^*} \right) \geq 0, & \text{if } i > j.
\end{cases}
$$
Consequently, $B \preceq A$.

(2) If $L' \in \mathcal{F}_\Delta$ satisfies
\[
(\mathbf{L}, \mathbf{L}') \in \mathcal{O}_{\Lambda^+} + \text{diag}(\mu), (\mathbf{L}', \mathbf{L}'') \in \mathcal{O}_{\Lambda^-} + \text{diag}(\nu)
\]
for some $\mu \in \Lambda_0(n, r - \sigma(A^+))$ and $\nu \in \Lambda_0(n, r - \sigma(A^-))$, then $L' \subseteq L \cap L''$ as seen above. Thus, for all $i \in \mathbb{Z}$,
\[
\dim \left( \frac{L_i \cap L_i''}{L_i'} \right) = \dim (L_i/L_i') - \dim \left( \frac{L_i}{L_i \cap L_i''} \right)
\]
\[
= \dim \left( \frac{L_i}{L_i \cap L_i''} \right) - \dim \left( \frac{L_i}{L_i \cap L_i''} \right)
\]
\[
= \sum_{s \leq i < t} a_{s,t} - \sum_{s \leq i < t} a_{s,t} = 0,
\]
by Lemma 3.7.1(4) again. Hence, $L' = L \cap L''$, proving the assertion. \qed

**Proposition 3.7.3.** Let $A \in \Theta^\pm_\Delta(n)$. Then the following triangular relation relative to $\prec$ holds:
\[
A^+(0, r)A^-(0, r) = A(0, r) + \sum_{C \in \Theta(n, r)} f_{C,A}[C] \quad \text{(in $\mathcal{S}_\Delta(n, r)$)}
\]
\[
= A(0, r) + \sum_{B \in \Theta^\pm_\Delta(n)} \sum_{B \prec A; j \in \mathbb{Z}} g_{B,j,A;r} B(j, r) \quad \text{(in $\mathcal{S}_\Delta(n, r)$)},
\]
where $f_{C,A} \in \mathbb{Z}$, $g_{B,j,A;r} \in \mathbb{Q}(v)$.

**Proof.** Since the elements $B(j, r)$ span $\mathcal{S}_\Delta(n, r)$ by Proposition 3.4.1, the second equality follows from the first one. We now prove the first equality.

Let $r^\pm = \sigma(A)$, $r^+ = \sigma(A^+)$ and $r^- = \sigma(A^-)$. There is nothing to prove if $r^\pm > r$. Assume now $r^\pm \leq r$. By (3.1.11),
\[
A^+(0, r)A^-(0, r) = \sum_{\mu \in \Lambda(n, r - r^+)} \sum_{\nu \in \Lambda(n, r - r^-)} [A^+ + \text{diag}(\mu)] [A^- + \text{diag}(\nu)]
\]
\[
= \sum_{C \in \Theta(n, r)} \sum_{\mu, \nu} u^{-d_{A^+} + \text{diag}(\mu)} - d_{A^- + \text{diag}(\nu)} \cdot p_{A^+ + \text{diag}(\mu), A^- + \text{diag}(\nu)} \cdot C^d_{C}[C]
\]
\[
= \sum_{C \in \Theta(n, r)} f_{C,A}[C],
\]
where
\[
f_{C,A} = \sum_{\mu \in \Lambda(n, r - r^+)} \sum_{\nu \in \Lambda(n, r - r^-)} u^{-d_{A^+} + \text{diag}(\mu)} - d_{A^- + \text{diag}(\nu)} \cdot p_{A^+ + \text{diag}(\mu), A^- + \text{diag}(\nu)} \cdot C^d_{C}.
\]

If $f_{C,A} \neq 0$, then $p_{A^+ + \text{diag}(\mu), A^- + \text{diag}(\nu)} \cdot C \neq 0$ for some $\mu, \nu$ as above. Thus, by definition, there is a finite filed $\mathbb{F}$ of $q$ elements such that
\[
p_{A^+ + \text{diag}(\mu), A^- + \text{diag}(\nu)} \cdot C | v^q = q_{A^+ + \text{diag}(\mu), A^- + \text{diag}(\nu)} \cdot C \cdot q \neq 0,
\]
where \( n_{A^+ + \text{diag}(\mu), A^- + \text{diag}(\nu)} \) is defined in (3.1.0.6). By Lemma 3.7.2(1), we conclude \( C \preceq A \). We need to prove that \( f_{C,A} = 1 \) if \( C = A + \text{diag}(\lambda) \) for any \( \lambda \in \Lambda(n, r - r) \). First, Lemma 3.7.2(2) implies that there exist unique \( \mu, \nu \) such that \( n_{A^+ + \text{diag}(\mu), A^- + \text{diag}(\nu), A + \text{diag}(\lambda)} q = 1 \). Thus,

\[
f_{A + \text{diag}(\lambda), A} = v^{d_{A + \text{diag}(\lambda)} - d_{A + \text{diag}(\mu)} - d_{A^- + \text{diag}(\nu)}}.
\]

Second, since \( d_{A + \text{diag}(\lambda)} = d_{A^+ + \text{diag}(\mu)} + d_{A^- + \text{diag}(\nu)} \) by a direct computation (see Lemma 3.10.2), we obtain \( f_{A + \text{diag}(\lambda), A} = 1 \). Finally, since \( \preceq \) is a partial ordering on \( \Theta(n) \) by [23, Lem. 6.1], we conclude that

\[
A^+(0, r)A^-(0, r) = A(0, r)+ g,
\]

where \( g \) is a \( Z \)-linear combination of \( [C] \) with \( C \in \Theta(n, r) \) and \( C \preceq A \).

We now use the triangular relation to establish a triangular decomposition for the \( Z \)-algebra \( S(n, r) \).

Consider the following \( Z \)-submodules of \( S(n, r) \)

\[
S(n, r)^+ = \text{span}_Z \{ A(0, r) \mid A \in \Theta(n) \},
S(n, r)^- = \text{span}_Z \{ A(0, r) \mid A \in \Theta(n) \}, \quad \text{and}
S(n, r)^0 = \text{span}_Z \{ \text{diag}(\lambda) \mid \lambda \in \Lambda(n, r) \}.
\]

As homomorphic images of Ringel–Hall algebras (see Proposition 3.6.1), both \( S(n, r)^+ \) and \( S(n, r)^- \) are \( Z \)-subalgebras of \( S(n, r) \). It can be directly checked that \( S(n, r)^0 \) is also a \( Z \)-subalgebra of \( S(n, r) \). Moreover, \( S(n, r)^0 \) is isomorphic to the zero part of the (non-affine) quantum Schur algebra. We will call the subalgebras \( S(n, r)^- \), \( S(n, r)^0 \) and \( S(n, r)^+ \) the negative, zero and positive parts of \( S(n, r) \), respectively. The next result shows that all three subalgebras are free as \( Z \)-modules. Recall the notation \( [X_{\alpha}^\mu] \) introduced in (1.1.0.6).

**Proposition 3.7.4.** Let \( \ell_i = 0(e_i, r) \), \( 1 \leq i \leq n \).

1. The set \( \{ A(0, r) \mid A \in \Theta(n), \sigma(A) \leq r \} \) (resp., \( \{ A(0, r) \mid A \in \Theta(n), \sigma(A) \leq r \} \)) forms a \( Z \)-basis for \( S(n, r)^+ \) (resp., \( S(n, r)^- \)).
2. For \( \lambda \in \Lambda(n, r) \),

\[
[\text{diag}(\lambda)] = t_\lambda := \begin{bmatrix}
\ell_1; 0 \\
\lambda_1
\end{bmatrix} \begin{bmatrix}
\ell_2; 0 \\
\lambda_2
\end{bmatrix} \cdots \begin{bmatrix}
\ell_n; 0 \\
\lambda_n
\end{bmatrix}
\]

In particular, the set \( \{ t_\lambda \mid \lambda \in \Lambda(n, r) \} \) forms a \( Z \)-basis of \( S(n, r)^0 \).

**Proof.** Assertion (1) follows from the definition of \( A(0, r) \). To see (2), since \( \ell_i[\text{diag}(\mu)] = \sum_{\nu \in \Lambda(n, r)} v^{\mu_i}[\text{diag}(\nu)][\text{diag}(\mu)] = v^{\mu_i}[\text{diag}(\mu)] \), by (3.1.3.3), it follows that \( [t_i; 0] [\text{diag}(\mu)] = [t_i] [\text{diag}(\mu)] \). Hence, for \( \lambda \in \Lambda(n, r) \),

\[
t_\lambda = \sum_{\mu \in \Lambda(n, r)} t_\lambda[\text{diag}(\mu)] = \sum_{\mu \in \Lambda(n, r)} [\mu_1; \lambda_1] \cdots [\mu_n; \lambda_n] [\text{diag}(\mu)] = [\text{diag}(\lambda)],
\]
as desired. \( \square \)

\(^2\)In the literature, \( t_\lambda \) is denoted by \( k_\lambda \) or \( l_\lambda \). We modified the notation in order to introduce its preimage \( L_\lambda \) in \( D(n) \); see (5.1.1.1).
As in §2.2, let $\mathcal{D}_\alpha(n)\pm$ (resp., $\mathcal{H}_\alpha(n)\pm$) be the $\mathbb{Q}(v)$-submodules (resp., $\mathcal{Z}$-submodules) of $\mathcal{D}_\alpha(n)$ spanned by $u_A^\pm$ for $A \in \Theta_\alpha^+(n)$. They are respectively the $\mathbb{Q}(v)$-subalgebras and $\mathcal{Z}$-subalgebras of $\mathcal{D}_\alpha(n)$. The above proposition together with the results in §3.6 gives the following result; see Remark 2.2.11.

**Corollary 3.7.5.** For each $s \geq 1$, we have $z_s^+ \in \mathcal{H}_\alpha(n)^+$ and $z_s^- \in \mathcal{H}_\alpha(n)^-$.  

**Proof.** We only prove $z_s^+ \in \mathcal{H}_\alpha(n)^+$. The proof for $z_s^- \in \mathcal{H}_\alpha(n)^-$ is similar.

By Proposition 3.6.1 and Theorem 3.6.3, the restriction of $\xi_r : \mathcal{D}_\alpha(n) \to \mathcal{S}_\alpha(n,r)$ gives an algebra homomorphism

$$\zeta_r^+ : \mathcal{D}_\alpha(n)^+ \to \mathcal{S}_\alpha(n,r) = \text{End}_{\mathcal{H}_\alpha(r)}(\Omega^{\otimes r})$$

taking $u_A^+ \mapsto A(0,r)$ for $A \in \Theta_\alpha^+(n)$. Write

$$z_s^+ = \sum_{A \in \Theta_\alpha^+(n)} f_A u_A^+$$

where all but finitely many $f_A \in \mathbb{Q}(v)$ are zero. By (3.5.4.1), we have $z_s^+(\Omega^{\otimes r}) \subseteq \Omega^{\otimes r}$. Hence, $\zeta_r^+(z_s^+) \in \text{End}_{\mathcal{H}_\alpha(r)}(\Omega^{\otimes r}) = \mathcal{S}_\alpha(n,r)$; see Proposition 3.3.1. In other words,

$$\zeta_r^+(z_s^+) = \sum_{A \in \Theta_\alpha^+(n)} f_A A(0,r) = \sum_{A \in \Theta_\alpha^+(n), \sigma(A) \leq r} f_A A(0,r) \in \mathcal{S}_\alpha(n,r)^+.$$

By Proposition 3.7.4(1), $\{A(0,r) \mid A \in \Theta_\alpha^+(n), \sigma(A) \leq r\}$ is a $\mathcal{Z}$-basis for $\mathcal{S}_\alpha(n,r)^+$. Hence, $f_A \in \mathcal{Z}$ for all $A \in \Theta_\alpha^+(n)$ with $\sigma(A) \leq r$. Since $r$ can be chosen to be an arbitrary positive integer, it follows that $f_A \in \mathcal{Z}$ for all $A \in \Theta_\alpha^+(n)$. We conclude that $z_s^+ \in \mathcal{H}_\alpha(n)^+$. 

We now patch the three bases to obtain a basis for $\mathcal{S}_\alpha(n,r)$. For $A \in \Theta_\alpha(n)$, define (cf. 3)

$$\|A\| = \sum_{1 \leq i \leq j \leq n} \left(\frac{(j-i)(j-i+1)}{2}\right) a_{i,j} + \sum_{1 \leq i < j \leq n} \left(\frac{(i-j)(i-j+1)}{2}\right) a_{i,j}.$$  

**Lemma 3.7.6.** For $A \in \Theta_\alpha(n)$, the equality

$$\|A\| = \sum_{1 \leq i \leq j} \sigma_{i,j}(A) + \sum_{1 \leq i < j} \sigma_{i,j}(A)$$

holds. In particular, if $A, B \in \Theta_\alpha(n)$ satisfy $A < B$, then $\|A\| < \|B\|$.

**Proof.** By definition, we have

$$\sum_{1 \leq i < j} \sigma_{i,j}(A) = \sum_{1 \leq i \leq s} a_{s,t} = \sum_{1 \leq i \leq s, s \leq t} a_{s,t} \left| \{(i,j) \mid s \leq i < j \leq t\} \right|$$

$$= \sum_{1 \leq s \leq n} \left(\frac{(t-s)(t-s+1)}{2}\right) a_{s,t},$$
\[
\sum_{1 \leq i \leq s, i \neq j} \sigma_{i,j}(A) = \sum_{1 \leq i < s, i > j} a_{s,t} = \sum_{1 \leq i < s, i > t} a_{s,t}|\{(i, j) \mid t < j < i \leq s\}|
\]
\[
= \sum_{1 \leq i, s \leq n, i > t} \frac{(s - t)(s - t + 1)}{2} a_{s,t}.
\]

The assertion follows from the definition of \(|A|\). \(\square\)

For \(A \in \Theta_{\delta}(n)\) and \(i \in \mathbb{Z}\), define the “hook sum”
\[
\sigma_i(A) = a_{i,i} + \sum_{j < i} (a_{i,j} + a_{j,i}).
\]

It is easy to see that \(\sigma(A) = \sum_{1 \leq i \leq n} \sigma_i(A)\). Let
\[
\sigma(A) = (\sigma_i(A))_{i \in \mathbb{Z}} \in \Lambda_{\delta}(n, r) \quad \text{and} \quad p_A = A^+(0, r)l_{\sigma(A)}A^-(0, r) \quad (3.7.6.1)
\]

We now describe a PBW type basis for \(S_{\delta}(n, r)\).

**Theorem 3.7.7.** Keep the notation introduced above. There exist \(g_{B,A} \in \mathbb{Z}\) such that
\[
p_A = [A] + \sum_{B \in \Theta_{\delta}(n, r), B \prec A} g_{B,A}[B].
\]

Moreover, the set \(\mathcal{P}_r := \{p_A \mid A \in \Theta_{\delta}(n, r)\}\) forms a \(\mathbb{Z}\)-basis for \(S_{\delta}(n, r)\). In particular, we obtain a (weak) triangular decomposition:
\[
S_{\delta}(n, r) = S_{\delta}(n, r)^+S_{\delta}(n, r)^0S_{\delta}(n, r)^-.\]

**Proof.** By the notational convention right above Lemma 3.7.2 if \(A \in \Theta_{\delta}(n, r)\), then \(\sigma_i(A^\pm)\) is the \(i\)-th component of \(\text{co}(A^+) + \text{ro}(A^-)\) and
\[
l_{\sigma(A)}A^-(0, r) = [\text{diag}(\sigma(A))]A^-(0, r) = A^-(0, r)[\text{diag}(\sigma(A) + \text{co}(A^-) - \text{ro}(A^-))].
\]

On the other hand, \(A^+(0, r)A^-(0, r) = A^\pm(0, r) + g\), where \(g\) is a \(\mathbb{Z}\)-linear combination of \([B]\) with \(B \in \Theta_{\delta}(n, r)\) and \(B \prec A\), by Proposition 3.7.3. Thus,
\[
p_A = A^+(0, r)l_{\sigma(A)}A^-(0, r)
\]
\[
= A^+(0, r)A^-(0, r)[\text{diag}(\sigma(A) + \text{co}(A^-) - \text{ro}(A^-))]
\]
\[
= A^\pm(0, r)[\text{diag}(\sigma(A) + \text{co}(A^-) - \text{ro}(A^-)) + g']
\]
\[
= [A^\pm + \text{diag}(\sigma(A) - (\text{co}(A^+) + \text{ro}(A^-))] + g'
\]
\[
= [A] + g'
\]

where \(g'\) is the \(\mathbb{Z}\)-linear combination of \([B]\) with \(B \in \Theta_{\delta}(n, r)\) and \(B \prec A\). Thus, the set \(\mathcal{P}_r\) is linearly independent. To see it spans, we can apply Lemma 3.7.6 and an induction on \(|A|\) to show that \([A]\) is a \(\mathbb{Z}\)-linear combination of \(p_B\) with \(B \in \Theta_{\delta}(n, r)\). Hence, \(\mathcal{P}_r\) forms a \(\mathbb{Z}\)-basis for \(S_{\delta}(n, r)\). The last assertion follows from Proposition 3.7.4. \(\square\)
3.8. Affine quantum Schur–Weyl duality, I

We now use the triangular decomposition given in Theorem 3.7.1 to partially establish an affine analogue of the quantum Schur–Weyl reciprocity.

As in Remark 2.2.8(4), for each \( m \geq 0 \), let \( \mathcal{D}_\lambda(n)^{(m)} \) (resp., \( \mathcal{D}_\lambda(n)^{(0)} \)) denote the subalgebra of \( \mathcal{D}_\lambda(n) \) generated by \( u_i^+, u_i^-, K_i^{\pm 1}, z_s^+, z_s^- \) (resp., \( u_i^+, u_i^-, K_i^{\pm 1} \)) for \( i \in I, 1 \leq s \leq m \) (resp., for \( i \in I, m = 0 \)). Thus, \( \mathcal{D}_\lambda(n)^{(0)} = U_\lambda(n) \).

**Theorem 3.8.1.** Let \( n, r \) be two positive integers with \( n \geq 2 \).

1. The algebra homomorphism \( \xi_r : \mathcal{D}_\lambda(n) \to \mathcal{S}_\lambda(n, r) \) is surjective.

2. If we write \( r = mn + m_0 \) with \( m \geq 0 \) and \( 0 \leq m_0 < n \), then \( \xi_r \) induces a surjective algebra homomorphism \( \mathcal{D}_\lambda(n)^{(m)} \to \mathcal{S}_\lambda(n, r) \). In particular, if \( n > r \), then \( \xi_r \) induces a surjective algebra homomorphism \( U_\lambda(n) \to \mathcal{S}_\lambda(n, r) \).

**Proof.** (1) As in Remark 2.2.11 let \( \mathcal{F}_{\lambda}(n)^+ \) (resp., \( \mathcal{F}_{\lambda}(n)^- \)) be the \( \mathbb{Z} \)-subalgebra of \( \mathcal{D}_\lambda(n) \) generated by \( u_i^+ \) (resp., \( u_i^- \)) for all \( A \in \Theta^+(\lambda), \mathcal{D}_\lambda(n)^0 \) the \( \mathbb{Z} \)-subalgebra of \( \mathcal{D}_\lambda(n) \) generated by \( K_i^{\pm 1} \) and \( [K_i^{0}, 0] \) for \( i \in I \) and \( t > 0 \), and set

\[
\widetilde{\mathcal{D}}_\lambda(n) = \mathcal{F}_{\lambda}(n)^+ \mathcal{D}_\lambda(n)^0 \mathcal{F}_{\lambda}(n)^- \cong \mathcal{F}_{\lambda}(n)^+ \otimes \mathcal{D}_\lambda(n)^0 \otimes \mathcal{F}_{\lambda}(n)^-.
\]

By Theorem 3.6.3 and Proposition 3.7.4, \( \xi_r \) maps \( \mathcal{F}_{\lambda}(n)^{\varepsilon} \) onto \( \mathcal{S}_\lambda(n, r)^{\varepsilon} \) for \( \varepsilon = +, - \) and \( \mathcal{D}_\lambda(n)^0 \) onto \( \mathcal{S}_\lambda(n, r)^0 \). Hence, \( \xi_r \) maps \( \widetilde{\mathcal{D}}_\lambda(n) \) onto \( \mathcal{S}_\lambda(n, r) \) by Theorem 3.7.7. Taking base change to \( \mathbb{Q}(v) \) gives the required surjectivity.

(2) By Proposition 1.4.3, \( \mathcal{D}_\lambda(n) \) is generated by \( u_i^+, u_i^-, K_i^{\pm 1}, u_{s\delta}^+, u_{s\delta}^- (i \in I, s \in \mathbb{Z}^+) \). For each \( s \geq 1 \), the semisimple module \( S_{s\delta} \) has dimension \( sn \). Thus, if \( s > m \geq 1 \), then \( S_{s\delta} \succ r \). Moreover, in this case, we have by Corollary 3.5.7 that for each \( \omega_i \in \Omega^{\otimes r} \),

\[
u_{s\delta} \cdot \omega_i = 0 = u_{s\delta}^- \cdot \omega_i.
\]

In other words, \( \xi_r(u_{s\delta}^+) = 0 = \xi_r(u_{s\delta}^-) \) whenever \( s > m \) and \( m \geq 1 \). The assertion follows from the fact that \( \mathcal{D}_\lambda(n)^{(m)} \) is generated by \( u_i^+, u_i^-, K_i^{\pm 1}, u_{s\delta}^+, u_{s\delta}^- (i \in I, 0 \leq s \leq m) \); see Remark 2.2.8(4). The last assertion follows from Corollary 3.5.8.

Combining the above theorem with Corollary 3.5.7 yields the following result which can also be derived from [58 §4.1, Th.8.2].

**Corollary 3.8.2.** Suppose \( n > r \). Then \( \xi_r : \mathcal{D}_\lambda(n) \to \mathcal{S}_\lambda(n, r) \) induces a surjective \( \mathbb{Z} \)-algebra homomorphism

\[
\theta_r : U_\lambda(n) \to \mathcal{S}_\lambda(n, r),
\]

where \( U_\lambda(n) \) is the \( \mathbb{Z} \)-subalgebra of \( \mathcal{D}_\lambda(n) \) generated by \( K_i^{\pm 1}, [K_i^{0}, 0] \), \( (u_i^+)^{(m)} \) and \( (u_i^-)^{(m)} \) for \( i \in I \) and \( t, m \geq 1 \) (see §2.2).

**Proof.** By Proposition 3.7.4, \( \xi_r : \mathcal{D}_\lambda(n) \to \mathcal{S}_\lambda(n, r) \) induces surjective \( \mathbb{Z} \)-algebra homomorphisms

\[
\xi_{r, Z}^+ : \mathcal{F}_{\lambda}(n)^+ \to \mathcal{S}_\lambda(n, r)^+, \text{ and } \xi_{r, Z}^- : \mathcal{F}_{\lambda}(n)^- \to \mathcal{S}_\lambda(n, r)^-.
\]

\(^3\) Lusztig constructed a canonical basis in §4.1 for \( \mathcal{S}_\lambda(n, r) \) and proved that those canonical basis elements labeled by aperiodic matrices form a basis for \( U_\lambda(n, r) := \xi_r(U_\lambda(n)) \).
By [12] Th. 5.2, $\mathfrak{S}_\alpha(n)^+$ is generated by $(u_i^+)^{(m)}$ and $u_i^+$ for $i \in I$, $m \geq 1$, and sincere $a \in \mathbb{N}^n$. Since $n > r$, it follows from Corollary 3.5.7 that $\xi_{r,z}^+(u_i^+) = 0$ for all sincere $a \in \mathbb{N}^n$. Thus, $\mathfrak{S}_{r,z}$ gives rise to a surjective $\mathcal{Z}$-algebra homomorphism

$$\theta_r^+: \mathfrak{C}_\alpha(n)^+ \longrightarrow \mathcal{S}_\alpha(n,r)^+,$$

where $\mathfrak{C}_\alpha(n)^+$ is the $\mathcal{Z}$-algebra of $\mathfrak{D}_\alpha(n)$ generated by the $(u_i^+)^{(m)}$. Similarly, we obtain a surjective $\mathcal{Z}$-algebra homomorphism

$$\theta_r^-: \mathfrak{C}_\alpha(n)^- \longrightarrow \mathcal{S}_\alpha(n,r)^-,$$

where $\mathfrak{C}_\alpha(n)^-$ is the $\mathcal{Z}$-algebra of $\mathfrak{D}_\alpha(n)$ generated by the $(u_i^-)^{(m)}$. By [2.2.9.1], we have

$$U_\alpha(n) = \mathfrak{C}_\alpha(n)^+ \mathfrak{D}_\alpha(n)^0 \mathfrak{C}_\alpha(n)^-.$$

The assertion then follows from the triangular decomposition of $\mathcal{S}_\alpha(n,r)$ given in Theorem 3.7.7. □

If $z \in \mathbb{C}$ is not a root of unity, and $\mathfrak{D}_{\alpha,C}(n)$ is the double Hall algebra over $\mathbb{C}$ with parameter $z$ considered in Remark 2.1.4, then we have an algebra homomorphism $\xi_{r,C}: \mathfrak{D}_{\alpha,C}(n) \rightarrow \mathcal{S}_{\alpha}(n,r)_C$ as given in [3.5.9.1]. The proof of the theorem above gives the following.

**Corollary 3.8.3.** The $\mathbb{C}$-algebra homomorphism

$$\xi_{r,C}: \mathfrak{D}_{\alpha,C}(n) \longrightarrow \mathcal{S}_{\alpha}(n,r)_C$$

is surjective.

The above corollary together with [62] Th. 8.1] shows the following Schur–Weyl reciprocity in the affine quantum case.

**Corollary 3.8.4.** Let $q$ be a prime power. By specializing $v$ to $\sqrt{q}$, the $\mathfrak{D}_{\alpha,C}(n)$-$\mathcal{H}_\alpha(r)_C$-bimodule $\Omega_C^{\otimes r}$ induces algebra homomorphisms

$$\xi_{r,C}: \mathfrak{D}_{\alpha,C}(n) \longrightarrow \text{End}_C(\Omega_C^{\otimes r}) \text{ and } \xi_{r,C}': \mathcal{H}_\alpha(r)_C \longrightarrow \text{End}_C(\Omega_C^{\otimes r})$$

such that

$$\text{Im}(\xi_{r,C}) = \text{End}_{\mathcal{H}_\alpha(r)_C}(\Omega_C^{\otimes r}) = \mathcal{S}_{\alpha}(n,r)_C \text{ and } \text{Im}(\xi_{r,C}') = \text{End}_{\mathcal{S}_{\alpha}(n,r)_C}(\Omega_C^{\otimes r}).$$

**Remarks 3.8.5.**

1. As established in §2.3, $\mathfrak{D}_\alpha(n) \cong U(\hat{\mathfrak{g}l}_n)$, the quantum loop algebra. Hence, $\xi_r$ induces a surjective algebra homomorphism $U(\hat{\mathfrak{g}l}_n) \rightarrow \mathcal{S}_\alpha(n,r)$. Similarly, $\xi_{r,C}$ induces an algebra epimorphism $U_C(\hat{\mathfrak{g}l}_n) \rightarrow \mathcal{S}_{\alpha}(n,r)_C$. Here $U_C(\hat{\mathfrak{g}l}_n)$ is the quantum loop algebra over $\mathbb{C}$ defined in Definition 2.3.1 which is isomorphic to $\mathfrak{D}_{\alpha,C}(n)$ by Remarks 2.3.1(2); cf. Theorem 2.3.5. It would be interesting to find explicit formulas for the action of generators of $U(\hat{\mathfrak{g}l}_n)$ on the tensor space $\Omega_C^{\otimes r}$.

2. In [79] Th. 2], Vasserot has also constructed a surjective map $\Psi_z$ from $U_C(\hat{\mathfrak{g}l}_n)$ to the $K$-theoretic construction $K^G(Z)_z$ of $\mathcal{S}_\alpha(n,r)_C$. It would also be interesting to know if $\Psi_z$ is equivalent to the epimorphism $\xi_{r,C}$, namely, if $g_r \circ \Psi_z = f \circ \xi_{r,C}$ under the isomorphisms $f: U_C(\hat{\mathfrak{g}l}_n) \sim \mathfrak{D}_{\alpha,C}(n)$ and $g_r: K^G(Z)_z \sim \mathcal{S}_\alpha(n,r)_C$ (see [32] (9.4)).

3. By the epimorphisms $\xi_r$ and $\xi_{r,C}$, different types of generators for double Ringel–Hall algebras (see Remark 2.2.8(1)) give rise to corresponding generators for
affine quantum Schur algebras. Thus, we may speak of semisimple generators, homogeneous indecomposable generators, etc., for \( S_\Delta(n, r) \). See §§5.4, 6.2.

We end this section with a few conjectures.

In the proof of the surjectivity of \( \xi_r \) in Theorem 3.8.1(1), we proved that the restriction of \( \xi_r \) to the free \( Z \)-module \( \widehat{D}_\Delta(n) \) defined in (3.8.11) maps onto the (integral) algebra \( S_\Delta(n, r) \). Since the \( H_\Delta(n) \) is generated by certain semisimple generators (see [12] Th. 5.2(iii)), it is natural to expect that the commutator formulas given in Corollary 2.4.8 hold in \( \widehat{D}_\Delta(n) \). Naturally, if the following conjecture was true, we would call \( \widehat{D}_\Delta(n) \) an integral form of Lusztig type for \( D_\Delta(n) \).

**Conjecture 3.8.6.** The \( Z \)-module \( \widehat{D}_\Delta(n) \) is a subalgebra of \( D_\Delta(n) \).

We make some comparisons with the integral form \( D_\Delta(n) \) for \( D_\Delta(n) \) introduced at the end of §2.2 and the restricted integral form discussed in [28] §7.2.

**Remarks 3.8.7.** (1) Since the integral composition algebra \( \xi_\Delta(n) \) is a \( Z \)-subalgebra of the integral Ringel–Hall algebra \( H_\Delta(n) \) which also contains the central generators \( Z_m \) by Corollary 3.7.5, it follows that

\[
D_\Delta(n) \subset \widehat{D}_\Delta(n) \subset D_\Delta(n).
\] (3.8.7.1)

However, we will see in Remark 5.3.8 that the restriction to \( D_\Delta(n) \) of the homomorphism \( \xi_r \) in general does not map onto the integral affine quantum Schur algebra \( S_\Delta(n, r) \). Thus, \( D_\Delta(n) \neq \widehat{D}_\Delta(n) \), and we cannot use this integral form to get the Schur–Weyl theory at the roots of unity.

(2) The restricted integral form \( U^\text{res}_v(\hat{g}_n) \) is the \( C[v, v^{-1}] \)-subalgebra of \( U(\hat{g}_n) \) generated by divided powers \( (x^{\pm}_t)^{(m)} \), \( k^{\pm}_t \), \( [k^{\pm}_t] \), and \( \xi^{\pm}_{m} \) (see [28] §7.2). If we identify \( D_\Delta(n) \) with \( U(\hat{g}_n) \) under the isomorphism \( \Xi_H \) given in Theorem 2.3.5 (2.3.1.1) implies that \( \xi^{\pm}_{m} \in U^\text{res}_v(\hat{g}_n) \) for all \( m \geq 1 \). Now the integral action of \( Z_m \) on the tensor space (3.5.4.4) shows that \( \xi^{\pm}_{m} \notin \widehat{D}_\Delta(n) \). Hence, it seems to us that the restricted integral form \( U^\text{res}_v(\hat{g}_n) \) cannot be defined over \( Z = \mathbb{Z}[v, v^{-1}] \). If it were defined over \( Z \), it would not be a subalgebra of \( \widehat{D}_\Delta(n) \).

The surjective homomorphism \( \xi_v : H_\Delta(r) \rightarrow \text{End}_S(n, r) \) for \( v = \sqrt{q} \) was established by a geometric method. We do not know if the surjectivity holds over \( \mathbb{Q}(v) \). Since both \( \xi_r : D_\Delta(n) \rightarrow S_\Delta(n, r) \) and \( \xi_r_\mathbb{C} : D_\Delta(\mathbb{C}) \rightarrow S_\Delta(n, r) \) are surjective, the following conjecture gives the affine Schur–Weyl reciprocity over \( \mathbb{Q}(v) \) and \( \mathbb{C} \) for a non-root of unity specialization.

**Conjecture 3.8.8.** The algebra homomorphisms

\[
\xi_r : H_\Delta(r) \rightarrow \text{End}_S(n, r), \quad \xi_r_\mathbb{C} : H_\Delta(r) \rightarrow \text{End}_S(n, r)_\mathbb{C}
\]

are surjective, where base change to \( \mathbb{C} \) is obtained by specializing \( v \) to a non-root of unity \( z \in \mathbb{C} \).

With the truth of Conjecture 3.8.6 specializing \( v \) to any element in a field \( \mathbb{F} \) (of any characteristic) results in a surjective homomorphism \( \widehat{D}_\Delta(n) \otimes \mathbb{F} \rightarrow S_\Delta(n, r) \otimes \mathbb{F} \).
It is natural to further expect that the affine Schur–Weyl reciprocity holds at roots of unity.

**Conjecture 3.8.9.** The affine quantum Schur–Weyl reciprocity over any field $\mathbb{F}$ holds.

### 3.9. Polynomial identities arising from commutator formulas for semisimple generators

In this last section we will give an application of our theory. We use the commutator formulas in Theorem 2.4.3(5) to derive certain polynomial identities which seem to be interesting of its own.

For $\lambda \in \mathbb{N}_0^n$, set as in (2.4.3.1)

$$S_\lambda = \bigoplus_{i=1}^n \lambda_i S_i \quad \text{and} \quad A_\lambda = \sum_{i=1}^n \lambda_i E_{i,i+1} \in \Theta_\delta^+(n).$$

Then, $\mathfrak{d}(A_\lambda) = \dim S_\lambda = \sigma(\lambda)$ and $M(A_\lambda) = S_\lambda$. Furthermore, for $\lambda, \alpha, \beta \in \mathbb{N}_0^n$, set $\varphi^{\lambda,\alpha \beta}$ to be the Hall polynomial $\varphi^{A_\lambda,A_\alpha}$ and

$$\begin{bmatrix} \lambda \\ \alpha \end{bmatrix} = \begin{bmatrix} \lambda_1 \\ \alpha_1 \end{bmatrix} \begin{bmatrix} \lambda_2 \\ \alpha_2 \end{bmatrix} \cdots \begin{bmatrix} \lambda_n \\ \alpha_n \end{bmatrix} \quad \text{(cf. (2.4.7.1)).}$$

Recall from (1.1.0.3) that, for $\lambda = (\lambda_i), \mu = (\mu_i) \in \mathbb{N}_0^n$, $\lambda \leq \mu$ means $\lambda_i \leq \mu_i$ for all $i$. Recall also from (1.2.0.12) and (1.2.0.9) the number $d'^{A}$ and the polynomial $a_\lambda$. For semisimple modules, we have the following easy formulas.

**Lemma 3.9.1.** Let $\lambda, \alpha \in \mathbb{N}_0^n$ satisfy $\alpha \leq \lambda$. Then

$$\varphi^{\lambda}_{\alpha,\lambda-\alpha} = \begin{bmatrix} \lambda \\ \alpha \end{bmatrix}, \quad d'^{A}_{\lambda} = \sum_{1 \leq i \leq n} (\lambda_i^2 - \lambda_i) \quad \text{and} \quad a_\lambda := a_{A_\lambda} = \prod_{1 \leq i \leq n} \left( v^{2\lambda_i} - v^{2\alpha_i} \right).$$

In particular, $\varphi^{\lambda}_{\alpha,\lambda-\alpha} = v^{2 \sum_{i=1}^n \alpha_i(\alpha_i - \lambda_i)} \frac{a_\lambda}{a_{\alpha} a_{\lambda-\alpha}}$.

We will also use the abbreviation for the elements

$$\varphi^{A_{A_1 B_1},B_1}_{A,B} = \frac{a_{A_1} a_{B_1}}{a_A a_B} \sum_{A_2 \in \Theta_\delta^+(n)} v^{2\alpha(A_2)} a_{A_2} \varphi^{A_{A_2 A_1}A_2}_{A_1 A_2} \varphi^{B_{B_1 A_1}}_{A_1, A_2},$$

$$\tilde{\varphi}^{A_{A_1 B_1},B_1}_{A,B} = \frac{a_{A_1} a_{B_1}}{a_A a_B} \sum_{A_2 \in \Theta_\delta^+(n)} v^{2\alpha(A_2)} a_{A_2} \varphi^{A_{A_2 A_1}A_2}_{A_1 A_2} \varphi^{B_{B_1 A_1}}_{A_1, A_2},$$

defined in (2.4.3.1) by setting, for $\lambda, \mu, \alpha, \beta \in \mathbb{N}_0^n$,

$$\varphi^{\alpha,\beta}_{\lambda,\mu} = \varphi^{A_{A_\lambda A_\mu}}_{A_\lambda, A_\mu} \quad \text{and} \quad \tilde{\varphi}^{\alpha,\beta}_{\lambda,\mu} = \tilde{\varphi}^{A_{A_\lambda A_\mu}}_{A_\lambda, A_\mu}.$$

**Proposition 3.9.2.** For $\lambda, \mu \in \mathbb{N}_0^n$ and $A, B \in \Theta_\delta^+(n)$, if $\varphi^{A_{A_\lambda A_\mu}}_{A_\lambda, A_\mu}$ or $\tilde{\varphi}^{A_{A_\lambda A_\mu}}_{A_\lambda, A_\mu}$ is nonzero, then there exist $\alpha, \beta \in \mathbb{N}_0^n$ such that $A = A_\alpha$, $B = A_\beta$, $\lambda - \alpha = \mu - \beta \geq 0$, and

$$\varphi^{\alpha,\beta}_{\lambda,\mu} = \tilde{\varphi}^{\alpha,\beta}_{\lambda,\mu} = \frac{1}{a_{\lambda-\alpha}} v^{2\sigma(\lambda-\alpha)+\sum_{1 \leq i \leq n} 2(\alpha_i(\alpha_i - \lambda_i)+\beta_i(\beta_i - \mu_i))}.$$
3.9. POLYNOMIAL IDENTITIES ARISING FROM COMMUTATOR FORMULAS

Proof. If either \( \varphi_{\lambda, A} \neq 0 \) or \( \varphi_{\lambda, A} = 0 \), then \( \varphi_{\lambda, C} \varphi_{A, C} \neq 0 \) or \( \varphi_{\lambda, A} \varphi_{A, C} \neq 0 \) for some \( C \). In either case, both \( M(A) \) and \( M(B) \), as submodules or quotient modules of a semisimple module, are semisimple, and \( \lambda \) is a root of unity. Write \( A = A_\alpha, B = A_\beta \) for some \( \alpha, \beta \in \mathbb{N}_0 \). Then \( \lambda = \lambda_\alpha = \lambda_\beta \) and \( \text{so } a_{\lambda_\alpha} = a_{\lambda_\beta} \). By the last assertion of Lemma 3.9.1, one sees immediately that

\[
\varphi_{\lambda_\alpha, A} = \frac{a_{\lambda_\alpha} a_{\lambda_\beta}}{a_{\lambda_\lambda} a_{\mu}} \left[ \begin{array}{c} \lambda_\alpha \\ \mu \\ \beta \end{array} \right] \left[ \begin{array}{c} \lambda_\beta \\ \mu \\ \beta \end{array} \right] a_{\lambda_\alpha} v^{2\lambda_\alpha - \lambda_\beta - \lambda - 2},
\]

as required.

Recall the surjective homomorphism \( \xi_r : \mathcal{D}_\lambda(n) \to \mathcal{S}_\lambda(n, r) \) as explicitly described in Theorem 3.6.3. For \( A, B \in \Theta^*_\lambda(n) \), let \( X_{A,B} := \xi_r(L_{A,B}) \) and \( Y_{A,B} := \xi_r(R_{A,B}) \), where \( L_{A,B}, R_{A,B} \) are defined in Theorem 2.4.3(5). Then \( X_{A,B} = Y_{A,B} \). In fact, since these commutator formulas continue to hold in \( \mathcal{D}_{\lambda,C}(n) \) where \( v \) is specialized to a non-root of unity in \( \mathbb{C} \) (see Remark 2.1.4), \( X_{A,B} = Y_{A,B} \) in \( S_\lambda(n, r)_C \). In particular, for each prime power \( q \), by specializing \( v \to \sqrt{q} \), we will view both \( X_{A,B} \) and \( Y_{A,B} \) as elements in the convolution algebra \( \mathbb{C}_G(\mathcal{U} \times \mathcal{U}) \cong S_\lambda(n, r)_C \). In this case, denote \( X_{A,B} \) and \( Y_{A,B} \) by \( X^q_{A,B} \) and \( Y^q_{A,B} \), respectively. Thus, we have \( X^q_{A,B} = Y^q_{A,B} \), where

\[
X^q_{A,B} = \sqrt{q}^{d(A),d(B)} \sum_{A_1,B_1} \varphi^q_{A_1,B_1}(q) \sqrt{q}^{d(B_1),d(A_1)+d(B_1)-d(A_1)-d(B_1)} \times \tilde{\epsilon}_{d(B_1)-d(B)} \ast (B_1)(0, r) \ast A_1(0, r),
\]

\[
Y^q_{A,B} = \sqrt{q}^{d(A),d(B)} \sum_{A_1,B_1} \varphi^q_{A_1,B_1}(q) \sqrt{q}^{d(B_1),d(A_1)+d(B_1)-d(A_1)-d(B_1)} \times \tilde{\epsilon}_{d(B_1)-d(B)} \ast A_1(0, r) \ast (B_1)(0, r),
\]

with \( \epsilon_i = \xi_r(K_i) = 0(\epsilon_i, r) \) for any \( i \in I \) and \( \tilde{\epsilon}_a = \prod_{i=1}^n \epsilon_i^{a_i} \tilde{\epsilon}_{i}^{-a_i} \) for any \( a = (a_i) \in \mathbb{N}_0^n \).

In the following we are going to use the equality \( X^q_{A,B} = Y^q_{A,B} \) to derive some interesting polynomial identities. In the rest of this section, we fix the finite field \( \mathbb{F} \) with \( q \) elements. As in §3.1, let \( \mathcal{U} = \mathcal{F}_\lambda(q) \) be the set of all cyclic flags \( L = (L_i)_{i \in \mathbb{Z}} \) of lattices in a fixed \( \mathbb{F}[\varepsilon, \varepsilon^{-1}] \)-free module \( V \) of rank \( r \geq 1 \).

Lemma 3.9.3. For \( a \in \mathbb{N}_0^n \) and \( (L, L') \in \mathcal{U} \times \mathcal{U} \),

\[
\tilde{\epsilon}_a(L, L') = \begin{cases} q^{\frac{1}{2}(a, \lambda)}, & \text{if } L = L' \text{ and } (L, L) \in \mathcal{O}_{\text{diag}(\lambda)} \text{ for } \lambda \in \Lambda_\lambda(n, r); \\ 0, & \text{otherwise.} \end{cases}
\]

Proof. Let \( \lambda \in \Lambda_\lambda(n, r) \). By Lemma 3.7.1(1) and (2), \( (L, L') \in \mathcal{O}_{\text{diag}(\lambda)} \) if and only if \( L = L' \) and \( \lambda_i = \dim(L_i/L_{i-1}) \) for all \( i \). Thus, if \( \tilde{\epsilon}_a(L, L') \neq 0 \), then \( L = L' \). Now assume \( L = L' \) and \( (L, L) \in \mathcal{O}_{\text{diag}(\lambda)} \). Since \( \tilde{\epsilon}_a = \sum_{\mu \in \Lambda_\lambda(n, r)} q^{\frac{1}{2}(\mu, \lambda)} \sum_{1 \leq i \leq n} (a_i - a_{i-1}) \mu_i [\text{diag}(\mu)] \) and \( [\text{diag}(\mu)] = \chi_{\text{diag}(\mu)} \), it follows that

\[
\tilde{\epsilon}_a(L, L) = q^{\frac{1}{2} \sum_{1 \leq i \leq n} (a_i - a_{i-1}) \lambda_i} = q^{\frac{1}{2}(a, \lambda)}.
\]

\( \square \)
For integers $N, t$ with $t \geq 0$, let $\left[ \begin{array}{c} N \\ t \end{array} \right]_q = \prod_{1 \leq i \leq t} \frac{q^{N+i-1}}{q-1}$. For $\alpha, \beta \in \mathbb{N}_0$ and $(L, L'') \in \mathcal{Y} \times \mathcal{Y}$, consider the subsets of $\mathcal{Y}$:

\[
X(\alpha, \beta, L, L'') := \{ L' \in \mathcal{Y} \mid L, L'' \subseteq L', L'/L \cong S_{\beta}, L'/L'' \cong S_{\alpha} \},
\]

\[
Y(\alpha, \beta, L, L'') := \{ L' \in \mathcal{Y} \mid L' \subseteq L, L'' \subseteq L' \cong S_{\alpha}, L''/L' \cong S_{\beta} \}.
\]

Here, $L, L'' \subseteq L'$ and $L' \subseteq L, L''$ are the short form of $L \subseteq L', L'' \subseteq L'$ and $L' \subseteq L, L'' \subseteq L'$, respectively.

**Lemma 3.9.4.** For $\alpha, \beta \in \mathcal{Y}$ and $(L, L'') \in \mathcal{Y} \times \mathcal{Y}$, if $X(\alpha, \beta, L, L'') \neq \emptyset$ or $Y(\alpha, \beta, L, L'') \neq \emptyset$, then $L_i + L''_i \subseteq L_i + L''_i$ and $\beta_i - \dim((L_i + L''_i)/L_i) = \alpha_i - \dim((L_i + L''_i)/L''_i) \geq 0$ for all $i \in \mathbb{Z}$. Moreover, in this case,

\[
|X(\alpha, \beta, L, L'')| = \prod_{1 \leq i \leq n} \left[ \dim(L_i + L''_i) - \dim((L_i + L'')_i)/L''_i \right]_q \quad \text{and}
\]

\[
|Y(\alpha, \beta, L, L'')| = \prod_{1 \leq i \leq n} \left[ \dim(L_i + L''_i) - \dim((L_i + L''_i)/L''_i) \right]_q.
\]

**Proof.** If, as representations of $\Delta(n)$, both $L'/L = (L_i'/L, f_i')$ and $L''/L' = (L''_i/L', f''_i)$ are semisimple, then the linear maps $f_i', f''_i$ induced from inclusion $L_i' \subseteq L''_i$ are zero maps. This forces $L_i' \subseteq L_i+1$ and $L''_i \subseteq L''_i+1$ for all $i$. Hence,

$X(\alpha, \beta, L, L'') \neq \emptyset \iff \exists L' \in X(\alpha, \beta, L, L'')$

\[
\iff \begin{cases} 
L_t + L''_t \subseteq L'_t \subseteq L_{t+1} \cap L''_{t+1}, & \text{for } t \in \mathbb{Z}; \\
\dim(L''_t/L_t) = \beta_t, \dim(L''_t/L''_t) = \alpha_t, & \text{for } t \in \mathbb{Z};
\end{cases}
\]

\[
\iff \end{cases} 
\]

\[
\iff \begin{cases} 
L_t + L''_t \subseteq L'_t \subseteq L_{t+1} \cap L''_{t+1}, & \text{for } t \in \mathbb{Z}; \\
\dim(L''_t/(L_t + L''_t)) = \beta_t - \dim((L_t + L''_t)/L_t), & \text{for } t \in \mathbb{Z};
\end{cases}
\]

\[
\iff \end{cases} 
\]

\[
\iff \begin{cases} 
L_t + L''_t \subseteq L'_t \subseteq L_{t+1} \cap L''_{t+1}, & \text{for } t \in \mathbb{Z}; \\
\dim(L''_t/(L_t + L''_t)) = \alpha_t - \dim((L_t + L''_t)/L''_t), & \text{for } t \in \mathbb{Z}.
\end{cases}
\]

\[
\iff \end{cases} 
\]

and

$Y(\alpha, \beta, L, L'') \neq \emptyset \iff \exists L' \in Y(\alpha, \beta, L, L'')$

\[
\iff \begin{cases} 
L_t \subseteq L_t \subseteq L'_{t-1}, & \text{for } t \in \mathbb{Z}; \\
L'_{t-1} \subseteq L_t \subseteq L'_{t+1}, & \text{for } t \in \mathbb{Z};
\end{cases}
\]

\[
\iff \end{cases} 
\]

\[
\iff \begin{cases} 
L''_{t-1} \subseteq L_t \subseteq L'_{t-1}, & \text{for } t \in \mathbb{Z}; \\
L''_{t-1} \subseteq L_t \subseteq L''_{t+1}, & \text{for } t \in \mathbb{Z};
\end{cases}
\]

\[
\iff \end{cases} 
\]

\[
\iff \begin{cases} 
L''_{t-1} + L''_{t-1} \subseteq L_t \subseteq L_t \cap L''_t, & \text{for } t \in \mathbb{Z}; \\
\dim(L_t \cap L''_t/L'_t) = \alpha_t - \dim((L_t + L''_t)/L''_t), & \text{for } t \in \mathbb{Z};
\end{cases}
\]

\[
\iff \end{cases} 
\]

\[
\iff \begin{cases} 
L''_{t-1} + L''_{t-1} \subseteq L_t \subseteq L_t \cap L''_t, & \text{for } t \in \mathbb{Z}; \\
\dim(L_t \cap L''_t/L'_t) = \beta_t - \dim((L_t + L''_t)/L'_t), & \text{for } t \in \mathbb{Z}.
\end{cases}
\]

The rest of the proof is clear. \qed
For any \( \lambda = (\lambda_i)_{i \in \mathbb{Z}}, \mu = (\mu_i)_{i \in \mathbb{Z}} \in \mathbb{N}_0^n \), define polynomials in \( v^2 \) over \( \mathbb{Z} \):

\[
P_{\lambda,\mu}(v^2) = \sum_{0 \leq \nu \leq \lambda} v^{2(\sum_{1 \leq i \leq n} \frac{\nu_i^2}{2} + (\lambda_i - \nu_i)(\mu_i - \nu_i) - 1)} \prod_{i=1}^{n} (v^2 - 1)^{\nu_i} \binom{\lambda_i}{\nu_i} \binom{\mu_i + 1}{\nu_i}.
\]

\[
P'_{\lambda,\mu}(v^2) = \sum_{0 \leq \nu \leq \lambda} v^{2(\sum_{1 \leq i \leq n} \frac{\nu_i^2}{2} + (\lambda_i - \nu_i)(\mu_i + 1 - \nu_i + 1))} \prod_{i=1}^{n} (v^2 - 1)^{\mu_i} \binom{\lambda_i}{\nu_i} \binom{\mu_i}{\nu_i}.
\]

We now prove that these polynomials occur naturally in the coefficient s of \( X_{A,B}, Y_{A,B} \) for \( A, B \in \Theta_0^+(n) \) when they are written as a linear combination of \( e_C, C \in \Theta_0(n, r) \).

**Theorem 3.9.5.** For \( \lambda, \mu \in \mathbb{N}_0^n, x, y \in A_\lambda(n, r) \) and \( (L, L'') \in \mathcal{F}_{\delta,x}(q) \times \mathcal{F}_{\delta,y}(q) \), let \( \lambda := \lambda - \gamma \) and \( \mu := \mu - \delta \), where

\[
\gamma = (\dim(L_i + L''_i)/L''_i)_{i \in \mathbb{Z}}, \quad \delta = (\dim(L_i + L''_i)/L''_i)_{i \in \mathbb{Z}}.
\]

If \( X^q_{\lambda,\mu}(L, L'') \neq 0 \) or \( Y^q_{\lambda,\mu}(L, L'') \neq 0 \), then \( L_i + L''_i \subseteq L_{i+1} \cap L''_{i+1} \) for all \( i \in \mathbb{Z} \) and \( \lambda = \mu = 0 \). Moreover, putting \( z_i = \dim(L_i + L''_i)/(L_{i-1} + L''_{i-1})) \) for all \( i \in \mathbb{Z} \), we have in this case:

\[
X^q_{\lambda,\mu}(L, L'') := X^q_{A,\lambda,A,\mu}(L, L'') = q^{\frac{1}{2} (f_{\lambda} + \sum_{1 \leq i \leq n} (\lambda_i + \mu_i + \lambda_i - \lambda_i) + (\lambda_i - \lambda_i - 1) - x_{i+1}(\delta_i + \lambda_i) + (\lambda_i + \lambda_i) + (\delta + \lambda_i, \lambda_i))} \prod_{1 \leq i \leq n, \lambda_i \leq \lambda_i} \frac{1}{q^{s_i} - 1} \cdot P_{\lambda,\mu}(q)
\]

\[
Y^q_{\lambda,\mu}(L, L'') := Y^q_{A,\lambda,A,\mu}(L, L'') = q^{\frac{1}{2} (f_{\lambda} + \sum_{1 \leq i \leq n} (\lambda_i + \mu_i + \lambda_i - \lambda_i) + (\lambda_i - \lambda_i - 1) - x_{i+1}(\delta_i + \lambda_i) + (\lambda_i + \lambda_i) + (\delta + \lambda_i, \lambda_i))} \prod_{1 \leq i \leq n, \lambda_i \leq \lambda_i} \frac{1}{q^{s_i} - 1} \cdot P'_{\lambda,\mu}(q)
\]

where \( f_{\lambda} = \sum_{1 \leq i \leq n} [\lambda_i(\lambda_i - 1 - \lambda_i - y_i) - x_{i+1}(\delta_i + \lambda_i)] + (\lambda, \lambda_i) + (\delta + \lambda_i, \lambda_i) \).

**Proof.** We need to compute the value of \( (3.9.2.1) \) at \( (L, L'') \) for \( A = A_\lambda, B = A_\mu \) (hence, \( A_1 = A_\alpha \) and \( B_1 = A_\beta \)). By Corollary 3.6.2 and Lemma 3.9.3 and noting \( \dim \mathcal{O}_v = 0 \) for \( v \in \mathbb{N}_0^n \),

\[
(\mathfrak{t}_{\mu - \beta} \ast t_{\alpha}(0, r) \ast A_\alpha(0, r))(L, L'') = \sum_{L' \in \mathcal{Q}} (\mathfrak{t}_{\mu - \beta} \ast t_{\alpha}(0, r))(L, L') A_\alpha(0, r)(L', L'') = q^{\frac{1}{2} (\mu - \beta, -a(L, L') - c(L', L''))} \sum_{L' \in \mathcal{Q}, L'' \subseteq L'} q^{\frac{1}{2} (\mu - \beta, -a(L, L') - c(L', L''))},
\]

where \( a(L, L'), c(L', L'') \) are defined in \( (3.6.0.2) \). Thus, if \( X^q_{\lambda,\mu}(L, L'') \neq 0 \) or \( Y^q_{\lambda,\mu}(L, L'') \neq 0 \), then some \( \varphi^{A,B}_{A_\lambda,A_\mu} = \varphi^{A,B}_{A_\lambda,A_\mu} \neq 0 \). So applying the first assertion of Proposition 3.9.2 yields

\[
X^q_{\lambda,\mu}(L, L'') = \sum_{\alpha, \beta \in \mathbb{N}_0^n, \lambda - \alpha = \mu - \beta \geq 0} \varphi^{\alpha,\beta}_{\lambda,\mu}(q) q^{\frac{1}{2} (\mu - (\beta_1, \beta_2) + (\beta_3, \lambda) - d_{A_\beta} - d_{A_\alpha})} \times \sum_{L' \in \mathcal{Q}, L'' \subseteq L'} q^{\frac{1}{2} (\mu - \beta, -a(L, L') - c(L', L''))},
\]
Similarly,

$$Y_{\lambda,\mu}^q(L, L'') = \sum_{\alpha, \beta \in \mathcal{Q}_n^{\lambda,\mu}} \varphi_{\lambda,\mu}^\alpha \beta(q)q^{t\frac{1}{2}(\langle \mu, \lambda \rangle + \langle \mu, \beta \rangle - d_{\lambda,\beta} - d_{\lambda,\alpha})} \times \sum_{L' \in \mathcal{Y}, L' \subseteq L''} q^{t\frac{1}{2}(\langle \beta, \mu, x \rangle - a(L',L'') - c(L,L'))}.$$  

If $L' \in \mathcal{Y}$ satisfies $L, L'' \subseteq L'$, $L'/L \cong S_{\beta}$ and $L'/L'' \cong S_{\alpha}$, then

$$a(L, L') + c(L', L'') = \sum_{1 \leq i \leq n} \beta_i (x_i - 1 - \beta_i) + \sum_{1 \leq i \leq n} \alpha_i (y_{i+1} - \alpha_i).$$  

Likewise, if $L' \in \mathcal{Y}$ satisfies $L' \subseteq L, L'/L \cong S_{\alpha}$ and $L'/L'' \cong S_{\beta}$, then

$$L_i \subseteq L_{i+1}$$

and $L_i' \subseteq L_{i+1}'$ for all $i$. Thus, $(L_{i+1}' / L_i') \cong L_{i+1}' / L_i$ and $(L_{i+1} / L_i) / (L_{i+1}' / L_i') \cong L_{i+1}' / L_i$, and so dim$(L_{i+1}' / L_i') = x_{i+1} - \alpha_{i+1} + \alpha_i$. Similarly, dim$(L_{i+1}' / L_i') = y_{i+1} - \beta_{i+1} + \beta_i$. Hence,

$$a(L', L) + c(L, L') = \sum_{1 \leq i \leq n} \beta_i (\text{dim}(L_{i+1}' / L_i') - \beta_i) + \sum_{1 \leq i \leq n} \alpha_i (\text{dim}(L_{i+1}' / L_i') - \alpha_i)$$

and consequently,

$$X_{\lambda,\mu}^q(L, L'') = \sum_{\alpha, \beta \in \mathcal{Q}_n^{\lambda,\mu}} \varphi_{\lambda,\mu}^\alpha \beta(q)q^{t\frac{1}{2}(-d_{\lambda,\alpha} - d_{\lambda,\beta} - \sum_{1 \leq i \leq n} \beta_i (x_i - 1 - \beta_i) - \sum_{1 \leq i \leq n} \alpha_i (y_{i+1} - \alpha_i))} \times q^{t\frac{1}{2}(\langle \mu, \lambda \rangle + \langle \mu, \beta \rangle - \langle \beta, \lambda \rangle + \langle \mu, \beta \rangle x) |X(\alpha, \beta, L, L'')|},$$

$$Y_{\lambda,\mu}^q(L, L'') = \sum_{\alpha, \beta \in \mathcal{Q}_n^{\lambda,\mu}} \varphi_{\lambda,\mu}^\alpha \beta(q)q^{t\frac{1}{2}(-d_{\lambda,\alpha} - d_{\lambda,\beta} - \sum_{1 \leq i \leq n} \beta_i (x_i - 1 - \beta_i) - \sum_{1 \leq i \leq n} \alpha_i (y_{i+1} - \alpha_i))} \times q^{t\frac{1}{2}(\langle \mu, \lambda \rangle + \langle \mu, \beta \rangle + \langle \beta, \lambda \rangle + \langle \mu, \beta \rangle x) |Y(\alpha, \beta, L, L'')|}.$$  

Thus, $X_{\lambda,\mu}^q(L, L'') \neq 0$ or $Y_{\lambda,\mu}^q(L, L'') \neq 0$ implies some $X(\alpha, \beta, L, L'') \neq 0$ or $Y(\alpha, \beta, L, L'') \neq 0$, which implies, by Lemma 3.9.3, $L_i + L_i'' \subseteq L_{i+1} \cap L_i''$ for all $i$ and $\beta - \alpha \leq \gamma \geq 0$. The latter together with $\lambda - \lambda = \mu - \beta \geq 0$ implies $\lambda - \hat{\lambda} = (\lambda - \mu) + (\gamma - \delta) = (\alpha - \beta) + (\gamma - \delta) = 0$ and $\hat{\lambda} = \lambda - \gamma \geq \alpha - \gamma \geq 0$. So we have proved the first assertion.

It remains to simplify $X_{\lambda,\mu}^q(L, L'')$ and $Y_{\lambda,\mu}^q(L, L'')$ under the assumption that $L_i + L_i'' \subseteq L_{i+1} \cap L_i''$ for all $i$ and $\hat{\lambda} = \hat{\mu} \geq 0$. First, putting $z_i = \text{dim}(L_i \cap L_i'' / (L_{i-1} + L_i''))$, Lemma 3.9.4 gives $|X(\alpha, \beta, L, L'')| = \prod_{1 \leq i \leq n} \left( \frac{z_{i+1}}{\alpha_i - \gamma_i} \right)$. Second, for $\alpha, \beta \in \mathbb{N}_0$
satisfying \( \lambda - \alpha = \mu - \beta \geq 0 \), Lemma 3.9.1 and Proposition 3.9.2 imply
\[
\varphi_{\alpha,\mu}(q)q^{1/2}(-d^{\alpha}_{\lambda_0} - d_{\alpha}^{-}\sum_{1 \leq i \leq n} \beta_i(x_i+1-\beta_i) - \sum_{1 \leq i \leq n} \alpha_i(1-\alpha_i))
\]
\[
= q^{1/2}\sum_{1 \leq i \leq n}(\lambda_i - \alpha_i + \mu_i(\alpha_i - \lambda_i)) + \beta_i(\beta_i - \mu_i))
\]
\[
= q^{1/2}\sum_{1 \leq i \leq n}(\lambda_i - \alpha_i + \mu_i) q^{1/2}\sum_{1 \leq i \leq n}(\alpha_i(1-\alpha_i) - \beta_i(1-\beta_i) - \alpha_i(1-\alpha_i))
\]
since \( 2\lambda_i - \alpha_i + \beta_i = \lambda_i + \mu_i \) for all \( i \). Hence,
\[
X_{\lambda,\mu}(L, L'') = q^{1/2}\sum_{1 \leq i \leq n}(\lambda_i + \mu_i) \sum_{\alpha, \beta \in \mathbb{N}_0} q^{1/2}\sum_{1 \leq i \leq n}[\alpha_i(1-\alpha_i) - \beta_i(1-\beta_i) - \alpha_i(1-\alpha_i)]
\]
\[
\times q^{1/2}(\mu, \mu) + (\beta, \beta) + \lambda - \alpha \prod_{1 \leq i \leq n}\left[\frac{z_i + 1}{\alpha_i - \gamma_i}\right]_q.
\]
Here we implicitly assumed \( \alpha \geq \gamma \) (or equivalently, \( \beta \geq \delta \)). Setting \( \nu = \alpha - \gamma = \beta - \delta \) gives
\[
X_{\lambda,\mu}(L, L'') = q^{1/2}\sum_{1 \leq i \leq n}(\lambda_i + \mu_i) \sum_{\nu \in \mathbb{N}_0} q^{1/2}\sum_{1 \leq i \leq n}[\alpha_i(1-\alpha_i) - \beta_i(1-\beta_i) - \alpha_i(1-\alpha_i)] \prod_{1 \leq i \leq n}\left[\frac{z_i + 1}{\nu_i}\right]_q, \text{ where}
\]
\[
f_{\nu} = \sum_{1 \leq i \leq n}((\gamma_i + \nu_i)(\gamma_i + \nu_i + \gamma_i - 1 + \nu_i - 2\lambda_i - y_i) + (\delta_i + \nu_i)(2(\gamma_i + \nu_i - \lambda_i) - x_i+1))
\]
\[
+ \langle \mu, \mu \rangle + \langle \delta, \nu, \lambda \rangle + \langle \gamma + \nu \rangle + \langle \lambda - \gamma + \nu \rangle, \quad (3.9.5.1)
\]
for \( \nu \in \mathbb{N}_0^\lambda \) with \( 0 \leq \nu \leq \lambda \). Similarly,
\[
Y_{\lambda,\mu}(L, L'') = q^{1/2}\sum_{1 \leq i \leq n}(\lambda_i + \mu_i) \sum_{\alpha, \beta \in \mathbb{N}_0} q^{1/2}\sum_{1 \leq i \leq n}(\alpha_i(1-\alpha_i) - \beta_i(1-\beta_i) - \alpha_i(1-\alpha_i))
\]
\[
\times q^{1/2}(\mu, \lambda) + (\beta, \alpha) + (\mu, \beta) \prod_{1 \leq i \leq n}\left[\frac{z_i}{\alpha_i - \gamma_i}\right]_q
\]
\[
= q^{1/2}\sum_{1 \leq i \leq n}(\lambda_i + \mu_i) \sum_{\nu \in \mathbb{N}_0^\lambda} q^{1/2}\sum_{1 \leq i \leq n}[\alpha_i(1-\alpha_i) - \beta_i(1-\beta_i) - \alpha_i(1-\alpha_i)] \prod_{1 \leq i \leq n}\left[\frac{z_i}{\nu_i}\right]_q, \text{ where}
\]
\[
g_{\nu} = \sum_{1 \leq i \leq n}((\gamma_i + \nu_i)(\gamma_i + \nu_i + \gamma_i - 1 + \nu_i - 2\lambda_i - y_i) + (\delta_i + \nu_i)(2(\gamma_i + \nu_i - \lambda_i) - x_i+1))
\]
\[
+ \langle \mu, \lambda \rangle + \langle \lambda - \gamma - \nu, \gamma + \nu \rangle + \langle \mu, \delta + \nu \rangle + \langle \gamma + \nu, \lambda \rangle, \quad (3.9.5.2)
\]
Simplifying \( f_{\lambda} - f_{\nu} \) and \( f_{\lambda} - g_{\nu} \) and substituting, we obtain by Lemma 3.10.3

\[
\frac{X_{\lambda,\mu}^q(L, L^\prime)}{q^{\frac{1}{2}\sum_{1 \leq i \leq n}(\lambda_i + \mu_i) + \frac{1}{2}f_{\lambda}}} = \sum_{0 \leq \mu \leq \lambda, \mu \in \mathbb{N}_0^n} q^{\sum_{1 \leq i \leq n}(\lambda_i z_i - \nu_i + \lambda_i + \lambda_i + 1 - \nu_i + 1)} \prod_{1 \leq i \leq n} \left[ \frac{z_{i + 1}}{\nu_i} \right] q^i,
\]

\[
= \sum_{0 \leq \mu \leq \lambda, \mu \in \mathbb{N}_0^n} h_{\nu} q^{\sum_{1 \leq i \leq n}(\lambda_i z_i + \mu_i - \nu_i + \lambda_i + 1 - \nu_i + 1)} \prod_{1 \leq i \leq n} \left[ \frac{z_{i + 1}}{\nu_i} \right] q^i,
\]

Further simplification by Lemma 3.9.1, we obtain

\[
h_{\nu} = q^{-\sum_{1 \leq i \leq n} \nu_i (\lambda_i - \nu_i + 1)} \prod_{1 \leq i \leq n, n \leq \nu_i} \frac{1}{q - 1} \prod_{1 \leq i \leq n, \nu_i \leq n} \frac{1}{q - 1}.
\]

Thus,

\[
X_{\lambda,\mu}^q(L, L^\prime) = q^{\frac{1}{2}(f_{\lambda} + \sum_{1 \leq i \leq n}(\lambda_i + \mu_i + \lambda_i + \lambda_i))} \prod_{1 \leq i \leq n, n \leq \lambda_i} \frac{1}{q - 1} \cdot Q_{\lambda, z}
\]

\[
Y_{\lambda,\mu}^q(L, L^\prime) = q^{\frac{1}{2}(f_{\lambda} + \sum_{1 \leq i \leq n}(\lambda_i + \mu_i + \lambda_i + \lambda_i))} \prod_{1 \leq i \leq n, \lambda_i \leq n} \frac{1}{q - 1} \cdot Q'_{\lambda, z}
\]

where, for \( p_{\nu, \lambda}(q) = q^{\sum_{1 \leq i \leq n} (\nu_i^2 + \lambda_i + \lambda_i)} \prod_{1 \leq i \leq n} \left[ \frac{\lambda_i}{\nu_i} \right] q^i \),

\[
Q_{\lambda, z} = \sum_{0 \leq \mu \leq \lambda, \mu \in \mathbb{N}_0^n} p_{\nu, \lambda}(q) q^{\sum_{1 \leq i \leq n}(\lambda_i z_i - \nu_i + \lambda_i + 1)} \prod_{1 \leq i \leq n, \nu_i \leq n} (q^{z_{i + 1} - s + 1} - 1)
\]

\[
Q'_{\lambda, z} = \sum_{0 \leq \mu \leq \lambda, \mu \in \mathbb{N}_0^n} p_{\nu, \lambda}(q) q^{\sum_{1 \leq i \leq n}(\lambda_i z_i + \nu_i + \lambda_i + 1)} \prod_{1 \leq i \leq n, \nu_i \leq n} (q^{z_i - s + 1} - 1),
\]

Finally, it is clear to see that \( P_{\lambda, z} = Q_{\lambda, z} \) and \( P'_{\lambda, z} = Q'_{\lambda, z} \). \( \square \)
The fact that $\xi_r$ is an algebra homomorphism gives immediately the following polynomial identity.

**Corollary 3.9.6.** For any $\lambda = (\lambda_i)_{i \in \mathbb{Z}}, \mu = (\mu_i)_{i \in \mathbb{Z}} \in \mathbb{N}^n$, $P_{\lambda,\mu}(v^2) = P'_{\lambda,\mu}(v^2)$.

**Proof.** If $\mu = 0$, then the equality holds trivially. Now suppose $\mu \neq 0$ and set $r = \sum_{i=1}^n \mu_i$. Let $\mathbb{F}$ be a finite field with $q$ elements. By Theorems [3.6.3 and 2.4.3(5)], we have $X_{\lambda,\mu}(L, L') = Y_{\lambda,\mu}(L, L)$ for all $\lambda, \mu$ and $(L, L')$. Take $L = (L_i)_{i \in \mathbb{Z}} \in \mathcal{Y}$ such that $\dim L_i/L_{i-1} = \mu_i$ for all $i \in \mathbb{Z}$, and $L' = L$ (thus, $\hat{\lambda} = \lambda = \mu = \mu'$). Applying Theorem 3.9.5 to the equality $X_{\lambda,\lambda}(L, L) = Y_{\lambda,\lambda}(L, L)$ gives the equality $P_{\lambda,\mu}(q) = P'_{\lambda,\mu}(q)$.

**Remarks 3.9.7.** We point out that the polynomial identity $P_{\lambda,\mu}(v^2) = P'_{\lambda,\mu}(v^2)$ for all $\lambda, \mu$ is equivalent to the fact that the algebra homomorphisms $\xi^\pm_r : \mathfrak{D}(n)^{\pm} \rightarrow \mathfrak{S}(n,r)$ constructed by Varagnolo and Vasserot [77] (see (3.6.2.1)), which have easy extensions $\xi_r^{>0} : \mathfrak{D}(n)^{>0} \rightarrow \mathfrak{S}(n,r)$ and $\xi_r^{<0} : \mathfrak{D}(n)^{<0} \rightarrow \mathfrak{S}(n,r)$, can be extended to an algebra homomorphism $\mathfrak{D}(n) \rightarrow \mathfrak{S}(n,r)$.

In fact, there is an obvious linear extension $\xi'_r$ which is an algebra homomorphism if and only if $\xi'_r$ preserves the commutator relations in Theorem 2.4.3(5) on semisimple generators (see Lemma 2.4.1). This is the case by Theorem 3.9.5 if $P_{\lambda,\mu}(q) = P'_{\lambda,\mu}(q)$ for every prime power $q$ and $\lambda, \mu$.

**Problem 3.9.8.** Give a direct (or combinatorial) proof for the polynomial identity $P_{\lambda,\mu}(v^2) = P'_{\lambda,\mu}(v^2)$.

### 3.10. Appendix

In this Appendix, we prove a few lemmas which have been used in the previous sections. The first one reflects some affine phenomenon for the length of the longest element $w_{0,\lambda}$ of $\mathfrak{G}_\lambda$. This is used in the proof of Corollary 3.2.4.

**Lemma 3.10.1.** For $\lambda \in \Lambda(n, r)$ and $d \in \mathcal{D}_\lambda^d$, let

\[ Y = \{ (s,t) \in \mathbb{Z}^2 \mid 1 \leq d^{-1}(s) \leq r, s < t, s, t \in R_k^\lambda \text{ for some } k \in \mathbb{Z} \} \]

\[ Z = \{ (s,t) \in \mathbb{Z}^2 \mid 1 \leq s \leq r, s < t, s, t \in R_k^\lambda \text{ for some } 1 \leq k \leq n \}. \]

Then $|Y| = |Z| = \ell(w_{0,\lambda})$.

**Proof.** For $a \in \mathbb{Z}$ let $Y_a = \{ b \in \mathbb{Z} \mid a < b, a, b \in R_k^\lambda \text{ for some } k \in \mathbb{Z} \}$. We first claim $|Y_{a_1}| = |Y_{a_2}|$ whenever $a_1 = a_2 \mod r$. Indeed, write $a_2 = a_1 + cr$ and assume $a_1 \in R_k^\lambda$ (see (3.2.1.4)). Then $a_2 \in R_{k+cn}^\lambda$. By definition,

\[ Y_{a_2} = \{ b \in \mathbb{Z} \mid a_2 < b, b \in R_{k+cn}^\lambda \} = \{ b \in \mathbb{Z} \mid a_1 < b - cr, b - cr \in R_k^\lambda \}. \]

Hence, there is a bijection from $Y_{a_2}$ to $Y_{a_1}$ defined by sending $b$ to $b - cr$, proving the claim.

Since the remainders of $d(i)$ when divided by $r$ are all distinct and

\[ Y = \bigcup_{1 \leq s \leq r} \{ (d(s), j) \mid j \in Y_{d(s)} \}, \]
it follows from the claim that
\[ |Y| = \sum_{1 \leq s \leq r} |Y_{d(s)}| = \sum_{1 \leq s \leq r} |Y_s| \]
\[ = \sum_{1 \leq s \leq r} |\{ t \in \mathbb{Z} \mid s < t, s, t \in R^\lambda_k \text{ for some } k \in \mathbb{Z} \}| \]
\[ = |Z| = \ell(w_0, \lambda). \]

The next lemma is used in the proof of Proposition 3.7.3.

**Lemma 3.10.2.** Keep the notations \( A, A^+, A^-, \lambda, \mu, \nu \) used in Proposition 3.7.3.1. We have
\[ d_{A^+ + \text{diag}(\lambda)} = d_{A^+ + \text{diag}(\mu)} + d_{A^- + \text{diag}(\nu)}. \]

**Proof.** Recall from Lemma 3.7.2(2) that \( \mu, \nu \) are uniquely determined by the conditions
\[ (L, L') \in O_{A^+ + \text{diag}(\mu)} \text{ and } (L', L'') \in O_{A^- + \text{diag}(\nu)}, \]
whenever \( (L, L'') \in O_{A^+ + \text{diag}(\lambda)} \) and \( L' = L \cap L'' \). By Lemma 3.7.1(3), for \( i \in \mathbb{Z} \),
\[ \lambda_i + \sum_{k, k \neq i} a_{i,k} = \dim(L_i/L_{i-1}) = \mu_i + \sum_{k, k < i} a_{i,k}; \]
\[ \lambda_i + \sum_{k, k \neq i} a_{k,i} = \dim(L''_i/L''_{i-1}) = \nu_i + \sum_{k, k > i} a_{k,i}. \]
Thus, \( \mu_i = \lambda_i + \sum_{k < i} a_{i,k} \) and \( \nu_i = \lambda_i + \sum_{k < i} a_{k,i} \) for all \( i \). Moreover, since for such \( \mu, \nu \),
\[ d_{A^+ + \text{diag}(\lambda)} = \sum_{1 \leq i \leq n} a_{i,j} a_{k,l} + \sum_{1 \leq i \leq n} \lambda_i a_{k,l} + \sum_{1 \leq i \leq n} \lambda_k a_{i,j}, \]
\[ d_{A^+ + \text{diag}(\mu)} = \sum_{1 \leq i \leq n} a_{i,j} a_{k,l} + \sum_{1 \leq i \leq n} \mu_i a_{k,l}, \]
\[ = \sum_{1 \leq i \leq n} a_{i,j} a_{k,l} + \sum_{1 \leq i \leq n} \lambda_i a_{k,l} + \sum_{1 \leq i \leq n} \lambda_k a_{i,j}, \]
\[ d_{A^- + \text{diag}(\nu)} = \sum_{1 \leq i \leq n} a_{i,j} a_{k,l} + \sum_{1 \leq i \leq n} \nu_k a_{i,j}. \]
it follows that

\[
\begin{align*}
&d_{A+\text{diag}(\lambda)} - d_{A+\text{diag}(\mu)} - d_{A^-+\text{diag}(\nu)} \\
&= \sum_{1 \leq i \leq n, \ i \geq k, j < l} a_{i,j}a_{k,l} - \sum_{1 \leq i \leq n, \ i > j, k < l} a_{i,j}a_{k,l} - \sum_{1 \leq i \leq n, \ i > j, k > l} a_{i,j}a_{k,l} \\
&\quad - \sum_{1 \leq i \leq n, \ k \leq i < l, \ i > j} a_{i,j}a_{k,l} - \sum_{1 \leq i \leq n, \ k < i \leq l, \ i > j} a_{i,j}a_{k,l}
\end{align*}
\]

\[
= 0,
\]

as required. \(\square\)

Let \(f_\nu, g_\nu\) be the numbers defined as in (3.9.5.1), (3.9.5.2). The following lemma tells a certain relationship between these numbers and is used in the proof of Theorem 3.9.5.

Lemma 3.10.3. Maintain the notation in the proof of Theorem 3.9.3. For any \(0 \leq \nu \leq \tilde{\lambda} = \lambda - \gamma,\)

\[
\begin{align*}
f_{\tilde{\lambda}} - f_\nu &= -2 \sum_{1 \leq i \leq n} (\hat{\lambda}_i + \gamma_i)(\hat{\lambda}_{i-1} + \gamma_{i-1} - (\gamma_i + \hat{\lambda}_i) - y_i) - \sum_{1 \leq i \leq n} (\delta_i + \hat{\mu}_i)x_{i+1} + \langle \delta + \hat{\mu}, \gamma + \hat{\lambda} \rangle \\
g_{\tilde{\lambda}} - g_\nu &= -2 \sum_{1 \leq i \leq n} (\hat{\lambda}_{i+1} + \gamma_{i+1} - (\gamma_i + \hat{\lambda}_{i-1}) - y_i - \nu_{i+1}) - \sum_{1 \leq i \leq n} (\delta_i + \nu_i)(2(\nu_i - \tilde{\lambda}_i) - x_{i+1}) \\
&\quad - \langle \delta + \nu, \tilde{\lambda} - \nu \rangle - \langle \delta + \nu, \gamma + \hat{\lambda} \rangle - \langle \hat{\lambda} - \nu, x \rangle
\end{align*}
\]

Proof. By definition, for \(0 \leq \nu \leq \tilde{\lambda} = \lambda - \gamma,\)

\[
\begin{align*}
f_{\tilde{\lambda}} - f_\nu &= \sum_{1 \leq i \leq n} (\hat{\lambda}_i + \gamma_i)(\hat{\lambda}_{i-1} + \gamma_{i-1} - (\gamma_i + \hat{\lambda}_i) - y_i) - \sum_{1 \leq i \leq n} (\delta_i + \hat{\mu}_i)x_{i+1} + \langle \delta + \hat{\mu}, \gamma + \hat{\lambda} \rangle \\
&\quad - \sum_{1 \leq i \leq n} (\gamma_i + \nu_i)(-\gamma_i + \nu_i + \gamma_{i-1} + \nu_{i-1} - 2\hat{\lambda}_i - y_i) - \sum_{1 \leq i \leq n} (\delta_i + \nu_i)(2(\nu_i - \tilde{\lambda}_i) - x_{i+1}) \\
&\quad - \langle \delta + \nu, \tilde{\lambda} - \nu \rangle - \langle \delta + \nu, \gamma + \hat{\lambda} \rangle - \langle \hat{\lambda} - \nu, x \rangle
\end{align*}
\]

\[
\begin{align*}
&= \sum_{1 \leq i \leq n} (\hat{\lambda}_i\hat{\lambda}_{i-1} + \hat{\lambda}_i\gamma_{i-1} - \hat{\lambda}_i^2 - \hat{\lambda}_i y_i + \gamma_i\hat{\lambda}_{i-1} - x_{i+1}\hat{\mu}_i - \gamma_i\nu_{i-1} - 3\nu_i^2 - \nu_i\gamma_{i-1} - \nu_i\nu_{i-1}) \\
&\quad + \sum_{1 \leq i \leq n} (4\nu_i\hat{\lambda}_i + \nu_i y_i - 2\delta_i\nu_i + 2\delta_i\hat{\lambda}_i + \nu_i x_{i+1}) \\
&\quad + \langle \hat{\mu} - \nu, \gamma + \hat{\lambda} \rangle - \langle \delta + \nu, \tilde{\lambda} - \nu \rangle - \langle \hat{\lambda} - \nu, x \rangle = f'_\nu + f''_\nu,
\end{align*}
\]
where
\[ f'_\nu = \sum_{1 \leq i \leq n} (\hat{\lambda}_i \hat{\lambda}_{i-1} + \hat{\lambda}_i \gamma_i \hat{\lambda}_{i-1} - \hat{\lambda}_i^2 - \hat{\lambda}_i y_i + \gamma_i \hat{\lambda}_{i-1} - x_{i+1} \hat{\mu}_i + \delta_i \hat{\lambda}_i \]
\[ + \hat{\mu}_i \hat{\lambda}_i + \hat{\mu}_i \gamma_i - \hat{\mu}_i \gamma_i + \hat{\mu}_i \hat{\lambda}_{i+1}) + \sum_{1 \leq i \leq n} (\delta_i \hat{\lambda}_{i+1} - x_i \hat{\lambda}_i + x_{i+1} \hat{\lambda}_i), \]
\[ f''_\nu = \sum_{1 \leq i \leq n} (-\gamma_i \nu_i - \gamma_i \nu_{i-1} - 2 \nu_i^2 - \nu_i \gamma_i - \nu_i \nu_{i-1} + 2 \nu_i \hat{\lambda}_i + \nu_i y_i - \delta_i \nu_i + \nu_i \gamma_{i+1} + 2 \nu_i \hat{\lambda}_{i+1}) \]
\[ + \sum_{1 \leq i \leq n} (-\delta_i \nu_{i+1} - \nu_i \nu_{i+1} + x_i \nu_i). \]

Since \( \hat{\mu} = \hat{\lambda} \) and \( \gamma_i - y_i - x_i + \delta_i - \delta_{i-1} + \delta_i = -2 z_i \) for all \( i \in \mathbb{Z} \), we have
\[ f'_\nu = \sum_{1 \leq i \leq n} \hat{\lambda}_i (\gamma_i - y_i + \delta_i + \gamma_i - \gamma_i - x_i) + \sum_{1 \leq i \leq n} \gamma_i \hat{\lambda}_{i-1} + \sum_{1 \leq i \leq n} \delta_i \hat{\lambda}_{i+1} \]
\[ = \sum_{1 \leq i \leq n} \hat{\lambda}_i (\gamma_i - y_i - x_i + \delta_i - \delta_{i-1} + \delta_i) \]
\[ = -2 \sum_{1 \leq i \leq n} \hat{\lambda}_i z_i, \]
\[ f''_\nu = \sum_{1 \leq i \leq n} \nu_i (-\gamma_i - y_i - x_i + \delta_i - \delta_{i-1} + \delta_i) - 2 \nu_i - \nu_{i-1} + 2 \hat{\lambda}_i + 2 \hat{\lambda}_{i+1} - \nu_{i+1} \]
\[ = \sum_{1 \leq i \leq n} 2 \nu_i (z_i + \hat{\lambda}_i + \hat{\lambda}_{i+1} - \nu_i - \nu_{i+1}). \]

Consequently, for \( 0 \leq \nu \leq \hat{\lambda} \), we obtain that
\[ f'_{\hat{\lambda}} - f'_\nu = -2 \sum_{1 \leq i \leq n} \hat{\lambda}_i z_i + \sum_{1 \leq i \leq n} 2 \nu_i (z_i + \hat{\lambda}_i + \hat{\lambda}_{i+1} - \nu_i - \nu_{i+1}). \]

Since \( \hat{\mu} = \hat{\lambda} \), for \( 0 \leq \nu \leq \hat{\lambda} \), we have
\[ g'_{\hat{\lambda}} - g'_{\nu} = \sum_{1 \leq i \leq n} (\hat{\lambda}_i + \gamma_i)(\gamma_i - \hat{\lambda}_i - y_i) - \sum_{1 \leq i \leq n} (\delta_i + \hat{\lambda}_i) x_{i+1} + (\delta + \hat{\lambda}, \delta + \hat{\lambda}) \]
\[ - \sum_{1 \leq i \leq n} (\gamma_i + \nu_i)(-\gamma_i + \gamma_i - \nu_i - \nu_i - 2 \hat{\lambda}_i - y_i) \]
\[ - \sum_{1 \leq i \leq n} (\delta_i + \nu_i)(2 \nu_i - \hat{\lambda}_{i+1} - x_{i+1}) - (\hat{\lambda} - \nu, \gamma + \nu) - (\delta + \hat{\lambda}, \delta + \nu) - (\nu - \hat{\lambda}, x) \]
\[ = g''_{\nu} + g''_{\nu}, \]

where
\[ g''_{\nu} = \sum_{1 \leq i \leq n} (\gamma_i \nu_i - \gamma_i \nu_{i-1} - 2 \nu_i^2 - \nu_i \gamma_i - \nu_i \nu_{i-1} + 2 \nu_i \hat{\lambda}_i + \nu_i y_i - 3 \delta_i \nu_i + 2 \nu_i \nu_{i+1} + \delta_i \nu_{i+1} + 2 \hat{\lambda}_i \nu_{i+1} - \nu_i \nu_{i+1} - x_i \nu_i). \]
It is easy to check that for all $i \in \mathbb{Z}$,
\[
\gamma_{i-1} - \gamma_i + 2\gamma_{i+1} + x_i - y_i - 2x_{i+1} + 3\delta_i - \delta_{i-1} = -2z_{i+1}.
\]
Therefore,
\[
g'_\nu = \sum_{1 \leq i \leq n} \hat{\lambda}_i (\gamma_{i-1} - \gamma_i + 2\gamma_{i+1} + x_i - y_i - 2x_{i+1} + 3\delta_i - \delta_{i-1}) = -2 \sum_{1 \leq i \leq n} \hat{\lambda}_i z_{i+1},
\]
\[
g''_\nu = \sum_{1 \leq i \leq n} (- (\gamma_{i-1} - \gamma_i + 2\gamma_{i+1} + x_i - y_i - 2x_{i+1} + 3\delta_i - \delta_{i-1})
\quad - 2\nu_i - \nu_{i-1} - \nu_{i+1} + 2\hat{\lambda}_i + 2\hat{\lambda}_{i-1})
\quad = \sum_{1 \leq i \leq n} 2\nu_i (z_{i+1} + \hat{\lambda}_i + \hat{\lambda}_{i-1} - \nu_i - \nu_{i+1}).
\]
Note that $g_{\hat{\lambda}} = f_{\hat{\lambda}}$. Thus, for $0 \leq \nu \leq \hat{\lambda}$,
\[
f_{\hat{\lambda}} - g_\nu = g_{\hat{\lambda}} - g_\nu = -2 \sum_{1 \leq i \leq n} \hat{\lambda}_i z_{i+1} + \sum_{1 \leq i \leq n} 2\nu_i (z_{i+1} + \hat{\lambda}_i + \hat{\lambda}_{i-1} - \nu_i - \nu_{i+1}).
\]
\qed
CHAPTER 4

Representations of affine quantum Schur algebras

The quantum Schur–Weyl duality links representations of quantum \( \mathfrak{g} \mathfrak{l}_n \) with those of Hecke algebras of symmetric groups. More precisely, there are category equivalences between level \( r \) representations of quantum \( \mathfrak{g} \mathfrak{l}_n \) and representations of the Hecke algebra of \( S_r \). This relationship provides in turn two approaches to representations of quantum Schur algebras. First, one uses the polynomial representation theory of quantum \( \mathfrak{g} \mathfrak{l}_n \) to determine representations of quantum Schur algebras. This is a downwards approach. Second, representations of quantum Schur algebras can also be determined by those of Hecke algebras. We call this an upwards approach. In this chapter, we will investigate the affine versions of the two approaches.

Classification of finite dimensional simple (or irreducible) polynomial representations of the quantum loop algebra \( U_C(\widehat{\mathfrak{g} \mathfrak{l}}_n) \) was completed by Frenkel–Mukhin [28], based on Chari–Pressley’s classification of finite dimensional simple representations of the quantum loop algebra \( U_C(\widehat{\mathfrak{sl}}_n) \) [5, 6]. On the other hand, Zelevinsky [85] and Rogawski [69] classified simple representations of the Hecke algebra \( H_{\triangle}(r)_C \). Moreover, Chari–Pressley have also established a category equivalence between the module category \( H_{\triangle}(r)_C\mod \) and a certain full subcategory of \( U_C(\widehat{\mathfrak{sl}}_n)_\mod \) when \( n > r \) without using affine quantum Schur algebras.

We will first establish in §4.1 a category equivalence between the categories \( S_{\triangle}(n,r)_F\mod \) and \( H_{\triangle}(r)_F\mod \) when \( n \geq r \) (Theorem 4.1.3). As an immediate application of this equivalence, we prove that every simple representation in \( S_{\triangle}(n,r)_F\mod \) is finite dimensional (Theorem 4.1.6). We will briefly review the classification theorems of Chari–Pressley and Frenkel–Mukhin in §4.2 and of Rogawski in §4.3. We will then use the category equivalence to classify simple representations of affine quantum Schur algebras via Rogawski’s classification of simple representations of \( H_{\triangle}(r)_C \) (Theorem 4.3.4).

From §4.4 onwards, we will investigate the downwards approach. Using the surjective homomorphism \( \zeta_{C} : U_C(\widehat{\mathfrak{g} \mathfrak{l}}_n) \to S_{\triangle}(n,r)_C \), every simple \( S_{\triangle}(n,r)_C \)-module is inflated to a simple \( U_C(\widehat{\mathfrak{g} \mathfrak{l}}_n) \)-module. Our question is how to identify those inflated simple modules. We use a two-step approach. First, motivated by a result of Chari–Pressley, we identify in the \( n > r \) case the simple \( S_{\triangle}(n,r)_C \)-modules arising from simple \( H_{\triangle}(r)_C \)-modules in terms of simple polynomial representations of \( U_C(\widehat{\mathfrak{g} \mathfrak{l}}_n) \) (Theorem 4.4.2). Then, using this identification, we will classify all simple \( S_{\triangle}(n,r)_C \)-modules through simple polynomial representations of \( U_C(\widehat{\mathfrak{g} \mathfrak{l}}_n) \) (Theorem 4.5.8). Thus, all finite dimensional simple polynomial representations of \( U_C(\widehat{\mathfrak{g} \mathfrak{l}}_n) \) are inflations of simple representations of affine quantum Schur algebras. In this way, like the classical
theory, affine quantum Schur algebras play a bridging role between polynomial representations of quantum affine $\mathfrak{gl}_n$ and those of affine Hecke algebras of $\mathfrak{S}_r$. We end the chapter by presenting a classification of simple $U_h(n,r)_\mathbb{C}$-modules (Theorem 4.6.5).

Throughout the chapter, all representations are defined over a ground field $\mathbb{F}$ with a fixed specialization $\mathcal{Z} \to \mathbb{F}$ by sending $v$ to a non-root of unity $z \in \mathbb{F}$. From §4.2 onwards, $\mathbb{F}$ will be the complex number field $\mathbb{C}$. The algebras $U_{\mathbb{C}}(\mathfrak{sl}_n)$ and $U_{\mathbb{C}}(\mathfrak{gl}_n)$ are defined in §2.3 with Drinfeld’s new presentation. For any algebra $\mathcal{A}$ considered in this chapter, the notation $\mathcal{A}\text{-mod}$ represents the category of all finite dimensional left $\mathcal{A}$-modules. We also use $\mathcal{A}\text{-Mod}$ to denote the category of all left $\mathcal{A}$-modules.

### 4.1. Affine quantum Schur–Weyl duality, II

In this section we establish the affine version of the category equivalences mentioned in the introduction above. As a byproduct, we prove that every irreducible representation over the affine quantum Schur algebra is finite dimensional.

Recall from §2.2 (see footnote 2 there) the extended affine $\mathfrak{sl}_n$, $U_\Delta(n)$, generated by $E_i, F_i, K_i^\pm$ subject to relations (QGL1)–(QGL5) given in Definition 2.2.3. By dropping the subscripts $\Delta$ from $U_\Delta(n)$, $\mathcal{S}_\Delta(n,r)$, and $\mathcal{H}_\Delta(r)$, we obtain the notations $U(n)$, $\mathcal{S}(n,r)$, and $\mathcal{H}(r)$ for quantum $\mathfrak{gl}_n$, quantum Schur algebras and Hecke algebras of type $A$. The algebras $U(n)$, $\mathcal{S}(n,r)$ and $\mathcal{H}(r)$ will be naturally viewed as subalgebras of $U_\Delta(n)$, $\mathcal{S}_\Delta(n,r)$, and $\mathcal{H}_\Delta(r)$, respectively. Moreover, we may also regard $U(n)$ as a subalgebra of $\mathcal{D}_\Delta(n) = U(\mathfrak{gl}_n)$. Let $U_{\Delta}(n)$ be the $\mathcal{Z}$-form of $U_\Delta(n)$ defined in (2.2.9.1) and let $U(n)$, $\mathcal{S}(n,r)$ and $\mathcal{H}(r)$ denote the corresponding $\mathcal{Z}$-free subalgebras of $U_\Delta(n)$, $\mathcal{S}_\Delta(n,r)$, and $\mathcal{H}_\Delta(r)$.

The tensor space $\Omega^{\otimes r}$ over $\mathcal{Z}$ is a $U_\Delta(n)-\mathcal{H}_\Delta(r)$-bimodule via the actions (3.5.0.1) and (3.3.0.3), where the affine $\mathcal{H}_\Delta(r)$-action is a natural extension from the $\mathcal{H}(r)$-action on $\Omega^{\otimes r}_n$, where $\Omega_n$ is the $\mathcal{Z}$-subspace of $\Omega$ spanned by the elements $\omega_i^j$ ($1 \leq i \leq n$); see (3.3.0.3). Thus, $\Omega^{\otimes r}_n$ is a $U(n)-\mathcal{H}(r)$-subbimodule of $\Omega^{\otimes r}$ by restriction.

**Lemma 4.1.1.** There is a $U(n)-\mathcal{H}(r)$-bimodule isomorphism

$$\Omega^{\otimes r}_n \otimes_{\mathcal{H}(r)} \mathcal{H}_\Delta(r) \cong \Omega^{\otimes r}, \quad x \otimes h \mapsto x h.$$

**Proof.** Clearly, there is a $U(n)-\mathcal{H}_\Delta(r)$-bimodule homomorphism

$$\varphi : \Omega^{\otimes r}_n \otimes_{\mathcal{H}(r)} \mathcal{H}_\Delta(r) \to \Omega^{\otimes r}, \quad x \otimes h \mapsto x h.$$

Since the set $\{ T_w X_1^{a_1} \cdots X_r^{a_r} \mid w \in \mathfrak{S}_r, a_i \in \mathbb{Z}, 1 \leq i \leq r \}$ forms a $\mathcal{Z}$-basis for $\mathcal{H}_\Delta(r)$, it follows that the set

$$\mathcal{X} := \{ \omega_i \otimes X_1^{a_1} \cdots X_r^{a_r} \mid i \in I(n,r), a_i \in \mathbb{Z}, 1 \leq i \leq r \}$$

forms a $\mathcal{Z}$-basis for $\Omega^{\otimes r}_n \otimes_{\mathcal{H}(r)} \mathcal{H}_\Delta(r)$. Furthermore, by (3.3.0.3),

$$\varphi(\omega_i \otimes X_1^{a_1} \cdots X_r^{a_r}) = \omega_i^{a_1} X_1^{a_1} \cdots X_r^{a_r} = \omega_i^{a_1} \cdots \omega_i^{a_r},$$

for all $(a_1, a_2, \ldots, a_r) \in \mathbb{Z}^r$ and $i \in I(n,r)$. Thus, the bijection (3.3.0.2) from $I_\Delta(n,r)$ to $\mathbb{Z}^r = I(n,r) + n\mathbb{Z}^r$ implies that $\varphi(\mathcal{X}) = \{ \omega_i \mid i \in I_\Delta(n,r) \}$ forms a $\mathcal{Z}$-basis for $\Omega^{\otimes r}_n$. Hence, $\varphi$ is a $U(n)-\mathcal{H}_\Delta(r)$-bimodule isomorphism.

For $N = \max\{n,r\}$, let $\omega \in \Lambda(N,r)$ be defined as in (3.1.3.1). Thus, if $\omega = (\omega_i)$, then $\omega_i = 1$ for $1 \leq i \leq r$, and $\omega_i = 0$ if $n > r$ and $r < i \leq n$. Let $e_\omega = e_{\text{diag}(\omega)}$. 

Corollary 4.1.2. If \( n \geq r \), then there is an \( \mathcal{S}(n, r)\)-\( \mathcal{H}(r)\)-bimodule isomorphism

\[
\mathcal{S}_\alpha(n, r)e_\omega \cong \mathcal{S}(n, r)e_\omega \otimes_{\mathcal{H}(r)} \mathcal{H}(r).
\]

Proof. By the proof of Lemma 3.1.3, there is an \( \mathcal{S}_\alpha(n, r)\)-\( \mathcal{H}(r)\)-bimodule isomorphism \( \mathcal{S}_\alpha(n, r)e_\omega \cong T_\alpha(n, r) \). By Proposition 3.3.1, this isomorphism extends to a bimodule isomorphism \( \mathcal{S}_\alpha(n, r)e_\omega \cong \Omega^{\otimes r} \). Now, the required result follows from the lemma above.

We are now ready to establish a category equivalence. For the rest of this section, we assume \( \mathbb{F} \) is a (large enough) field which is a \( \mathcal{Z} \)-algebra such that the image \( z \in \mathbb{F} \) of \( v \) is not a root of unity. Thus, both \( \mathcal{H}(r) \mathbb{F} \) and \( \mathcal{S}(n, r) \mathbb{F} \) are semisimple \( \mathbb{F} \)-algebras, and every finite dimensional \( \mathcal{U}(n) \mathbb{F} \)-module is completely reducible. Let \( \mathcal{S}_\alpha(n, r)\)-\( \mathbb{F} \)-mod (resp., \( \mathcal{H}(r)\)-\( \mathbb{F} \)-mod) be the category of finite dimensional \( \mathcal{S}_\alpha(n, r)\)\( \mathbb{F} \)-modules (resp., \( \mathcal{H}(r)\)\( \mathbb{F} \)-modules). The following result generalizes the category equivalence between \( \mathcal{S}(n, r)\)-\( \mathbb{F} \)-mod and \( \mathcal{H}(r)\)-\( \mathbb{F} \)-mod \((n \geq r)\) to the affine case.

Theorem 4.1.3. Assume \( n \geq r \). The categories \( \mathcal{S}_\alpha(n, r)\)-\( \mathbb{F} \)-Mod and \( \mathcal{H}(r)\)-\( \mathbb{F} \)-Mod are equivalent. It also induces a category equivalence between \( \mathcal{S}_\alpha(n, r)\)-\( \mathbb{F} \)-mod and \( \mathcal{H}(r)\)-\( \mathbb{F} \)-mod. Hence, in this case, the algebras \( \mathcal{S}_\alpha(n, r) \mathbb{F} \) and \( \mathcal{H}(r) \mathbb{F} \) are Morita equivalent.

Proof. The \( \mathcal{S}_\alpha(n, r)\)-\( \mathbb{F} \)-bimodule \( \Omega^{\otimes r} \) induces a functor

\[
\mathcal{F} : \mathcal{H}(r)\mathbb{F}-\text{Mod} \rightarrow \mathcal{S}_\alpha(n, r)\mathbb{F}-\text{Mod}, \quad L \mapsto \Omega^{\otimes r} \otimes_{\mathcal{H}(r)\mathbb{F}} L. \tag{4.1.3.1}
\]

Since \( n \geq r \), there is a functor, the Schur functor,

\[
\mathcal{G} : \mathcal{S}_\alpha(n, r)\mathbb{F}-\text{Mod} \rightarrow \mathcal{H}(r)\mathbb{F}-\text{Mod}, \quad M \mapsto e_\omega M.
\]

Here we have identified \( e_\omega \mathcal{S}_\alpha(n, r)\mathbb{F}e_\omega \) with \( \mathcal{H}(r)\mathbb{F} \). We need to prove that there are natural isomorphisms \( \mathcal{G} \circ \mathcal{F} \cong \text{id}_{\mathcal{H}(r)\mathbb{F}-\text{Mod}}, \) which is clear (see, e.g., \([33] (6.2d))\right)\), and \( \mathcal{F} \circ \mathcal{G} \cong \text{id}_{\mathcal{S}_\alpha(n, r)\mathbb{F}-\text{Mod}} \).

By the semisimplicity, for any \( \mathcal{S}(n, r)\mathbb{F} \)-module \( M \), there is a left \( \mathcal{S}(n, r)\mathbb{F} \)-module isomorphism

\[
f : \mathcal{S}(n, r)\mathbb{F}e_\omega \otimes_{\mathcal{H}(r)\mathbb{F}} e_\omega M \cong M \tag{4.1.3.2}
\]

defined by \( f(x \otimes m) = xm \) for any \( x \in \mathcal{S}(n, r)\mathbb{F}e_\omega \) and \( m \in e_\omega M \). By Corollary 4.1.2, \( \mathcal{G} \circ \mathcal{F} \) induces a left \( \mathcal{S}(n, r)\mathbb{F} \)-module isomorphism

\[
g : \mathcal{S}_\alpha(n, r)\mathbb{F}e_\omega \otimes_{\mathcal{H}(r)\mathbb{F}} e_\omega M \cong M
\]

satisfying \( g(x \otimes m) = xm \) for any \( x \in \mathcal{S}(n, r)\mathbb{F}e_\omega \) and \( m \in e_\omega M \).

We now claim that \( g \) is an \( \mathcal{S}_\alpha(n, r)\mathbb{F} \)-module isomorphism. Indeed, by identifying \( \mathcal{S}_\alpha(n, r)\mathbb{F} \) with \( \mathcal{S}_\alpha^\mathcal{H}(n, r) \) under the isomorphism given in Proposition 3.2.8 and considering the basis \( \{ \phi_{\lambda, \omega} \} \), we have \( e_\omega = \phi_{\omega, \omega}^1 \) and

\[
\mathcal{S}_\alpha(n, r)\mathbb{F}e_\omega = \bigoplus_{\lambda \in \Lambda_\alpha(n, r)} \text{Hom}_{\mathcal{H}(r)\mathbb{F}}(\mathcal{H}(r)\mathbb{F}, \mathcal{S}_\alpha \mathcal{H}(r)\mathbb{F}) = \bigoplus_{\lambda \in \Lambda_\alpha(n, r)} \phi_{\lambda, \omega}^1 \mathcal{H}(r)\mathbb{F},
\]

where \( \phi_{\lambda, \omega}^1 \in \mathcal{S}(n, r)\mathbb{F} \). Since \( g(\phi_{\lambda, \omega} \otimes m) = \phi_{\lambda, \omega}^1 m \), for all \( \lambda \in \Lambda_\alpha(n, r) \) and \( m \in e_\omega M \), it follows that for any \( \lambda \in \Lambda_\alpha(n, r) \), \( h \in \mathcal{H}(r)\mathbb{F} \) and \( m \in e_\omega M \),

\[
g(\phi_{\lambda, \omega}^1 h \otimes m) = g(\phi_{\lambda, \omega}^1 \otimes hm) = \phi_{\lambda, \omega}^1 (hm) = (\phi_{\lambda, \omega}^1 h)m.
\]
Hence, $g(x \otimes m) = xm$ for all $x \in S_\omega(n, r)_\mathbb{F}e_\omega$ and $m \in e_\omega M$. Thus, $g$ is an $S_\omega(n, r)_\mathbb{F}$-module isomorphism. Therefore, for any $M \in S_\omega(n, r)_\mathbb{F} \text{-Mod}$, there is a natural isomorphism

$$F \circ G(M) \cong S_\omega(n, r)_\mathbb{F} e_\omega \otimes H_\omega(n)_\mathbb{F} e_\omega M \cong M,$$

proving $F \circ G \cong \text{id}_{S_\omega(n, r)_\mathbb{F} \text{-Mod}}$.

The last assertion follows from the fact that, if $N$ is a finite dimensional $H_\omega(n)_\mathbb{F}$-module, then Lemma 4.1.1 implies that $F(N) = \Omega^{\omega r}_\mathbb{F} \otimes H_\omega(n)_\mathbb{F} N$ is also finite dimensional.

**Remarks 4.1.4.** (1) For $\mathbb{F} = \mathbb{C}$, a direct category equivalence from $H_\omega(n)_\mathbb{C} \text{-mod}$ to a full subcategory of $U_\mathbb{C}(\widehat{\mathfrak{sl}}_n) \text{-mod}$ has been established in [31, Th. 6.8] when $n \geq r$. The construction there is geometric, using intersection cohomology complexes.

(2) See [80] for a similar equivalence in the context of representations of $p$-adic groups. See also [78] for a connection with representations of double affine Hecke algebras of type $A$.

Following [8, 2.5], a finite dimensional $U(n)_\mathbb{F}$-module $M$ is said to be of level $r$ if every irreducible component of $M$ is isomorphic to an irreducible component of $\Omega^{\omega r}_\mathbb{F}$. In other words, a $U(n)_\mathbb{F}$-module $M$ has level $r$ if and only if it is an $S(n, r)_\mathbb{F}$-module. We will generalize this definition to the affine case; see Corollaries 4.5.9 and 4.5.10 below. Note that, since levels are defined for modules of quantum $\mathfrak{sl}_n$ in [8, 2.5], the condition $n > r$ is necessary.

Recall that a $U_\omega(n)_\mathbb{F}$-module $M$ is called of type 1, if it is a direct sum $M = \bigoplus_{\lambda \in \mathbb{Z}^n} M_\lambda$ of its weight spaces $M_\lambda$ which has the form

$$M_\lambda = \{ x \in M \mid K_i x = z^{\lambda_i} x \}.$$

In other words, a $U_\omega(n)_\mathbb{F}$-module $M$ is of type 1 if it is of type 1 as a $U(n)_\mathbb{F}$-module.

Theorem 4.1.3 immediately implies the following category equivalence due to Chari–Pressley [8]. However, a different functor is used in [8, Th. 4.2]. We will make a comparison of the two functors in the next section.

**Corollary 4.1.5.** If $n > r$, then the functor $F$ induces a category equivalence between the category of finite dimensional $U_\omega(n)_\mathbb{F}$-modules of type 1 which are of level $r$ when restricted to $U(n)_\mathbb{F}$-modules and the category of finite dimensional $H_\omega(n)_\mathbb{F}$-modules.

**Proof.** By Lemma 5.2.1, the condition $n > r$ implies $S_\omega(n, r)_\mathbb{F} = U_\omega(n, r)_\mathbb{F}$ is a homomorphic image of $U_\omega(n)_\mathbb{F}$. Thus, level $r$ representations considered are precisely $S_\omega(n, r)_\mathbb{F}$-modules. Now the result follows immediately from the theorem above. □

If $N \geq n$, then there is a natural injective map

$$\tilde{\lambda} : \Theta_\omega(n) \rightarrow \Theta_\omega(N), \quad A = (a_{i,j}) \mapsto \tilde{A} = (\tilde{a}_{i,j}),$$

where $\tilde{A}$ is defined in (3.1.2.1). Similarly, there is an injective map

$$\tilde{\lambda} : \mathbb{Z}_\omega^n \rightarrow \mathbb{Z}_\omega^N, \quad \lambda \mapsto \tilde{\lambda},$$

where $\tilde{\lambda}_i = \lambda_i$ for $1 \leq i \leq n$ and $\tilde{\lambda}_i = 0$ for $n + 1 \leq i \leq N$. See the proof of Lemma 3.1.3.
These two maps induce naturally by Lemma 3.1.3 an injective algebra homomorphism (not sending 1 to 1)

\[ \iota_r = \iota_{n,N,r} : S_\Theta(n, r) \rightarrow S_\Theta(N, r), \quad [A] \mapsto [\tilde{A}] \text{ for } A \in \Theta_\Theta(n, r). \]

In other words, we may identify \( S_\Theta(n, r) \) as the centralizer subalgebra of \( eS_\Theta(N, r)e \) of \( S_\Theta(N, r) \), where \( e = \sum_{\lambda \in \Lambda_\Theta(n, r)} \phi_{\lambda, \lambda}^1 - \sum_{\lambda \in \Lambda_\Theta(n, r)} [\text{diag}(\tilde{\lambda})] \in S_\Theta(N, r). \)

Now, the fact that every simple module of an affine Hecke algebra is finite dimensional implies immediately that the same is true for affine quantum Schur algebras.

**Theorem 4.1.6.** Every simple \( S_\Theta(n, r)_\mathbb{F} \)-module is finite dimensional.

**Proof.** Let \( L \) be a simple \( S_\Theta(n, r)_\mathbb{F} \)-module. By Corollary 3.2.9 we identify the quantum Schur algebra \( S(n, r)_\mathbb{F} \) as a subalgebra of \( S_\Theta(n, r)_\mathbb{F} \). Thus, for any \( 0 \neq x \in L \), \( S(n, r)_\mathbb{F}x \subset L \) is a nonzero finite dimensional \( S(n, r)_\mathbb{F} \)-module. Hence, it is a direct sum of simple \( S(n, r)_\mathbb{F} \)-modules.

If \( n \geq r \), then the Hecke algebra \( H(r)_\mathbb{F} \) identifies the centralizer subalgebra \( e\omega S(n, r)_\mathbb{F}e\omega \), where \( e\omega \) is the idempotent \( \phi_{\omega, \omega}^1 \). Thus, \( e\omega S(n, r)_\mathbb{F}x \) is a nonzero \( H(r)_\mathbb{F} \)-module. We conclude that \( e\omega L \) is a nonzero simple \( H(r)_\mathbb{F} \)-module. Since every simple \( H(r)_\mathbb{F} \)-module is finite dimensional, the simple \( S_\Theta(n, r)_\mathbb{F} \)-module \( L \cong \Omega_{\mathbb{F}}^{\omega \delta} \otimes_{H(r)} e\omega L \) is finite dimensional.

If \( n < r \), then, for \( N = r \), \( S_\Theta(n, r)_\mathbb{F} \cong eS_\Theta(r, r)_\mathbb{F}e \), where \( e = \sum_{\lambda \in \Lambda_\Theta(n, r)} \phi_{\lambda, \lambda}^1 \). It follows that each simple \( S_\Theta(n, r)_\mathbb{F} \)-module is isomorphic to \( eL \) for a simple \( S_\Theta(r, r)_\mathbb{F} \)-module \( L \); see, for example, [33, 6.2(g)]. As shown above, all simple \( S_\Theta(n, r)_\mathbb{F} \)-modules are finite dimensional. Hence, so are all simple \( S_\Theta(n, r)_\mathbb{F} \)-modules. \( \square \)

### 4.2. Chari–Pressley’s category equivalence and classification

We first prove that the functor \( F \) defined in [4, 1.3.1] coincides with the functor \( F \) defined in [8, Th. 4.2]. Then, we describe the Chari–Pressley’s classification of simple \( U_{\mathbb{C}}(\widehat{sl}_n) \)-modules and its generalization to \( U_{\mathbb{C}}(\widehat{g}_n) \) for later use.

*From now on, we assume the ground field \( \mathbb{F} = \mathbb{C} \), the complex number field, which is a \( \mathbb{Z} \)-module where \( v \) is mapped to \( z \) with \( z^m \neq 1 \) for all \( m \geq 1 \).*

Following [8], let \( E_\theta \) and \( F_\theta \) be the operators on \( \Omega_{n, \mathbb{C}} \) defined respectively by

\[ E_\theta \omega_i = \delta_{i,n} \omega_1 \quad \text{and} \quad F_\theta \omega_i = \delta_{i,1} \omega_n. \]  

(4.2.0.1)

Let \( K_\theta = K_{n-1} \cdots K_0^{-1} K_0 \). For a left \( H_\theta(r)_\mathbb{F} \)-module \( M \), define

\[ F(M) = \Omega_{n, \mathbb{C}}^{\omega \delta} \otimes_{H(r)} M. \]

\(^1\text{The } K_0 \text{ and } E_0, F_0 \text{ below should be regarded as } K_n, E_n, F_n, \text{ respectively, if the index set } I = \mathbb{Z}/n\mathbb{Z} \text{ is identified as } \{1, 2, \ldots, n\}.\)
Then \( \mathcal{F}(M) \) is equipped with the natural action of \( U(n)_{\mathbb{C}} \)-module structure induced by that on \( \Omega^\otimes_{n,\mathbb{C}} \). By [8] Th. 4.2, \( \mathcal{F}(M) \) becomes a \( U_\delta(n)_{\mathbb{C}} \)-module via the action

\[
E_0(w \otimes m) = \sum_{j=1}^{r} (Y_j^+w) \otimes (X_jm),
\]
\[
F_0(w \otimes m) = \sum_{j=1}^{r} (Y_j^-w) \otimes (X_j^{-1}m),
\]

where \( w \in \Omega^\otimes_{n,\mathbb{C}} \), \( m \in M \) and the operators \( Y_j^\pm \in \text{End}_\mathbb{C}(\Omega^\otimes_{n,\mathbb{C}}) \) (1 \( \leq j \leq r \)) are defined by

\[
Y_j^+ = 1^\otimes j^{-1} \otimes F_\theta \otimes (\widetilde{K}_\theta^{-1})^{\otimes r-j} = 1^\otimes j^{-1} \otimes F_\theta \otimes (\widetilde{K}_\theta)^{\otimes r-j},
\]
\[
Y_j^- = (\widetilde{K}_\theta)^{\otimes j-1} \otimes E_\theta \otimes 1^{\otimes r-j} = (\widetilde{K}_\theta^{-1})^{\otimes j-1} \otimes E_\theta \otimes 1^{\otimes r-j}.
\]

Hence, we obtain a functor

\[
\mathcal{F} : \mathcal{H}_\delta(r)_{\mathbb{C}}\text{-mod} \longrightarrow U_\delta(n)_{\mathbb{C}}\text{-mod}.
\]

When \( n > r \), Chari–Pressley used this functor to establish a category equivalence between \( \mathcal{H}_\delta(r)_{\mathbb{C}}\text{-mod} \) and the full subcategory of \( U_\delta(n)_{\mathbb{C}}\text{-mod} \) consisting of finite dimensional \( U_\delta(n)_{\mathbb{C}} \)-modules which are of level \( r \) when restricted to \( U(n)_{\mathbb{C}} \)-modules; see Corollary [1.1.5].

On the other hand, the algebra homomorphism \( \xi_{r,\mathbb{C}} : U_\delta(n)_{\mathbb{C}} \rightarrow S_\delta(n,r)_{\mathbb{C}} \) (cf. Remark [3.5.9]) gives an inflation functor

\[
\Upsilon : S_\delta(n,r)_{\mathbb{C}}\text{-mod} \longrightarrow U_\delta(n)_{\mathbb{C}}\text{-mod}.
\]

Thus, we obtain the functor

\[
\Upsilon \mathcal{F} = \Upsilon \circ \mathcal{F} : \mathcal{H}_\delta(r)_{\mathbb{C}}\text{-mod} \longrightarrow U_\delta(n)_{\mathbb{C}}\text{-mod}.
\]

**Proposition 4.2.1.** There is a natural isomorphism of functors \( \varphi : \mathcal{F} \cong \Upsilon \mathcal{F} \). In other words, for any \( \mathcal{H}_\delta(r)_{\mathbb{C}} \)-modules \( M, M' \) and homomorphism \( f : M \rightarrow M' \), there is a \( U_\delta(n)_{\mathbb{C}} \)-module isomorphism

\[
\varphi_M : \mathcal{F}(M) \cong \Upsilon \mathcal{F}(M), \quad w \otimes m \mapsto w \otimes_\delta m,
\]

for all \( w \in \Omega^\otimes_{n,\mathbb{C}} \) and \( m \in M \) such that \( \Upsilon \mathcal{F}(f) \varphi_M = \varphi_{M'} \mathcal{F}(f) \). Here \( \otimes = \otimes_{\mathcal{H}(r)_{\mathbb{C}}} \) and \( \otimes_\delta = \otimes_{\mathcal{H}(r)_{\mathbb{C}}} \).

**Proof.** We first recall from Remark [3.5.9] that the representation \( U_\delta(n)_{\mathbb{C}} \rightarrow \text{End}_\mathbb{C}(\Omega_{\mathbb{C}}^\otimes) \) factors through the algebra homomorphism \( \xi_{r,\mathbb{C}} : U_\delta(n)_{\mathbb{C}} \rightarrow S_\delta(n,r)_{\mathbb{C}} \). Thus, by Lemma [1.1.1], there is a \( U(n)_{\mathbb{C}} \)-module isomorphism

\[
\varphi = \varphi_M : \mathcal{F}(M) \rightarrow \Upsilon \mathcal{F}(M)
\]

\[
 w \otimes m \mapsto w \otimes_\delta m \quad (\text{for all } w \in \Omega^\otimes_{n,\mathbb{C}}, \ m \in M).
\]

It remains to prove that \( \varphi(E_0(\omega_i \otimes m)) = E_0(\omega_i \otimes_\delta m) \) and \( \varphi(F_0(\omega_i \otimes m)) = F_0(\omega_i \otimes_\delta m) \)

for all \( i \in I(n,r) \) and \( m \in M \).
By the definition above, for \( i \in I(n, r) \) and \( m \in M \),
\[
\varphi(E_0(\omega_i \otimes m)) = \varphi(\sum_{j=1}^{r} (Y_j^+ \omega_i) \otimes (X_j m))
\]
\[
= \sum_{j=1}^{r} Y_j^+ \omega_i \otimes X_j m = \sum_{j=1}^{r} (Y_j^+ \omega_i) X_j \otimes \delta m,
\]
where, by (4.2.0.1) and (3.3.0.3),
\[
(Y_j^+ \omega_i) X_j = v \sum_{j+1 \leqslant k \leqslant r} (\delta_{k,n} - \delta_{k,1}) \delta_{i,j,1} (\omega_1 \cdots \omega_{i,j-1} \omega_n \omega_{i,j+1} \cdots \omega_r) X_j
\]
\[
= v \sum_{j+1 \leqslant k \leqslant r} (\delta_{k,n} - \delta_{k,1}) \delta_{i,j,1} \omega_1 \cdots \omega_{i,j-1} \omega_n \omega_{i,j+1} \cdots \omega_r.
\]

On the other hand, \( E_0 \) acts on \( \Omega_{\mathcal{C}}^{\otimes r} \) via the comultiplication \( \Delta \) as described in Corollary 2.2.7 Since
\[
\Delta^{(r-1)}(E_0) = \sum_{j=1}^{r} 1 \otimes \delta^{-1} \otimes E_0 \otimes \tilde{K}_0^{\otimes (r-j)},
\]
this together with (3.5.0.1) gives
\[
E_0 \omega_i = \sum_{j=1}^{r} v \sum_{j+1 \leqslant k \leqslant r} (\delta_{k,n} - \delta_{k,1}) \delta_{i,j,1} \omega_1 \cdots \omega_{i,j-1} \omega_n \omega_{i,j+1} \cdots \omega_r
\]
\[
= \sum_{j=1}^{r} (Y_j^+ \omega_i) X_j.
\]
(Note that, for \( 1 \leq i, j \leq n \), the values \( \delta_{i,j} \) is unchanged regardless viewing \( i, j \) as elements in \( \mathbb{Z} \) or in \( I = \mathbb{Z}/n\mathbb{Z} \).) Hence, by (4.2.1.1),
\[
E_0 \varphi(\omega_i \otimes m) = E_0 \omega_i \otimes \delta m = \varphi(E_0(\omega_i \otimes m)).
\]
Similarly, we can prove that for \( i \in I(n, r) \) and \( m \in M \),
\[
F_0 \varphi(\omega_i \otimes m) = \sum_{j=1}^{r} v \sum_{j+1 \leqslant k \leqslant j-1} (\delta_{k,1} - \delta_{k,n}) \delta_{i,j,n} \omega_1 \cdots \omega_{i,j-1} \omega_n \omega_{i,j+1} \cdots \omega_r \otimes \delta m
\]
\[
= \varphi(F_0(\omega_i \otimes m)),
\]
as required. The commutativity relation \( \Upsilon F(f) \circ \varphi = \varphi M' \circ F(f) \) is clear. \( \square \)

We now recall another theorem of Chari–Pressley which classifies finite dimensional simple \( U_{\mathbb{C}}(\mathfrak{sl}_n) \)-modules and its generalization by Frenkel–Mukhin to the classification of finite dimensional irreducible polynomial representations of \( U_{\mathbb{C}}(\mathfrak{sl}_n) \).

For \( 1 \leq j \leq n-1 \) and \( s \in \mathbb{Z} \), define the elements \( \mathcal{P}_{j,s} \in U_{\mathbb{C}}(\mathfrak{sl}_n) \) through the generating functions
\[
\mathcal{P}_j^{\pm}(u) := \exp \left( - \sum_{t \geq 1} \frac{1}{t} h_{j,\pm t}(zu)^{\pm t} \right) = \sum_{s \geq 0} \mathcal{P}_{j,\pm s} u^{\pm s} \in U_{\mathbb{C}}(\mathfrak{sl}_n)[[u, u^{-1}]].
\]
here we may view $\mathcal{P}_j^\pm(u)$ as formal power series (at 0 or $\infty$) with coefficients in $U_C(\mathfrak{sl}_n)$. Note that these elements are related to the elements $\phi_{j,s}^\pm$ used in the definition of $U_C(\mathfrak{sl}_n)$ (see Definition 2.3.1(2)) through the formula

$$
\Phi_j^\pm(u) = k_j^{\pm 1} \frac{\mathcal{P}_j^\pm(z^{-2}u)}{\mathcal{P}_j^\pm(u)}.
$$

(For a proof, see, e.g., [6], p. 291).

For any polynomial $f(u) = \prod_{1 \leq i \leq m} (1 - a_i u) \in \mathbb{C}[u]$ with constant term 1 and $a_i \in \mathbb{C}^*$, define $f^\pm(u)$ (so that $f^+(u) = f(u)$) as follows:

$$
f^\pm(u) = \prod_{1 \leq i \leq m} (1 - a_i^{\pm 1} u^{\pm 1}).
$$

Note that $f^{-}(u) = (\prod_{i=1}^m (-a_i u)^{-1}) f^+(u)$.

Let $V$ be a finite dimensional representation of $U_C(\mathfrak{sl}_n)$ of type 1. Then $V = \bigoplus_{\lambda \in \mathbb{Z}^n} V_{\lambda}$ and, since all $\mathcal{P}_{j,s}$ commute with the $k_j$, each $V_{\lambda}$ is a direct sum of generalized eigenspaces of the form

$$
V_{\lambda,\gamma} = \{ x \in V_{\lambda} \mid (\mathcal{P}_{i,s} - \gamma_{i,s})^p x = 0 \text{ for some } p (1 \leq i \leq n - 1, s \in \mathbb{Z}) \},
$$

(4.2.1.5)

where $\gamma = (\gamma_{i,s})$ with $\gamma_{i,s} \in \mathbb{C}$. If we put $\Gamma_j^\pm(u) = \sum_{s \geq 0} \gamma_{j,\pm s} u^{\pm s}$, then by [29, Prop. 1], there exist polynomials $f_i(u) = \prod_{1 \leq j \leq m} (1 - a_j u)$ and $g_i(u) = \prod_{1 \leq j \leq m} (1 - b_j u)$ in $\mathbb{C}[u]$, such that

$$
\Gamma_j^\pm(u) = \frac{f_j^\pm(u)}{g_j^\pm(u)} \quad \text{and} \quad \lambda_i = m_i - n_i.
$$

(4.2.1.6)

Following [6, 12.2.4], a nonzero ($\mu$-weight) vector $w \in V$ is called a pseudo-highest weight vector, if there exist some $P_{j,s} \in \mathbb{C}$ such that

$$
x_{j,s}^+ w = 0, \quad \mathcal{P}_{j,s} w = P_{j,s} w, \quad \tilde{k}_j w = z^{\mu_j} w
$$

for all $1 \leq j \leq n - 1$ and $s \in \mathbb{Z}$. The module $V$ is called a pseudo-highest weight module\footnote{If $P_{j,s}^\pm(u)$ denote the elements defined in line 2 above [28 (4.1)], then $\mathcal{P}_{j,s}^\pm(u) = P_{j,s}^\pm(u z)$. We have corrected a typo by removing the + sign in exp(+$\sum$...). If the + is there, then the − case of $\Phi_j^\pm(u) = k_j^{\pm 1} P_{j,s}^\pm(u z^{-1}) / P_{j,s}^\pm(u z)$ as given in [28 (4.1)] is no longer true. Also, 4.2.1.3 shows that + sign is unnecessary.\footnote{There are simple highest weight integrable modules $\Lambda_\lambda$ considered in [56, 6.2.3] (defined in [56 3.5.6]) which, in general, are infinite dimensional.}} if $V = U_C(\mathfrak{sl}_n) w$ for some pseudo-highest weight vector $w$.

For notational simplicity, the expressions $\mathcal{P}_{j,s} w = P_{j,s} w$ for all $s \in \mathbb{Z}$ will be written by a single expression

$$
\mathcal{P}_j^\pm(u) w = P_j^\pm(u) w \in V[[u, u^{-1}]],
$$

where

$$
P_j^\pm(u) = \sum_{s \geq 0} P_{j,\pm s} u^{\pm s},
$$

(4.2.1.7)

Let $P(n)$ be the set of $(n - 1)$-tuples of polynomials with constant terms 1. For $P = (P_1(u), \ldots, P_{n-1}(u)) \in P(n)$, define $P_{j,s} \in \mathbb{C}$, for $1 \leq j \leq n - 1$ and $s \in \mathbb{Z}$, as in $P_j^\pm(u) = \sum_{s \geq 0} P_{j,\pm s} u^{\pm s}$, where $P_j^\pm(u)$ is defined by (1.2.1.4).
Let \( \bar{I}(P) \) be the left ideal of \( U_\mathbb{C}(\hat{\mathfrak{sl}}_n) \) generated by \( x^{\pm}_{j,s}, \mathcal{P}_{i,s} - P_{j,s}, \tilde{k}_j - z^{\mu_j} \), for \( 1 \leq j \leq n - 1 \) and \( s \in \mathbb{Z} \), where \( \mu_j = \text{deg} P_j(u) \), and define “Verma module”
\[
\bar{\mathcal{M}}(P) = U_\mathbb{C}(\hat{\mathfrak{sl}}_n)/\bar{I}(P).
\]
Then \( \bar{M}(P) \) has a unique simple quotient, denoted by \( \bar{L}(P) \). The polynomials \( P_i(u) \) are called Drinfeld polynomials associated with \( \bar{L}(P) \).

The following result is due to Chari–Pressley (see [5, 6] or [7, pp.7-8]).

**Theorem 4.2.2.** The modules \( \bar{L}(P) \) with \( P \in \mathcal{P}(n) \) are all nonisomorphic finite dimensional simple \( U_\mathbb{C}(\hat{\mathfrak{sl}}_n) \)-modules of type 1.

Let \( U_\mathbb{C}(\hat{\mathfrak{gl}}_n) \) be the algebra over \( \mathbb{C} \) generated by \( x^{\pm}_{i,s} (1 \leq i < n, s \in \mathbb{Z}) \), \( k_i^{\pm 1} \) and \( \mathfrak{g}_{i,t} (1 \leq i \leq n, t \in \mathbb{Z} \setminus \{0\}) \) with relations similar to (QLA1)–(QLA7) as defined in §2.3. Chari–Pressley’s classification is easily generalized to simple \( U_\mathbb{C}(\hat{\mathfrak{gl}}_n) \)-modules as follows; see [28].

For \( 1 \leq i \leq n \) and \( s \in \mathbb{Z} \), define the elements \( \mathcal{Q}_{i,s} \in U_\mathbb{C}(\hat{\mathfrak{gl}}_n) \) through the generating functions
\[
\mathcal{Q}^{\pm}_{i}(u) := \exp \left( - \sum_{t \geq 1} \frac{1}{t!} g_{i,\pm t}(zu)^{\pm t} \right) = \sum_{s \geq 0} \mathcal{Q}_{i,\pm s} u^{\pm s} \in U_\mathbb{C}(\hat{\mathfrak{gl}}_n)[[u, u^{-1}]].
\]

Since \( h_{i,m} = z^{(i-1)s} g_{i,m} - z^{(i+1)s} g_{i+1,m} \), it follows from the definitions that
\[
\mathcal{P}^{\pm}_{j}(u) = \frac{\mathcal{Q}^{\pm}_{j}(uz^{-1})}{\mathcal{Q}^{\pm}_{j+1}(uz^{-1})},
\]
for \( 1 \leq j \leq n - 1 \).

As in the case of \( U_\mathbb{C}(\hat{\mathfrak{sl}}_n) \), if \( V \) is a representation of \( U_\mathbb{C}(\hat{\mathfrak{gl}}_n) \) then a nonzero (\( \lambda \)-weight) vector \( w \in V \) is called a pseudo-highest weight vector; if there exist some \( Q_{i,s} \in \mathbb{C} \) such that
\[
x^{\pm}_{j,s} w = 0, \quad \mathcal{Q}_{i,s} w = Q_{i,s} w, \quad k_i w = z^{\lambda_i} w \quad (4.2.2.1)
\]
for all \( 1 \leq i \leq n \) and \( 1 \leq j \leq n - 1 \) and \( s \in \mathbb{Z} \). The module \( V \) is called a pseudo-highest weight module if \( V = U_\mathbb{C}(\hat{\mathfrak{gl}}_n)w \) for some pseudo-highest weight vector \( w \).

Associated to the sequence \( (Q_{i,s})_{s \in \mathbb{Z}} \), defined two formal power series by
\[
Q^{\pm}_{i}(u) = \sum_{s \geq 0} Q_{i,\pm s} u^{\pm s}. \quad (4.2.2.2)
\]

We also write the short form \( \mathcal{Q}^{\pm}_{i}(u)w = Q^{\pm}_{i}(u)w \) for the relations \( \mathcal{Q}_{i,s} w = Q_{i,s} w \) \( (s \in \mathbb{Z}) \).

A finite dimensional \( U_\mathbb{C}(\hat{\mathfrak{gl}}_n) \)-module \( V \) is called a polynomial representation if it is of type 1 and, for every weight \( \lambda = (\lambda_1, \ldots, \lambda_n) \in \mathbb{Z}^n \) of \( V \), the formal power series \( \Gamma_i^{\pm}(u) \) associated to the eigenvalues \( (\gamma_{i,s})_{s \in \mathbb{Z}} \) defining the generalized eigenspaces \( V_{\lambda,\gamma} \) as given in (4.2.1.5), where \( \mathcal{P}_{i,s} \) is replaced by \( \mathcal{Q}_{i,s} \) and \( n - 1 \) by \( n \), are polynomials in \( u^{\pm} \) of degree \( \lambda_i \) so that the zeroes of the functions \( \Gamma_i^{+}(u) \) and \( \Gamma_i^{-}(u) \) are the same.

Following [28], an \( n \)-tuple of polynomials \( Q = (Q_1(u), \ldots, Q_n(u)) \) with constant terms 1 is called dominant if for \( 1 \leq i \leq n - 1 \) the ratio \( Q_i(z^{i-1}u)/Q_{i+1}(z^{i+1}u) \) is a polynomial. Let \( \mathcal{Q}(n) \) be the set of dominant \( n \)-tuples of polynomials.
For \( Q = (Q_1(u), \ldots, Q_n(u)) \in \mathcal{Q}(n) \), define \( Q_i, s \in \mathbb{C} \), for \( 1 \leq i \leq n \) and \( s \in \mathbb{Z} \), by the following formula
\[
Q_i^\pm(u) = \sum_{s \geq 0} Q_i, s u^\pm s,
\]
where \( Q_i^\pm(u) \) is defined using \( (4.2.1.4) \). Let \( I(Q) \) be the left ideal of \( U_\mathbb{C}(\hat{\mathfrak{gl}}_n) \) generated by \( x_j, s - Q_i, s \), \( k_i - z^\lambda_i \) for \( 1 \leq j \leq n - 1, 1 \leq i \leq n \) and \( s \in \mathbb{Z} \), where \( \lambda_i = \deg Q_i(u) \), and define
\[
M(Q) = U_\mathbb{C}(\hat{\mathfrak{gl}}_n)/I(Q).
\]
Then \( M(Q) \) has a unique simple quotient, denoted by \( L(Q) \). The polynomials \( Q_i(u) \) are called Drinfeld polynomials associated with \( L(Q) \).

**Theorem 4.2.3** (28). The \( U_\mathbb{C}(\hat{\mathfrak{gl}}_n) \)-modules \( L(Q) \) with \( Q \in \mathcal{Q}(n) \) are all nonisomorphic finite dimensional simple polynomial representations of \( U_\mathbb{C}(\hat{\mathfrak{gl}}_n) \). Moreover,
\[
L(Q)|_{U_\mathbb{C}(\hat{\mathfrak{g}}_1)} \cong L(P)
\]
where \( P = (P_1(u), \ldots, P_{n-1}(u)) \) with \( P_i(u) = Q_i(z^{i-1}u)/Q_{i+1}(z^{i+1}u) \).

### 4.3. Classification of simple \( \mathcal{S}_n(n, r)_{\mathcal{C}} \)-modules: the upwards approach

We first recall the classification of irreducible representations of \( \mathcal{H}_\mathcal{C}(r) \) or equivalently, simple \( \mathcal{H}_\mathcal{C}(r) \)-modules.

Let \( \mathbb{C}^* = \mathbb{C} \setminus \{0\} \). For \( a = (a_1, \ldots, a_r) \in (\mathbb{C}^*)^r \), let \( M_a = \mathcal{H}_\mathcal{C}(r)/J_a \), where \( J_a \) is the left ideal of \( \mathcal{H}_\mathcal{C}(r) \) generated by \( X_j - a_j \) for \( 1 \leq j \leq r \). Then \( M_a \) is an \( \mathcal{H}_\mathcal{C}(r) \)-module of dimension \( r! \) and, regarded as an \( \mathcal{H}(r) \)-module by restriction, \( M_a \) is isomorphic to the regular representation of \( \mathcal{H}(r) \).

Applying the functor \( F \) to \( M_a \) yields an \( \mathcal{S}_n(n, r)_{\mathcal{C}} \)-module \( \Omega_{\mathcal{C}} \otimes_{\mathcal{H}_\mathcal{C}(r)} M_a \) and hence, a \( \mathcal{D}_{\mathcal{C}}(n) \)-module inflated by the homomorphism \( \xi_{r, \mathcal{C}} \) given in \( (3.5.9.1) \). The following result, which will be used in the next section, tells how the central generators \( z_i^\pm \) of \( \mathcal{D}_{\mathcal{C}}(n) \) defined in \( (2.2.0.3) \) act on this module.

**Lemma 4.3.1.** Let \( a = (a_1, \ldots, a_r) \in (\mathbb{C}^*)^r \) and \( w \in \Omega_{\mathcal{C}} \otimes_{\mathcal{H}_\mathcal{C}(r)} M_a \). Then we have
\[
z_t^\pm w = \sum_{1 \leq s \leq r} a_s^\pm t w \quad \text{for } t \geq 1.
\]

**Proof.** We may assume \( w = \omega_1 \otimes \bar{h} \) for some \( i \in I_\mathcal{C}(n, r) \) and \( \bar{h} \in M_a \). Since for each \( t \geq 1 \), \( \sum_{1 \leq s \leq r} X_s^t \) is a central element in \( \mathcal{H}_\mathcal{C}(r) \), it follows from \( (3.5.4.4) \) that
\[
z_t^\pm w = \omega_1 \sum_{1 \leq s \leq r} X_s^t \otimes \bar{h} = \omega_1 \otimes h \sum_{1 \leq s \leq r} X_s^t \bar{h} = \sum_{1 \leq s \leq r} a_s^\pm t \omega_1 \otimes h \bar{h} = \sum_{1 \leq s \leq r} a_s^\pm t w.
\]

A segment \( s \) with center \( a \in \mathbb{C}^* \) is by definition an ordered sequence
\[
s = (az^{-k+1}, az^{-k+3}, \ldots, az^{k-1}) \in (\mathbb{C}^*)^k.
\]
Here \( k \) is called the length of the segment, denoted by \( |s| \). If \( s = \{s_1, \ldots, s_p\} \) is an unordered collection of segments, define \( \varphi(s) \) to be the partition associated with the sequence \( (|s_1|, \ldots, |s_p|) \). That is, \( \varphi(s) = (|s_1|, \ldots, |s_p|) \) with \( |s_1| \geq \cdots \geq |s_p| \), where \( |s_1|, \ldots, |s_p| \) is a permutation of \( |s_1|, \ldots, |s_p| \). We also call \( |s| := |\varphi(s)| \) the length of \( s \).
Lemma 4.3.3. Let \( \mathcal{S}_r \) be the set of unordered collections of segments \( s \) with \( |s| = r \). Then \( \mathcal{S}_r = \bigcup_{\lambda \in \Lambda(r)} \mathcal{S}_{r,\lambda} \), where \( \mathcal{S}_{r,\lambda} = \{ s \in \mathcal{S}_r \mid \psi(s) = \lambda \} \).

For \( s = \{s_1, \ldots, s_p\} \in \mathcal{S}_{r,\lambda} \), let

\[
a(s) = (s_1, \ldots, s_p) \in (C^*)^r
\]

be the \( r \)-tuple obtained by juxtaposing the segments in \( s \). Then the element

\[
y_s = \sum_{w \in \mathcal{S}_\lambda} (-z^2)^{-\ell(w)} T_w \in \mathcal{H}_d(r)_C
\]
generates the submodule \( \mathcal{H}_d(r)_C y_s \) of \( M_{\alpha(s)} \) which, as an \( \mathcal{H}(r)_C \)-module, is isomorphic to \( \mathcal{H}(r)_C y_s \). However,

\[
\mathcal{H}(r)_C y_s \cong S_\lambda \oplus \bigoplus_{\mu \vdash \lambda, \mu \geq \lambda} m_{\mu, \lambda} S_\mu,
\]

(4.3.1.1)

where \( S_\gamma \) is the left cell module defined by the Kazhdan–Lusztig’s C-basis [50] associated with the left cell containing \( w_{0,\lambda} \).

Let \( V_s \) be the unique composition factor of the \( \mathcal{H}_d(r)_C \)-module \( \mathcal{H}_d(r)_C y_s \) such that the multiplicity of \( S_\lambda \) in \( V_s \) as an \( \mathcal{H}(r)_C \)-module is nonzero.

We now can state the following classification theorem due to Zelevinsky [85] and Rogawski [69]. The construction above follows [69].

**Theorem 4.3.2.** Let \( \text{Irr}(\mathcal{H}(r)_C) \) be the set of isoclasses of all simple \( \mathcal{H}(r)_C \)-modules. Then the correspondence \( s \mapsto V_s \) defines a bijection from \( \mathcal{S}_r \) to \( \text{Irr}(\mathcal{H}(r)_C) \).

We record the following general result.

**Lemma 4.3.3.** Let \( S \) and \( H \) be two algebras over a field \( \mathbb{F} \). If \( V \) is an \( S-H \)-bimodule, \( M \) is a left \( H \)-module, and \( e \in S \) is an idempotent element, then \( e V \) is an \( eSe-H \)-bimodule and there is an \( eSe \)-module isomorphism

\[
(eV) \otimes_H M \cong e(V \otimes_H M) \quad (ew \otimes m \mapsto e(w \otimes m)).
\]

**Proof.** There is a natural map \( \alpha : (eV) \otimes_H M \to V \otimes_H M \) defined by sending \( ew \otimes m \) to \( ew \otimes m \). The map \( \alpha \) induces a surjective map \( \beta : (eV) \otimes_H M \to (eV \otimes_H M) \). On the other hand, there is a surjective right \( H \)-module homomorphism from \( V \) to \( eV \) defined by sending \( w \) to \( ew \). This map induces a natural surjective map \( \beta : V \otimes_H M \to (eV) \otimes_H M \) defined by sending \( w \otimes m \) to \( ew \otimes m \) for \( w \in V \) and \( m \in M \). By restriction, we get a map \( \tilde{\beta} : e(V \otimes_H M) \to (eV) \otimes_H M \). Since \( \tilde{\alpha} \beta = \text{id} \) and \( \tilde{\beta} \alpha = \text{id} \), the assertion follows.

Let

\[
\mathcal{S}_r^{(n)} = \{ s \in \mathcal{S}_r \mid \Omega^r_C \otimes_{\mathcal{H}_d(r)_C} V_s \neq 0 \}.
\]

Then \( \mathcal{S}_r^{(n)} = \mathcal{S}_r \) for all \( r \leq n \). We have the following classification theorem.

**Theorem 4.3.4.** The set

\[
\{ \Omega^r_C \otimes_{\mathcal{H}_d(r)_C} V_s \mid s \in \mathcal{S}_r^{(n)} \}
\]
is a complete set of nonisomorphic simple \( \mathcal{S}_d(n, r)_C \)-modules. In particular, if \( n \geq r \), then the set \( \{ \Omega^r_C \otimes_{\mathcal{H}_d(r)_C} V_s \mid s \in \mathcal{S}_r \} \) is a complete set of nonisomorphic simple \( \mathcal{S}_d(n, r)_C \)-modules.
Proposition 4.3.5. \( H \) the Hecke algebra

Here, for \( \lambda \) that depends on the description of the set \( S \) modules for \( \phi \) proves the \( n < r \) case.

We end this section with a discussion on how the index set \( \mathcal{S}_r \) of simple \( S_\lambda(n, r) \)-modules for \( n < r \) is related to a certain Branching Rule.

Since the parameter \( z \) for the specialization \( z \rightarrow \mathbb{C}, v \rightarrow z \) is not a root of unity, the Hecke algebra \( H(r) \) is semisimple. Thus, as an \( H(r) \)-module, \( V_s \) is semisimple. By (4.3.1.1), we can decompose the \( H(r) \)-module

\[
V_s|_{H(r)} = \bigoplus_{\mu(s) = r, \mu(s) \geq \varphi(s)} m_{\mu(s)} S_{\mu(s)}.
\]

Here, for \( \lambda = \varphi(s) \), \( m_\lambda = 1 \), and \( m_{\mu(s)} \leq m_{\mu(s), \lambda} \) (see (4.3.1.1)).

Proposition 4.3.5. Maintain the notation above. We have \( \mathbf{s} \in \mathcal{S}_r^{(n)} \) if and only if \( m_{\mu(s)} \neq 0 \) for some partition \( \mu(s) \in \Lambda^+(n, r) \).

Proof. By Lemma 4.1.1 we have \( S(n, r)_C \)-module isomorphisms

\[
\Omega_C^{sr} \otimes_{H(r)_C} V_s \cong \Omega_C^{sr} \otimes_{H(r)_C} V_s \cong \bigoplus_{\mu(s) = r, \mu(s) \geq \varphi(s)} m_{\mu(s)} (\Omega_c^{sr} \otimes_{H(r)_C} S_{\mu(s)}).
\]

Since \( \Omega_c^{sr} \otimes_{H(r)_C} S_{\mu(s)} \neq 0 \) if and only if \( \mu(s) \in \Lambda^+(n, r) \), it follows that \( \Omega_C^{sr} \otimes_{H(r)_C} S_{\mu(s)} \neq 0 \) if and only if \( m_{\mu(s)} \neq 0 \) for some partition \( \mu(s) \in \Lambda^+(n, r) \).

The upwards approach to the classification of simple \( S_\lambda(n, r)_C \)-modules when \( n < r \) depends on the description of the set \( \mathcal{S}_r^{(n)} \). From the proof above, one sees easily that

\[
\bigcup_{\lambda \in \Lambda^+(n, r)} \mathcal{S}_{\lambda} \subseteq \mathcal{S}_r^{(n)}.
\]
The next example shows that $\mathcal{I}_r(n) \neq \mathcal{I}_r$ does occur.

**Example 4.3.6.** For any $a \in \mathbb{C}$, there is an algebra homomorphism $ev_a : \mathcal{H}(r)_\mathbb{C} \to \mathcal{H}(r)_\mathbb{C}$, call the evaluation map (see [8, 5.1]), such that

1. $ev_a(T_i) = T_i, \quad 1 \leq i \leq r - 1$;
2. $ev_a(X_j) = az^{-2(j-1)}T_{j-1} \cdots T_2T_1T_2 \cdots T_{j-1}, \quad 1 \leq j \leq r$.

Thus, every simple $\mathcal{H}(r)_\mathbb{C}$-module $S_\lambda$ is also a simple $\mathcal{H}(r)_\mathbb{C}$-module. Those $s$ such that $V_s$ is isomorphic to $S_\lambda$ with $\lambda \notin \Lambda^+(n, r)$ are not in $\mathcal{I}_r(n)$.

However, the proof above also shows that if we know explicitly the decomposition in (4.3.4.1), especially for those $s \in \mathcal{I}_r$ with $\varphi(s)$ having more than $n$ parts, then we are able to determine $\mathcal{I}_r(n)$. We will call the description of the nonzero multiplicities in (4.3.4.1) the affine-to-finite Branching Rule or simply the affine Branching Rule.

**Problem 4.3.7.** Describe the affine Branching Rule. In other words, find a necessary and sufficient condition for the nonzero multiplicity $m_{\mu(s)}$ given in (4.3.4.1).

We will use the downwards approach to complete the classification in §4.5. We will prove that each simple $S_\lambda(n, r)_\mathbb{C}$-module is an irreducible polynomial representation of $V_{\mathbb{C}}(\hat{\mathfrak{g}}_n)$ in Proposition 4.5.4 and prove that each irreducible polynomial representation of $V_{\mathbb{C}}(\hat{\mathfrak{g}}_n)$ is a simple $S_\lambda(n, r)_\mathbb{C}$-module for some $r$ in Proposition 4.5.7. Combining Propositions 4.5.4 with 4.5.7 we can classify the simple modules for $S_\lambda(n, r)_\mathbb{C}$.

**4.4. Identification of simple $S_\lambda(n, r)_\mathbb{C}$-modules: the $n > r$ case**

Recall the $\mathbb{C}$-algebra $\mathcal{D}_\lambda(\mathbb{C}) (n)$ defined in Remark 2.1.1 and the $\mathbb{C}$-algebra isomorphism $\mathcal{E}_H : \mathcal{D}_\lambda(\mathbb{C}) (n) \to U_{\mathbb{C}}(\hat{\mathfrak{g}}_n)$ discussed in Theorem 2.3.3 and Remarks 2.3.7. By the presentation given in Theorem 2.2.3 it is easy to see that there is an automorphism $g$ of $\mathcal{D}_\lambda(\mathbb{C}) (n)$ satisfying

$$g(K_i^{\pm 1}) = K_i^{\mp 1}, \quad g(u_i^\pm) = u_i^\mp, \quad (1 \leq i < n),$$

$$g(u_n^\pm) = (-1)^nz^{\pm 1}u_n^\pm, \quad g(z_s^\pm) = -z^{\mp(n-1)s}z_s^\mp (s \geq 1).$$

Combining the two gives the following.

**Proposition 4.4.1.** There is a $\mathbb{C}$-algebra isomorphism

$$f = \mathcal{E}_H \circ g : \mathcal{D}_\lambda(\mathbb{C}) (n) \to U_{\mathbb{C}}(\hat{\mathfrak{g}}_n)$$

such that

$$K_i^{\pm 1} \mapsto k_i^{\pm 1}, \quad u_i^\pm \mapsto x_i^{\pm 1} (1 \leq i < n),$$

$$u_n^\pm \mapsto (-1)^nz^{\pm 1}x_n^\pm, \quad z_s^\pm \mapsto z^{\mp(n-1)s} \frac{s}{s} \theta_{s \pm 1} (s \geq 1).$$

Now the $\mathbb{C}$-algebra epimorphism $\xi_{r, \mathbb{C}} : \mathcal{D}_\lambda(\mathbb{C}) (n) \to S_\lambda(n, r)_\mathbb{C}$ described in Corollary 3.8.3 and Theorem 3.8.1 together with $f$ gives a $\mathbb{C}$-algebra epimorphism

$$\xi_{r, \mathbb{C}}' := \xi_{r, \mathbb{C}} \circ f^{-1} : U_{\mathbb{C}}(\hat{\mathfrak{g}}_n) \to S_\lambda(n, r)_\mathbb{C}.$$ 

(4.4.1.1)

Thus, every $S_\lambda(n, r)_\mathbb{C}$-module will be inflated into a $U_{\mathbb{C}}(\hat{\mathfrak{g}}_n)$-module via this homomorphism. In particular, every simple $S_\lambda(n, r)_\mathbb{C}$-module given in Theorem 4.3.3 is a
simple $U_C(\widehat{gl}_n)$-module. We now identify them for the $n > r$ case in terms of the reducible polynomial representations of $U_C(\widehat{gl}_n)$ described in Theorem 4.2.3.

Recall from §4.2 that $Q(n)$ is the set of dominant $n$-tuples of polynomials. For $r \geq 1$, let

$$\mathcal{Q}(n)_r = \{ Q = (Q_1(u), \ldots, Q_n(u)) \in Q(n) \mid r = \sum_{1 \leq i \leq n} \deg Q_i(u) \}.$$ 

For $s = \{s_1, \ldots, s_p\} \in \mathcal{S}_r$ with

$$s_i = (a_i z^{-\mu_i+1}, a_i z^{-\mu_i+3}, \ldots, a_i z^{\mu_i-1}) \in (C^*)^{\mu_i},$$

let $Q_n(u) = 1$ and for $1 \leq i \leq n - 1$, define

$$P_i^+(u) = \prod_{1 \leq j \leq p, \mu_j = i} (1 - a_j^{\pm 1} u^{\pm 1}),$$

$$Q_i^+(u) = P_i^{\pm}(u z^{-i+1}) P_{i+1}^{\pm}(u z^{-i+2}) \cdots P_{n-1}^{\pm}(u z^{n-2i}),$$

$$Q_s = (Q_1(u), \ldots, Q_n(u)).$$

We now have the following identification theorem.

**Theorem 4.4.2.** Maintain the notation above and let $n > r$. The map $s \mapsto Q_s$ defines a bijection from $\mathcal{S}_r$ to $\mathcal{Q}(n)_r$, and induces $U_C(\widehat{gl}_n)$-module isomorphisms $\Omega_{\mathcal{S}_r} \otimes \mathcal{H}_{\mathcal{S}_r}$ $V_s \cong L(Q_s)$ for all $s \in \mathcal{S}_r$. Hence, the set $\{ L(Q) \mid Q \in \mathcal{Q}(n)_r \}$ forms a complete set of nonisomorphic simple $\mathcal{S}_r(n, r)_c$-modules.

**Proof.** By the algebra homomorphism $\xi_{r,c}$ given in (4.4.1), every $\mathcal{S}_r(n, r)_c$-module $M$ is regarded as a $U_C(\widehat{gl}_n)$-module. Let $[M]$ denote the isoclass of $M$. By Theorem 4.3.1 it suffices to prove that

1. $\Omega_{\mathcal{S}_r} \otimes \mathcal{H}_{\mathcal{S}_r} V_s \cong L(Q_s)$, and
2. $\{ L(Q) \mid Q \in \mathcal{Q}(n)_r \} = \{ [\Omega_{\mathcal{S}_r} \otimes \mathcal{H}_{\mathcal{S}_r} V_s] \mid s \in \mathcal{S}_r \}.$

We first prove (1). Let $s = \{s_1, \ldots, s_p\} \in \mathcal{S}_r$ be an unordered collection of segments with

$$s_i = (a_i z^{-\mu_i+1}, a_i z^{-\mu_i+3}, \ldots, a_i z^{\mu_i-1}) \in (C^*)^{\mu_i}.$$ 

Thus, $r = \sum_{1 \leq i \leq p} \mu_i$. Let $a = a(s) = (s_1, \ldots, s_p) \in (C^*)^r$ be the sequence obtained by juxtaposing the segments in $s$. Then the simple $\mathcal{S}_r(n, r)_c$-module $\Omega_{\mathcal{S}_r} \otimes \mathcal{H}_{\mathcal{S}_r} V_s$ becomes a simple $U_C(\widehat{gl}_n)$-module via (4.4.1). As a simple $U_C(\widehat{sl}_n)$-module, this module is isomorphic to the Chari–Pressley module $\mathcal{F}(V_s)$ by Proposition 4.2.1. Applying [28] 7.6 yields a $U_C(\widehat{sl}_n)$-module isomorphism $\Omega_{\mathcal{S}_r} \otimes \mathcal{H}_{\mathcal{S}_r} V_s \cong \mathcal{F}(P)$, where $P = (P_1(u), \ldots, P_{n-1}(u))$ with

$$P_i^\pm(u) = \prod_{1 \leq j \leq p, \mu_j = i} (1 - a_j^{\pm 1} u^{\pm 1}), \quad 1 \leq i \leq n - 1.$$  

(4.4.2.1)
is also a highest weight as an $S(n,r)_{c}$-module, and there exist $Q_{i}^{\pm}(u) \in \mathbb{C[[u]]}$ and $Q_{i}^{-}(u) \in \mathbb{C[[u^{-1}]]}$, $1 \leq i \leq n$, such that
\[
Q_{i}^{\pm}(u)w_{0} = Q_{i}^{\pm}(u)w_{0}, \quad \mathcal{P}_{j}^{\pm}(u)w_{0} = P_{j}^{\pm}(u)w_{0}, \quad K_{i}w_{0} = z^{\lambda_{i}}w_{0}
\]
\[
P_{j}^{\pm}(u) = \frac{Q_{j}^{\pm}(uz^{j-1})}{Q_{j+1}^{\pm}(uz^{j+1})}, \quad \text{and } \deg P_{i}(u) = \lambda_{i} - \lambda_{i+1}.
\]

We now prove that $Q_{i}^{\pm}(u)$ are polynomials of degree $\lambda_{i}$.

Since $f(z_{\pm}^{i}) = z_{\pm}^{(n-1)}t_{t}^{\theta_{\pm}t}$ for all $t \geq 1$ as in Proposition 4.4.1, it follows from (2.3.1.1) and Lemma 4.4.1 that
\[
\frac{t_{z}^{\pm t}}{[t]_{z}} \sum_{1 \leq i \leq n} g_{i,\pm}w_{0} = z_{i}^{\pm}w_{0} = \sum_{1 \leq i \leq p, \mu_{j} \leq i} (a_{i}z^{\mu_{j}+2k-1})^{\pm t}w_{0}.
\]

Thus,
\[
\prod_{1 \leq i \leq n} Q_{i}^{\pm}(u)w_{0} = \prod_{1 \leq i \leq n} \mathcal{Q}_{i}^{\pm}(u)w_{0} = \exp \left( - \sum_{t \geq 1} \frac{1}{[t]_{z}} \left( \sum_{1 \leq i \leq n} g_{i,\pm} \right) (uz^{\pm})^{t} \right) w_{0}
\]
\[
= \exp \left( - \sum_{t \geq 1} \sum_{1 \leq i \leq p, \mu_{j} \leq i} \frac{1}{t} (a_{i}uz^{2k-1-\mu_{i}})^{\pm t} \right) w_{0}
\]
\[
= \prod_{1 \leq i \leq p, \mu_{j} \leq i} \left( 1 - (a_{i}uz^{2k-1-\mu_{i}})^{\pm 1} \right) w_{0},
\]
as $- \sum_{t \geq 1} \frac{1}{t^{\pm}} (a_{i}uz^{2k-1-\mu_{i}})^{\pm t} = \ln(1 - a_{i}uz^{2k-1-\mu_{i}})$. Hence,
\[
\prod_{1 \leq i \leq n} Q_{i}^{\pm}(u) = \prod_{1 \leq i \leq p, \mu_{j} \leq i} \left( 1 - (a_{i}uz^{2k-1-\mu_{i}})^{\pm 1} \right).
\]

On the other hand, by (4.4.2.2),
\[
Q_{i}^{\pm}(u) = P_{i}^{\pm}(uz^{-i+1})P_{i+1}^{\pm}(uz^{-i+2}) \cdots P_{n-1}^{\pm}(uz^{-2i})Q_{n}^{\pm}(uz^{2(n-i)})
\]
for all $1 \leq i \leq n$, and by (4.4.2.1),
\[
P_{i}^{\pm}(uz^{-i+1})P_{i}^{\pm}(uz^{-i+3}) \cdots P_{i}^{\pm}(uz^{-i-1})
\]
\[
= \prod_{1 \leq j \leq p, \mu_{j} \leq i} (1 - (a_{j}uz^{-\mu_{j}+1})^{\pm 1})(1 - (a_{j}uz^{-\mu_{j}+3})^{\pm 1}) \cdots (1 - (a_{j}uz^{\mu_{j}-1})^{\pm 1})
\]
\[
= \prod_{1 \leq j \leq p, \mu_{j} \leq i} (1 - (a_{j}uz^{2k-1-\mu_{j}})^{\pm 1}).
\]
Thus,
\[ \prod_{1 \leq i \leq n-1} \left( P_i^+(uz^{-i+1})P_i^+(uz^{-i+3}) \cdots P_i^+(uz^{i-1}) \right) = \prod_{1 \leq j \leq p} \left( 1 - (a_j uz^{2k-1-\mu_j})^{\pm 1} \right) \]

Hence,
\[ \prod_{1 \leq i \leq n} Q_i^+(u) = \prod_{1 \leq i \leq n-1} \left( P_i^+(uz^{-i+1})P_i^+(uz^{-i+3}) \cdots P_i^+(uz^{i-1}) \right) \prod_{0 \leq l \leq n-1} Q_n^+(uz^{2l}) \]
\[ = \prod_{1 \leq i \leq p} \left( 1 - (a_i uz^{2k-1-\mu_i})^{\pm 1} \right) \prod_{0 \leq l \leq n-1} Q_n^+(uz^{2l}). \]

Combining this with (4.4.2.3) yields
\[ \prod_{0 \leq l \leq n-1} Q_n^+(uz^{2l}) = 1. \]

So we have
\[ \exp \left( -\sum_{t \geq 1} \frac{1}{t} g_{n,\pm t} \left( \sum_{0 \leq l \leq n-1} z^{\pm 2lt}(uz)^{\pm t} \right) \right) w_0 = \prod_{0 \leq l \leq n-1} Q_n^+(uz^{2l}) w_0 = w_0. \]

It follows that
\[ -\sum_{t \geq 1} \frac{1}{t} g_{n,\pm t} \left( \sum_{0 \leq l \leq n-1} z^{\pm 2lt}(uz)^{\pm t} \right) w_0 = 0. \]

This forces \( g_{n,\pm t}w_0 = 0 \) for all \( t \geq 1 \). Consequently,
\[ Q_n^+(u)w_0 = \mathcal{Q}_n^+(u)w_0 = w_0, \]
and hence, \( Q_n^+(u) = 1 \). We conclude by (1.3.2.4) that all \( Q_i^+(u) \) are polynomials with constant term 1 and \( Q_n = (Q_1(u), \ldots, Q_n(u)) \in \mathcal{Q}(n) \). Moreover,
\[ \sum_{1 \leq i \leq n} \deg Q_i(u) = \sum_{1 \leq j \leq n-1} j \deg P_j(u) = \sum_{1 \leq j \leq p} \mu_j = r = \sum_{i=1}^n \lambda_i. \]

This forces \( \lambda_n = 0 \) and consequently, \( \deg Q_i(u) = \lambda_i \) for all \( 1 \leq i \leq n \). Therefore, \( \Omega_{C}^{\otimes r} \otimes_{\mathcal{H}_0(r)c} V_s \) is a simple polynomial representation of \( U_C( \mathfrak{g}_n ) \) and \( \Omega_{C}^{\otimes r} \otimes_{\mathcal{H}_0(r)c} V_s \cong L(\mathcal{Q}_n) \), proving (1).

We now prove (2). For any \( \mathcal{Q} = (Q_1(u), \ldots, Q_n(u)) \in \mathcal{Q}(n) \) such that \( r = \sum_{1 \leq i \leq n} \lambda_i \) with \( \lambda_i = \deg Q_i(u) \), we now prove that \( L(\mathcal{Q}) \) is a simple \( S_\Lambda(n,r)c\)-module.

Since the polynomials
\[ P_j(u) = \frac{Q_j(uz^{j-1})}{Q_{j+1}(uz^{j+1})} \quad (1 \leq j \leq n-1). \]

have constant term 1 and \( \deg P_j(u) = \lambda_j = \lambda_{j+1} = \nu_j \), it follows that \( \lambda \in \Lambda^+(n,r) \) is a partition with at most \( n \) parts. So \( n > r \) implies \( \lambda_n = 0 \). Moreover, we may write, for \( 1 \leq i \leq n-1 \),
\[ P_i(u) = (1 - a_{\nu_{i+\cdots+i-1+1}}u)(1 - a_{\nu_{i+\cdots+i-1+2}}u) \cdots (1 - a_{\nu_{i+\cdots+i-1+u}}u), \]
where $a_j^{-1} \in \mathbb{C}$, $1 \leqslant j \leqslant p = \sum_i \nu_i$, are the roots of $P_i(u)$. Let $s = \{s_1, \ldots, s_p\}$, where

$$s_i = (a_i z^{-\mu} + 1, a_i z^{-\mu_i+3}, \ldots, a_i z^{\mu_i-1})$$

and $(\mu_1, \ldots, \mu_p) = (1^n, \ldots, (n-1)^{\nu_n-1})$, and let $a = (s_1, \ldots, s_p)$. Since

$$\sum_{1 \leqslant j \leqslant p} \mu_j = \sum_{1 \leqslant i \leqslant n-1} i\nu_i = \sum_{1 \leqslant i \leqslant n} \lambda_i = r,$$

we have $a \in (\mathbb{C}^*)^r$. By the first part of the proof, we see $Q = Q_s$, and hence, $\Omega_{\mathbb{C}} \otimes_{\mathcal{H}(1)} V_s \cong L(Q)$ as $U_C(\widehat{gl}_n)$-modules. In other words, $L(Q)$ is a simple $S(n, r)_{\mathbb{C}}$-module.

4.5. Classification of simple $S(n, r)_{\mathbb{C}}$-modules: the downwards approach

We now complete the classification of simple $S(n, r)_{\mathbb{C}}$-modules by removing the condition $n > r$ in Theorem 4.4.2. We will continue to use the downwards approach with a strategy different from that in the previous section. Throughout this section, we will identify $U_C(\widehat{gl}_n)$ with $\mathcal{O}_{\mathbb{A}}(n)$ via the isomorphism $f$ in Proposition 4.4.1 and will regard every $S(n, r)_{\mathbb{C}}$-module as a $U_C(\widehat{gl}_n)$-module via the algebra homomorphism $\xi_{\mathbb{A}} : \mathcal{O}_{\mathbb{A}}(n) \rightarrow S(n, r)_{\mathbb{C}}$; see (4.4.1.1).

Consider the $U_C(\widehat{gl}_n)$-module via $\xi_{1, \mathbb{C}}$

$$\Omega_{\mathbb{C}}(a) := F(M_a) = \Omega_{\mathbb{C}} \otimes_{\mathcal{H}(1)} M_a$$

for $a \in \mathbb{C}^*$. By Proposition 4.4.1, $\Omega_{\mathbb{C}}(a) \cong \Omega_{n, \mathbb{C}} \otimes_{\mathcal{H}(1)} M_a \cong \Omega_{n, \mathbb{C}}$ as $S(n, 1)_{\mathbb{C}}$-modules. Hence, $\dim \Omega_{\mathbb{C}}(a) = n$.

By Theorem 4.4.3, $\Omega_{\mathbb{C}}(a)$ is a simple $U_C(\widehat{gl}_n)$-module since $\dim C M_a = 1$ and $M_a = V_s$ with $s = (a) \in \mathcal{S}_1$. Since $n > 1$, by Theorem 4.4.2, we have

$$\Omega_{\mathbb{C}}(a) \cong L(Q)$$

with $Q_1(u) = 1 - au$ and $Q_i(u) = 1$ for $2 \leqslant i \leqslant n$. (4.5.0.5)

The $U_C(\widehat{gl}_n)$-module $\Omega_{\mathbb{C}}(a)$ is very useful and we will prove that every finite dimensional simple $S_n(n, r)_{\mathbb{C}}$-module is a quotient module of $\Omega_{\mathbb{C}}(a_1) \otimes_{\mathbb{C}} \cdots \otimes_{\mathbb{C}} \Omega_{\mathbb{C}}(a_r)$ for some $a \in (\mathbb{C}^*)^r$ in Corollary 4.5.2.

Let $\widehat{\omega}_i = \omega_i \otimes \mathbb{I} \in \Omega_{\mathbb{C}}(a)$ for all $i \in \mathbb{Z}$.

**Lemma 4.5.1.** For any $a = (a_1, \ldots, a_r) \in (\mathbb{C}^*)^r$, there is a $U_C(\widehat{gl}_n)$-module isomorphism

$$\varphi : \Omega_{\mathbb{C}}(a_1) \otimes_{\mathbb{C}} \cdots \otimes_{\mathbb{C}} \Omega_{\mathbb{C}}(a_r) \rightarrow \Omega_{\mathbb{C}} \otimes_{\mathcal{H}(1)} M_a$$

defined by sending $\widehat{\omega}_i$ to $\omega_i \otimes \mathbb{I}$ for $i \in I_b(n, r)$, where $\widehat{\omega}_i = \widehat{\omega}_{i_1} \otimes \cdots \otimes \widehat{\omega}_{i_r}$. Moreover, as an $S(n, r)_{\mathbb{C}}$-module, $\Omega_{\mathbb{C}}(a_1) \otimes_{\mathbb{C}} \cdots \otimes_{\mathbb{C}} \Omega_{\mathbb{C}}(a_r)$ is isomorphic to the finite tensor space $\Omega_{n, \mathbb{C}}^r$ for all $a \in (\mathbb{C}^*)^r$.

**Proof.** The set

$$\{\widehat{\omega}_i \mid 1 \leqslant i \leqslant n\}$$

forms a basis of $\Omega_{\mathbb{C}}(a)$. Hence, the set

$$\{\widehat{\omega}_i \mid i \in I(n, r)\}$$

forms a basis of $\Omega_{\mathbb{C}}(a_1) \otimes_{\mathbb{C}} \cdots \otimes_{\mathbb{C}} \Omega_{\mathbb{C}}(a_r)$. 

\[\]
Similarly by Proposition 4.2.1 we have
\[ \Omega_{\mathbb{C}}^{\otimes r} \otimes \mathcal{H}(r)_c \ M_a \cong \Omega_{\mathbb{C}}^{\otimes r} \otimes \mathcal{H}(r)_c \ M_a \cong \Omega_{\mathbb{C}}^{\otimes r} \] (4.5.1.1)
as \mathcal{S}(n, r)_C\text{-modules}. So the set
\[ \{ \omega_i \otimes 1 \mid i \in I(n, r) \} \]
forms a basis of \( \Omega_{\mathbb{C}}^{\otimes r} \otimes \mathcal{H}(r)_c \ M_a \). Hence, there is a linear isomorphism
\[ \varphi : \Omega_{\mathbb{C}}(a_1) \otimes \cdots \otimes \Omega_{\mathbb{C}}(a_r) \rightarrow \Omega_{\mathbb{C}}^{\otimes r} \otimes \mathcal{H}(r)_c \ M_a \]
defined by sending \( \tilde{\omega}_i \) to \( \omega_i \otimes 1 \) for \( i \in I(n, r) \).

Now we assume \( i \in I_0(n, r) \). We write \( i = j + nt \) with \( j \in I(n, r) \) and \( t \in \mathbb{Z}^r \). Then
\[
\varphi(\tilde{\omega}_1) = \varphi((a_1^{-t_1} \tilde{\omega}_{j_1}) \otimes \cdots \otimes (a_r^{-t_r} \tilde{\omega}_{j_r}))
= a_1^{-t_1} a_2^{-t_2} \cdots a_r^{-t_r} \omega_j \otimes 1
= \omega_j X_1^{-t_1} X_2^{-t_2} \cdots X_r^{-t_r} \otimes 1
= \omega_1 \otimes 1.
\]

It follows easily that \( \varphi \) is a \( U_{\mathbb{C}}(\hat{\mathfrak{gl}}_n)_c \)-module isomorphism. The last assertion is clear from (4.5.1.1). \( \square \)

**Corollary 4.5.2.** Let \( V \) be a finite dimensional simple \( U_{\mathbb{C}}(\hat{\mathfrak{gl}}_n)_c \)-module. Then the following conditions are equivalent

1. \( V \) can be regarded as an \( \mathcal{S}_0(n, r)_C \)-module via \( \xi_{r, C} \);
2. \( V \) is a quotient module of the \( U_{\mathbb{C}}(\hat{\mathfrak{gl}}_n)_c \)-module \( \Omega_{\mathbb{C}}(a_1) \otimes \cdots \otimes \Omega_{\mathbb{C}}(a_r) \) for some \( a \in (\mathbb{C}^*)^r \);
3. \( V \) is a quotient module of \( \Omega_{\mathbb{C}}^{\otimes r} \);
4. \( V \) is a subquotient module of \( \Omega_{\mathbb{C}}^{\otimes r} \).

**Proof.** By the lemma above, the map
\[ \Omega_{\mathbb{C}}^{\otimes r} \rightarrow \Omega_{\mathbb{C}}(a_1) \otimes \cdots \otimes \Omega_{\mathbb{C}}(a_r), \quad \omega_i \mapsto \tilde{\omega}_i, \]
is a \( U_{\mathbb{C}}(\hat{\mathfrak{gl}}_n)_c \)-module epimorphism (say, induced by the natural \( \mathcal{H}_0(r)_c \)-module epimorphism \( \mathcal{H}_0(r)_C \rightarrow M_a \)). Hence, (2) implies (3). Certainly, (3) implies (4). Since \( \Omega_{\mathbb{C}}^{\otimes r} \) is an \( \mathcal{S}_0(n, r)_C \)-module, (4) implies (1).

If \( V \) can be regarded as an \( \mathcal{S}_0(n, r)_C \)-module via \( \xi_{r, C} \), then, by Theorem 4.3.4, \( V \cong \Omega_{\mathbb{C}}^{\otimes r} \otimes \mathcal{H}_0(r)_C \ V_s \) for some \( s \). Since \( V_s \) is a homomorphic image of some \( M_s \) (see [8, 3.4], say), it follows that \( V \) is a homomorphic image of \( \tilde{V} \cong \Omega_{\mathbb{C}}^{\otimes r} \otimes \mathcal{H}(r)_c \ M_a \), which implies Lemma 4.5.1 isomorphic to \( \Omega_{\mathbb{C}}(a_1) \otimes \cdots \otimes \Omega_{\mathbb{C}}(a_r) \). Hence, \( V \) is a homomorphic image of \( \Omega_{\mathbb{C}}^{\otimes r} \). \( \square \)

**Remark 4.5.3.** The algebras \( U_{\mathbb{C}}(\hat{\mathfrak{gl}}_n)_c \), \( \mathcal{S}_0(n, r)_C \), etc., under consideration are all defined over \( \mathbb{C} \) with parameter \( z \) which is not a root of unity. As an \( \mathcal{S}(n, r)_C \)-module, the finite dimensional tensor space \( \Omega_{n, C}^{\otimes r} \) is a semisimple module (i.e., is completely reducible). In the affine case, however, it is unclear if the infinite dimensional tensor space \( \Omega_{\mathbb{C}}^{\otimes r} \) is completely reducible. The fact that every simple \( \mathcal{S}_0(n, r)_C \)-module is a homomorphic image of \( \Omega_{\mathbb{C}}^{\otimes r} \) does reflect a certain degree of the complete reducibility.
Using Corollary 4.5.2 we can prove the first key result for the classification theorem.

**Proposition 4.5.4.** Every simple \( \mathcal{S}_s(n, r) \)-module is a polynomial representation of \( U_\mathbb{C}(\hat{\mathfrak{g}}_n) \).

**Proof.** Let \( V \) be a simple \( \mathcal{S}_s(n, r) \)-module. Then \( V \) is finite dimensional by Theorem 4.1.6. Thus, \( V \) is a quotient module of \( \Omega_\mathbb{C}(a_1) \otimes \cdots \otimes \Omega_\mathbb{C}(a_r) \) for some \( a \in (\mathbb{C}^*)^r \), by Corollary 4.5.2. Now, (4.5.0.5) implies that \( \Omega_\mathbb{C}(a) \) is a polynomial representation of \( U_\mathbb{C}(\hat{\mathfrak{g}}_n) \). So, by [28 4.3], the tensor product \( \Omega_\mathbb{C}(a_1) \otimes \cdots \otimes \Omega_\mathbb{C}(a_r) \) is a polynomial representation of \( U_\mathbb{C}(\hat{\mathfrak{g}}_n) \). Hence, \( V \) is also a polynomial representation of \( U_\mathbb{C}(\hat{\mathfrak{g}}_n) \). \( \square \)

Now let us define the \( U_\mathbb{C}(\hat{\mathfrak{g}}_n) \)-module \( \text{Det}_a \) for \( a \in \mathbb{C}^* \) in the following lemma. The \( U_\mathbb{C}(\hat{\mathfrak{g}}_n) \)-module \( \text{Det}_a \) plays the same role in the representation theory of \( U_\mathbb{C}(\hat{\mathfrak{g}}_n) \) as the quantum determinant in the representation theory of \( U(\mathfrak{g}_n)_\mathbb{C} \). One can easily see that by restriction \( \text{Det}_a \) is isomorphic to the quantum determinant for \( U(\mathfrak{g}_n)_\mathbb{C} \) for any \( a \in \mathbb{C}^* \).

**Lemma 4.5.5.** Fix \( a \in \mathbb{C}^* \). Let \( a = s = (a, a z^2, \ldots, a z^{2(n-1)}) \) regarded as a single segment, and let

\[
\text{Det}_a := \Omega_\mathbb{C}^\otimes n \otimes \mathcal{H}_\mathbb{C}(n) \otimes V_a,
\]

where \( V_a = V_s \) is the submodule of \( M_a \) generated by \( \overline{y}_n \). Then \( \dim \text{Det}_a = 1 \) and

\[
\text{Det}_a = \text{span}_\mathbb{C} \{ \omega \otimes \cdots \otimes \omega_n \otimes \overline{y}_n \}.
\]

Moreover, as a \( U_\mathbb{C}(\hat{\mathfrak{g}}_n) \)-module, \( \text{Det}_a \cong L(Q) \), where \( Q = (Q_1(u), \ldots, Q_n(u)) \in Q(n) \) with \( Q_i(u) = 1 - az^{2(n-1)}u \) for all \( i = 1, 2, \ldots, n \).

**Proof.** Recall the notations used in §4.3. We have \( M_a \cong \mathcal{H}(n)_\mathbb{C} \) and, by Theorem 4.3.2, \( V_a = \mathcal{H}(n)_\mathbb{C} \overline{y}_n = \mathbb{C} \overline{y}_n \), since \( T_i \overline{y}_n = - \overline{y}_n \) for all \( 1 \leq i \leq n - 1 \).

By Theorem 4.1.3, \( \text{Det}_a \) is a simple \( \mathcal{S}_s(n, r) \)-module. By Proposition 4.5.4, \( \text{Det}_a \cong L(Q) \) for some \( Q \in Q(n) \). Since

\[
\Omega_\mathbb{C}^\otimes n = \bigoplus_{i \in I_0(n, n)} \omega_i \mathcal{H}(n)_\mathbb{C},
\]

by Proposition 4.2.1,

\[
\text{Det}_a \cong \Omega_\mathbb{C}^\otimes n \otimes \mathcal{H}(n)_\mathbb{C} \otimes V_a \cong \bigoplus_{i \in I_0(n, n)} \omega_i \mathcal{H}(n)_\mathbb{C} \otimes \mathcal{H}(n)_\mathbb{C} \otimes V_a.
\]

Hence, \( \text{Det}_a = \text{span}_\mathbb{C} \{ \omega_i \otimes \overline{y}_n | i \in I_0(n, n, n) \} \). If \( i_k = i_{k+1} \) in an \( i \in I_0(n, n) \) for some \( 1 \leq k \leq n - 1 \), then

\[
z^2 \omega_i \otimes \overline{y}_n = \omega_i T_k \otimes \overline{y}_n = \omega_i \otimes T_k \overline{y}_n = -\omega_i \otimes \overline{y}_n.
\]

This forces \( \omega_i \otimes \overline{y}_n = 0 \) as \( z \) is not a root of unity. The only \( i \in I_0(n, n, n) \) with \( i_k \neq i_{k+1} \) for \( 1 \leq k \leq n - 1 \) is \( i = (1, 2, \ldots, n) \). Hence,

\[
\text{Det}_a = \mathbb{C} \omega_1 \otimes \cdots \otimes \omega_n \otimes \overline{y}_n.
\]
Lemma 4.5.6. Let $V$ be a simple $\mathcal{S}_c(n,i)\mathbb{C}$-module. Then $V$ is a polynomial, we must have $P_i(u) = \frac{Q_i(uz^{i-1})}{Q_{i+1}(uz^{i+1})}$.

is a polynomial, we must have $P_i(u) = 1$ for all $1 \leq i \leq n - 1.$

Suppose $Q_n(u) = 1 - bu$ for some $b \in \mathbb{C}^*$. Then $Q_i(u) = 1 - bz^{2(n-i)}u$ for all $i$. Thus, as in the proof of Theorem 4.4.2, Lemma 4.3.1 implies

$\prod_{1 \leq i \leq n} \left( 1 - (bz^{2(n-i)}u)^\pm 1 \right) w_0 = \prod_{1 \leq i \leq n} Q_i^\pm(u) w_0$

for all $t \geq 1$, and hence,

$\prod_{1 \leq i \leq n} \left( 1 - (bz^{2(n-i)}u)^\pm 1 \right) w_0 = \prod_{1 \leq i \leq n} Q_i^\pm(u) w_0 = \prod_{1 \leq i \leq n} \left( 1 - (az^{2(k-1)}u)^\pm 1 \right) w_0.$

Equating the coefficients of $u$ forces $a = b$. □

Lemma 4.5.6. Let $V$ be a simple $\mathcal{S}_c(n,k)\mathbb{C}$-module and $W$ be a simple $\mathcal{S}_c(n,l)\mathbb{C}$-module. Then $V \otimes W$ is an $\mathcal{S}_c(n,k+l)\mathbb{C}$-module.

Proof. By Corollary 4.5.2 $V$ is a quotient module of the $\mathcal{U}_c(\hat{\mathfrak{g}}_n)$-module $\Omega_c(a_1) \otimes \cdots \otimes \Omega_c(a_k)$ for some $a \in (\mathbb{C}^*)^k$ and $W$ is a quotient module of $\Omega_c(b_1) \otimes \cdots \otimes \Omega_c(b_l)$ for some $b \in (\mathbb{C}^*)^l$. Thus, $V \otimes W$ is a quotient module of the $\mathcal{U}_c(\hat{\mathfrak{g}}_n)$-module $\Omega_c(a_1) \otimes \cdots \otimes \Omega_c(a_k) \otimes \mathcal{S}_c(n,k+l)\mathbb{C}$-module, $V \otimes W$ is an $\mathcal{S}_c(n,k+l)\mathbb{C}$-module. □

We remark that it would be possible to embed $\mathcal{H}_c(k)\mathbb{C} \otimes \mathcal{H}_c(l)\mathbb{C}$ into $\mathcal{H}_c(k+l)\mathbb{C}$ as a subalgebra (see, e.g., [8, 3.2]), and hence, regard $\mathcal{S}_c(n,k+l)\mathbb{C}$ as a subalgebra of $\mathcal{S}_c(n,k)\mathbb{C} \otimes \mathcal{S}_c(n,l)\mathbb{C}$. Thus, by restriction, the $\mathcal{S}_c(n,k)\mathbb{C} \otimes \mathcal{S}_c(n,l)\mathbb{C}$-module $V \otimes W$ is an $\mathcal{S}_c(n,k+l)\mathbb{C}$-module.

For $1 \leq i \leq n - 1$ and $a \in (\mathbb{C}^*)^n$, define $Q_{i,a} \in \mathcal{Q}(n)$ by setting $Q_{i,a}(u) = 1$ and

$Q_{i,a}(uz^{j-1}) = \frac{Q_j(uz^{j-1})}{Q_{j+1}(uz^{j+1})} = (1 - au)^{\delta_{i,j}}$

for $1 \leq j \leq n - 1$. In other words,

$Q_{i,a} = (1 - az^{j-1}u, \ldots, 1 - az^{j+1}u, 1 - az^{-i+3}u, 1 - az^{-i+1}u, 1, \ldots, 1).$

Since $n > i$, by Theorem 4.4.2 the simple $\mathcal{U}_c(\hat{\mathfrak{g}}_n)$-module $L_{i,a} := L(Q)$ is also a simple $\mathcal{S}_c(n,i)\mathbb{C}$-module. The weight of the pseudo-highest weight vector of $L_{i,a}$ is $\lambda(i,a) = (1^i, 0^{n-i})$. Now we can prove the second key result for the classification theorem.
Proposition 4.5.7. If \( Q = (Q_i(u)) \in Q(n) \) with \( r = \sum_{1 \leq i \leq n} \deg(Q_i(u)) \), then \( L(Q) \) is (isomorphic to) a simple \( S_\delta(n, r)_C \)-module.

Proof. Let \( \lambda = (\lambda_1, \ldots, \lambda_n) \) with \( \lambda_j = \deg(Q_j(u)) \) and let
\[
P_i(u) = \frac{Q_i uz^{i-1}}{Q_i u (uz^{i+1})}, \quad 1 \leq i \leq n - 1.
\]
Write \( Q_n(u) = (1 - b_1 u) \cdots (1 - b_n u) \) and
\[
P_i(u) = \prod_{1 \leq j \leq \mu_i} (1 - a_{i,j} u),
\]
where \( \mu_i = \lambda_i - \lambda_{i+1} \). Let
\[
V = L_1 \otimes \cdots \otimes L_{n-1} \otimes \text{Det}_{b_1} \otimes \cdots \otimes \text{Det}_{b_n}
\]
where \( L_i = L_{i,a_{i,1}} \otimes \cdots \otimes L_{i,a_{i,\mu_i}} \) for \( 1 \leq i \leq n - 1 \).

Let \( w_{i,a_{i,k}} \) (resp. \( v_j \)) be a pseudo-highest weight vector of \( L_{i,a_{i,k}} \) (resp., \( \text{Det}_{b_j} \)), and let \( w_0 = w_1 \otimes w_2 \otimes \cdots \otimes w_{n-1} \), where \( w_i = w_{i,a_{i,1}} \otimes w_{i,a_{i,2}} \otimes \cdots \otimes w_{i,a_{i,\mu_i}} \), and \( v_0 = v_1 \otimes \cdots \otimes v_n \). Since \( w_{i,a_{i,k}} \) has weight \((1, \ldots, 0^{a_i})\) and
\[
\mathcal{D}^\pm_j(u) w_{i,a_{i,k}} = \begin{cases} (1 - (a_{i,k} z^{i-2j+1} u)^{\pm 1}) w_{i,a_{i,k}}, & \text{if } 1 \leq j \leq i; \\ w_{i,a_{i,k}}, & \text{if } i < j \leq n, \end{cases}
\]
and
\[
\mathcal{D}^\pm_j(u) v_i = (1 - (b_j z^{2(n-j)} u)^{\pm 1}) v_i \quad \text{for } 1 \leq i \leq \lambda_n,
\]
it follows from \[23\] Lem. 4.1] that
\[
\mathcal{D}^\pm_j(u) (w_0 \otimes v_0) = Q_j^\pm(u) (w_0 \otimes v_0).
\]
Moreover, the weight of \( w_0 \otimes v_0 \) is
\[
\lambda = (\mu_1, 0, \ldots, 0) + (\mu_2, \mu_2, 0, \ldots, 0) + (\mu_{n-1}, \ldots, \mu_{n-1}, 0) + (\lambda_n, \ldots, \lambda_n).
\]

Let \( W \) be the submodule of \( V \) generated by \( w_0 \otimes v_0 \). Then \( W \) is a pseudo-highest weight module whose pseudo-highest weight vector is a common eigenvector of \( k_i \) and \( \mathcal{D}_{i,s} \) with eigenvalues \( z^{\lambda_i} \) and \( Q_{i,s} \), respectively, where \( Q_{i,s} \) are the coefficients of \( Q_i^\pm(u) \). So the simple quotient module of \( W \) is isomorphic to \( L(Q) \) (cf. the construction in \[28\] Lem. 4.8]). Since \( \sum_{1 \leq i \leq n} i \mu_i + n \lambda_n = \sum_{1 \leq i \leq n} \lambda_i = r \), by Lemma 4.5.6 \( V \) is an \( S_\delta(n, r)_C \)-module. Hence, \( L(Q) \) has an \( S_\delta(n, r)_C \)-module structure. \( \square \)

Now using Propositions 4.5.4 and 4.5.7, we can prove the following classification theorem.

Theorem 4.5.8. For any \( n, r \geq 1 \), the set \( \{ L(Q) \mid Q \in Q(n)_r \} \) is a complete set of nonisomorphic simple \( S_\delta(n, r)_C \)-modules.

Proof. By Proposition 4.5.7, the set \( \{ L(Q) \mid Q \in Q(n)_r \} \) consists of nonisomorphic simple \( S_\delta(n, r)_C \)-modules. It remains to prove that every simple \( S_\delta(n, r)_C \)-module is isomorphic to \( L(Q) \) for some \( Q \in Q(n)_r \).

Let \( V \) be a simple \( S_\delta(n, r)_C \)-module. Then \( V \cong L(Q) \) as a \( U_C(\hat{gl}_n) \)-module for some \( Q \in Q(n) \) by Proposition 4.5.4. Let \( l = \sum_{1 \leq i \leq n} \deg Q_i(u) \). Then, by Proposition 4.5.7 \( L(Q) \) is an \( S_\delta(n, l)_C \)-module. Thus, by restriction, \( V \) is a module for the \( q \)-Schur
algebra $S(n,r)_C$ and $V$ is also a module for the $q$-Schur algebra $S(n,l)_C$. Hence, $r = l$.

**Corollary 4.5.9.** Let $V$ be a finite dimensional irreducible polynomial representation of $U_C(\mathfrak{g}l_n)$. Then $V$ can be regarded as an $S_\lambda(n,r)_C$-module via $\xi_{r,C}$ if and only if $V$ is of level $r$ as a $U(n)_C$-module.

**Proof.** If $V$ can be regarded as an $S_\lambda(n,r)_C$-module via $\xi_{r,C}$ then we may view $V$ as an $S(n,r)_C$-module by restriction, and hence, $V$ is of level $r$ as a $U(n)_C$-module.

Conversely, suppose that $V$ is of level $r$ as a $U(n)_C$-module and $V = L(Q)$ for some $Q \in Q(n)$. Then $V$ is an $S_\lambda(n,r)_C$-module by Theorem 4.5.8, where $r' = \sum_{1 \leq i \leq r} \deg Q_i(u)$. Hence, $V$ is of level $r'$ as a $U(n)_C$-module. So $r = r'$ and $V$ is an $S_\lambda(n,r)_C$-module.

**Remark 4.5.10.** It is reasonable to make the following definition. A finite dimensional $U_C(\mathfrak{g}l_n)_C$-module is said to be of level $r$ if it is an $S_\lambda(n,r)_C$-module via $\xi_{r,C}$. Thus, if $V$ is a $U_C(\mathfrak{g}l_n)_C$-module of level $r$, then its composition factors are all homomorphic images of $\Omega_C^\otimes r$. It would be interesting to know if the converse is also true.

It is natural to make a comparison between the Classification Theorems 4.3.4 and 4.5.8 and to raise the following problem.

**Problem 4.5.11.** Generalize the Identification Theorem 4.4.2 to the case where $n \leq r$.

### 4.6. Classification of simple $U_\lambda(n,r)_C$-modules

The homomorphic image $U_\lambda(n,r)_C$ of the extended affine quantum $\mathfrak{sl}_n$, $U_\lambda(n)_C$, is a proper subalgebra of $S_\lambda(n,r)_C$ when $n \leq r$. In other words, by restriction, the surjective algebra homomorphism $\xi_{r,C} : U_C(\mathfrak{g}l_n) \to S_\lambda(n,r)_C$ induces a surjective algebra homomorphism $\xi_{r,C} : U_\lambda(n)_C \to U_\lambda(n,r)_C$. In this section, we will classify simple $U_\lambda(n,r)_C$-modules.

Let $P \in P(n)$ and $\lambda \in \Lambda^+(n,r)$ be such that $\lambda_i - \lambda_{i+1} = \deg P_i$ for $1 \leq i \leq n-1$. Define

$$M(P, \lambda) = U_\lambda(n)_C / \tilde{L}(P, \lambda),$$

where $\tilde{L}(P, \lambda)$ is the left ideal of $U_\lambda(n)_C$ generated by $x_{i,s}^+$, $P_{i,s} - P_{i,s}$ and $k_j - z^{\lambda_j}$ for $1 \leq i \leq n-1$, $s \in \mathbb{Z}$ and $1 \leq j \leq n$, where $P_{i,s}$ is defined using (4.2.1.7). The $U_\lambda(n)_C$-module $M(P, \lambda)$ has a unique simple quotient $U_\lambda(n)_C$-module, which is denoted by $\tilde{L}(P, \lambda)$.

**Lemma 4.6.1.** For $Q \in Q(n)$, let $\lambda = (\lambda_1, \ldots, \lambda_n)$ with $\lambda_i = \deg(Q_i(u))$ for $1 \leq i \leq n$ and $P = (P_1(u), \ldots, P_{n-1}(u)) \in P(n)$ be such that

$$P_j(u) = \frac{Q_j(uz^{j-1})}{Q_{j+1}(uz^{j+1})}$$

for $1 \leq j \leq n-1$. Then $\tilde{L}(P, \lambda) \cong \tilde{L}(Q) |_{U_\lambda(n)_C}$. 

4.6. CLASSIFICATION OF SIMPLE $U_\Lambda(n, r)_C$-MODULES

Proof. Let $w_0 \in L(Q)$ be a pseudo-highest weight vector. Since $U_C(\mathfrak{gl}_n)$ is generated by $U_\Lambda(n)_C$ and the central elements $z_t^+$ for $t \geq 1$, every simple $U_C(\mathfrak{gl}_n)_C$-module is a simple $U_\Lambda(n)_C$-module by restriction. In particular, $L(Q)|_{U_\Lambda(n)_C}$ is simple. So we have $L(Q) = U_\Lambda(n)_C w_0$. Hence, there is a surjective $U_\Lambda(n)_C$-module homomorphism $\varphi : M(P, \lambda) \to L(Q)$ defined by sending $\bar{u}$ to $uw_0$ for $u \in U_\Lambda(n)_C$. Thus, $L(Q) \cong M(P, \lambda)/\text{Ker} \varphi$ as $U_\Lambda(n)_C$-modules. Since $L(Q)|_{U_\Lambda(n)_C}$ is simple and $M(P, \lambda)$ has a unique simple quotient $\bar{L}(P, \lambda)$, we have $\bar{L}(P, \lambda) \cong L(Q)$ as $U_\Lambda(n)_C$-modules.

Corollary 4.6.2. Let $P \in P(n)$ and $\lambda \in \Lambda^+(n, r)$ with $\lambda_i - \lambda_{i+1} = \deg P_i(u)$ for $1 \leq i \leq n - 1$. Then $\bar{L}(P, \lambda)$ is a $U_\Lambda(n, r)_C$-module via $\xi_{r, C}$ and $\bar{L}(P, \lambda)|_{U_\Lambda(\tilde{\mathfrak{sl}}_n)} \cong \bar{L}(P)$.

Proof. Let $Q_n(u) = 1 + u^\lambda$. Using the formula

$$P_j(u) = \frac{Q_j(u z^{j-1})}{Q_{j+1}(uz^{j+1})},$$

we define the polynomials $Q_i(u)$ for $1 \leq i \leq n - 1$. Then we have $Q = (Q_1(u), \ldots, Q_n(u)) \in Q(n)$ and $\lambda_i = \deg Q_i(u)$ for $1 \leq i \leq n$. By Theorem 4.5.8, $L(Q)$ is an $S(n, r)_C$-module. So, by Lemma 4.6.1, $\bar{L}(P, \lambda) \cong L(Q)|_{U_\Lambda(n)_C}$ is a $U_\Lambda(n, r)_C$-module. Hence, $\bar{L}(P, \lambda)|_{U_\Lambda(\tilde{\mathfrak{sl}}_n)}$ is simple since the algebra homomorphism $\xi_{r, C} : U_C(\tilde{\mathfrak{sl}}_n) \to U_\Lambda(n, r)_C$ is surjective.

Since $U_\Lambda(n, r)_C$ contains $S(n, r)_C$ as a subalgebra, it follows that, if $\lambda \in \Lambda^+(n, r)$, then $\bar{L}(P, \lambda)$ is an $S(n, r)_C$-module and

$$\bar{L}(P, \lambda) = \bigoplus_{\mu \in \Lambda(n, r)} \bar{L}(P, \lambda)_\mu \quad (4.6.2.1)$$

where $\bar{L}(P, \lambda)_\mu$ denote the weight space of $\bar{L}(P, \lambda)$ as a $U(n)_C$-module.

Lemma 4.6.3. Let $\lambda, \tilde{\lambda}$ be partitions and $P, \tilde{P} \in P(n)$. If $\bar{L}(P, \lambda) \cong \bar{L}(\tilde{P}, \tilde{\lambda})$, then $P = \tilde{P}$ and $\lambda = \tilde{\lambda}$. In particular, for $Q, Q' \in Q(n)$, $L(Q)|_{U_\Lambda(n)_C} \cong L(Q')|_{U_\Lambda(n)_C}$ if and only if $\deg Q_j(u) = \deg Q'_j(u)$ and $Q_j(u z^{j-1})/Q_{j+1}(uz^{j+1}) = Q'_j(u z^{j-1})/Q'_{j+1}(uz^{j+1})$ for all $1 \leq i \leq n$ and $1 \leq j \leq n - 1$.

Proof. By (4.6.2.1) we have $\lambda = \tilde{\lambda}$. Since $\bar{L}(P, \lambda) \cong \bar{L}(\tilde{P}, \tilde{\lambda})$, it follows from Corollary 4.6.2 that $\bar{L}(P) \cong \bar{L}(P, \lambda)|_{U_\Lambda(\tilde{\mathfrak{sl}}_n)} \cong \bar{L}(\tilde{P}, \tilde{\lambda})|_{U_\Lambda(\tilde{\mathfrak{sl}}_n)} \cong \bar{L}(\tilde{P})$. Therefore, $P = \tilde{P}$.

Lemma 4.6.4. Let $V$ be a finite dimensional simple $U_\Lambda(n, r)_C$-module. Then there exist $P = (P_1(u), \ldots, P_{n-1}(u)) \in P(n)$ and $\lambda \in \Lambda^+(n, r)$ with $\lambda_i - \lambda_{i+1} = \deg P_i(u)$, for all $1 \leq i \leq n - 1$, such that $V \cong \bar{L}(P, \lambda)$.

Proof. Since $\xi_{r, C} : U_C(\tilde{\mathfrak{sl}}_n) \to U_\Lambda(n, r)_C$ is surjective, $V$ is a simple $U_C(\tilde{\mathfrak{sl}}_n)_C$-module. Let $w_0$ be a pseudo-highest weight vector satisfying $z_i^+w_0 = 0$, $P_iw_0 = P_iw_0$, and $\tilde{k}_jw_0 = s^\mu_jw_0$

for all $1 \leq i, j \leq n - 1$ and $s \in \mathbb{Z}$, where $\mu_j = \deg P_j(u)$. Using the idempotent decomposition $1 = \sum_{r \in \Lambda(n, r)} r$, $\sum_{r \in \Lambda(n, r)} r w_0 = w_0 \neq 0$ implies that there exists $\lambda \in \Lambda(n, r)$ such that $I_\lambda w_0 \neq 0$. 

It is clear that $I_\lambda w_0$ is also a pseudo-highest weight vector satisfying $x^+_{i,s} I_\lambda w_0 = 0$, $\mathcal{P}_{s,s} I_\lambda w_0 = P_{i,s} I_\lambda w_0$, and $\tilde{k}_j I_\lambda w_0 = z^{\mu_j} I_\lambda w_0$. On the other hand, $k_i I_\lambda w_0 = z^\lambda_i I_\lambda w_0$ for $1 \leq i \leq n$. Thus, $\tilde{k}_j I_\lambda w_0 = z^{\lambda_j - \lambda_{j+1}} I_\lambda w_0$. So $\lambda_i - \lambda_{i+1} = \mu_i$ for $1 \leq i \leq n - 1$. Hence, there is a surjective $U_\lambda(n)_C$-module homomorphism $\varphi : \bar{M}(P, \lambda) \rightarrow V$ defined by sending $\bar{u}$ to $uw_0$ for all $u \in U_\lambda(n)_C$. This surjection induces a $U_\lambda(n)_C$-module isomorphism $V \simeq \bar{L}(P, \lambda)$. □

All together gives the following classification theorem.

**Theorem 4.6.5.** The set

$$\{L(P, \lambda) \mid P \in \mathcal{P}(n), \lambda \in \Lambda^+(n, r), \lambda_i - \lambda_{i+1} = \deg P_i(u) \text{ for } 1 \leq i \leq n - 1\}$$

is a complete set of nonisomorphic finite dimensional simple $U_\lambda(n, r)_C$-modules.

Define an equivalence relation $\sim$ on $Q(n)$ be setting for $Q, Q' \in Q(n)$,

$$Q \sim Q' \iff \deg Q_i(u) = \deg Q'_i(u), 1 \leq i \leq n, \text{ and } \frac{Q_j(uz^{j-1})}{Q_{j+1}(uz^{j+1})} = \frac{Q'_j(uz^{j-1})}{Q'_{j+1}(uz^{j+1})}, 1 \leq j \leq n - 1.$$ 

**Corollary 4.6.6.** If $\Pi_r = Q(n)/\sim$ denotes the set of equivalence classes and choose a representative $Q_\pi \in \pi$ for every $\pi \in \Pi_r$, then the set $\{L(Q_\pi)|_{U_\lambda(n)_C} : \pi \in \Pi_r\}$ is a complete set of nonisomorphic finite dimensional simple $U_\lambda(n, r)_C$-modules. Moreover, if $n > r$, then $\Pi_r = Q(n)_r$.

**Proof.** The last assertion follows from the fact that, if $n > r$, then $U_\lambda(n, r)_C = S_\lambda(n, r)_C$. □

As seen in Theorem 4.2.3, there is a rougher equivalence relation $\sim'$ on $Q(n)$ defined by setting for $Q, Q' \in Q(n)$,

$$Q \sim' Q' \iff \frac{Q_j(uz^{j-1})}{Q_{j+1}(uz^{j+1})} = \frac{Q'_j(uz^{j-1})}{Q'_{j+1}(uz^{j+1})} \text{ for } 1 \leq j \leq n - 1$$

such that the equivalence classes are in one-to-one correspondence to simple $U_C(\mathfrak{sl}_n)$-modules.
CHAPTER 5

The presentation and realization problems

As seen in Chapters 2 and 3, the double Ringel–Hall algebra $\mathcal{D}(n)$ is presented by generators and relations, while the affine quantum Schur algebra $\mathcal{S}(n, r)$ is defined as an endomorphism algebra which is a vector space with an explicitly defined multiplication. Now the algebra epimorphism from $\mathcal{D}(n)$ to $\mathcal{S}(n, r)$ raises two natural questions: how to present affine quantum Schur algebras $\mathcal{S}(n, r)$ in terms of generators and relations and how to realize the double Ringel–Hall algebra $\mathcal{D}(n)$ in terms of a vector space together with an explicitly defined multiplication? In this and next chapters, we will tackle these problems.

Since $\mathcal{D}(n) \cong U(n) \otimes Z(n)$ by Remark 2.2.8(2), it follows that $\mathcal{S}(n, r) = U(n, r)Z(n, r)$, where $U(n, r)$ (resp., $Z(n, r)$) is the homomorphic image of the quantum group $U(n)$, the extended quantum affine $\mathfrak{sl}_n$, (resp. the central subalgebra $Z(n)$) under the map $\xi$. We first review in §5.1 a presentation of McGerty for $U(n, r)$. This is a proper subalgebra of $\mathcal{S}(n, r)$ if $n \leq r$. As a natural affine analogue of the presentation given by Doty–Giaquinto [16], we will modify McGerty’s presentation to obtain a Drinfeld–Jimbo type presentation for $U(n, r)$ (Theorem 5.1.3). We then determine the structure of the central subalgebra $Z(n, r)$ of $\mathcal{S}(n, r)$ (Proposition 5.2.3). However, it is almost impossible to combine the two to give a presentation for $\mathcal{S}(n, r)$. In §5.3, we will use the multiplication formulas given in §3.4 to derive some extra relations for an extra generator required for presenting $\mathcal{S}(n, r)$ for all $r \geq 1$ (Theorem 5.3.5). In particular, we will then easily see why the Hopf algebra $\hat{U}$ considered in [35] maps onto affine quantum Schur algebras; see Remark 5.3.2. Strictly speaking, $\hat{U}$ cannot be regarded as a quantum enveloping algebra since it does not have a triangular decomposition.

From §5.4 onwards, we will discuss the realization problem. We first formulate a realization conjecture in §5.4, as suggested in [23] 5.2(2), and its classical ($v = 1$) version. In the last section, we show that Lusztig’s transfer maps are not compatible with the map $\xi$ for the double Ringel–Hall algebra $\mathcal{D}(n)$ considered in Remarks 2.2.8(3). This justifies that we cannot have a realization in terms of an inverse limit of the transfer maps. We will then establish the conjecture for the classical case in the next chapter.

5.1. McGerty’s presentation for $U(n, r)$

The presentation problem for $\mathcal{S}(n, r)$ when $n > r$ is relatively easy. In this case, $\mathcal{S}(n, r) = U(n, r)$ is a homomorphic image of $U(n)$. By using McGerty’s presentation for $U(n, r)$, we obtain a new presentation for $U(n, r)$ similar to that

\footnote{This algebra $\hat{U}$ is denoted by $U(\hat{gl}_n)$ in [35].}
for quantum Schur algebras given in [16] (cf. [26]). In particular, this gives Doty–Green’s result [17] for \( S_\lambda(n,r) \) with \( n > r \) (removing the condition \( n \geq 3 \) required there).

Let \( \xi_r : D_\lambda(n) \to S_\lambda(n,r) \) be the surjective homomorphism defined in [3.5.4.3]. For each \( r \geq 1 \), define
\[
U_\lambda(n,r) := \xi_r(U_\lambda(n)).
\]
Clearly, \( U_\lambda(n,r) \) is generated by the elements
\[
e_i := \xi_r(E_i) = E_{i+1}^\lambda(0,r), \quad f_i := \xi_r(F_i) = E_{i+1}^\lambda(0,r), \quad e_i := \xi_r(K_i) = 0(e_i,r),
\]
for all \( i \in I \).

Let \( C = (c_{i,j}) \) denote the generalized Cartan matrix of type \( \tilde{A}_{n-1} \) as in [1.3.2.1]. Recall the elements \( I_\lambda, \lambda \in \Lambda_\lambda(n,r) \), defined in Proposition [3.7.4](2). The following result is taken from [60] Prop. 6.4 & Lem. 6.6.

**Theorem 5.1.1.** As a \( \mathbb{Q}(v) \)-algebra, \( U_\lambda(n,r) \) is generated by
\[
e_i, \quad f_i, \quad I_{\lambda} \quad (i \in I, \ \lambda \in \Lambda_\lambda(n,r))
\]
subject to the following relations
\begin{enumerate}
\item \( I_i I_\mu = \delta_{i\mu} I_\lambda, \ \sum_{\lambda \in \Lambda_\lambda(n,r)} I_\lambda = 1; \)
\item \( e_i I_\lambda = \begin{cases} I_{\lambda + e_i^\lambda - e_{i+1}^\lambda}, & \text{if } \lambda + e_i^\lambda - e_{i+1}^\lambda \in \Lambda_\lambda(n,r); \\ 0, & \text{otherwise}; \end{cases} \)
\item \( f_i I_\lambda = \begin{cases} I_{\lambda - e_i^\lambda + e_{i+1}^\lambda}, & \text{if } \lambda - e_i^\lambda + e_{i+1}^\lambda \in \Lambda_\lambda(n,r); \\ 0, & \text{otherwise}; \end{cases} \)
\item \( e_i f_j - f_j e_i = \delta_{ij} \sum_{\lambda \in \Lambda_\lambda(n,r)} [\lambda_i - \lambda_{i+1}] I_\lambda; \)
\item \( \sum_{a+b=1-c_{i,j}} (-1)^a \left[ \begin{array}{c} 1 - c_{i,j} \\ a \end{array} \right] e_i^a e_j b^a = 0 \quad \text{for } i \neq j; \)
\item \( \sum_{a+b=1-c_{i,j}} (-1)^a \left[ \begin{array}{c} 1 - c_{i,j} \\ a \end{array} \right] f_i^a f_j b^a = 0 \quad \text{for } i \neq j. \)
\end{enumerate}

This theorem is the affine version of Theorem 3.4 in [16]. Naturally, one expects the affinization of Theorem 3.1 in [16] for a Drinfeld–Jimbo type presentation. In fact, this is an easy consequence of the following result for the Laurent polynomial algebra \( U^0 := \mathbb{Q}(v)[K_1^{\pm 1}, \ldots, K_n^{\pm 1}] = U_\lambda(n)^0 \), whose proof can be found in [16] Prop. 8.2, 8.3] and [26] 4.5, 4.6] in the context of quantum \( g\mathfrak{l}_n \) and quantum Schur algebras (though the result itself was not explicitly stated there).

For any \( \mu \in \mathbb{N}^n \) and \( 1 \leqslant i \leqslant n \), let
\[
\mathfrak{L}_\mu := \prod_{i=1}^n \left[ \begin{array}{c} K_i; 0 \\ \mu_i \end{array} \right] \quad \text{and} \quad \mathfrak{v}^\mu = (v^{\mu_1}, \ldots, v^{\mu_n}),
\]
\[
[K_i; r + 1] = (K_i - 1)(K_i - v) \cdots (K_i - v^r).
\]

If we regard \( \mathfrak{L}_\mu \) as a function from \( U^0 \) to \( \mathbb{Q}(v) \), then \( \mathfrak{L}_\lambda(\mathfrak{v}^\mu) = \delta_{\lambda,\mu} \) for all \( \lambda, \mu \in \Lambda(n,r) \).
Lemma 5.1.2. The ideals $\langle I_r \rangle$ and $\langle J_r \rangle$ of $U^0$ generated by the sets

$$I_r = \{1 - \Sigma_{\lambda \in \Lambda(n,r)} \mathcal{L}_\lambda \} \cup \{\mathcal{L}_\lambda \mathcal{L}_\mu - \delta_{\lambda,\mu} \mathcal{L}_\lambda \mid \lambda, \mu \in \Lambda(n,r)\}$$

$$\cup \{K_i \mathcal{L}_\lambda - v^{\lambda_i} \mathcal{L}_\lambda \mid 1 \leq i \leq n, \lambda \in \Lambda(n,r)\}, \quad \text{and}$$

$$J_r = \{\kappa := K_1 \cdots K_n - v^r; [K_i; r + 1] \mid 1 \leq i \leq n\};$$

are the same.

**Proof.** For completeness, we provide here a direct proof. Consider the algebra epimorphism

$$\varphi : U^0 \rightarrow \bigoplus_{\mu \in \Lambda(n,r)} U^0 / \langle K_1 - v^{\mu_1}, \ldots, K_n - v^{\mu_n} \rangle, \ f \mapsto (f(\varphi))^\mu \in \lambda(n,r).$$

It is clear from the relations $\mathcal{L}_\lambda(v^\mu) = \delta_{\lambda,\mu}$ that $\langle I_r \rangle = \text{Ker} \, \varphi$. Applying the Chinese Remainder Theorem yields

$$\langle I_r \rangle = \bigcap_{\mu \in \Lambda(n,r)} \langle K_1 - v^{\mu_1}, \ldots, K_n - v^{\mu_n} \rangle$$

$$= \bigcap_{0 \leq \mu_1, \ldots, \mu_n \leq r} (\langle \kappa \rangle + \langle K_1 - v^{\mu_1}, \ldots, K_n - v^{\mu_n} \rangle)$$

$$= \langle \kappa \rangle + \bigcap_{0 \leq \mu_1, \ldots, \mu_n \leq r} \langle K_1 - v^{\mu_1}, \ldots, K_n - v^{\mu_n} \rangle$$

$$= \langle \kappa \rangle + \langle [K_1; r + 1]^1, \ldots, [K_n; r + 1]^1 \rangle$$

$$= \langle J_r \rangle,$$

since $\kappa \in \langle K_1 - v^{\mu_1}, \ldots, K_n - v^{\mu_n} \rangle \iff \mu_1 + \cdots + \mu_n = r.$

The above lemma together with Theorem 5.1.1 gives the following result, which, as mentioned above, was proved in [17] under the assumption that $n \geq 3$ and $n > r$.

**Theorem 5.1.3.** The algebra $U_\omega(n, r)$ is generated by the elements

$$e_i, f_i, \delta_i \ (i \in I = \mathbb{Z}/n\mathbb{Z})$$

subject to the relations:

(QS1) $e_i e_j = e_j e_i$;

(QS2) $e_i f_j = v^{\delta_{i,j} - \delta_{i,j+1}} e_i f_j = v^{-\delta_{i,j} + \delta_{i,j+1}} f_j e_i$;

(QS3) $e_i f_j - f_j e_i = \delta_{i,j} - \frac{1}{v^r}$, where $\bar{e}_i = e_i \frac{1}{v^r}$;

(QS4) $\sum_{a+b=1} (-1)^a \begin{bmatrix} 1 - c_{i,j} \\ a \end{bmatrix} e_i^a e_j^b e_i^b = 0$ for $i \neq j$;

(QS5) $\sum_{a+b=1} (-1)^a \begin{bmatrix} 1 - c_{i,j} \\ a \end{bmatrix} f_i^a f_j^b f_i^b = 0$ for $i \neq j$.

\[2\text{The ideal } J \text{ appeared in the proof of [11] Lem. 13.36} \text{ should be}

$$\bigcap_{0 \leq \mu_1, \ldots, \mu_n \leq r} \langle x_1 - v^{\mu_1}, \ldots, x_n - v^{\mu_n} \rangle,$$

while the quotient algebra $R/J$ should have dimension $(r + 1)^n$.\]
5. THE PRESENTATION AND REALIZATION PROBLEMS

(QS6) \([t_i; r + 1] = 0, \ t_1 \cdots \ t_n = v^r.\]

**Proof.** First, by the lemma, the ideal \(I_r\) of \(U_\lambda(n)\) generated by \(I_r\) is the same as the ideal \(J_r\) generated by \(J_r\). Second, if \(\xi'_r : U_\lambda(n) \to S_\lambda(n, r)\) denotes the restriction of \(\xi_r\) to \(U_\lambda(n)\), then it is clear that \(I_r \subseteq \text{Ker } \xi'_r\) (see the proof of Proposition 3.7.4). Thus, we obtain an epimorphism

\[\varphi : U_\lambda(n)/I_r \longrightarrow U_\lambda(n)/\text{Ker } \xi'_r \cong U_\lambda(n, r)\]

satisfying \(\varphi(E_i + I_r) = e_i, \ \varphi(F_i + I_r) = f_i,\) and \(\varphi(\mathcal{L}_\lambda + I_r) = I_\lambda\) for \(i \in I\) and \(\lambda \in \Lambda_\lambda(n, r)\).

On the other hand, it is direct to check that all relations given in Theorem 5.1.1 hold in \(U_\lambda(n)/I_r\) (see, e.g., the proof of [11 Lem 13.40]). Thus, applying Theorem 5.1.1 yields a natural algebra homomorphism

\[\psi : U_\lambda(n, r) \longrightarrow U_\lambda(n)/I_r\]

satisfying \(e_i \mapsto E_i + I_r, \ f_i \mapsto F_i + I_r,\) and \(I_\lambda \mapsto \mathcal{L}_\lambda + I_r\). Therefore, \(\varphi\) has to be an isomorphism, forcing \(\text{Ker } \xi'_r = I_r = J_r\).

**Remarks 5.1.4.** (1) It is possible to replace the relations in (QS6) by the relations

\[\left[t_1; \mu_1\right] \left[t_2; \mu_2\right] \cdots \left[t_n; \mu_n\right] = 0 \text{ for all } \mu \in \mathbb{N}_\geq\text{ with } \sigma(\mu) = r + 1,\]

and replace \(t_n\) used in (QS1)–(QS5) by \(t_n := v^r t_{i-1} \cdots t_{n-1}\). The new presentation uses only \(3n - 1\) generators. For more details, see [26] or [11 §13.10]. It is interesting to point out that the homomorphic image \(U(\infty, r)\) of \(U(\mathfrak{g}l_\infty)\), which is a proper subalgebra of the infinite quantum Schur algebra \(S(\infty, r)\) for all \(r \geq 1\), has only a presentation of this type; see [23 4.7.5.4].

(2) If \(\tilde{I}_r\) denotes the ideal of \(\mathcal{D}_\lambda(n)\) generated by \(I_r\), then

\[\mathcal{D}_\lambda(n)/\tilde{I}_r \cong U_\lambda(n, r) \otimes \mathcal{Z}_\lambda(n)\]

Thus, adding (QS6) to relations (QGL1)–(QGL8) in Theorem 2.2.3 gives a presentation for this algebra.

The relations (QS1)–(QS6) in Theorem 5.1.3 will form part of the relations in a presentation for \(S_\lambda(r, r), r \geq 1\); see §5.3.

5.2. Structure of affine quantum Schur algebras

When \(n \leq r\), \(U_\lambda(n, r)\) is a proper subalgebra of \(S_\lambda(n, r)\). The next two sections are devoted to the study of the structure of affine quantum Schur algebras \(S_\lambda(n, r)\) in this case. We will first see in this section a general structure of \(S_\lambda(n, r)\) inherited from \(\mathcal{D}_\lambda(n)\) and give an explicit presentation for \(S_\lambda(r, r)\) in §5.3.

We first endow \(S_\lambda(n, r)\) with a \(\mathbb{Z}\)-grading through the surjective algebra homomorphism

\[\xi_r : \mathcal{D}_\lambda(n) \longrightarrow S_\lambda(n, r) = \text{End}_{\mathcal{H}_\lambda(r)}(\Omega^{\otimes r}).\]

If we assign to each \(u_A^+\) (resp., \(u_A^-\), \(K_i\)) the degree \(\mathfrak{d}(A) = \dim M(A)\) (resp., \(-\mathfrak{d}(A), 0\), then \(\mathcal{D}_\lambda(n)\) admits a \(\mathbb{Z}\)-grading \(\mathcal{D}_\lambda(n) = \oplus_{m \in \mathbb{Z}} \mathcal{D}_\lambda(n)_m\). By definition, we have for
each \( x \in \mathcal{D}_\triangle(n)_m \) and \( \omega_1 = \omega_{i_1} \otimes \cdots \otimes \omega_{i_r} \in \Omega^{\otimes r} \),
\[
x \cdot \omega_1 = \sum_{p=1}^{l} a_p \omega_{j(p)},
\]
where \( a_p \in \mathbb{Q}(v) \) and \( j^{(p)} = (j_{1,p}, \ldots, j_{r,p}) \in \mathbb{Z}^r \) satisfy \( \sum_{s=1}^{r} j_{s,p} = \sum_{s=1}^{r} i_s - m \) for all \( 1 \leq p \leq l \). Thus, letting \( \mathcal{S}_\triangle(n,r)_m = \xi_r(\mathcal{D}_\triangle(n)_m) \) gives a decomposition
\[
\mathcal{S}_\triangle(n,r) = \bigoplus_{m \in \mathbb{Z}} \mathcal{S}_\triangle(n,r)_m
\]
of \( \mathcal{S}_\triangle(n,r) \), i.e., \( \mathcal{S}_\triangle(n,r) \) is \( \mathbb{Z} \)-graded, too.

By Remark [2.2.8(2)], there is a central subalgebra \( \mathbb{Z}_\triangle(n) = \mathbb{Q}(v)[z_m^+, z_m^-]_{m \geq 1} \) of \( \mathcal{D}_\triangle(n) \) such that \( \mathcal{D}_\triangle(n) = \mathbb{U}_\triangle(n) \otimes_{\mathbb{Q}(v)} \mathbb{Z}_\triangle(n) \). This gives another subalgebra of \( \mathcal{S}_\triangle(n,r) \)
\[
\mathbb{Z}_\triangle(n,r) := \xi_r(\mathbb{Z}_\triangle(n))
\]
such that \( \mathcal{S}_\triangle(n,r) = \mathbb{U}_\triangle(n,r) \mathbb{Z}_\triangle(n,r) \). In other words, \( \xi_r \) induces a surjective algebra homomorphism
\[
\mathbb{U}_\triangle(n,r) \otimes \mathbb{Z}_\triangle(n,r) \longrightarrow \mathcal{S}_\triangle(n,r), ~ x \otimes y \longmapsto x \xi_r(y).
\]
Clearly, \( \mathbb{Z}_\triangle(n,r) \) is contained in the center of \( \mathcal{S}_\triangle(n,r) \).

By [58] Th. 7.10 & 8.4 (see also Corollary [3.5.8], we have the following result.

**Lemma 5.2.1.** The equality \( \mathbb{U}_\triangle(n,r) = \mathcal{S}_\triangle(n,r) \) holds if and only if \( n > r \). In other words, \( \mathbb{Z}_\triangle(n,r) \subseteq \mathbb{U}_\triangle(n,r) \) if and only if \( n > r \).

Moreover, for each \( m \geq 1 \), \( \xi_r(z_m^+) \in \mathcal{S}_\triangle(n,r)_{mn} \) and \( \xi_r(z_m^-) \in \mathcal{S}_\triangle(n,r)_{-mn} \), and the \( \mathbb{Z} \)-grading of \( \mathcal{S}_\triangle(n,r) \) induces a \( \mathbb{Z} \)-grading
\[
\mathbb{U}_\triangle(n,r) = \bigoplus_{m \in \mathbb{Z}} \mathbb{U}_\triangle(n,r)_m
\]
of \( \mathbb{U}_\triangle(n,r) \), where \( \mathbb{U}_\triangle(n,r)_m = \mathbb{U}_\triangle(n,r) \cap \mathcal{S}_\triangle(n,r)_m \).

We are now going to determine the structure of both \( \mathbb{Z}_\triangle(n,r) \) and \( \mathbb{U}_\triangle(n,r) \). For all \( 1 \leq s \leq r \), define commuting \( \mathbb{Q}(v) \)-linear maps
\[
\phi_s : \Omega^{\otimes r} \longrightarrow \Omega^{\otimes r}, ~ \omega_1 \longmapsto \omega_{1-ne_s} = \omega_{i_1} \otimes \cdots \otimes \omega_{i_s-n} \otimes \cdots \otimes \omega_{i_r}
\]
and set for each \( m \geq 1 \),
\[
p_m = \sum_{s=1}^{r} \phi_s^m \text{ and } q_m = \sum_{s=1}^{r} \phi_s^{-m}.
\]
By [3.5.4.4], \( p_m = \xi_r(z_m^+) \) and \( q_m = \xi_r(z_m^-) \). Thus, they both lie in \( \mathcal{S}_\triangle(n,r) \). Moreover, \( \mathbb{Z}_\triangle(n,r) = \mathbb{Q}(v)[p_m, q_m]_{m \geq 1} \).

**Remark 5.2.2.** The right action [3.3.0.3] of \( \mathcal{H}_\triangle(r) \) on \( \Omega^{\otimes r} \) induces an algebra homomorphism \( \psi_r : \mathcal{H}_\triangle(r) \rightarrow \text{End}_{\mathbb{Q}(v)}(\Omega^{\otimes r}) \). It is easy to see from the definition that for each \( m \geq 1 \),
\[
p_m = \psi_r(X_1^m + \cdots + X_r^m) \text{ and } q_m = \psi_r(X_1^{-m} + \cdots + X_r^{-m}).
\]
It is well known that for each \( m \in \mathbb{Z} \), the element \( X_1^m + \cdots + X_r^m \) is central in \( \mathcal{H}_\triangle(r) \).
Now let $\sigma_1, \ldots, \sigma_r$ (resp., $\tau_1, \ldots, \tau_r$) denote the elementary symmetric polynomials in $\phi_1, \ldots, \phi_r$ (resp., $\phi_1^{-1}, \ldots, \phi_r^{-1}$), i.e., for $1 \leq s \leq r$,

$$
\sigma_s = \sum_{1 \leq t_1 < \cdots < t_s \leq r} \phi_{t_1} \cdots \phi_{t_s} \quad \text{(resp., } \tau_s = \sum_{1 \leq t_1 < \cdots < t_s \leq r} \phi_{t_1}^{-1} \cdots \phi_{t_s}^{-1}).
$$

Then $\sigma_s, \tau_s \in \mathbb{Z}_\triangle(n,r)$ and

$$
\mathbb{Z}_\triangle(n,r) = \mathbb{Q}(\sigma_1, \ldots, \sigma_r, \tau_1, \ldots, \tau_r).
$$

Since $\tau_r = \sigma_r^{r-1}$ and $\tau_s = \sigma_r^{r-s} \tau_r$ for each $1 \leq s < r$,

this implies that

$$
\mathbb{Z}_\triangle(n,r) = \mathbb{Q}(\sigma_1, \ldots, \sigma_r, \sigma_r^{-1}).
$$

**Proposition 5.2.3.** The set

$$
X := \{ \sigma^{\lambda_1} \cdots \sigma_{r-1}^{\lambda_r} \sigma_r^{-\lambda_r} \mid \lambda_1, \ldots, \lambda_{r-1} \in \mathbb{N}, \lambda_r \in \mathbb{Z} \}
$$

forms a $\mathbb{Q}(v)$-basis of $\mathbb{Z}_\triangle(n,r)$. In other words, $\mathbb{Z}_\triangle(n,r)$ is a (Laurent) polynomial ring in $\sigma_1, \ldots, \sigma_r, \sigma_r^{-1}$.

**Proof.** It is obvious that $\mathbb{Z}_\triangle(n,r)$ is spanned by $X$. It remains to show that $X$ is linearly independent.

For $i = (i_1, \ldots, i_r), j = (j_1, \ldots, j_r) \in \mathbb{Z}^r$, we define the lexicographic ordering $i \preceq_{\text{lex}} j$ if $i = j$ or there exists $1 < s \leq r$ such that

$$
i_r = j_r, \ldots, i_s = j_s, i_{s-1} < j_{s-1}.
$$

Clearly, this gives a linear ordering on $\mathbb{Z}^r$.

For each $\lambda = (\lambda_1, \ldots, \lambda_{r-1}, \lambda_r) \in \mathbb{N}^{r-1} \times \mathbb{Z}$, define

$$
\sigma^\lambda = \sigma_1^{\lambda_1} \cdots \sigma_{r-1}^{\lambda_{r-1}} \sigma_r^{-\lambda_r}.
$$

Then, by definition, for $i = (i_1, \ldots, i_r) \in \mathbb{Z}^r$, we obtain that

$$
\sigma^\lambda(\omega_i) = \omega_{i \ast \lambda} + \sum_{i+s \leq \omega j} b_j \omega_j,
$$

where all but finitely many $b_j \in \mathbb{N}$ are zero and

$$
i \ast \lambda = (i_1 - \lambda_r n, i_2 - (\lambda_{r-1} + \lambda_r)n, \ldots, i_r - (\lambda_1 + \cdots + \lambda_r)n).
$$

Note that for $\lambda, \mu \in \mathbb{N}^{r-1} \times \mathbb{Z}$,

$$
i \ast \lambda = i \ast \mu \iff \lambda = \mu.
$$

Now suppose

$$
\sum_{t=1}^m a_t \sigma^{\lambda(t)} = 0,
$$

The linear maps $\sigma_i$ and $\sigma^\lambda$ should not be confused with the sum function $\sigma$ defined on $M_{\triangle}(\mathbb{Z})$ and $\mathbb{Z}^n$ in §1.1.
where \( a_t \in \mathbb{Q}(v) \) and \( \lambda^{(t)} \in \mathbb{N}^{r-1} \times \mathbb{Z} \) for \( 1 \leq t \leq m \). Fix an \( i \in \mathbb{Z}^r \). Without loss of generality, we may suppose \( i * \lambda^{(1)} <_{\text{lex}} i * \lambda^{(t)} \) for all \( 2 \leq t \leq m \). Then

\[
0 = \sum_{t=1}^{m} a_t \sigma^{\lambda^{(t)}}(\omega_i) = a_1 \omega_{i*\lambda^{(1)}} + x',
\]

where \( x' \) is a linear combination of \( \omega_j \) with \( i * \lambda^{(1)} <_{\text{lex}} j \). Hence, \( a_1 = 0 \). Inductively, we deduce that \( a_t = 0 \) for all \( 1 \leq t \leq m \). This finishes the proof. \( \square \)

**Remark 5.2.4.** It has been proved in [84] that the center of the affine Schur algebra of type \( A_n \) is isomorphic to the polynomial algebra \( \mathbb{Q}[\sigma_1, \ldots, \sigma_r, \sigma_r^{-1}] \). It is natural to conjecture that \( Z_{\Delta}(n, r) = \mathbb{Q}(v)[\sigma_1, \ldots, \sigma_r, \sigma_r^{-1}] \) is exactly the center of \( S_{\Delta}(n, r) \).

Recall that \( e_i = \xi_i(E_i), \ f_i = \xi_i(F_i), \ t_i = \xi_i(K_i) \) for each \( 1 \leq i \leq n \). Let \( S_{\Delta}(n, r)^0 \) denote the subalgebra of \( S_{\Delta}(n, r) \) generated by \( t_i \) for \( 1 \leq i \leq n \). Then, by [26, Cor. 4.7(1)] (see also [11, Lem. 3.29]), \( S_{\Delta}(n, r)^0 \) has a basis

\[
\{ t_j = t_{j_1} \cdots t_{j_{n-1}} | j = (j_1, \ldots, j_{n-1}) \in (\mathbb{N}^n-1)_{\leq r} \},
\]

where \( (\mathbb{N}^n-1)_{\leq r} = \{ j = (j_1, \ldots, j_{n-1}) \in \mathbb{N}^n-1 | j_1 + \cdots + j_{n-1} \leq r \} \). Let further \( \hat{Z}_{\Delta}(n, r) \) be the subalgebra of \( S_{\Delta}(n, r) \) generated by \( Z_{\Delta}(n, r) \) and \( S_{\Delta}(n, r)^0 \).

**Proposition 5.2.5.** The multiplication map

\[
Z_{\Delta}(n, r) \otimes_{\mathbb{Q}(v)} S_{\Delta}(n, r)^0 \rightarrow \hat{Z}_{\Delta}(n, r)
\]

is a \( \mathbb{Q}(v) \)-algebra isomorphism.

**Proof.** It remains to show that the set

\[
\{ \sigma^\lambda t_j | \lambda \in \mathbb{N}^n-1 \times \mathbb{Z}, j \in (\mathbb{N}^n-1)_{\leq r} \}
\]

is linearly independent. By definition, for each \( i \in \mathbb{Z}^r \), \( t_j(\omega_i) = v^{f(i,j)} \omega_i \), where \( f(i,j) \in \mathbb{Z} \) is determined by \( i \) and \( j \). Thus, by the proof of Proposition 5.2.3, we infer that for \( \lambda \in \mathbb{N}^n-1 \times \mathbb{Z}, j \in (\mathbb{N}^n-1)_{\leq r} \), and \( i \in \mathbb{Z}^r \),

\[
\sigma^\lambda t_j(\omega_i) = v^{f(i,j)} \omega_{i*\lambda} + \sum_{i*\lambda <_{\text{lex}} j} c_j \omega_j,
\]

where all but finitely many \( c_j \in \mathbb{Q}(v) \) are zero.

Since \( i * \lambda = i * \mu \) if and only if \( \lambda = \mu \), it suffices to show that for each fixed \( \lambda \),

\[
\{ \sigma^\lambda t_j | j \in (\mathbb{N}^n-1)_{\leq r} \}
\]

is a linearly independent set. This follows from the fact that \( \{ t_j | j \in (\mathbb{N}^n-1)_{\leq r} \} \) is a linearly independent set. \( \square \)

By the discussion above, the center of the positive part \( S_{\Delta}(n, r)^+ \) of \( S_{\Delta}(n, r) \) contains the polynomial algebra \( \mathbb{Q}(v)[\sigma_1, \ldots, \sigma_r] := Z_{\Delta}(n, r)^+ \), and the center of the negative part \( S_{\Delta}(n, r)^- \) contains the polynomial algebra \( \mathbb{Q}(v)[\tau_1, \ldots, \tau_r] := Z_{\Delta}(n, r)^- \). Moreover,

\[
S_{\Delta}(n, r)^+ = U_{\Delta}(n, r)^+ \cdot Z_{\Delta}(n, r)^+ \quad \text{and} \quad S_{\Delta}(n, r)^- = U_{\Delta}(n, r)^- \cdot Z_{\Delta}(n, r)^-.
\]

For each \( m \geq 0 \), set

\[
S_{\Delta}(n, r)^\pm_m = S_{\Delta}(n, r)^\pm \cap S_{\Delta}(n, r)_m \quad \text{and} \quad U_{\Delta}(n, r)^\pm_m = U_{\Delta}(n, r)^\pm \cap U_{\Delta}(n, r)_m.
\]
Thus, if $A$ is a spanning set for $U$, for each Proposition 5.2.6.

10 by $\sigma$.

For each $S$ is a basis of $U$, where $E$ then we have $\tilde{m}$. Note that for $S$, $\dim S = \dim U$.

By Proposition 5.2.6, $\tilde{m}$ and $q_m \in S_{\tilde{m}}(n, r)_{mn}$, and for $1 \leq s \leq r$, $\sigma_s \in S_{\tilde{m}}(n, r)_{sn}$.

**Proposition 5.2.6.** For each $m \geq 0$,

$$\dim S_{\tilde{m}}(n, r)_m^+ / U_{\tilde{m}}(n, r)_m^+ = |\{ A \in \Theta_{\tilde{m}}^+(n) \mid A \text{ is periodic with } \sigma(A) \leq r, \vartheta(A) = m \}|.$$

**Proof.** We only prove the assertion for the “+” case, and the “−” case is similar. By [12] §8, the composition subalgebra $C_{\tilde{m}}(n)^+$ of $D_{\tilde{m}}(n)^+$ has a basis

$$\{ E_A^+ \mid A \in \Theta_{\tilde{m}}^+(n) \text{ is aperiodic} \},$$

where $E_A^+ = \tilde{u}_A^+ + \sum_{B < d_{\tilde{m}}} \eta_B A \tilde{u}_B^+$ with all $B$ periodic and $\eta_B^A \in \mathbb{Q}(v)$. Furthermore, by [10] §6, for $A, B \in \Theta_{\tilde{m}}^+(n)$,

$$B \leq_{d_{\tilde{m}}} A \implies \sigma(B) \geq \sigma(A).$$

Thus, if $A \in \Theta_{\tilde{m}}^+(n)$ is aperiodic with $\sigma(A) > r$, then by (3.4.0.1),

$$\xi_r(E_A^+) = A(0, r) + \sum_{B < d_{\tilde{m}}} \eta_B^A B(0, r) = 0.$$

Hence, for each $m \geq 0$, the set

$$\mathcal{X}_m := \{ \xi_r(E_A^+) \mid A \in \Theta_{\tilde{m}}^+(n) \text{ is aperiodic with } \sigma(A) \leq r, \vartheta(A) = m \}$$

is a spanning set for $U_{\tilde{m}}(n, r)_m^+$. By Proposition 3.7.4(1), the set

$$\{ A(0, r) \mid A \in \Theta_{\tilde{m}}^+(n), \sigma(A) \leq r, \vartheta(A) = m \}$$

is a basis of $S_{\tilde{m}}(n, r)_{m}^+$. Hence, $\mathcal{X}_m$ is a linearly independent set and, thus, is a basis of $U_{\tilde{m}}(n, r)_m^+$. This gives the desired assertion.

**Corollary 5.2.7.** For each $r \geq 2$,

$$S_{\tilde{m}}(n, r)_m^+ / U_{\tilde{m}}(n, r)_m^+ = \bigoplus_{t \geq 1} \mathbb{Q}(v) \sigma_t^1$$

and $S_{\tilde{m}}(n, r)_m^- = U_{\tilde{m}}(n, r)_m^- \oplus \bigoplus_{t \geq 1} \mathbb{Q}(v) \tau_1^t$.

**Proof.** By Proposition 5.2.6

$$\dim S_{\tilde{m}}(n, r)_m^+ / U_{\tilde{m}}(n, r)_m^+ = \begin{cases} 1, & \text{if } m \neq 0 \text{ and } m \equiv 0 \mod r, \\ 0, & \text{otherwise}. \end{cases}$$

Since $\sigma_1 = p_1 = \xi_r(z_1^1)$, it follows from Theorem 3.8.1(2) that $S_{\tilde{m}}(n, r)_m^+$ is generated by $e_i$ ($1 \leq i \leq r$) and $\sigma_1$. This implies the first decomposition. The second one can be proved similarly.
5.3. A presentation for $\mathcal{S}_\delta(r, r)$

In this section we give a presentation for $\mathcal{S}_\delta(r, r)$ by describing explicitly a complement of $U_\delta(r, r)$ in $\mathcal{S}_\delta(r, r)$.

We first consider the general case and recall the surjective algebra homomorphism $\xi_r : D_\delta(n) \to \mathcal{S}_\delta(n, r)$. For each $a = (a_i) \in \mathbb{N}^n$, we write in $D_\delta(n)$,

$$u_\pm^a = u_{[Sa]}^\pm$$ and $\tilde{u}_\pm^a = v \sum_r a_i (a_i - 1) u_\pm^a$.

By (1.4.2.1), if $a$ is not sincere, say $a_i = 0$, then

$$\tilde{u}_\pm^a = \sum_j a_j (a_j - 1) u_\pm^a = (u_\pm^{a_1})(a_1) \cdots (u_\pm^{a_n})(a_n) \cdots (u_\pm^{a_i+1})(a_{i+1}) \in U_\delta(n).$$

Thus, if $a$ is not sincere, then both $e_a := \xi_r(\tilde{u}_\pm^a)$ and $f_a := \xi_r(\tilde{u}_\pm^a)$ lie in $U_\delta(n, r)$.

Now consider the following element $\rho$ in $\text{End}_{\mathcal{Q}(\Omega)}(\Omega^\otimes r)$:

$$\rho : \Omega^\otimes r \to \Omega^\otimes r, \omega_1 \mapsto \omega_1 - e_1 - \cdots - e_r,$$

i.e., $\rho(\omega_{i_1} \otimes \cdots \otimes \omega_{i_r}) = \omega_{i_1 - 1} \cdots \otimes \omega_{i_r - 1}$. It is clear that $\rho^* = \sigma \in \mathcal{S}_\delta(n, r)$.

**Lemma 5.3.1.** Suppose $n \geq r$. Then

$$\rho = \sum_{a \in \mathbb{N}^n, \sigma(a) = r} e_a$$ and $\rho^{-1} = \sum_{a \in \mathbb{N}^n, \sigma(a) = r} f_a$.

In particular, if $n > r$, then $\rho, \rho^{-1} \in U_\delta(n, r)$.

**Proof.** For each $a \in \mathbb{N}^n$, let $Y_a$ denote the set of the sequences $j = (j_1, \ldots, j_r)$ satisfying that for each $1 \leq i \leq n$,

$$a_i = |\{1 \leq s \leq r \mid j_s = i\}|.$$

By Corollary 3.5.1, we have for each $\omega_{i_1} \otimes \cdots \otimes \omega_{i_r} \in \Omega^\otimes r$,

$$\tilde{u}_\pm^a \cdot (\omega_{i_1} \otimes \cdots \otimes \omega_{i_r}) = \sum_{j \in Y_a} \delta_{j_1, i_1 - 1} \cdots \delta_{j_r, i_r - 1} \omega_{i_1 - 1} \otimes \cdots \otimes \omega_{i_r - 1},$$

where for $m \in \mathbb{Z}$, $\overline{m}$ denotes its residue class in $\mathbb{Z}/n\mathbb{Z}$. Therefore,

$$(\sum_{a \in \mathbb{N}^n, \sigma(a) = r} \tilde{u}_\pm^a \cdot (\omega_{i_1} \otimes \cdots \otimes \omega_{i_r}) = \omega_{i_1 - 1} \otimes \cdots \otimes \omega_{i_r - 1},$$

that is, the first equality holds. The second one can be proved similarly.

The above lemma implies that

$$e'_\delta := \rho - e_\delta, f'_\delta := \rho^{-1} - f_\delta \in U_\delta(r, r),$$

(5.3.1.1)

where $\delta = (1, \ldots, 1)$. More precisely,

$$e'_\delta = \sum_{i=1}^n \sum_{a \in \mathbb{N}^n \mid \sigma(a) = r, a_i = 0} (e_{i-1})^{(a_{i-1})} \cdots (e_1)^{(a_1)} (e_n)^{(a_n)} \cdots (e_{i+1})^{(a_{i+1})},$$

(5.3.1.2)

$$f'_\delta = \sum_{i=1}^n \sum_{a \in \mathbb{N}^n \mid \sigma(a) = r, a_i = 0} (f_{i-1})^{(a_{i-1})} \cdots (f_1)^{(a_1)} (f_n)^{(a_n)} \cdots (f_{i+1})^{(a_{i+1})}.$$
5. THE PRESENTATION AND REALIZATION PROBLEMS

From now on, we assume $n = r$. By \S 1.4 and Theorem 3.8.1(2), $S_\alpha(r, r)$ is generated by $e_i, f_i, t_i$ (1 $\leq i \leq n = r$), and $e_\delta, f_\delta$. It follows from (5.3.1.1) and (5.3.1.2) that $S_\alpha(r, r)$ is also generated by the $e_i, f_i, t_i$, and $\rho, \rho^{-1}$. Since

$S_\alpha(r, r)^+ = U_\alpha(r, r)^+ \oplus \mathbb{Q}(v)\rho = U_\alpha(r, r)^+ \oplus \mathbb{Q}(v)\sigma_1$ and

$S_\alpha(r, r)^- = U_\alpha(r, r)^-_r \oplus \mathbb{Q}(v)\rho^{-1} = U_\alpha(r, r)^-_r \oplus \mathbb{Q}(v)\tau_1$,

it follows from Corollary 5.2.7 that

$S_\alpha(r, r)^+ = U_\alpha(r, r)^+ \oplus \bigoplus_{t \geq 1} \mathbb{Q}(v)^t$ and $S_\alpha(r, r)^- = U_\alpha(r, r)^- \oplus \bigoplus_{t \geq 1} \mathbb{Q}(v)^-t$.

(5.3.1.3)

Remark 5.3.2. As a consequence of the above discussion, we obtain [35, Th. 3.4.8] which states that (for $n \geq r$ with $n \geq 3$) there is a surjective algebra homomorphism $\alpha_r : \hat{U} \rightarrow S_\alpha(n, r)$ taking $R$ to $\rho^{-1}$, where $\hat{U}$ is a Hopf algebra obtained from $U_\alpha(n)$ by adding primitive elements $R, R^{-1}$ with $RR^{-1} = R^{-1}R = 1$. It seems to us that $\hat{U}$ is not a quantum group in a strict sense since it does not admit a triangular decomposition.

Proposition 5.3.3. For each $1 \leq i \leq r$, we have in $S_\alpha(r, r)$,

1. $\mathfrak{e}_i \mathfrak{e}_\delta = v \mathfrak{e}_\delta$;
2. $\mathfrak{e}_i \mathfrak{e}_\delta = \frac{1}{v^2+1} \mathfrak{e}_i \mathfrak{e}_i \cdots \mathfrak{e}_{i-1} \mathfrak{e}_1 \mathfrak{e}_r \cdots \mathfrak{e}_{i+1}$;
3. $\mathfrak{f}_i \mathfrak{e}_\delta = \frac{1}{v^2+1} \mathfrak{f}_i \mathfrak{f}_i \cdots \mathfrak{f}_{i-1} \mathfrak{f}_1 \cdots \mathfrak{f}_{i+1}$;
4. $\mathfrak{f}_\delta = v \mathfrak{f}_\delta$;
5. $\mathfrak{f}_i \mathfrak{f}_\delta = \frac{1}{v^2+1} \mathfrak{f}_i \mathfrak{f}_i \cdots \mathfrak{f}_{i-1} \mathfrak{f}_1 \cdots \mathfrak{f}_{i-1} \mathfrak{f}_{i+1}$;
6. $\mathfrak{e}_i \mathfrak{e}_\delta = \frac{1}{v^2+1} \mathfrak{e}_i \mathfrak{e}_i \cdots \mathfrak{e}_{i-1} \mathfrak{e}_1 \mathfrak{e}_r \cdots \mathfrak{e}_{i+1}$.

Proof. All these relations can be deduced from the multiplication formulas in Theorem 3.4.2. However, we provide here a direct proof for (1) and (2). The relations (4) and (5) can be proved in a similar manner.

By definition, we have in $S_\alpha(r)$,

$u_i^+ u_\delta^+ = u_{[M]}^+ + (v^2+1)u_{\delta+e_i}^+$,

where $M = S_1 \oplus \cdots \oplus S_{i-1} \oplus S_{i}[2] \oplus S_{i+2} \oplus \cdots \oplus S_r$. On the other hand,

$(u_i^+)^2 u_{i-1}^+ \cdots u_1^+ u_r^+ \cdots u_{i+1}^+ = v(v^2+1)u_{[2S]}^+ |u_{S_1}^{-1} \cdots S_{i-1}^{-1} S_{i+1}^{-1} \cdots S_r^{-1}|

= (v+v^{-1})(u_{[M]}^+ + u_{\delta+e_i}^+)$. 

Since $S_{\delta+e_i}$ is semisimple of dimension $r+1$, it follows that $\xi_r(u_{\delta+e_i}^+). Hence,

$e_i e_\delta = \xi_r(u_i^+ u_\delta^+) = \xi_r(u_i^+) = \frac{1}{v^2+1} \xi_r((u_i^+)^2 u_{i-1}^+ \cdots u_1^+ u_r^+ \cdots u_{i+1}^+)$

$= \frac{1}{v^2+1} e_i^2 e_{i-1} \cdots e_1 e_r \cdots e_{i+1}$,

which gives the relation (2).
5.3. A PRESENTATION FOR $S_\delta(r, r)$

The relation (1) follows from the fact that for each $\omega_1 \otimes \cdots \otimes \omega_r \in \Omega^{\otimes r}$,

$$u_\delta \cdot (\omega_1 \otimes \cdots \otimes \omega_r) = \sum_{j \in Y_\delta} \delta_{j_1, i_1} \cdots \delta_{j_r, i_r} \omega_{i_1-1} \otimes \cdots \otimes \omega_{i_r-1}$$

$$= \begin{cases} \omega_{i_1-1} \otimes \cdots \otimes \omega_{i_r-1}, & \text{if } i_1, \ldots, i_r \text{ are pairwise distinct;} \\ 0, & \text{otherwise.} \end{cases}$$

Note that if $i_1, \ldots, i_r$ are pairwise distinct, then $K_i \cdot (\omega_1 \otimes \cdots \otimes \omega_r) = u \omega_1 \otimes \cdots \otimes \omega_r$.

The above proposition together with $\rho = \epsilon_\delta' + \epsilon_\delta$ and $\rho^{-1} = f_\delta' + f_\delta$ gives the following result.

**Corollary 5.3.4.** For each $1 \leq i \leq r$, we have in $S_\delta(r, r)$,

- (QS1') $(t_i - v) \rho = (t_i - v) \epsilon_\delta'$;
- (QS2') $\epsilon_i \rho = \epsilon_i \epsilon_\delta' + \frac{1}{v^{i-1}} \epsilon_i \epsilon_{i-1} \cdots \epsilon_{i} \epsilon_r \cdots \epsilon_{i+1}$;
- (QS3') $f_i \rho = f_i \epsilon_\delta' + \frac{1}{v^{i-1}} f_i \epsilon_{i-1} \cdots f_{i} \epsilon_r \cdots f_{i+1}$;
- (QS4') $(t_i - v) \rho^{-1} = (t_i - v) f_\delta'$;
- (QS5') $f_i \rho^{-1} = f_i f_\delta' + \frac{1}{v^{i-1}} f_i f_{i-1} \cdots f_{i} f_r \cdots f_{i+1}$;
- (QS6') $\epsilon_i \rho^{-1} = \epsilon_i f_\delta' + \frac{1}{v^{i-1}} \epsilon_i f_{i-1} \cdots \epsilon_i f_r \cdots \epsilon_i f_{i+1}$,

where $\epsilon_\delta'$ and $f_\delta'$ are given in (5.3.1.2).

**Theorem 5.3.5.** The $\mathbb{Q}(v)$-algebra $S_\delta(r, r)$ is generated by $\epsilon_i, f_i, t_i^{\pm 1}$ ($1 \leq i \leq r$) and $\rho^{\pm 1}$ subject to the relations

- (QS0') $\rho \rho^{-1} = \rho^{-1} = 1, \rho \epsilon_i \rho^{-1} = \epsilon_{i-1}, \rho f_i \rho^{-1} = f_{i-1}, \rho t_i \rho^{-1} = t_{i-1}$

Together with the relations (QS1')–(QS6') and the relations (QS1)–(QS6) in Theorem 5.1.3. In particular,

$$S_\delta(r, r) = U_\delta(r, r) \oplus \bigoplus_{0 \neq m \in \mathbb{Z}} \mathbb{Q}(v) \rho^m.$$ 

**Proof.** Let $S'$ be the $\mathbb{Q}(v)$-algebra generated by $r_i, \eta_i, \delta_i^{\pm 1}$ ($1 \leq i \leq r$) and $\eta^{\pm 1}$ with the relations (QS1)–(QS7) and (QS0')–(QS6') (Here we replace $\epsilon_i, f_i, t_i^{\pm 1}$, and $\rho^{\pm 1}$ by $r_i, \eta_i, \delta_i^{\pm 1}$, and $\eta^{\pm 1}$, respectively). Thus, there is a surjective $\mathbb{Q}(v)$-algebra homomorphism

$$\Upsilon : S' \longrightarrow S_\delta(r, r)$$

$$r_i \longrightarrow \epsilon_i$$

$$\eta_i \longrightarrow f_i$$

$$\delta_i^{\pm 1} \longrightarrow t_i^{\pm 1}$$

$$\eta^{\pm 1} \longrightarrow \rho^{\pm 1}.$$ 

Let $U'$ be the $\mathbb{Q}(v)$-subalgebra of $S'$ generated by $r_i, \eta_i$, and $\delta_i^{\pm 1}$ ($1 \leq i \leq r$). Then $\Upsilon$ induces a surjective homomorphism $\Upsilon_1 : U' \rightarrow U_\delta(r, r)$. Since the relations (QS1)–(QS7) are the generating relations for $U_\delta(r, r)$, there is also a natural surjective homomorphism $\Phi : U_\delta(r, r) \rightarrow U'$. Clearly, the compositions $\Upsilon_1 \Phi$ and $\Phi \Upsilon_1$ are identity maps. Thus, both $\Upsilon_1$ and $\Phi$ are isomorphisms.
It is clear that for each $0 \neq t \in \mathbb{Z}$, $\rho^t$ lies in $\mathcal{S}_\triangle(r, r)_{rt}$. We claim that $\rho^t$ does not lie in $\mathcal{U}_\triangle(r, r)_{rt}$. Otherwise, applying relations (QS0')–(QS6') would give that

$$\rho = \rho^t \rho^{-t+1} \in (\mathcal{U}_\triangle(r, r)_{rt}) \rho^{-t+1} \subseteq \mathcal{U}_\triangle(r, r)_{r}.$$  

This implies $\mathcal{S}_\triangle(r, r) = \mathcal{U}_\triangle(r, r)$, which contradicts Lemma 5.2.1. Hence, $\rho^t \not\in \mathcal{U}_\triangle(r, r)_{rt}$ for all $0 \neq t \in \mathbb{Z}$.

For each $m \in \mathbb{Z}$, choose a $\mathbb{Q}(v)$-basis $\mathcal{B}_m$ of $\mathcal{U}_\triangle(r, r)_m$. Then the set $\mathcal{B} := \bigcup_{m \in \mathbb{Z}} \mathcal{B}_m$ forms a basis of $\mathcal{U}_\triangle(r, r)$. Moreover, by the discussion above, the set $\mathcal{B} \cup \{\rho^t \mid 0 \neq t \in \mathbb{Z}\}$ is linearly independent in $\mathcal{S}_\triangle(r, r)$. On the other hand, by the definition of $\mathcal{S}'$, the set

$$\{\Phi(c) \mid c \in \mathcal{B}\} \cup \{\eta^m \mid 0 \neq m \in \mathbb{Z}\}$$

is a spanning set of $\mathcal{S}'$. Since $\Upsilon(\Phi(c)) = c$ and $\Upsilon(\eta^m) = \rho^m$, it follows that the above spanning set is a basis of $\mathcal{S}'$. Therefore, $\Upsilon$ is an isomorphism. This finishes the proof.

**Remark 5.3.6.** We can also present $\mathcal{S}_\triangle(r, r)$ by using generators $e_i, f_i, t_i^{\pm 1}$ ($1 \leq i \leq r$), $e_{\delta}$ and $f_{\delta}$, but the relation between $e_{\delta}$ and $f_{\delta}$ is not clear. Furthermore, if we use generators $\sigma_1$ and $\tau_1$ instead of $\rho$ and $\rho^{-1}$, the relations would be much more complicated; see the example below. From the relations obtained in the case $n = r$, it seems very hard to get the relations for the general case $n < r$.

**Example 5.3.7.** We consider the special case $n = r = 2$. In this case, $\mathcal{U}_\triangle(2, 2) = \xi_2(\mathcal{U}_\triangle(2))$ is generated by $e_i, f_i, t_i$ for $i = 1, 2$, and $\mathbb{Z}_\triangle(2, 2) = \mathbb{Q}(v)[\sigma_1, \sigma_2, \sigma_2^{-1}]$. Moreover, $\rho \in \text{End}_{\mathbb{Q}(v)}(\Omega^\otimes 2)$ is defined by $\rho(\omega_s \otimes \omega_t) = \omega_{s-1} \otimes \omega_{t-1}$ and satisfies $\rho^2 = \sigma_2$. A direct calculation shows that

$$\rho = \frac{1}{v+v^{-1}}(e_1^2 + e_2 e_1 + e_2 e_2 + e_2^2 - \sigma_1).$$

By (5.3.1.3), we obtain that

$$\mathcal{S}_\triangle(2, 2)^+ = \mathcal{U}_\triangle(2, 2)^+ \oplus \bigoplus_{m \geq 1} \mathbb{Q}(v) \rho^m = \mathcal{U}_\triangle(2, 2)^+ \oplus \bigoplus_{m \geq 1} \mathbb{Q}(v) \sigma_1^m.$$  

Similarly,

$$\rho^{-1} = \frac{1}{v+v^{-1}}(f_1^2 + f_1 f_2 + f_2 f_1 + f_2^2 - \tau_1)$$

and

$$\mathcal{S}_\triangle(2, 2)^- = \mathcal{U}_\triangle(2, 2)^- \oplus \bigoplus_{m \geq 1} \mathbb{Q}(v) \rho^{-m} = \mathcal{U}_\triangle(2, 2)^- \oplus \bigoplus_{m \geq 1} \mathbb{Q}(v) \tau_1^m.$$  

Hence, $\sigma_1 \tau_1 \in \mathcal{U}_\triangle(2, 2)$ and

$$\mathcal{S}_\triangle(2, 2) = \mathcal{U}_\triangle(2, 2) \oplus \bigoplus_{0 \neq m \in \mathbb{Z}} \mathbb{Q}(v) \rho^m = \mathcal{U}_\triangle(2, 2) \oplus \bigoplus_{m \geq 1} \left(\mathbb{Q}(v) \sigma_1^m \oplus \mathbb{Q}(v) \tau_1^m\right).$$
Furthermore, the following relations hold in $\mathcal{S}_\delta(2, 2)$:

\[
\begin{align*}
\sigma_1 e_1 &= e_1 e_2 e_1, \quad \sigma_1 e_2 = e_2 e_1 e_2, \\
\tau_1 f_1 &= f_1 f_2 f_1, \quad \tau_1 f_2 = f_2 f_1 f_2, \\
\sigma_1 f_1 &= e_1 e_2 f_1 + f_1 e_2 e_1, \quad \sigma_1 f_2 = e_2 e_1 f_2 + f_2 e_1 e_2, \\
\tau_1 e_1 &= f_1 f_2 e_1 + e_1 f_2 f_1, \quad \tau_1 e_2 = f_2 f_1 e_2 + e_2 f_1 f_2, \\
\sigma_1 (t_i - v) &= (e_1 e_2 + e_2 e_1)(t_i - v), \quad i = 1, 2, \\
\tau_1 (t_i - v) &= (f_1 f_2 + f_2 f_1)(t_i - v), \quad i = 1, 2.
\end{align*}
\]  

(5.3.7.1)

**Remark 5.3.8.** Recall from §2.2 that $\mathcal{D}_\delta(n)$ is the $\mathbb{Z}$-subalgebra of $\mathcal{D}_\delta(n)$ generated by $K^\pm_t$, $[K_t^0 Z]$, $z^+_t$, $z^-_t$, $(u^+_i(t))$ and $(u^-_i(t))$ for $i \in I$ and $s, t, m \geq 1$. By Proposition 3.6.1 and Corollary 3.7.3, all $\xi_r(\mathcal{S}_\delta)$ lie in $\mathcal{S}_\delta(n, r)$. Thus, the $\mathbb{Q}(v)$-algebra homomorphism $\xi_r : \mathcal{D}_\delta(n) \to \mathcal{S}_\delta(n, r)$ induces a $\mathbb{Z}$-algebra homomorphism $\xi_{r, \mathbb{Z}} : \mathcal{D}_\delta(n) \to \mathcal{S}_\delta(n, r)$. By Corollary 3.8.2, $\xi_{r, \mathbb{Z}}$ is surjective in case $n > r$. However, it is in general not surjective as shown below.

Let $n = r = 2$. By Theorem 5.3.3

\[
\mathcal{S}_\delta(2, 2) = U_\delta(2, 2) \oplus \bigoplus_{0 \neq m \in \mathbb{Z}} \mathbb{Q}(v) \rho^m,
\]

where $\rho = \sum_{a \in \mathbb{N}^2, \sigma(a) = 2} e_a$ and $\rho^{-1} = \sum_{a \in \mathbb{N}^2, \sigma(a) = 2} f_a$; see Lemma 5.3.1. By definition, $e_a = \xi_r(v_a^+)$ and $f_a = \xi_r(v_a^-)$. It follows that $\rho$ and $\rho^{-1}$ lie in $\mathcal{S}_\delta(2, 2)$. Using an argument similar to the proof of Corollary 3.8.2, we can show that $\mathcal{S}_\delta(2, 2)$ can be generated by $e_i^{(m)}$, $f_i^{(m)}$ ($i = 1, 2, m \geq 1$), $l_\lambda$ ($\lambda \in \Lambda_\delta(2, 2)$), $\rho$ and $\rho^{-1}$. Thus, we obtain that

\[
\mathcal{S}_\delta(2, 2) = U_\delta(2, 2) \oplus \bigoplus_{0 \neq m \in \mathbb{Z}} \mathbb{Z} \rho^m,
\]

where $U_\delta(2, 2)$ is the $\mathbb{Z}$-subalgebra of $\mathcal{S}_\delta(2, 2)$ generated by $e_i^{(m)}$, $f_i^{(m)}$, $l_\lambda$ for $i = 1, 2$, $m \geq 1$, and $\lambda \in \Lambda_\delta(2, 2)$.

On the other hand, the image $\text{Im} \xi$ for $\xi := \xi_{2, \mathbb{Z}} : \mathcal{D}_\delta(2) \to \mathcal{S}_\delta(2, 2)$ is the $\mathbb{Z}$-subalgebra of $\mathcal{S}_\delta(2, 2)$ generated by $t_i^{\pm 1}$, $[t_i^{0}]$, $\xi(z^+_i)$, $\xi(z^-_i)$, $e_i^{(m)}$ and $f_i^{(m)}$ for $i = 1, 2$ and $s, t, m \geq 1$. Since $\sigma_1 = \xi(z^+_1)$ and $\tau_1 = \xi(z^-_1)$, we have by the example above that

\[
\xi(z^+_1) = -(v + v^{-1}) \rho + (e_1^2 + e_1 e_2 + e_2 e_1 + e_2^2)
\]

and

\[
\xi(z^-_1) = -(v + v^{-1}) \rho^{-1} + (f_1^2 + f_1 f_2 + f_2 f_1 + f_2^2).
\]

Furthermore, for each $s \geq 1$,

\[
\xi(z_s^+) = \begin{cases} 
(\xi(z_s^+))^{-s} - \sum_{t=1}^{(s-1)/2} \binom{s}{t} \xi(z_{s-2t}^+) \rho^{s-2t}, & \text{if } s \text{ is odd;} \\
(\xi(z_s^+))^{-s} - \sum_{t=1}^{s/2} \binom{s}{t} \xi(z_{s-2t}^+) \rho^{s-2t}, & \text{if } s \text{ is even.}
\end{cases}
\]

By (5.3.7.1), all the elements

\[
e_i \rho^{\pm 1}, \ f_i \rho^{\pm 1}, \ \rho \rho^{\pm 1} e_i, \ \rho^{\pm 1} e_i
\]

lie in $U_\delta(2, 2)$ for $i = 1, 2$. Thus, an inductive argument implies that for each $s \geq 1$,

\[
\xi(z_s^+) \equiv (-1)^s (v^s + v^{-s}) \rho^{s} \mod U_\delta(2, 2).
\]
From (5.3.7.1) it also follows that
\[ e_i \rho_{\pm 1} \equiv v \rho_{\pm 1} \equiv \rho_{\pm 1} e_i \mod U(2, 2) \text{ for } i = 1, 2. \]
We conclude that neither of \( \rho \) and \( \rho^{-1} \) lies in \( \text{Im} \xi \). Therefore, the \( \mathcal{Z} \)-algebra homomorphism \( \xi = \xi_{2,2} : \mathfrak{D}(2) \to \mathcal{S}_\Delta(2) \) is not surjective.

### 5.4. The realization conjecture

We now look at the realization problem for quantum affine \( \mathfrak{gl}_n \). In the non-affine case, Beilinson–Lusztig–MacPherson [3] provided a construction for quantum \( \mathfrak{gl}_n \) via quantum Schur algebras. In order to generalize the BLM approach to the affine case, a modified BLM approach has been introduced in [23]. On the one hand, this approach produces a realization of quantum \( \mathfrak{gl}_n \) which serves as a “cut-down” version of the original BLM realization. On the other hand, most of the constructions in this approach can be generalized to the affine case. The conjecture proposed below is a natural outcome from this consideration; see [23], 5.2.

Let \( \mathcal{K}_\Delta(n) \) be the \( \mathcal{Z} \)-algebra which has \( \mathcal{Z} \)-basis \( \{ [A] \}_{A \in \Theta_\Delta(n)} \) and multiplication defined by \( [A] \cdot [B] = 0 \) if \( \text{co}(A) \neq \text{ro}(B) \), and \( [A] \cdot [B] \) as given in \( \mathcal{S}_\Delta(n, r) \) if \( \text{co}(A) = \text{ro}(B) \) and \( r = \sigma(A) \), where \( \text{co}(A) \) (resp., \( \text{ro}(A) \)) is the column (resp., row) sum vector associated with \( A \) (see §1.1). This algebra has no identity but infinitely many idempotents \( \text{diag}(\lambda) \) for all \( \lambda \in \mathbb{N}_0^n \). Moreover, \( \mathcal{K}_\Delta(n) \cong \oplus_{r \geq 0} \mathcal{S}_\Delta(n, r) \). (Note that \( \mathcal{S}_\Delta(n, 0) = \mathcal{Z} \) with a basis labeled by the zero matrix.)

Let \( \hat{\mathcal{K}}_\Delta(n) = \mathcal{K}_\Delta(n) \otimes \mathbb{Q}(v) \) and let \( \tilde{\mathcal{K}}_\Delta(n) \) be the vector space of all formal (possibly infinite) \( \mathbb{Q}(v) \)-linear combinations \( \sum_{A \in \Theta_\Delta(n)} \beta_A [A] \) which have the following properties: for any \( x \in \mathbb{N}_0^n \),

\[
\begin{align*}
\{ A \in \Theta_\Delta(n) & \mid \beta_A \neq 0, \ \text{ro}(A) = x \} \\
\{ A \in \Theta_\Delta(n) & \mid \beta_A \neq 0, \ \text{co}(A) = x \}
\end{align*}
\]

are finite. (5.4.0.1)

In other words, for \( \lambda, \mu \in \mathbb{N}_0^n \), both

\[
\sum_{A \in \Theta_\Delta(n)} \beta_A [\text{diag}(\lambda)] \cdot [A] \quad \text{and} \quad \sum_{A \in \Theta_\Delta(n)} \beta_A [A] \cdot [\text{diag}(\mu)]
\]

are finite sums. Thus, there is a well-defined multiplication on \( \tilde{\mathcal{K}}_\Delta(n) \) by setting

\[
( \sum_{A \in \Theta_\Delta(n)} \alpha_A [A] ) \cdot ( \sum_{B \in \Theta_\Delta(n)} \beta_B [B] ) := \sum_{A, B \in \Theta_\Delta(n)} \alpha_A \beta_B [A][B].
\]

This defines an associative algebra structure on \( \tilde{\mathcal{K}}_\Delta(n) \). This algebra has an identity element \( \sum_{\lambda \in \mathbb{N}_0^n} [\text{diag}(\lambda)] \), the sum of all \([D]\) with \( D\) a diagonal matrix in \( \Theta_\Delta(n) \), and contains \( \mathcal{K}_\Delta(n) \) as a natural subalgebra without identity. Note that \( \tilde{\mathcal{K}}_\Delta(n) \) is isomorphic to the direct product algebra \( \prod_{r \geq 0} \mathcal{S}_\Delta(n, r) \), and that the anti-involutions \( \tau_r \) given in (3.1.3.4) induce the algebra anti-involution

\[
\tau := \sum_r \tau_r : \tilde{\mathcal{K}}_\Delta(n) \longrightarrow \tilde{\mathcal{K}}_\Delta(n), \quad \sum_{A \in \Theta_\Delta(n)} \beta_A [A] \longmapsto \sum_{A \in \Theta_\Delta(n)} \beta_A [^T A].
\]
5.4. THE REALIZATION CONJECTURE

For $A \in \Theta^+_{\Delta}(n)$ and $j \in \mathbb{Z}_n^d$, define $A(j) \in \hat{\mathfrak{h}}_\Delta(n)$ by

$$A(j) = \sum_{\lambda \in \mathbb{N}_0^d} v^{\lambda}[A + \text{diag}(\lambda)],$$

where $\lambda \cdot j = \sum_{1 \leq i \leq n} \lambda_i j_i$. Clearly, $A(j) = \sum_{r \geq 0} A(j, r)$.

Let $\mathfrak{A}_\Delta(n)$ be the subspace of $\hat{\mathfrak{h}}_\Delta(n)$ spanned by $A(j)$ for all $A \in \Theta^+_{\Delta}(n)$ and $j \in \mathbb{Z}_n^d$. Since the structure constants (with respect to the BLM basis) appeared in the multiplication formulas given in Theorem 3.4.2 are independent of $r$, we obtain immediately the following similar formulas in $\mathfrak{A}_\Delta(n)$. Here, again for the simplicity of the statement, we extend the definition of $A(j)$ to all the matrices in $M_{n,\Delta}(\mathbb{Z})$ by setting $A(j) = 0$ if some off-diagonal entries of $A$ are negative.

**Theorem 5.4.1.** Maintain the notations used in Theorem 3.4.2. The following multiplication formulas hold in $\mathfrak{A}_\Delta(n)$:

$$0(j)A(j') = v^{\lambda\alpha(A)} A(j + j'),$$

$$A(j')0(j) = v^{\lambda\alpha(A)} A(j + j'),$$

where $0$ stands for the zero matrix.

$$E_{h,h+1}(0)A(j) = \sum_{i < h; a_{h,i+1} \geq 1} v^{f(i)} \left[ \begin{array}{c} a_{h,i} + 1 \\ 1 \end{array} \right] (A + E_{h,i}^\Delta - E_{h+1,i}^\Delta)(j + \alpha_h^\Delta)$$

$$+ \sum_{i > h+1; a_{h+1,i} \geq 1} v^{f(i)} \left[ \begin{array}{c} a_{h,i} + 1 \\ 1 \end{array} \right] (A + E_{h,i}^\Delta - E_{h+1,i}^\Delta)(j)$$

$$+ v^{f(h) - j_h - 1} \left( A - E_{h+1,h}^\Delta \right) (j + \alpha_h^\Delta) - \left( A - E_{h+1,h}^\Delta \right) (j + \beta_h^\Delta)$$

$$+ v^{f(h+1) + j_h - 1} \left[ \begin{array}{c} a_{h,h+1} + 1 \\ 1 \end{array} \right] (A + E_{h,h+1}^\Delta)(j),$$

$$E_{h+1,h}(0)A(j) = \sum_{i < h; a_{h,i} \geq 1} v^{f(i)} \left[ \begin{array}{c} a_{h+1,i} + 1 \\ 1 \end{array} \right] (A - E_{h,i}^\Delta + E_{h+1,i}^\Delta)(j)$$

$$+ \sum_{i > h+1; a_{h,i} \geq 1} v^{f(i)} \left[ \begin{array}{c} a_{h+1,i} + 1 \\ 1 \end{array} \right] (A - E_{h,i}^\Delta + E_{h+1,i}^\Delta)(j - \alpha_h^\Delta)$$

$$+ v^{f(h+1) - j_{h+1} - 1} \left( A - E_{h,h+1}^\Delta \right) (j - \alpha_h^\Delta) - \left( A - E_{h,h+1}^\Delta \right) (j + \beta_h^\Delta)$$

$$+ v^{f(h) + j_h} \left[ \begin{array}{c} a_{h+1,h} + 1 \\ 1 \end{array} \right] (A + E_{h+1,h}^\Delta)(j).$$

There is a parallel construction in the non-affine case as discussed in [23, §8]. By removing the sub/superscripts $\Delta$, we obtain the corresponding objects and multiplication formulas in this (non-affine) case. Since the quantum $\mathfrak{gl}_n$, denoted by $U(n)$,
generated by $E_i$, $F_i$ and $K_j^\pm (1 \leq i \leq n-1, 1 \leq j \leq n)$, the corresponding multiplication formulas define an algebra isomorphism $\mathbb{U}(n) \rightarrow \mathfrak{g}(n)$ sending $E_h$ to $E_{h,h+1}(0)$, $F_h$ to $E_{h+h}(0)$ and $K_j \rightarrow 0(e_j)$. In this way, we obtain a realization of the quantum $\mathfrak{g}(n)$. This is the so-called modified approach introduced in [23]. In this approach, the algebra $\mathcal{K}(n)$ as a direct sum of all quantum Schur algebras $\mathfrak{S}(n, r)$ is just a homomorphic image of the BLM algebra $\mathfrak{K}$ constructed in [3], which is isomorphic to the modified quantum group $\hat{\mathbb{U}}(n)$. However, since we avoid using the stabilization property (see [3 §4]) required in the construction of $\mathfrak{K}$, it can be generalized to obtain the affine construction above.

The $\mathbb{Q}(v)$-space $\mathfrak{A}_\alpha(n)$ is a natural candidate for a realization of $\mathfrak{D}_\alpha(n) \cong \mathbb{U}(\hat{\mathfrak{g}}(n))$. Since $\mathfrak{D}_\alpha(n)$ has generators other than simple generators, the formulas in Theorem 5.4.1 are not sufficient to show that $\mathfrak{A}_\alpha(n)$ is a subalgebra. However, as seen in [23 5.4 &7.5], these formulas are sufficient to embed the subalgebras $\mathfrak{U}_\alpha(n)$, $\mathfrak{H}_\alpha(n)^{>0}$ and $\mathfrak{H}_\alpha(n)_{\leq 0}$ into $\mathfrak{A}_\alpha(n)$. Thus, it is natural to formulate the following conjecture.

**Conjecture 5.4.2.** The $\mathbb{Q}(v)$-space $\mathfrak{A}_\alpha(n)$ is a subalgebra of $\hat{\mathfrak{K}}_\alpha(n)$ which is isomorphic to $\mathfrak{D}_\alpha(n)$, the quantum $\mathfrak{g}(n)$.

As seen in §1.4, there are three types of extra generators for $\mathfrak{D}_\alpha(n)$. We expect to derive more multiplication formulas between these extra generators and the BLM basis elements for $\mathfrak{S}_\alpha(n, r)$ (see, e.g., Problem 6.4.2) and, hence, to prove the conjecture. As a first test, we will establish the conjecture for the classical ($v = 1$) case in the next chapter. We end this section with a formulation of the conjecture in this case.

Let $\mathbb{Z} \rightarrow \mathbb{Q}$ be the specialization by sending $v$ to 1, and let $\hat{\mathfrak{K}}_\alpha(n)_\mathbb{Q}$ be the vector space of all formal (possibly infinite) $\mathbb{Q}$-linear combinations $\sum_{A \in \Theta_\alpha(n)} \beta_A [A]_1$ satisfying (5.4.0.1). Here $[A]_1$ denote the image of $[A]$ in $\mathfrak{S}_\alpha(n, r)_\mathbb{Q}$. For any $r > 0$, $A \in \Theta_\alpha^+(n)$ and $j \in \mathbb{N}_n$, define in $\mathfrak{S}_\alpha(n, r)_\mathbb{Q}$ (cf. [30 (3.0.3)])

$$A[j, r] = \begin{cases} \sum_{\lambda \in \Lambda(n, r - \sigma(A))} \lambda^\dagger [A + \text{diag}(\lambda)]_1, & \text{if } \sigma(A) \leq r; \\
0, & \text{otherwise.}
\end{cases} \quad (5.4.2.1)$$

where $\lambda^\dagger = \prod_{i=1}^n \lambda_i^{\sigma_i}$. (These elements play a role similar to the elements $A(j, r)$ for affine quantum Schur algebras. See §6.2 below for more discussion of the elements.) Let

$$A[j] = \sum_{r=0}^{\infty} A[j, r] \in \hat{\mathfrak{K}}_\alpha(n)_\mathbb{Q}. \quad (5.4.2.2)$$

Then the classical version of Conjecture 5.4.2 claims that the $\mathbb{Q}$-span $\mathfrak{A}_\alpha(n)_\mathbb{Q}$ of all $A[j]$ is a subalgebra of $\hat{\mathfrak{K}}_\alpha(n)_\mathbb{Q}$ which is isomorphic to the algebra

$$\overline{\mathfrak{D}}_\alpha(n)_\mathbb{Q} := \mathfrak{D}_\alpha(n)_\mathbb{Q}/\langle K_i - 1 \mid 1 \leq i \leq n \rangle,$$

where $\mathfrak{D}_\alpha(n)$ is the integral form defined at the end of §2.2. We will prove in §6.1 that the specialized algebra $\overline{\mathfrak{D}}_\alpha(n)_\mathbb{Q}$ is isomorphic to the universal enveloping algebra $\mathcal{U}(\hat{\mathfrak{g}}(n))$ over $\mathbb{Q}$ introduced in §1.1.
5.5. Lusztig’s transfer maps and semisimple generators

In [59] Lusztig defined an algebra homomorphism \( \phi_{r,r-n} : S_\lambda(n, r) \to S_\lambda(n, r-n) \) for \( r \geq n \), called the transfer map. In this section, we describe the images of \( A(0, r) \) and \( A(0, r) \) under \( \phi_{r,r-n} \) for all \( A = A_\lambda = \sum_{i=1}^{n} \lambda_i E_{i,i+1} \in \Theta_\lambda(n) \).

Throughout this section, for a prime power \( q \), \( S_\lambda(n, r)_C = S_\lambda(n, r) \otimes \mathbb{Z} \mathbb{C} \) always denotes the specialization of \( S_\lambda(n, r) \) by at \( v = \sqrt{q} \). In other words, \( S_\lambda(n, r)_C \) is a \( \mathbb{C} \)-vector space with a basis \( \{ e_A = e_A \otimes 1 | A \in \Theta_\lambda(n, r) \} \); see Definition 3.1.1.

We first recall from [59] §1 the definition of \( \phi_{r,r-n} \).

As in §3.1, let \( V \) be a free \( \mathbb{F}[\varepsilon, \varepsilon^{-1}] \)-module of rank \( r \) and let \( \mathcal{F}_\lambda = \mathcal{F}_{\lambda n}(V) \) be the set of all cyclic flags \( L = (L_i)_{i \in \mathbb{Z}} \), where each \( L_i \) is a lattice in \( V \) such that \( L_{i-1} \subseteq L_i \) and \( L_{i-n} = \varepsilon L_i \) for all \( i \in \mathbb{Z} \). If \( \mathbb{F} \) is the finite field with \( q \) elements, then we use the notation \( \mathscr{Y} = \mathcal{F}_\lambda(q) \) for \( \mathcal{F}_\lambda \) and \( S_\lambda(n, r)_C \) is identified with \( \mathbb{C} \mathbb{G}(\mathscr{Y} \times \mathscr{Y}) \), where \( G = G_V \) is the group of automorphisms of the \( \mathbb{F}[\varepsilon, \varepsilon^{-1}] \)-module \( V \). Given \( L = (L_i), \tilde{L} = (\tilde{L}_i) \in \mathcal{F}_\lambda \) with \( \tilde{L} \subseteq L \), i.e., \( \tilde{L}_i \subseteq L_i \) for all \( i \in \mathbb{Z} \), \( L/\tilde{L} \) can be viewed as a nilpotent representation of the cyclic quiver \( \triangle(n) \); see §3.6. By Corollary 3.6.2 for all \( \lambda = (\lambda_i)_{i \in \mathbb{Z}} \in \mathbb{N}^n_0 \), let \( S_\lambda = \oplus_{1 \leq i \leq n} \lambda_i S_i \), where \( S_i \) denotes the simple representation of \( \triangle(n) \) corresponding to the vertex \( i \), and set \( A_\lambda = \sum_{1 \leq i \leq n} \lambda_i E_{i,i+1} \in \Theta_\lambda(n) \).

For \( A \in \Theta_\lambda^+(n) \) and \( j \in \mathbb{Z}^n_0 \), let \( A(j, r) \in S_\lambda(n, r) \) be the BLM basis elements defined as in (3.4.0.1). We also view \( A(j, r) \) as an element in \( S_\lambda(n, r)_C \) via specializing \( v \) to \( \sqrt{q} \).

By Corollary 3.6.2 for all \( \lambda \in \mathbb{N}^n_0 \) and \( L = (L_i), \tilde{L} = (\tilde{L}_i) \in \mathcal{F}_\lambda \), we have

\[
A_\lambda(0, r)(L, \tilde{L}) = \left\{ \begin{array}{ll}
v^{-c(L, \tilde{L})}, & \text{if } \tilde{L} \subseteq L \text{ and } L/\tilde{L} \cong S_\lambda; \\
0, & \text{otherwise},
\end{array} \right.
\] (5.5.0.3)

where

\[
c(L, \tilde{L}) = \sum_{1 \leq i \leq n} \dim(L_{i+1}/\tilde{L}_{i+1})(\dim(\tilde{L}_{i+1}/\tilde{L}_i) - \dim(L_i/\tilde{L}_i))
= \sum_{1 \leq i \leq n} \dim(L_i/\tilde{L}_i)(\dim(L_i/L_{i-1}) - \dim(L_i/\tilde{L}_i)).
\]

Moreover,

\[
0(\lambda, r)(L, \tilde{L}) = \left\{ \begin{array}{ll}
v^{\mu \lambda}, & \text{if } \tilde{L} = L; \\
0, & \text{otherwise},
\end{array} \right.
\] (5.5.0.4)

where \( \mu = (\mu_i) \in \mathbb{N}^n_0 \) with \( \mu_i = \dim L_i/L_{i-1} \).

Now let \( r, r', r'' \geq 0 \) satisfy \( r = r' + r'' \). Let \( V'' \) be a direct summand of \( V \) of rank \( r'' \). Set \( V' = V/V'' \). Define \( \pi' : \mathcal{F}_{\lambda n}(V) \to \mathcal{F}_{\lambda n}(V'), L \mapsto L' \) (resp., \( \pi'' : \mathcal{F}_{\lambda n}(V) \to \mathcal{F}_{\lambda n}(V''), L \mapsto L'' \)) by setting

\[
L'_i = (L_i + V'')/V'' \quad \text{(resp., } L''_i = L_i \cap V'')
\]
for all \( i \in \mathbb{Z} \). Thus, for each \( i \in \mathbb{Z} \), there is an exact sequence

\[
0 \to L''_i/L''_{i-1} \to L_i/L_{i-1} \to L'_i/L'_{i-1} \to 0
\]
of \( \mathbb{F} \)-vector spaces.
Let \( \mathbb{F} \) be the finite field with \( q \) elements. Following \cite[1.2]{lusztig}, let \( \Xi : \mathcal{S}_\triangle(n, r)_\mathbb{C} \to \mathcal{S}_\triangle(n, r')_\mathbb{C} \otimes \mathcal{S}_\triangle(n, r'')_\mathbb{C} \) be the map defined by\(^4\)

\[
\Xi(f)(L', \tilde{L}', L'', \tilde{L}'') = \sum_{\tilde{L} \in \mathcal{F}_{\triangle}(V)} f(L, \tilde{L})
\]

for \( f \in \mathcal{S}_\triangle(n, r)_\mathbb{C} \), where \( L', \tilde{L}' \in \mathcal{F}_{\triangle}(V') \), \( L'', \tilde{L}'' \in \mathcal{F}_{\triangle}(V'') \), and \( L \) is a fixed element in \( \mathcal{F}_{\triangle}(V) \) satisfying \( \pi'(L) = L' \) and \( \pi''(L) = L'' \), and the sum is taken over all \( \tilde{L} \in \mathcal{F}_{\triangle}(V) \) such that \( \pi'(L) = \tilde{L}' \) and \( \pi''(\tilde{L}) = \tilde{L}'' \).

For two lattices \( L, L' \) in \( V \), define

\[
(L : L') = \dim_{\mathbb{F}}(L / \tilde{L}) - \dim_{\mathbb{F}}(L' / \tilde{L}),
\]

where \( \tilde{L} \) is a lattice contained in \( L \cap L' \). For \( L = (L_i) \), \( L' = (L'_i) \in \mathcal{F}_{\triangle}(V) \), set

\[
(L : L') = \sum_{i=1}^{n} (L_i : L'_i).
\]

We finally define a \( \mathbb{C} \)-linear isomorphism \( \xi : \mathcal{S}_\triangle(n, r)_\mathbb{C} \to \mathcal{S}_\triangle(n, r)_\mathbb{C} \) by

\[
\xi(f)(L, L') = q^{(L : L')/2} f(L, L')
\]

for \( f \in \mathcal{S}_\triangle(n, r)_\mathbb{C} \) and \( L, L' \in \mathcal{F}_{\triangle}(V) \). Then \( \xi \) is an algebra isomorphism; see \cite[1.7]{lusztig}.

As before, let \( \delta = (\delta_i) \in \mathbb{N}^n_{\triangle} \) with all \( \delta_i = 1 \). For each \( A = (a_{i,j}) \in \Theta_{\triangle}(n, n) \), if \( \rho(A) \neq \delta \) or \( \text{co}(A) \neq \delta \), then we set \( \text{sgn}_A = 0 \). Suppose now \( \rho(A) = \text{co}(A) = \delta \).

Then there is a unique permutation \( w : \mathbb{Z} \to \mathbb{Z} \) such that \( a_{i,j} = \delta_{w(j),i} \). In this case, we set \( \text{sgn}_A = (-1)^{\text{Inv}(w)} \), where

\[
\text{Inv}(w) = \{|(i, j) \in \mathbb{Z}^2 \mid 1 \leq i \leq n, i < j, w(i) > w(j)\}.
\]

(cf. §3.2). By \cite[1.8]{lusztig}, there is an algebra homomorphism \( \chi : \mathcal{S}_\triangle(n, n)_\mathbb{C} \to \mathbb{C} \) such that \( \chi(e_\lambda) = \text{sgn}_A \). In particular, for 1 \( \leq i \leq n \) and \( \lambda \in \mathbb{Z}^n_{\triangle} \),

\[
\chi(E^0_{i,i+1}(0, n)) = 0, \quad \chi(E^0_{i+1,i}(0, n)) = 0, \quad \chi(0(\lambda, n)) = q^{(\lambda, \delta)/2}.
\]

Suppose \( r \geq n \) and let \( \phi^q_{r,r-n} \) denote the composition

\[
\mathcal{S}_\triangle(n, r)_\mathbb{C} \xrightarrow{\Xi} \mathcal{S}_\triangle(n, r-n)_\mathbb{C} \otimes \mathcal{S}_\triangle(n, n)_\mathbb{C} \xrightarrow{\xi \otimes \chi} \mathcal{S}_\triangle(n, r-n)_\mathbb{C} \otimes \mathbb{C} = \mathcal{S}_\triangle(n, r-n)_\mathbb{C}.
\]

Lusztig \cite{lusztig} showed that for each pair \( A \in \Theta_{\triangle}(n, r) \) and \( B \in \Theta_{\triangle}(n, r-n) \), there is a uniquely determined polynomial \( f_{A,B}(v, v^{-1}) \in \mathbb{Z} = \mathbb{Z}[v, v^{-1}] \) such that for each finite field \( \mathbb{F} \) of \( q \) elements,

\[
\phi^q_{r,r-n}(q^{-d_A/2}e_A) = \sum_{B \in \Theta_{n}(n, r-n)} f_{A,B}(q^{1/2}, q^{-1/2})q^{-d_B/2}e_B.
\]

This gives a \( \mathbb{Q}(v) \)-algebra homomorphism \( \phi_{r,r-n} : \mathcal{S}_\triangle(n, r) \to \mathcal{S}_\triangle(n, r-n) \) defined by setting

\[
\phi_{r,r-n}([A]) = \sum_{B \in \Theta_{n}(n, r-n)} f_{A,B}(v, v^{-1})[B],
\]

\(^4\)The map \( \Xi \) is denoted by \( \Delta \) in \cite{lusztig}.
which is called the transfer map. Moreover, \( \phi_{r,r-n} \) takes

\[
E_{i,i+1}^0(0, r) \mapsto E_{i,i+1}^0(0, r - n), \\
E_{i+1,i}^0(0, r) \mapsto E_{i+1,i}^0(0, r - n), \\
0(\lambda, r) \mapsto v^\lambda 0(\lambda, r - n)
\]

for \( i \in \mathbb{Z} \) and \( \lambda \in \mathbb{Z}_n^\lambda. \)

By the definition, for each \( i \in \mathbb{I} \), we have

\[
\phi_{r,r-n}\xi_r(K_i) = v 0(e_i^\lambda, n - r) \neq 0(e_i^\lambda, n - r) = \xi_{r-n}(K_i).
\]

Thus, \( \phi_{r,r-n}\xi_r \neq \xi_{r-n}. \) However, if we view \( U(\widehat{sl}_n) \) as a subalgebra of \( \mathfrak{D}_n(n) \) generated by \( E_i, F_i, K_i \) for \( i \in \mathbb{I} \) and denote the restriction of \( \xi_r \) (resp., \( \xi_{r-n} \)) to \( U(\widehat{sl}_n) \) still by \( \xi_r \) (resp., \( \xi_{r-n} \)), then \( \phi_{r,r-n}\xi_r = \xi_{r-n}, \) i.e., the following triangle commutes

\[
\begin{array}{c}
\xi_r \\
\downarrow \phi_{r,r-n} \\
\xi_{r-n}
\end{array}
\]

As a result, there is an induced algebra homomorphism \( U(\widehat{sl}_n) \rightarrow \lim S_\Delta(n, n + m); \) see [59, 3.4]. As seen above (a fact pointed out by Lusztig in [59]), if \( U(\widehat{sl}_n) \) is replaced by \( U_\Delta(n), \) then the diagram above is not commutative. Hence, the homomorphism \( U(\widehat{sl}_n) \rightarrow \lim S_\Delta(n, n + m) \) cannot be extended to \( U_\Delta(n), \) nor to \( \mathfrak{D}_\Delta(n). \) However, it is natural to ask if this homomorphism can be extended to the double Ringel–Hall algebra \( \mathfrak{D}_\Delta(n) \) introduced in Remarks 2.2.8(3), which has the same 0-part as \( U(\widehat{sl}_n). \)

We now show below that this is not the case.

It is known from §3.7 that \( S_\Delta(n, r) \) is generated by the \( A_\lambda(0, r), \hat{t}A_\lambda(0, r) \) and \( 0(e_\lambda^r, r) \) for \( \lambda \in \mathbb{N}_\Lambda^n \) and \( i \in \mathbb{I}. \) In the following we describe the images of \( A_\lambda(0, r) \) and \( \hat{t}A_\lambda(0, r) \) under \( \phi_{r,r-n}. \) As in §2.1, for \( \lambda = (\lambda_i) \in \mathbb{Z}_n^\Lambda, \) define \( \tau \lambda \in \mathbb{Z}_n^\Lambda \) by setting \( \tau \lambda_i = \lambda_{i-1} \) for all \( i \in \mathbb{Z}. \)

**Proposition 5.5.1.** Keep the notation above. Let \( \mathbb{F} \) be the finite field with \( q \) elements. For each \( \lambda = (\lambda_i) \in \mathbb{N}_\Lambda^n, \) we have

\[
\Xi(A_\lambda(0, r)) = \sum_{\mu, \nu \in \mathbb{N}_\Lambda^n, \mu + \nu = \lambda} q^{(\mu r r - \tau \mu r \nu)/2} A_\mu(0, r') 0(\nu, r') \otimes A_\nu(0, r'') 0(-\mu, r'').
\]

Dually, we have

\[
\Xi(\hat{t}A_\lambda(0, r)) = \sum_{\mu, \nu \in \mathbb{N}_\Lambda^n, \mu + \nu = \lambda} q^{(\mu r r - \tau \mu r \nu)/2} \cdot \hat{t}A_\mu(0, r') 0(\tau \nu, r') \otimes \hat{t}A_\nu(0, r'') 0(-\tau \mu, r'').
\]

**Proof.** We only prove the first formula. The second one can be proved similarly. For \( \mu + \nu = \lambda \) with \( \mu, \nu \in \mathbb{N}_\Lambda^n, \) we write

\[
\Psi_{\mu, \nu} = A_\mu(0, r') 0(\nu, r') \otimes A_\nu(0, r'') 0(-\mu, r'').
\]
Thus, it suffices to show that for all fixed \( L', \tilde{L}' \in \mathcal{F}_{\triangle_n}(V') \) and \( L'', \tilde{L}'' \in \mathcal{F}_{\triangle_n}(V'') \),
\[
\Xi(A_{\lambda}(0, r))(L', \tilde{L}', L'', \tilde{L}'') = \sum_{\mu, \nu \in \mathcal{L}, \mu + \nu = \lambda} q^{(\mu + \nu - \tau_{\mu \nu})/2} \Psi_{\mu, \nu}(L', \tilde{L}', L'', \tilde{L}'').
\]
By the definition and (5.5.0.3), we obtain that
\[
\Xi(A_{\lambda}(0, r))(L', \tilde{L}', L'', \tilde{L}'') = \sum_{L} A_{\lambda}(0, r)(L, \tilde{L}) = q^{-\sum_{1 \leq i \leq n} \lambda_i (\dim L_i / L_{i-1} - \lambda_i)}/2 \ell,
\]
where \( \ell \) denotes the cardinality of the set
\[
\mathcal{L} := \{ \tilde{L} \in \mathcal{F}_{\triangle_n}(V) \mid \tilde{L} \subseteq L, L/\tilde{L} \cong S_{\lambda}, \pi'(\tilde{L}) = \tilde{L}', \pi''(\tilde{L}) = \tilde{L}'' \}.
\]
Now let \( \tilde{L} \in \mathcal{L} \). For each \( i \in \mathbb{Z} \), consider the projection
\[
\theta_i : L_i \to L_i' = (L_i + V'')/V''.
\]
Thus, \( \theta_i^{-1}(\tilde{L}_i) = \tilde{L}_i + L_i \cap V'' = \tilde{L}_i + L_i'' \) and \( L_i / \theta_i^{-1}(\tilde{L}_i) \cong L_i' / \tilde{L}_i' \). This implies that
\[
\dim \theta_i^{-1}(\tilde{L}_i)/\tilde{L}_i = \dim L_i / \tilde{L}_i - \dim L_i' / \tilde{L}_i' = \dim L_i'' / \tilde{L}_i''.
\]
The semisimplicity of \( L / \tilde{L} \cong S_{\lambda} \) shows \( L_{i-1} \subseteq \tilde{L}_i \). Hence, we have the inclusions
\[
L_{i-1} + \tilde{L}_i'' \subseteq \tilde{L}_i \subseteq \theta_i^{-1}(\tilde{L}_i) = \tilde{L}_i + L_i'' \subseteq L_i.
\]
Then
\[
\theta_i^{-1}(\tilde{L}_i)/(L_{i-1} + \tilde{L}_i'') = \tilde{L}_i/(L_{i-1} + \tilde{L}_i'') + (L_{i-1} + L_i'')/(L_{i-1} + \tilde{L}_i'')
\]
and
\[
\dim \theta_i^{-1}(\tilde{L}_i)/(L_{i-1} + \tilde{L}_i'') = \dim L_i / L_{i-1} + \tilde{L}_i'' + \dim L_i'' / \tilde{L}_i''.
\]
The inequality \( \dim (L_{i-1} + L_i'')/(L_{i-1} + \tilde{L}_i'') \leq \dim L_i'' / \tilde{L}_i'' \) gives that
\[
\dim (L_{i-1} + L_i'')/(L_{i-1} + \tilde{L}_i'') = \dim L_i'' / \tilde{L}_i''
\]
and
\[
\theta_i^{-1}(\tilde{L}_i)/(L_{i-1} + \tilde{L}_i'') = \tilde{L}_i/(L_{i-1} + \tilde{L}_i'') \oplus (L_{i-1} + L_i'')/(L_{i-1} + \tilde{L}_i'').
\]
Thus, \( \tilde{L}_i/(L_{i-1} + \tilde{L}_i'') \) is a complement of \( (L_{i-1} + L_i'')/(L_{i-1} + \tilde{L}_i'') \).
Consequently,
\[
\ell = \prod_{1 \leq i \leq n} \ell_i,
\]
where \( \ell_i \) is the number of subspaces in \( \theta_i^{-1}(\tilde{L}_i)/(L_{i-1} + \tilde{L}_i'') \) which are complementary to \( (L_{i-1} + L_i'')/(L_{i-1} + \tilde{L}_i'') \). Further,
\[
\dim \theta_i^{-1}(\tilde{L}_i)/(L_{i-1} + \tilde{L}_i'') = \dim L_i / (L_{i-1} + \tilde{L}_i'') - \dim L_i / \theta_i^{-1}(\tilde{L}_i)
\]
\[
= \dim L_i / (L_{i-1} + L_i'') + \dim (L_{i-1} + L_i'')/(L_{i-1} + \tilde{L}_i'') - \dim L_i' / \tilde{L}_i'
\]
\[
= \dim L_i / L_{i-1} - \dim (L_{i-1} + L_i'')/L_{i-1} + \dim L_i'' / \tilde{L}_i'' - \dim L_i' / \tilde{L}_i'
\]
Therefore,
\[
\ell_i = q^{\dim L_i'' / \tilde{L}_i'' (\dim L_i' / L_{i-1} - \dim L_i' / \tilde{L}_i')}.
\]
We finally get that
\[
\Xi(A_{\lambda}(0, r))(L', \tilde{L}', L'', \tilde{L}'') = q^{\ell / 2},
\]
where \( a = \sum_{1 \leq i \leq r} (-\lambda_i (\dim \mathcal{L}_i/\mathcal{L}_{i-1} - \lambda_i) + 2 \dim \mathcal{L}_i''/\mathcal{L}_i'' (\dim \mathcal{L}_i'/\mathcal{L}_{i-1} - \dim \mathcal{L}_i'/\mathcal{L}_i')). \)

On the other hand, by (5.5.0.3) and (5.5.0.4),

\[
\Psi_{\mu,\nu}(L', \tilde{L}', L'', \tilde{L}'') \neq 0
\]

\[
\iff L' \subseteq L', \tilde{L}'' \subseteq L'', L'/L' \cong S_{\mu}, L''/\tilde{L}'' \cong S_{\nu}
\]

\[
\iff \tilde{L}_i' \subseteq L_i', \tilde{L}_i'' \subseteq L_i'', L_i'/\tilde{L}_i' \cong \mathbb{F}_{\mu_i}, L_i''/\tilde{L}_i'' \cong \mathbb{F}_{\nu_i}, \forall i \in \mathbb{Z}.
\]

Moreover, if this is the case, then

\[
\Psi_{\mu,\nu}(L', \tilde{L}', L'', \tilde{L}'') = A_{\mu}(0, r')(L', \tilde{L}')0(\nu, r')(\tilde{L}', \tilde{L}')A_{\nu}(0, r'')(L'', \tilde{L}'')0(-\mu, r'')(\tilde{L}'', \tilde{L}'')
\]

\[
= q^{b/2}
\]

where \( b = -c(L', \tilde{L}') - c(L'', \tilde{L}'') + \sum_{1 \leq i \leq n} (\nu_i \dim \tilde{L}_i'/\tilde{L}_i' - \mu_i \dim \tilde{L}_i''/\tilde{L}_i''). \)

\[
c(L', \tilde{L}') = \sum_{1 \leq i \leq n} \mu_i (\dim \mathcal{L}_i'/\mathcal{L}_{i-1} - \mu_i), \quad c(L'', \tilde{L}'') = \sum_{1 \leq i \leq n} \nu_i (\dim \mathcal{L}_i''/\mathcal{L}_{i-1} - \nu_i),
\]

\[
\dim \tilde{L}_i'/\tilde{L}_i' = \dim \mathcal{L}_i'/\mathcal{L}_{i-1} + \mu_i - \mu_i, \quad \dim \tilde{L}_i''/\tilde{L}_i'' = \dim \mathcal{L}_i''/\mathcal{L}_{i-1} + \nu_i - \nu_i,
\]

it follows that

\[
b = \sum_{1 \leq i \leq n} (-\mu_i \dim \mathcal{L}_i'/\mathcal{L}_{i-1} - \nu_i \dim \mathcal{L}_i''/\mathcal{L}_{i-1} + \mu_i^2 + \nu_i^2
\]

\[
+ \nu_i \mathcal{L}_i'/\mathcal{L}_{i-1} - \mu_i \dim \mathcal{L}_i''/\mathcal{L}_{i-1} + \nu_i \mu_i - \mu_i \nu_i)
\]

\[
=a + \tau \mu \bullet \nu - \mu \bullet \tau \nu.
\]

Note that \( \lambda_i = \mu_i + \nu_i \) and \( \dim \mathcal{L}_i/\mathcal{L}_{i-1} = \dim \mathcal{L}_i'/\mathcal{L}_{i-1} + \dim \mathcal{L}_i''/\mathcal{L}_{i-1} \) for all \( i \in \mathbb{Z} \).

Therefore,

\[
\Xi(A_{\lambda}(0, r))(L', \tilde{L}', L'', \tilde{L}'') = \sum_{\mu + \nu = \lambda} q^{(\mu \tau \nu - \tau \mu \nu)/2} \Psi_{\mu,\nu}(L', \tilde{L}', L'', \tilde{L}''),
\]

which finishes the proof. \( \square \)

**Corollary 5.5.2.** Suppose \( r \geq n \). If \( \lambda = (\lambda_i) \in \mathbb{N}_0^n \) satisfies \( \lambda_i \geq 1 \) for all \( i \in \mathbb{Z} \), then

\[
\phi_{r - r - n}(A_{\lambda}(0, r)) = A_{\lambda}(0, r - n) + A_{\lambda - \delta}(0, r - n) \cdot 0(\delta, r - n)
\]

and

\[
\phi_{r - r - n}(t A_{\lambda}(0, r)) = t A_{\lambda}(0, r - n) + t A_{\lambda - \delta}(0, r - n) \cdot 0(\delta, r - n).
\]

**Proof.** Write \( r' = r - n \). Fix a finite field \( \mathbb{F} \) with \( q \) elements. Then applying the above proposition gives

\[
\Xi(A_{\lambda}(0, r)) = \sum_{\mu + \nu = \lambda} q^{(\mu \tau \nu - \tau \mu \nu)/2} A_{\mu}(0, r')0(\nu, r') \otimes A_{\nu}(0, n)0(-\mu, n).
\]

If \( \sigma(\nu) > n \), then \( A_{\nu}(0, n) = 0 \). If \( 1 \leq \sigma(\nu) \leq n \) and \( \nu \neq \delta \), then \( \chi(A_{\nu}(0, n)) = 0 \). Thus,

\[
\phi_{r - r - n}^q(A_{\lambda}(0, r)) = (\xi \otimes \chi) \Xi(A_{\lambda}(0, r))
\]

\[
= \xi(A_{\lambda}(0, r'))\chi(0(-\lambda, n)) + \xi(A_{\lambda - \delta}(0, r')0(\delta, r'))\chi(A_{\delta}(0, n)0(-\lambda + \delta, n))
\]

\[
= A_{\lambda}(0, r') + A_{\lambda - \delta}(0, r')0(\delta, r').
\]
The second formula can be proved similarly.

By the above corollary, if \( \lambda = (\lambda_i) \in \mathbb{N}_0^n \) satisfies \( \lambda_i \geq 1 \) for all \( i \in \mathbb{Z} \) and \( \sigma(\lambda) \leq r \), then

\[
\phi_{r,r-n}(A_\lambda(0,r)) \neq \xi_{r-n}(A_\lambda(0,r)) \quad \text{and} \quad \phi_{r,r-n}(A_\lambda(0,r)) \neq \xi_{r-n}(A_\lambda(0,r)).
\]

This shows that the transfer maps \( \phi_{r,r-n} \) are not compatible with the homomorphisms \( \xi_r : \mathbb{D}_\theta(n) \to \mathbb{S}_\theta(n,r) \).
The classical \((v = 1)\) case

Let \(U(\hat{\mathfrak{gl}}_n)\) be the universal enveloping algebra of the loop algebra \(\hat{\mathfrak{gl}}_n(\mathbb{Q})\) as mentioned in §1.1. We will establish, on the one hand, a surjective homomorphism from \(U(\hat{\mathfrak{gl}}_n)\) to the affine Schur algebra \(S_{\mathfrak{h}}(n, r)_{\mathbb{Q}}\) via the natural action of \(\hat{\mathfrak{gl}}_n(\mathbb{Q})\) on the \(\mathbb{Q}\)-space \(\Omega_{\mathbb{Q}}\), and prove, on the other hand, that \(U(\hat{\mathfrak{gl}}_n)\) is isomorphic to the specialization \(\mathfrak{D}_{\mathfrak{h}}(n)_{\mathbb{Q}}\) of the double Ringel–Hall algebra \(\mathfrak{D}_{\mathfrak{h}}(n)\) at \(v = 1\) and \(K_i = 1\). In this way, we obtain a surjective algebra homomorphism \(\eta_r : U(\hat{\mathfrak{gl}}_n) \to S_{\mathfrak{h}}(n, r)_{\mathbb{Q}}\) which is regarded as the classical \((v = 1)\) version of the surjective homomorphism \(\xi_r : \mathfrak{D}_{\mathfrak{h}}(n) \to S_{\mathfrak{h}}(n, r)\). We then prove the classical version of Conjecture 5.4.2 via the homomorphisms \(\eta_r\). A crucial step to establish the conjecture in this case is the extension of the multiplication formulas given in §3.4 to formulas between indecomposable modules of imaginary roots and arbitrary BLM basis elements. This is done in §6.2. The conjecture in the classical case is proved in §6.3.

In order to distinguish the specializations at non-roots of unity \(v = z \in \mathbb{C}\) considered in previous chapters from the specialization at \(v = 1\), we will particularly consider the specialization \(\mathcal{Z} \to \mathbb{Q}\) by sending \(v\) to 1 throughout the chapter. Thus, \(\mathcal{H}_n(n)_{\mathbb{Q}}\) identifies the group algebra \(\mathbb{Q}\mathfrak{S}_{\mathfrak{h}}, \Omega_{\mathbb{Q}}\) is the \(\mathbb{Q}\)-space with basis \(\{\omega_i\}_{i \in \mathbb{Z}}\), and \(S_{\mathfrak{h}}(n, r)_{\mathbb{Q}}\) identifies the classical affine Schur algebra. In other words, \(S_{\mathfrak{h}}(n, r)_{\mathbb{Q}} \cong \text{End}_{\mathbb{Q}\mathfrak{S}_{\mathfrak{h}}}(\Omega_{\mathbb{Q}}^r)\).

### 6.1. The universal enveloping algebra \(U(\hat{\mathfrak{gl}}_n)\)

Recall from §1.1 the loop algebra \(\hat{\mathfrak{gl}}_n(\mathbb{Q})\) has a basis \(\{E^0_{i,j}\}_{1 \leq i \leq n, j \in \mathbb{Z}}\). Thus, the natural action of these basis elements on \(\Omega_{\mathbb{Q}}\) defined by

\[
E^\triangle_{i,j} \omega_k = \begin{cases} 
\omega_{i+tn} & \text{if } k = j + tn; \\
0 & \text{otherwise}
\end{cases}
\]

(6.1.0.1)

gives rise to a \(U(\hat{\mathfrak{gl}}_n)\)-module structure on \(\Omega_{\mathbb{Q}}\), and hence, on the \(r\)-fold tensor product \(\Omega_{\mathbb{Q}}^r\). Thus, we obtain an algebra homomorphism

\[
\eta_r : U(\hat{\mathfrak{gl}}_n) \to S_{\mathfrak{h}}(n, r)_{\mathbb{Q}}.
\]

The surjectivity of \(\eta_r\) was established in [83 Th. 6.6(i)] by a coordinate algebra approach. We now present a different proof by identifying the above action with the Hall algebra action as discussed in §§3.5-6. We first interpret the \(\pm\)-part of \(U(\hat{\mathfrak{gl}}_n)\) as the specialization of Hall algebras. We need the following in this interpretation.

**Lemma 6.1.1.** For \(1 \leq k \leq t\), let \(A_k = (a^{(k)}_{i,j}), B = (b_{i,j}) \in \Theta^+_{\mathfrak{h}}(n)\).

1. If \(\sigma(B) \geq \sum_{k=1}^t \sigma(A_k)\) and \(B \neq \sum_{k=1}^t A_k\), then \((v^2 - 1)|\varphi_{A_1, A_2, \ldots, A_t}|.\)
(2) If \( B = \sum_{k=1}^{t} A_k \), then
\[
(v^2 - 1) \left( \phi_{A_1, A_2, \ldots, A_t} - \prod_{i<j} \frac{b_{i,j}!}{a_{i,j}! \cdots a_{i,j}^{(2)} \cdots a_{i,j}^{(t)}} \right).
\]

PROOF. By using [64] p. 441, Lem.] and [66] Prop. 3], the assertion can be proved in a way similar to the proof of [61] Prop. 4.1.

Since \( \mathfrak{H}_\lambda(n)^+ \cong \mathfrak{H}_\lambda(n)_Q \) and \( \mathfrak{H}_\lambda(n)^- \cong \mathfrak{H}_\lambda(n)^{op} \), it follows that \( \mathfrak{H}_\lambda(n)^\pm \) is generated by \( u_{E_{i,j}^{\pm}} \) for all \( i < j \). Here and below, the subscripts 1 indicate those elements in \( \mathfrak{H}_\lambda(n)^{+} \) obtained from elements in \( \mathfrak{H}_\lambda(n)^{\pm} \) by specializing \( v \) to 1.

**Theorem 6.1.2.** Suppose \( \mathcal{U}(\widehat{\mathfrak{g}_l})^+ \) (resp., \( \mathcal{U}(\widehat{\mathfrak{g}_l})^- \)) is the subalgebra of \( \mathcal{U}(\widehat{\mathfrak{g}_l}) \) generated by \( E_{i,j}^{\pm} \) (resp., \( E_{j,i}^{\pm} \)) for all \( i < j \). Then, for each \( \varepsilon \in \{+,-\} \), there is a unique algebra isomorphism \( \mathcal{U}(\widehat{\mathfrak{g}_l})^\varepsilon \rightarrow \mathfrak{H}_\lambda(n)^{\varepsilon} \) taking \( E_{i,j}^{\varepsilon} \mapsto u_{E_{i,j}^{\varepsilon}} \) (resp., \( E_{j,i}^{\varepsilon} \mapsto u_{E_{j,i}^{\varepsilon}} \)) for all \( i < j \). In particular, there are algebra embeddings
\[
u^{\pm} : \mathfrak{H}_\lambda(n)^{\pm} \rightarrow \mathcal{U}(\widehat{\mathfrak{g}_l}).
\]

**Proof.** It suffices to prove the + case. Let \( \widehat{\mathfrak{g}_l}^+ \) be the Lie subalgebra of \( \widehat{\mathfrak{g}_l} \) generated by \( E_{i,j}^{\pm} \) (\( i < j \)). Then \( \mathcal{U}(\widehat{\mathfrak{g}_l})^+ \) is isomorphic to the enveloping algebra of \( \widehat{\mathfrak{g}_l}^+ \) and in \( \mathcal{U}(\widehat{\mathfrak{g}_l})^+ \),
\[
[E_{i,j}^{\varepsilon}, E_{k,l}^{\varepsilon}] = \delta_{j,k} E_{i,i+j-k}^{\varepsilon} - \delta_{i,k} E_{k,j+i-l}^{\varepsilon} \quad \text{for } i, j, k, l \in \mathbb{Z}.
\]

On the other hand, by Lemma 6.1.1 for \( i < j \) and \( k < l \), we have in \( \mathfrak{H}_\lambda(n)^{\varepsilon} \),
\[
u^{+} E_{i,j}^{+} - u_{E_{i,j}^{+}} = \delta_{j,k} u_{E_{i,i+j-k}^{+}} - \delta_{i,k} u_{E_{k,j+i-l}^{+}} \quad \text{for } i, j, k, l \in \mathbb{Z}.
\]

Thus, there is an algebra homomorphism \( f : \mathcal{U}(\widehat{\mathfrak{g}_l})^+ \rightarrow \mathfrak{H}_\lambda(n)_Q^+ \) such that \( f(E_{i,j}^{+}) = u_{E_{i,j}^{+}} \) for \( i < j \). Let \( \mathcal{L} = \{(i,j) \mid 1 \leq i \leq n, \ j \in \mathbb{Z}, \ i < j\} \). By Lemma 6.1.1 again, we see for any \( A = \sum_{(i,j) \in \mathcal{L}} a_{i,j} E_{i,j}^{\varepsilon} \in \Theta_\lambda^{\varepsilon}(n) \),
\[
\prod_{(i,j) \in \mathcal{L}} (u_{E_{i,j}^{\varepsilon}})^{a_{i,j}} = \left( \prod_{(i,j) \in \mathcal{L}} a_{i,j}^{+} \right) u_{A,1}^{+} + \sum_{B \in \Theta_\lambda^{\varepsilon}(n), \sigma(B) < \sigma(A)} f_B(1) u_{B,1}^{+},
\]
where \( f_B \in \mathcal{Z} \) and the products are taken with respect to a fixed total order on \( \mathcal{L} \). Hence, the set
\[
\left\{ \prod_{(i,j) \in \mathcal{L}} (u_{E_{i,j}^{\varepsilon}})^{a_{i,j}} \mid A = (a_{i,j}) \in \Theta_\lambda^{\varepsilon}(n) \right\}
\]
is a \( \mathbb{Q} \)-basis of \( \mathfrak{H}_\lambda(n)^{\pm} \). Thus, \( f \) sends a PBW-basis of \( \mathcal{U}(\widehat{\mathfrak{g}_l})^+ \) to a basis of \( \mathfrak{H}_\lambda(n)^{\pm} \). Consequently, \( f \) is an isomorphism.

Recall from Proposition 3.6.1 that \( \mathfrak{H}_\lambda(n)^{\pm} \) act on the \( \mathbb{Z} \)-free module \( \Omega \) via the maps \( \zeta_r^{\pm} \). These induce actions of \( \mathfrak{H}_\lambda(n)^{\pm} \) on \( \Omega_Q \) via the maps
\[
\zeta_r^{\pm} : \mathfrak{H}_\lambda(n)^{\pm} \rightarrow \mathfrak{S}_n(n,r)_Q.
\]
Again, in the following the subscripts 1 indicate those elements in \( S_\omega(n, r) \) obtained from elements in \( S_\omega(n, r) \) by specializing \( v \) to 1.

**Lemma 6.1.3.** For any \( r \geq 0 \), we have \( \eta_r \circ \iota^\pm = \zeta_r^\pm \). More precisely, we have \( \eta_r(E_{i,j}^\pm) = E_{i,j}^\pm(0, r)_1 \) for \( i \neq j \) and \( \eta_r(E_{i,i}^\pm) = \left[ \frac{k_i, r}{1} \right]_1 \), where \( k_i, r := 0(e_i^\pm, r) \in S_\omega(n, r) \) and \( \left[ \frac{k_i, r}{1} \right] \) is defined as in (1.1.0.6). Moreover, the elements \( \left( E_{i}^\pm \right)_1 := E_{i}^\pm(0, r)_1 \) in \( U(\mathfrak{gl}_n) \) have the images \( \eta_t(E_i^\pm) = \left[ \frac{k_i}{t} \right]_1 \) for \( t \geq 0 \).

**Proof.** By Proposition 3.5.2 and Theorem 3.6.3, \( \mathcal{H}(n) \) acts on \( \Omega_Q \) via \( \zeta_i^\pm \); for \( i < j \),
\[
u_i^+, \omega_k = \begin{cases} \omega_k^+, & \text{if } k = j + t, \\ 0, & \text{otherwise} \end{cases}
\]
and
\[
u_i^-, \omega_k = \begin{cases} \omega_k^-, & \text{if } k = i + t, \\ 0, & \text{otherwise}. \end{cases}
\]
This action agrees with the action of \( E_{i,j}^\pm \) on \( \Omega_Q \) defined in (6.1.0.1). On the other hand, by Propositions 1.5.4(b) and 1.5.6(b), we have \( \sum_{\omega > 0} \Omega_Q \left. \right|_{E_{i,j}^\pm} = E_{i,j}^\pm(0, r)_1 \) and \( \sum_{\omega > 0} \Omega_Q \left. \right|_{E_{i,j}^\pm} = E_{i,j}^\pm(0, r)_1 \). Thus, the action of \( E_{i,j}^\pm \) on \( \Omega_Q^{\otimes r} \) agrees with the action of \( \nu_i^\pm \), proving the first statement.

For \( \lambda \in \Lambda_\omega(n, r) \), let \( \iota_\lambda \) be defined as in the proof of Proposition 3.3.1. Since \( E_{i,i}^\pm(\omega_\lambda, w) = \lambda \omega_\lambda, w = \left[ \frac{k_i, r}{1} \right]_1(\omega_\lambda, w) \) for all \( \omega \in \mathcal{S}_\omega(n, r) \), we have \( \eta_{\lambda}(E_{i,i}^\pm) = \left[ \frac{k_i, r}{1} \right]_1 \).
Hence,
\[
\eta_r(E_{i,i}^\pm) = \frac{1}{t!} \prod_{s=0}^{t-1} \sum_{\lambda \in \Lambda_\omega(n, r)} (\lambda_i - s)[\text{diag}(\lambda)]_1 = \sum_{\lambda \in \Lambda_\omega(n, r)} \left( \frac{\lambda_i}{t} \right)[\text{diag}(\lambda)]_1 = \left[ \frac{k_i}{t} \right]_1,
\]
as required. \( \square \)

**Theorem 6.1.4.** Identifying \( \mathcal{H}(n) \) with \( U(\mathfrak{gl}_n) \) via \( \iota^\pm \), the map \( \eta_r \) is surjective and \( \eta_r(u_{\Lambda, 1}^+) = A(0, r)_1 \) and \( \eta_r(u_{\Lambda, 1}^-) = \tilde{A}(0, r)_1 \) for \( A \in \Theta_\omega^+(n) \).

**Proof.** The first assertion follows from Proposition 3.6.1 and Theorem 3.7.7. Since \( \mathcal{H}(n) \) is generated by \( u_{E_{i,j}^\pm}^\pm \) for \( i < j \), the second assertion follows from Lemma 6.1.3 and Proposition 3.6.1. \( \square \)

Let \( \mathfrak{D}_\omega(n) \) be the integral form of \( \mathfrak{D}_\omega(n) \) defined right after Remark 2.2.9. We now prove that the specialization \( \mathfrak{D}_\omega(n)_Q \) of \( \mathfrak{D}_\omega(n) \) at \( v = 1 \) and \( K_i = 1 \) is isomorphic to the universal enveloping algebra \( U(\mathfrak{gl}_n) \), and thus, via the theorem above, we establish a surjective homomorphism \( \xi_r \) from \( \mathfrak{D}_\omega(n)_Q \) to the affine Schur algebra; cf. [83]. Clearly, \( \xi_r \) is a specialization of the homomorphism \( \xi_r \) defined in (3.5.4.3).

By specializing \( v \) to 1, \( Q \) is regarded as a \( \mathbb{Z} \)-module. Consider the \( Q \)-algebra
\[
\mathfrak{D}_\omega(n)_Q := \mathfrak{D}_\omega(n)_Q / \langle K_i - 1 | 1 \leq i \leq n \rangle \cong (\mathfrak{D}_\omega(n) \otimes \mathbb{Q}[v, v^{-1}]) / \langle v - 1, K_i - 1 | 1 \leq i \leq n \rangle.
\]
We have used and will use the same notation for elements in $\mathcal{D}_\alpha(n)_Q$ and $\mathcal{D}_\alpha(n)_Q$.

Let $\widehat{\mathfrak{sl}}(Q) = \mathfrak{sl}(Q) \otimes Q[t, t^{-1}]$ and set $\widehat{\mathfrak{gl}}^L_n = \widehat{\mathfrak{sl}}_n(Q) = \widehat{\mathfrak{sl}}(Q) \oplus QE^\alpha$, where $E^\alpha = \sum_{1 \leq i \leq n} E^\alpha_{i,i}$ is in the center of $\widehat{\mathfrak{gl}}_n^L(Q)$. Then the set
\[
X := \{ E^\alpha_{i,j} + l \mid 1 \leq i, j \leq n, i \neq j, l \in \mathbb{Z} \} \cup \{ E^\alpha_{i,i} \mid 1 \leq i \leq n \}
\]
\[
\cup \{ E^\alpha_{i,i+1} - E^\alpha_{i+1,i+1} + l \mid 1 \leq i \leq n, l \in \mathbb{Z}, l \neq 0 \}
\]
forms a $Q$-basis for $\widehat{\mathfrak{gl}}^L_n$. Let $z_m = \sum_{1 \leq h \leq n} E^\alpha_{n,h+mn}$ for $m \neq 0$. Then $X \cup \{ z_m \mid m \in \mathbb{Z}, m \neq 0 \}$ forms a $Q$-basis for $\widehat{\mathfrak{gl}}^L_n = \widehat{\mathfrak{gl}}^L_n(Q)$. By the PBW theorem,
\[
\mathcal{U}(\widehat{\mathfrak{gl}}_n) \cong \mathcal{U}(\widehat{\mathfrak{gl}}^L_n) \otimes Q[z_m]_{m \in \mathbb{Z}\setminus\{0\}}, \tag{6.1.4.2}
\]
where $\mathcal{U}(\widehat{\mathfrak{gl}}^L_n)$ is the enveloping algebra of $\widehat{\mathfrak{gl}}^L_n$. Note that the $z_m$ are central elements in $\mathcal{U}(\widehat{\mathfrak{gl}}_n)$.

**Theorem 6.1.5.** There is an algebra isomorphism $\phi : \mathcal{D}_\alpha(n)_Q \to \mathcal{U}(\widehat{\mathfrak{gl}}_n)$ defined by sending $[K_{i,t}^0]$ to $(E^\alpha_{i,i})$, $(u^+_i)^{(m)}$ to $(E^\alpha_{i+1,i+1} + m)!$, $(u^-_i)^{(m)}$ to $(E^\alpha_{i,i+1} + 1)!$, $z^+_s$ to $z_s$ and $z^-_s$ to $z^-_{s-1}$ for $1 \leq i \leq n$ and $m, s, t \geq 1$.

**Proof.** Let $U_\alpha(n)$ be the $\mathbb{Z}$-subalgebra of $\mathcal{D}_\alpha(n)$ generated by $K_{i,t}^{\pm 1}$, $[K_{i,t}^0]$, $(u^+_i)^{(m)}$ and $(u^-_i)^{(m)}$ for $1 \leq i \leq n$ and $m, t \geq 1$. By [54, 6.7] and [56], specializing $v$ to 1 induces an algebra isomorphism
\[
\alpha : U_\alpha(n)_Q := U_\alpha(n)_Q / \langle K_i - 1 \mid 1 \leq i \leq n \rangle \to \mathcal{U}(\widehat{\mathfrak{gl}}_n)
\]
defined by taking $[K_{i,t}^0] \mapsto (E^\alpha_{i,i})$, $(u^+_i)^{(m)} \mapsto (E^\alpha_{i+1,i+1} + m)!$, $(u^-_i)^{(m)} \mapsto (E^\alpha_{i,i+1} + 1)!$ for $1 \leq i \leq n$ and $m, t \geq 1$.

Let $\iota$ be the natural algebra homomorphism induced by the inclusion $U_\alpha(n) \subset \mathcal{D}_\alpha(n)$:
\[
\iota : U_\alpha(n)_Q \to \mathcal{D}_\alpha(n)_Q = \mathcal{D}_\alpha(n)_Q / \langle K_i - 1 \mid 1 \leq i \leq n \rangle.
\]

Since $\mathcal{D}_\alpha(n) \cong U_\alpha(n) \otimes \mathbb{Z}[z_m \mid m > 0]$, by (6.1.4.2), the map $\alpha$ induces an algebra homomorphism
\[
\phi : \mathcal{D}_\alpha(n)_Q \to \mathcal{U}(\widehat{\mathfrak{gl}}_n)
\]
such that $\phi \iota(x) = \alpha(x)$ for $x \in U_\alpha(n)_Q$ and $\phi(z^+_s) = z_s$ and $\phi(z^-_s) = z^-_{s-1}$ for $s > 0$. We choose a $Q$-basis $\{ x_j \mid j \in J \}$ of $U_\alpha(n)_Q$. Then $\mathcal{D}_\alpha(n)_Q$ is spanned by the set
\[
Y := \left\{ \iota(x_j) \prod_{i=1}^k (z^+_i)^{a_i} \prod_{i=1}^l (z^-_i)^{b_i} \mid j \in J, k, l \geq 1, a_i, b_i \in \mathbb{N}, \forall i \right\}.
\]

By (6.1.4.2), the set $\phi(Y)$ forms a $Q$-basis for $\mathcal{U}(\widehat{\mathfrak{gl}}_n)$. Thus, $\phi$ is an isomorphism. \qed

Put $\tilde{\xi}_r = \eta_r \circ \phi$. Theorem 6.1.5 gives rise to an algebra epimorphism
\[
\xi_r : \mathcal{D}_\alpha(n)_Q \to \mathcal{S}_\alpha(n, r)_Q,
\]
which is the classical version of the map $\xi_r : \mathcal{D}_\delta(n) \to \mathcal{S}_\delta(n, r)$. In the next two sections, we will describe explicitly the image of the map

$$\hat{\xi} = \prod_{r \geq 0} \xi_r : \mathcal{D}_\delta(n)_Q \to \hat{\mathcal{K}}_\delta(n)_Q,$$

or equivalently, the map

$$\eta = \prod_{r \geq 0} \eta_r : \mathcal{U}(\hat{g}_n) \to \hat{\mathcal{K}}_\delta(n)_Q.$$ (6.1.5.1)

Here we have identified the algebra $\hat{\mathcal{K}}_\delta(n)_Q$ defined at the end of §5.4 with the direct product $\prod_{r \geq 0} \mathcal{S}_\delta(n, r)_Q$.

### 6.2. More multiplication formulas in affine Schur algebras

In order to prove Conjecture 5.4.2 in the classical case, we use the elements $A[j, r]$ for $A \in \Theta_\delta^*(n), j \in \mathbb{N}_0^n$ defined in (5.4.2.1):

$$A[j, r] = \begin{cases} 
\sum_{\lambda \in \Lambda_\delta(n, r, -\sigma(A))} \lambda^1[A + \text{diag}(\lambda)]_1, & \text{if } \sigma(A) \leq r; \\
0, & \text{otherwise}.
\end{cases}$$

These elements can not be obtained by specializing $v$ to 1 from the elements $A[j, r]$ defined in (3.4.0.1). However, we have $A[0, r] = A(0, r)_1$ for $A \in \Theta_\delta^*(n)$ (assuming $0^0 = 1$). We also point out another difference when $\sigma(A) = r$. In this case, $A[j, r] = \delta_{0,j}A$ while $A(j, r)_1 = [A]_1$ for all $j \in \mathbb{N}_0^n$.

We will first show that, for a given $r > 0$, the set $\{A[j, r]\}_{A \in \Theta_\delta^*(n), j \in \mathbb{N}_0^n}$ spans the affine Schur algebra $\mathcal{S}_\delta(n, r)_Q$. Then we derive some multiplication formulas between $A[j, r]$ and certain generators corresponding to simple and homogeneous indecomposable representations of the cyclic quiver $\triangle(n)$. We will leave the proof of the conjecture to the next section.

The following result is the classical counterpart of [23 Prop. 4.1]. Its proof is similar to the proof there; cf. [30 4.3.4.2].

**Proposition 6.2.1.** For any fixed $1 \leq i_0 \leq n$, the set

$$\{A[j, r] \mid A \in \Theta_\delta^*(n), j \in \mathbb{N}_0^n, j_{i_0} = 0, \sigma(A) + \sigma(j) \leq r\}$$

is a basis for $\mathcal{S}_\delta(n, r)_Q$. In particular, the set $\{A[j, r] \mid A \in \Theta_\delta^*(n), j \in \mathbb{N}_0^n, \sigma(A) \leq r\}$ forms a spanning set of $\mathcal{S}_\delta(n, r)_Q$.

The first two of the following multiplication formulas in affine Schur algebras are a natural generalization of the multiplication formulas for Schur algebras given in [30 Prop. 3.1]. The third formula is new and is the key to the proof of Conjecture 5.4.2 in the classical case. It would be interesting to find the corresponding formula for affine quantum Schur algebras. For the simplicity of the statement in the next result, we also set $A[j, r] = 0$ if some off-diagonal entries of $A$ are negative.

**Theorem 6.2.2.** Assume $1 \leq h, t, j = (j_k) \in \mathbb{N}_0^n$ and $A = (a_{i,j}) \in \Theta_\delta^*(n)$. The following multiplication formulas hold in $\mathcal{S}_\delta(n, r)_Q$:

1. $0[e_i^\delta, r]A[j, r] = A[j + e_i^\delta, r] + (\sum_{s \in \mathbb{Z}} a_{i,s})A[j, r]$;
(2) for $\varepsilon \in \{1, -1\}$,
\[
E_{h,h+\varepsilon}[0, r]A[j, r] = \sum_{a_{h+\varepsilon,i} \geq 1 \lor i \neq h, h+\varepsilon} (a_{h,i} + 1)(A + E_{h,i}^\varepsilon - E_{h+\varepsilon,i}^\varepsilon)[j, r]
+ \sum_{0 \leq i \leq j_h} (-1)^i \left( \begin{array}{c} j_h \\ i \end{array} \right) (A - E_{h+\varepsilon,h}^\varepsilon)[j + (1 - i)e_h^\varepsilon, r]
+ (a_{h,h+\varepsilon} + 1) \sum_{0 \leq t \leq j_h} \left( \begin{array}{c} j_{h+\varepsilon} \\ t \end{array} \right) (A + E_{h,h+\varepsilon}^\varepsilon)[j - te_{h+\varepsilon}^\varepsilon, r];
\]

(3) for $m \in \mathbb{Z}\setminus\{0\}$,
\[
E_{h,h+mn}[0, r]A[j, r] = \sum_{s \notin \{h, h-hmn\} \quad a_{h,s} \geq 1} (a_{h,s+mn} + 1)(A + E_{h,s+mn}^\varepsilon - E_{h,s}^\varepsilon)[0, r]
\]
\[
+ \sum_{0 \leq t \leq j_h} (a_{h,h+mn} + 1) \left( \begin{array}{c} j_h \\ t \end{array} \right) (A + E_{h,h+mn}^\varepsilon)[j - te_{h}^\varepsilon, r]
+ \sum_{0 \leq t \leq j_h} (-1)^t \left( \begin{array}{c} j_h \\ t \end{array} \right) (A - E_{h, h-mn}^\varepsilon)[j + (1 - t)e_{h}^\varepsilon, r].
\]

It is natural to compare Theorem 6.2.2(1)-(2) with 23 (4.2.1-3) or Theorem 3.4.2 which generalize the corresponding ones for quantum Schur algebras. They are not obtained from the quantum counterpart by specializing $v$ to 1. For example, the second sum in the right hand side of (2) above is slightly different from the quantum version. In the case where $\sigma(A) = r+1$ and $a_{h+\varepsilon,h} \geq 1$, the left hand side of Theorem 6.2.2(2) is zero. By the remark at the beginning of the section, the right hand side is also 0 since $j + (1 - i)e_{h+\varepsilon}^\varepsilon \neq 0$ for all $0 \leq i \leq j_h$.

The proof of the following result will be given at the end of the chapter as an appendix; see §6.4. It should be pointed out that the first formula can also be obtained from 58,3.5 by specializing $v$ to 1, while the second formula is the key to the proof of part (3) of the theorem above.

**Proposition 6.2.3.** Let $1 \leq h \leq n$, $B = (b_{i,j}) \in \Theta_\lambda(n, r)$ and $\lambda = \text{ro}(B)$.

1. If $\varepsilon \in \{1, -1\}$ and $\lambda \geq e_{h+\varepsilon}^\varepsilon$, then
\[
[E_{h,h+\varepsilon}^\varepsilon + \text{diag}(\lambda - e_{h+\varepsilon}^\varepsilon)]_1[B]_1 = \sum_{i \in \mathbb{Z}, a_{h,i} \geq 1} (b_{h,i} + 1)[B + E_{h,i}^\varepsilon - E_{h+\varepsilon,i}^\varepsilon]_1.
\]

2. If $m \in \mathbb{Z}\setminus\{0\}$ and $\lambda \geq e_{h}^\varepsilon$, then
\[
[E_{h,h+mn}^\varepsilon + \text{diag}(\lambda - e_{h}^\varepsilon)]_1[B]_1 = \sum_{s \notin \{h, h-hmn\} \quad a_{h,s} \geq 1} (b_{h,s+mn} + 1)[B + E_{h,s+mn}^\varepsilon - E_{h,s}^\varepsilon]_1.
\]

We now use these formulas to prove the theorem.
6.2. MORE MULTIPLICATION FORMULAS IN AFFINE SCHUR ALGEBRAS 147

**Proof.** The proof of formula (1) is straightforward. Since for any \( A \in \Theta_\alpha(n, r) \) and \( \lambda \in \Lambda_\alpha(n, r) \),

\[
[\text{diag}(\lambda)]_1[A]_1 = \begin{cases} 
[A]_1, & \text{if } \lambda = \text{ro}(A); \\
0, & \text{otherwise},
\end{cases}
\]

it follows that

\[
0[e_\xi^\delta, r]A[j, r] = \sum_{\lambda \in \Lambda(n, r-1)} \lambda_t[\text{diag}(\lambda)]_1 \sum_{\mu \in \Lambda(n, r-\sigma(A))} \mu^j[A + \text{diag}(\mu)]_1
\]

\[
= \sum_{\mu \in \Lambda(n, r-\sigma(A))} \lambda_t \mu^j[A + \text{diag}(\mu)]_1 \quad \text{(where } \lambda = \text{ro}(A) + \mu\text{)}
\]

\[
= \sum_{\mu \in \Lambda(n, r-\sigma(A))} (\sum_{j \in \mathbb{Z}} a_{t,j} + \mu_t) \mu^j[A + \text{diag}(\mu)]_1
\]

\[
= \sum_{\mu \in \Lambda(n, r-\sigma(A))} \mu^{j+t} [A + \text{diag}(\mu)]_1 + \left( \sum_{j \in \mathbb{Z}} a_{t,j} \right) A[j, r] = \text{RHS}.
\]

We now prove formula (2). For convenience, we set \([B]_1 = 0\) if one of the entries of \(B\) is negative. Since \([A]_1[B]_1 = 0\) whenever \(\text{co}(A) \neq \text{ro}(B)\), we have

\[
E_{h, h+\varepsilon}^\delta[0, r]A[j, r] = \sum_{\mu \in \Lambda(n, r-\sigma(A))} \mu^j[E_{h, h+\varepsilon}^\delta + \text{diag}(\mu + \text{ro}(A) - e_{h+\varepsilon}^\delta)]_1 [A + \text{diag}(\mu)]_1.
\]

By Proposition \(6.2.3(1)\),

\[
[E_{h, h+\varepsilon}^\delta + \text{diag}(\mu + \text{ro}(A) - e_{h+\varepsilon}^\delta)]_1 [A + \text{diag}(\mu)]_1
\]

\[
= \sum_{i \neq h+\varepsilon, a_{h+\varepsilon,i} \geq 1} (a_{h,i} + 1)[A + E_{h,i}^\delta - E_{h+\varepsilon,i}^\delta + \text{diag}(\mu)]_1
\]

\[
+ (\mu_h + 1)[A - E_{h+\varepsilon,h}^\delta + \text{diag}(\mu + e_h^\delta)]_1
\]

\[
+ (a_{h,h+\varepsilon} + 1)[A + E_{h,h+\varepsilon} + \text{diag}(\mu - e_{h+\varepsilon}^\delta)]_1.
\]

Thus,

\[
E_{h, h+\varepsilon}^\delta[0, r]A[j, r] = \sum_{i \neq h+\varepsilon, a_{h+\varepsilon,i} \geq 1} (a_{h,i} + 1)(A + E_{h,i}^\delta - E_{h+\varepsilon,i}^\delta)[j, r] + \mathcal{Y}_h + \mathcal{Y}_{h+\varepsilon},
\]

where

\[
\mathcal{Y}_h = \sum_{\mu \in \Lambda(n, r-\sigma(A))} \mu^j(\mu_h + 1)[A - E_{h+\varepsilon,h}^\delta + \text{diag}(\mu + e_h^\delta)]_1
\]

\[
= \sum_{\mu \in \Lambda(n, r-\sigma(A))} (\prod_{i \neq h} \mu_i^j)(\mu_h + 1 - 1)^j_h (\mu_h + 1)[A - E_{h+\varepsilon,h}^\delta + \text{diag}(\mu + e_h^\delta)]_1
\]

\[
= \sum_{0 \leq i < j_h} (-1)^i \binom{j_h}{i} (A - E_{h+\varepsilon,h}^\delta)[j + (1 - i)e_h^\delta, r],
\]
and

\[ y_{h+\varepsilon} = \sum_{\mu \in \Lambda(n,r-\sigma(A))} \mu^j (a_{h,h+\varepsilon} + 1)[A + E_{h,h+\varepsilon} + \text{diag}(\mu - e_{h+\varepsilon}^h)]_1 \]

\[ = (a_{h,h+\varepsilon} + 1) \sum_{\mu \in \Lambda(n,r-\sigma(A))} \left( \prod_{i \neq h+\varepsilon}^{\mu_{h+\varepsilon}} \mu^j_{i} \right) (\mu_{h+\varepsilon} - 1 + 1)^{j_{h+\varepsilon}} [A + E_{h,h+\varepsilon} + \text{diag}(\mu - e_{h+\varepsilon}^h)]_1 \]

\[ = (a_{h,h+\varepsilon} + 1) \sum_{0 \leq i \leq j_{h+\varepsilon}} \left( \frac{j_{h+\varepsilon}}{i} \right) \sum_{\mu \in \Lambda(n,r-\sigma(A)-1)} \mu^{j_i - i e_{h+\varepsilon}^h} [A + E_{h,h+\varepsilon} + \text{diag}(\mu)]_1 \]

Substituting gives (2).

Finally, we prove formula (3). The proof is similar to that of (2). First, with a same reasoning,

\[ E_{h,h+mn}[0, r]A[j, r] = \sum_{\mu \in \Lambda(n,r-\sigma(A))} \mu^j [E_{h,h+mn} + \text{diag}(\mu) + r \sigma(A) - e_{h}^h]_1 \cdot [A + \text{diag}(\mu)]_1. \]

Applying Proposition 6.2.3(2) yields

\[ [E_{h,h+mn} + \text{diag}(\mu) + r \sigma(A) - e_{h}^h]_1 \cdot [A + \text{diag}(\mu)]_1 \]

\[ = \sum_{s \notin \{h,h+mn\}} (a_{h,s+mn} + 1)[A + E_{h,s+mn}^\triangle - E_{h,s}^\triangle + \text{diag}(\mu)]_1 \]

\[ + (a_{h,h+mn} + 1)[(A + E_{h,h+mn}^\triangle) + \text{diag}(\mu - e_{h}^h)]_1 \]

\[ + (\mu + 1)[(A - E_{h,h+mn}) + \text{diag}(\mu + e_{h}^h)]_1. \]

Thus,

\[ E_{h,h+mn}[0, r]A[j, r] = \sum_{s \notin \{h,h+mn\}} (a_{h,s+mn} + 1)(A + E_{h,s+mn}^\triangle - E_{h,s}^\triangle)[0, r] + \mathcal{X}_1 + \mathcal{X}_2 \]

where

\[ \mathcal{X}_1 = (a_{h,h+mn} + 1) \sum_{\mu \in \Lambda(n,r-\sigma(A))} \mu^j [(A + E_{h,h+mn}^\triangle) + \text{diag}(\mu - e_{h}^h)]_1 \]

\[ = (a_{h,h+mn} + 1) \prod_{s \notin \{h,h+mn\}}^{\mu_s} \mu_{s}^j (\mu_{s} - 1 + 1)^j_{s} [(A + E_{h,h+mn}^\triangle) + \text{diag}(\mu - e_{h}^h)]_1 \]

\[ = (a_{h,h+mn} + 1) \sum_{0 \leq l \leq j^h_t} \left( \frac{j^h_t}{l} \right) \mu - e_{h}^h [A + E_{h,h+mn}^\triangle + \text{diag}(\mu - e_{h}^h)]_1 \]

\[ = (a_{h,h+mn} + 1) \sum_{0 \leq l \leq j^h_t} \left( \frac{j^h_t}{l} \right) (A + E_{h,h+mn}^\triangle)[j - t e_{h}^h, r] \]
and
\[ \mathcal{X}_2 = \sum_{\mu \in \Lambda_2(n,r-\sigma(A))} \mu^1(\mu_h + 1)(A - E_{h,h-mn}) + \text{diag}(\mu + e_h^\Delta]_1 \]
\[ = \sum_{\mu \in \Lambda_2(n,r-\sigma(A))} \prod_{s \neq h} \mu_s^j(\mu_h + 1 - 1)^j(\mu_h + 1)(A - E_{h,h-mn}) + \text{diag}(\mu + e_h^\Delta]_1 \]
\[ = \sum_{\mu \in \Lambda_2(n,r-\sigma(A))} (-1)^{t}(\sum_{i \leq j}(\mu + e_h^\Delta(1-t)e_h^\Delta)](A - E_{h,h-mn})[j + (1-t)e_h^\Delta], \]
proving (3). This completes the proof of the theorem. □

6.3. Proof of Conjecture 5.4.1 at \( v = 1 \)

We now use Theorem 6.2.2 to prove Conjecture 5.4.2 in the classical case.

Recall from the proof of Theorem 6.2.2, the specialized Ringel–Hall algebra \( \mathfrak{S}_h(n)_Q \) is generated by \( u_{i,j} := u_{E_{i,j},1} \) for all \( i < j \in \mathbb{Z} \). As seen from Proposition 1.4.5, the Ringel–Hall algebra \( \mathfrak{S}_h(n)_Q \) over \( Q(v) \) can be generated by the elements associated with simple and homogeneous indecomposable representations of \( \Delta(n) \).

We first prove that this is also true for \( \mathfrak{S}_h(n)_Q \).

**Lemma 6.3.1.** The \( \mathfrak{S}_h(n)_Q \) is generated by the elements \( u_{i,i+1} \) and \( u_{i,i+mn} \) for \( i \in \mathbb{Z} \) and \( m \in \mathbb{N} \). In particular, the subalgebras \( \mathfrak{S}_h^\pm(n)_Q \) spanned by \( A[0, r] = A(0, r)_1 \) for all \( A \in \Theta^\pm(n) \) can be generated by \( E_{h,h+1}^\pm[0, r] \) and \( E_{h,h+mn}^\pm[0, r] \) for all \( 1 \leq h \leq n \) and \( m \geq 1 \), respectively.

**Proof.** Let \( \mathfrak{K} \) be the subalgebra of \( \mathfrak{S}_h(n)_Q \) generated by the elements \( u_{i,i+1} \) and \( u_{i,i+mn} \) for \( i \in \mathbb{Z} \) and \( m \in \mathbb{N} \). It is enough to prove \( u_{i,j} \in \mathfrak{K} \) for all \( i < j \). Write \( j - i = mn + k \), where \( m \in \mathbb{Z} \) and \( 1 \leq k \leq n \). Then it is clear that \( u_{i,j} \in \mathfrak{S}_h(n)_Q \) for \( k = n \). Now assume \( 1 \leq k < n \). We apply induction on \( k \). If \( k = 1 \), then by (6.1.2.1),
\[ u_{i,mn+1} = u_{i,i+1}u_{i+1,mn+1+i} - u_{i+1,mn+1}u_{i,i+1} \in \mathfrak{K}. \]
Now suppose \( u_{i,j} \in \mathfrak{K} \) for all \( i < j \) with \( j - i = mn + k - 1 \). Then by (6.1.2.1) and the induction hypothesis,
\[ u_{i,mn+k+i} = u_{i,i+1}u_{i+1,mn+k+i} - u_{i+1,mn+k+i}u_{i,i+1} \in \mathfrak{K}, \]
proving the first assertion.

The last assertion follows from Proposition 5.6.1. □

As in §5.4, let \( \tilde{\mathcal{K}}_h(n)_Q \) be the vector space of all formal (possibly infinite) \( Q \)-linear combinations \( \sum_{A \in \Theta_\Delta(n)} \beta_A[A]_1 \) satisfying (5.4.0.1). Recall from (5.4.2.2) that for \( A \in \Theta^\pm_\Delta(n) \) and \( j \in \mathbb{N}_\Delta \),
\[ A[j] = \sum_{r=0}^\infty A[j, r] \in \tilde{\mathcal{K}}_h(n)_Q. \]
Furthermore, let $\leq$ and $\preceq$ be the orders on $\mathbb{Z}_n^\Delta$ and $\Theta_\Delta(n)$ defined in (1.1.0.3) and (3.7.1.1), respectively.

**Proposition 6.3.2.** For $A \in \Theta_\Delta^\pm(n)$ and $j \in \mathbb{N}_n^\Delta$, we have

$$A^+[0]0[j]A^-[0] = A[j] + \sum_{\begin{subarray}{c} j' \in \mathbb{N}_n^\Delta \\ j' < j \end{subarray}} f_{A,j}^A A[j'] + \sum_{\begin{subarray}{c} B \in \Theta_\Delta^\pm(n) \\ B < A, j' \in \mathbb{N}_n^\Delta \end{subarray}} f_{A,j}^{B,j'} B[j'],$$

where $f_{A,j}^A, f_{A,j}^{B,j'} \in \mathbb{Q}$.

**Proof.** For each $r \geq 0$, by Lemma 6.3.1 we may write $A^+[0,r]$ as a linear combination of monomials in $E_{\Delta,h+1}^0[0,r]$ and $E_{\Delta,h+mn}^0[0,r]$. By Theorem 6.2.2, there exist $f_{A,j}^{B,j'} \in \mathbb{Q}$ (independent of $r$) such that

$$A^+[0,r]0[j,r]A^-[0,r] = \sum_{B \in \Theta_\Delta^\pm(n)} f_{A,j}^{B,j'} B[j',r] \hspace{1cm} (6.3.2.1)$$

for all $r \geq 0$. On the other hand, using an argument similar to the second display for the computation of $p_A$ in the proof of Theorem 3.7.7 yields

$$A^+[0,r]0[j,r]A^-[0,r] = \sum_{\begin{subarray}{c} \lambda \in \Delta_\Delta(n,r) \\ \lambda \not\preceq \sigma(A) \end{subarray}} \lambda^j A^+[0,r][\text{diag}(\lambda)]_1 A^-[0,r] = \sum_{\begin{subarray}{c} \lambda \in \Delta_\Delta(n,r) \\ \lambda \not\preceq \sigma(A) \end{subarray}} \lambda^j[A + \text{diag}(\lambda - \sigma(A))]_1 + g$$

where $\sigma(A) = \text{co}(A^+) + \text{ro}(A^-)$ and $g$ is a $\mathbb{Q}$-linear combination of $[B]_1$ with $B \in \Theta_\Delta(n,r)$ and $B \prec A$. Since

$$\lambda^j = (\lambda - \sigma(A) + \sigma(A))^j = (\lambda - \sigma(A))^j + \sum_{\begin{subarray}{c} j' < j \\ j' \in \mathbb{N}_n^\Delta \end{subarray}} f_{A,j}^{B,j'} (\lambda - \sigma(A))^j'$$

where $f_{A,j}^{B,j'} \in \mathbb{Z}$ are independent of $\lambda$ and $r$, it follows that

$$A^+[0,r]0[j,r]A^-[0,r] = A[j,r] + \sum_{\begin{subarray}{c} j' < j \\ j' \in \mathbb{N}_n^\Delta \end{subarray}} f_{A,j}^{B,j'} A[j',r] + g.$$

Combining this with (6.3.2.1) proves the assertion. 

For integers $a \geq -1$ and $l \geq 1$, let $\mathbb{Z}_{a,l} = \{a + i \mid i = 1, 2, \ldots, l\}$ and

$$(\mathbb{Z}_{a,l})^n = \{\lambda \in \mathbb{N}^n \mid \lambda_i \in \mathbb{Z}_{a,l} \forall i\}.$$

**Lemma 6.3.3.** For fixed integers $a \geq -1$ and $n, l \geq 1$, if we order $(\mathbb{Z}_{a,l})^n$ lexicographically and form an $l^n \times l^n$ matrix $B_n = (\lambda^\mu)_{\lambda, \mu \in (\mathbb{Z}_{a,l})^n}$, where $\lambda^\mu = \lambda_1^{\mu_1} \lambda_2^{\mu_2} \cdots \lambda_n^{\mu_n}$, then det($B_n$) $\neq 0$. 

6.3. PROOF OF CONJECTURE 5.4.1 AT $v = 1$

Theorem 6.3.4. The $\mathbb{Q}$-space $\mathfrak{A}_{\alpha, \mathbb{Q}}[n]$ is a subalgebra of $\hat{\mathfrak{K}}_{\alpha}(n)_{\mathbb{Q}}$ with $\mathbb{Q}$-basis

$$\mathfrak{B} = \{ A[j] \mid A \in \Theta_{\alpha}^{\pm}(n), j \in \mathbb{N}_0^n \}. $$

Moreover, the map $\eta : \prod_{r \geq 0} \eta_r$ defined in (6.1.5.1) is injective and induces a $\mathbb{Q}$-algebra isomorphism $\mathcal{U}(\hat{\mathfrak{g}}_\alpha) \cong \mathfrak{A}_{\alpha, \mathbb{Q}}[n]$. 

Proof. We first prove the linear independence of $\mathfrak{B}$. Suppose

$$\sum_{A \in \Theta_{\alpha}^{\pm}(n), j \in \mathbb{N}_0^n} f_{A, j} A[j] = 0$$

### Proof

Write $(\mathbb{Z}_{a,l})^n = \{ a_1, a_2, \ldots, a_l^n \}$ with $a_i <_{lx} a_{i+1}$ for all $i$ under the lexicographical order $<_{lx}$. If the $(i, j)$ entry of $B_n$ is $a_{i,j}$, then $B_n$ has the form

$$B_n = \begin{pmatrix}
(a + 1)^{(a+1)} B_{n-1} & (a + 1)^{(a+2)} B_{n-1} & \cdots & (a + 1)^{(a+l)} B_{n-1} \\
(a + 2)^{(a+1)} B_{n-1} & (a + 2)^{(a+2)} B_{n-1} & \cdots & (a + 2)^{(a+l)} B_{n-1} \\
\vdots & \vdots & \ddots & \vdots \\
(a + l)^{(a+1)} B_{n-1} & (a + l)^{(a+2)} B_{n-1} & \cdots & (a + l)^{(a+l)} B_{n-1}
\end{pmatrix}.$$ 

Thus,

$$\det(B_n) = \prod_{i=1}^l (a + i)^{(a+1)^{i-1}} \det \begin{pmatrix}
B_{n-1} & 0 & \cdots & 0 \\
B_{n-1} & (2-1)B_{n-1} & \cdots & ((a+2)^{l-1}-(a+2)^{l-2}(a+1)) B_{n-1} \\
B_{n-1} & (l-1)B_{n-1} & \cdots & ((a+l)^{l-1}-(a+l)^{l-2}(a+1)) B_{n-1}
\end{pmatrix}.$$ 

Hence,

$$\det(B_n) = \det(B_{n-1})^l \prod_{i=1}^l (a + i)^{(a+1)^{i-1}} \prod_{1 \leq j < i \leq l} (i-j)^{i-1} \neq 0,$$

by induction. 

Note that, in the proof above, if $a = -1$, then

$$\mathbb{Z}_l := \mathbb{Z}_{-1,l} = \{ 0, 1, \ldots, l \}$$

and so the product $\prod_{i=1}^l (a + i)^{(a+1)^{i-1}} = 1$.

As introduced at the end of §5.4, let $\mathfrak{A}_{\alpha, \mathbb{Q}}[n]$ be the subspace of $\hat{\mathfrak{K}}_{\alpha}(n)_{\mathbb{Q}}$ spanned by the elements $A[j]$ for all $A \in \Theta_{\alpha}^{\pm}(n)$ and $j \in \mathbb{N}_0^n$. The following theorem gives a realization of the universal enveloping algebra $\mathcal{U}(\mathfrak{g}_\alpha)$. Let $(\mathbb{Z}_l)^n = b_2^{-1}((\mathbb{Z}_l)^n)$, where $b_2$ is defined in (1.1.0.2).
for some $f_{A,j} \in \mathbb{Q}$. Then

$$0 = \sum_{A \in \Theta^\pm_\delta(n)} f_{A,j} A[j] = \sum_{r \geq 0} \sum_{\lambda \in \Lambda_\delta(n, r - \sigma(A))} \left( \sum_{J \in \mathbb{N}^n} \lambda^j f_{A,j} \right) [A + \text{diag}(\lambda)].$$

Thus, $\sum_{J \in \mathbb{N}^n} \lambda^j f_{A,j} = 0$ for all $A \in \Theta^\pm_\delta(n)$, $\lambda \in \Lambda_\delta(n, r - \sigma(A))$ and $r \geq \sigma(A)$. So, when $A$ is arbitrarily fixed, there is a finite subset $J$ of $\mathbb{N}^n$ satisfying $f_{A,j} \neq 0$ for all $j \in J$. Choose $l \geq 1$ such that $J$ is a subset of $(\mathbb{Z}d)^n_0$ and set $f_{A,j} = 0$ if $j \notin (\mathbb{Z}d)^n_0 \setminus J$. Since $\cup_{r \geq \sigma(A)} \Lambda_\delta(n, r - \sigma(A)) = \mathbb{N}^n$ which contains $(\mathbb{Z}d)^n_0$, it follows that $\sum_{J \in (\mathbb{Z}d)^n_0} \lambda^j f_{A,j} = 0$ for all $\lambda \in (\mathbb{Z}d)^n_0$. Applying Lemma 6.3.3 gives $f_{A,j} = 0$ for all $j$. Hence, $\mathfrak{B}$ forms a basis for $\mathfrak{A}_{n,\mathbb{Q}}[n]$.

Since $\mathcal{U}(\widehat{\mathfrak{g}}_n) \cong \mathcal{U}(\widehat{\mathfrak{g}}_n)^+ \cup \mathcal{U}(\widehat{\mathfrak{g}}_n)^- \mathcal{U}(\widehat{\mathfrak{g}}_n)^-$, by identifying $\mathcal{U}(\widehat{\mathfrak{g}}_n)^\pm$ with $\mathfrak{A}_\delta(n)^\pm_\mathbb{Q}$, the set

$$\{ u^+_{A,j}(E_{1,1})^{j_1} \cdots (E_{n,n})^{j_n} u^-_{B,j} \mid A, B \in \Theta^\pm_\delta(n), j \in \mathbb{N}^n \}$$

forms a basis of $\mathcal{U}(\widehat{\mathfrak{g}}_n)$. Now Lemma 6.1.3 and Theorem 6.1.4 imply

$$\eta(u^+_{A,j}(E_{1,1})^{j_1} \cdots (E_{n,n})^{j_n} u^-_{A,-1}) = A^+[0]0[j]A^-[0].$$

By Proposition 6.3.2 the set

$$\{ A^+[0]0[j]A^-[0] \mid A \in \Theta^\pm_\delta(n), j \in \mathbb{N}^n \}$$

forms another basis for $\mathfrak{A}_{n,\mathbb{Q}}[n]$. Hence, $\eta$ is injective and $\mathfrak{A}_{n,\mathbb{Q}}[n]$ is exactly the image of $\eta$. This completes the proof of the theorem. □

This theorem together with Theorem 6.2.2 implies immediately the following multiplication formulas in $\mathcal{U}(\widehat{\mathfrak{g}}_n)$.

**Corollary 6.3.5.** The universal enveloping algebra $\mathcal{U}(\widehat{\mathfrak{g}}_n)$ of the loop algebra $\widehat{\mathfrak{g}}_n(\mathbb{Q})$ has a basis $\{ A[j] \mid A \in \Theta^\pm_\delta(n), j \in \mathbb{N}^n \}$ which satisfies the following multiplication formulas: for $1 \leq h, t \leq n$, $j \in \mathbb{N}^n$, and $A = (a_{i,j}) \in \Theta^\pm_\delta(n)$,

1. $0[e^\lambda_i]A[j] = A[j + e^\lambda_i] + \left( \sum_{s \in \mathbb{Z}} a_{t,s} \right) A[j]$;
2. for $\varepsilon \in \{1, -1\}$,

$$E_{h,h+\varepsilon}^\lambda[0]A[j] = \sum_{s \geq 1 \atop s \not\equiv h+\varepsilon} (a_{h,i} + 1)(A + E_{h,i}^\lambda - E_{h+\varepsilon,i}^\lambda)[j]$$

$$+ \sum_{0 \leq i \leq j_h} (-1)^{i+1} (\begin{pmatrix} j_h - i \\ i \end{pmatrix}) (A - E_{h+\varepsilon,h})[j + (1 - i)e_i^\lambda],$$

$$+ \sum_{0 \leq i \leq j_{h+\varepsilon}} \left( \begin{pmatrix} j_{h+\varepsilon} - i \\ i \end{pmatrix} \right) (A + E_{h,h+\varepsilon})[j - ie_{h+\varepsilon}^\lambda].$$
(3) for \( m \in \mathbb{Z} \setminus \{0\} \),
\[
E_{h,h+mn}^\Delta[0] A[j] = \sum_{s \in g(h,h-\Delta mn)} (a_{h,s+mn} + 1)(A + E_{h,s+mn}^\Delta - E_{h,s}^\Delta)[0]
\]
\[+ \sum_{0 \leq t \leq j_h} (a_{h,h+mn} + 1) \left( \frac{j_h}{t} \right) (A + E_{h,h+mn}^\Delta)[j - te_h^\Delta]
\]
\[+ \sum_{0 \leq t \leq j_h} (-1)^t \left( \frac{j_h}{t} \right) (A - E_{h,h-\Delta mn}^\Delta)[j + (1-t)e_h^\Delta].
\]

**Remark 6.3.6.** There should be applications of these multiplication formulas. For example, one may define the \( \mathbb{Z} \)-subalgebra \( U(\mathfrak{g}_\mathbb{Z}) \) generated by the divided powers of \( E_{h,h+\varepsilon}[0] \) together with \( E_{h,h+mn}^\Delta[0] \) for all \( 1 \leq h \leq n, \varepsilon \in \{1, -1\} \) and \( m \in \mathbb{Z} \setminus \{0\} \). This should serve as the Kostant \( \mathbb{Z} \)-form of \( U(\mathfrak{g}_\mathbb{Z}) \).

### 6.4. Appendix: Proof of Proposition 6.2.3

For a finite subset \( X \subseteq \mathfrak{S}_{\lambda} \), define \( X = \sum_{x \in X} x \in \mathcal{Q}\mathfrak{S}_{\lambda} \). If \( A = j_\delta(\lambda, d, \mu) \) is the matrix corresponding to the double coset \( \mathfrak{S}_\lambda d \mathfrak{S}_\mu \) for \( \lambda, \mu \in \Lambda_\delta(n, r) \), \( d \in \mathcal{P}_{\lambda, \mu} \), then the element \([A]_1 \in \mathfrak{S}_\delta(n, r)_\mathcal{Q}\) is the map \( \phi_{\lambda, \mu}^\varepsilon \) (at \( v = 1 \)) as defined in (3.2.6.1). Note also that, if \( v = 1 \), then \( \lambda = \mathfrak{S}_\lambda \). Thus, \([A]_1(\mathfrak{S}_\nu) = 0 \) for \( \nu \neq \mu \) and \([A]_1(\mathfrak{S}_\mu) = \mathfrak{S}_\lambda d \mathfrak{S}_\mu = \mathfrak{S}_\lambda d P_{\nu, \lambda} \cap \mathfrak{S}_\mu \) by Lemma 3.2.3 where \( \nu \) is the composition defined by \( \mathfrak{S}_\mu = d^{-1} \mathfrak{S}_\lambda d \cap \mathfrak{S}_\mu \) (see Corollary 3.2.3 for a precise description of \( \nu \)). Lemma 3.2.3 implies also that for \( \lambda, \mu \in \Lambda_\delta(n, r) \) and \( w \in \mathfrak{S}_{\lambda, \mu} \),
\[
\mathfrak{S}_\lambda w \mathfrak{S}_\mu = |w^{-1} \mathfrak{S}_\lambda w \cap \mathfrak{S}_\mu| \mathfrak{S}_\lambda w \mathfrak{S}_\mu. \tag{6.4.0.1}
\]

This fact will be used frequently in the proofs below.

**Proposition 6.2.3(1).** Let \( h \in [1, n] \) and \( A = (a_{i,j}) = j_\delta(\lambda, d, \mu) \) in \( \Theta_\delta(n, r) \) with \( \text{ro}(A) = \lambda \). If \( \varepsilon \in \{1, -1\} \) and \( \lambda \geq e_{h,\varepsilon}^\varepsilon \), then
\[
[E_{h,h+\varepsilon}^\varepsilon + \text{diag}(\lambda - e_{h,\varepsilon}^\varepsilon)]_1[a]_1 = \sum_{i \in \mathbb{Z}, a_{h,i} \geq 1} (a_{h,i} + 1)[A + E_{h,i}^\varepsilon - E_{h,i}^\varepsilon]_1.
\]

**Proof.** Observe \( \text{ro}(E_{h,h+\varepsilon}^\varepsilon) = e_{h,\varepsilon}^\varepsilon \) and \( \text{co}(E_{h,h+\varepsilon}^\varepsilon) = e_{h,\varepsilon}^\varepsilon \). Thus, applying (3.2.2.2) yields
\[
j_\delta(\lambda + \alpha_{h,\varepsilon}^\varepsilon, 1, \lambda) = E_{h,h+\varepsilon}^\varepsilon + \text{diag}(\lambda - e_{h,\varepsilon}^\varepsilon),
\]
where \( \alpha_{h,\varepsilon}^\varepsilon = e_{h,\varepsilon}^\varepsilon - e_{h,\varepsilon}^\varepsilon \). In other words, the matrix \( E_{h,h+\varepsilon}^\varepsilon + \text{diag}(\lambda - e_{h,\varepsilon}^\varepsilon) \) is defined by the double coset \( \mathfrak{S}_\lambda - \alpha_{h,\varepsilon}^\varepsilon \mathfrak{S}_\lambda \). Hence, putting \( L = [1, n] \times \mathbb{Z} \), we have by Corollary 3.2.3 that
\[
[E_{h,h+\varepsilon}^\varepsilon + \text{diag}(\lambda - e_{h,\varepsilon}^\varepsilon)]_1[a]_1(\mathfrak{S}_\mu) = [E_{h,h+\varepsilon}^\varepsilon + \text{diag}(\lambda - e_{h,\varepsilon}^\varepsilon)]_1(\mathfrak{S}_\lambda d \mathfrak{S}_\mu)
\]
\[
= \prod_{s,t \in L} \frac{1}{a_{s,t}!} (\mathfrak{S}_{\lambda + \alpha_{h,\varepsilon}^\varepsilon} \mathfrak{S}_\lambda d \mathfrak{S}_\mu)
\]
\[
= \prod_{s,t \in L} \frac{1}{a_{s,t}!} (\mathfrak{S}_{\lambda + \alpha_{h,\varepsilon}^\varepsilon} \mathfrak{P}_\varepsilon \cap \mathfrak{S}_\lambda d \mathfrak{S}_\mu),
\]
where
\[
\gamma = \gamma(\varepsilon) = \begin{cases} 
(\lambda_1, \ldots, \lambda_h, 1, \lambda_{h+1} - 1, \lambda_{h+2}, \ldots, \lambda_n), & \text{if } \varepsilon = 1; \\
(\lambda_1, \ldots, \lambda_{h-1} - 1, 1, \lambda_h, \lambda_{h+1}, \ldots, \lambda_n), & \text{if } \varepsilon = -1,
\end{cases}
\]

For \( i \in R^\lambda_{h+\varepsilon} \), define \( w_{\varepsilon,i} \in \mathcal{G}_\lambda \) by setting
\[
w_{\varepsilon,i} = \begin{pmatrix}
1 \cdots \lambda_{0,h} & \lambda_{0,h} + 1 & \cdots & i - 1 & i & i + 1 & \cdots & \lambda_{0,h+1} & \cdots \r
1 \cdots \lambda_{0,h} & \lambda_{0,h} + 2 & \cdots & i & \lambda_{0,h} + 1 & i + 1 & \cdots & \lambda_{0,h+1} & \cdots \r
\end{pmatrix},
\]
if \( \varepsilon = 1 \), and
\[
w_{\varepsilon,i} = \begin{pmatrix}
1 \cdots \lambda_{0,h-2} & \cdots & i - 1 & i & i + 1 & \cdots & \lambda_{0,h-1} & \lambda_{0,h-1} + 1 & \cdots \r
1 \cdots \lambda_{0,h-2} & \cdots & i - 1 & \lambda_{0,h-2} & \lambda_{0,h-2} + 1 & \cdots & \lambda_{0,h-1} & \lambda_{0,h-1} + 1 & \cdots \r
\end{pmatrix}
\]
if \( \varepsilon = -1 \). Then \( \mathcal{D}_\gamma \cap \mathcal{G}_\lambda = \{ w_{\varepsilon,i} \mid i \in R^\lambda_{h+\varepsilon} \} \). Hence,
\[
[E^\lambda_{h,h+\varepsilon} + \text{diag}(\lambda - \mathbf{e}_{h+\varepsilon})][A]_1(\mathcal{G}_\mu) = \prod_{s,t \in \mathcal{L}} \frac{1}{a_{s,t}!} \sum_{i \in R^\lambda_{h+\varepsilon}} \mathcal{G}_{\lambda + \alpha^\circ_{h,\varepsilon}} w_{\varepsilon,i} d\mathcal{G}_\mu.
\]

Let \( B^{(\varepsilon,i)} = (t^{(\varepsilon,i)}_{s,t}) \in \Theta_\lambda(n, r) \) be the matrix associated with \( \lambda + \alpha^\circ_{h,\varepsilon}, \mu \) and the double coset \( \mathcal{G}_{\lambda + \alpha^\circ_{h,\varepsilon}} w_{\varepsilon,i} d\mathcal{G}_\mu \). Since
\[
w^{-1}_{\varepsilon,i}(R^\lambda_{s,h+\varepsilon}) = \begin{cases}
R^\lambda_s, & \text{if } 1 \leq s \leq n \text{ but } s \neq h, h + \varepsilon; \\
R^\lambda_h \cup \{ i \}, & \text{if } s = h; \\
R^\lambda_{h+\varepsilon} \setminus \{ i \}, & \text{if } s = h + \varepsilon,
\end{cases}
\]
it follows that for \( i \in R^\lambda_{h+\varepsilon} \),
\[
b^{(\varepsilon,i)}_{s,t} = |d^{-1} w^{-1}_{\varepsilon,i} R^\lambda_{s,h+\varepsilon} \cap R^\mu_t| = \begin{cases}
a_{s,t}, & \text{if } 1 \leq s \leq n \text{ but } s \neq h, h + \varepsilon; \\
a_{h,t} + |\{ d^{-1}(i) \} \cap R^\mu_t|, & \text{if } s = h; \\
a_{h+\varepsilon,t} - |\{ d^{-1}(i) \} \cap R^\mu_t|, & \text{if } s = h + \varepsilon.
\end{cases}
\]

If \( t_i \in \mathbb{Z} \) is the unique integer such that \( d^{-1}(i) \in R^\mu_{t_i} \) (and \( a_{h+\varepsilon,t_i} \geq 1 \)), then
\[
b^{(\varepsilon,i)}_{s,t} = \begin{cases}
a_{s,t}, & \text{if } 1 \leq s \leq n, s \neq h, h + \varepsilon \text{ or } t \neq t_i; \\
a_{h,t} + 1, & \text{if } s = h, t = t_i; \\
a_{h+\varepsilon,t} - 1, & \text{if } s = h + \varepsilon, t = t_i.
\end{cases}
\]
This implies that \( B^{(\varepsilon, i)} = A + E_{h,t}^{\lambda} - E_{h+\varepsilon,t}^{\lambda} \) for all \( i \in R_{h+\varepsilon}^\lambda \). By Corollary 3.2.3, again,

\[
[E_{h,h+\varepsilon}^{\lambda} + \text{diag}(\lambda - e_{h+\varepsilon}^\lambda)]_1[A]_1(\Sigma) = \prod_{s,t \in \mathcal{L}} \frac{1}{a_{s,t}} \sum_{t \in R_{h+\varepsilon}^\lambda} b_{s,t}^{(\varepsilon,i)}[\Lambda + \alpha_\varepsilon^\lambda w_{\varepsilon,i} d \Sigma]_1
\]

\[
= \sum_{t \in R_{h+\varepsilon}^\lambda} a_{h,t} + 1 [B^{(\varepsilon,i)}]_1(\Sigma).
\]

Finally,

\[
[E_{h,h+\varepsilon}^{\lambda} + \text{diag}(\lambda - e_{h+\varepsilon}^\lambda)]_1[A]_1
= \sum_{t \in \mathbb{Z}, a_{h+\varepsilon,t} \geq 1} \{ i \in \mathbb{Z} \mid i \in R_{h+\varepsilon}^\lambda, t = t_i \} \frac{a_{h,t} + 1}{a_{h+\varepsilon,t}} [A + E_{h,t}^\lambda - E_{h+\varepsilon,t}^\lambda]_1,
\]

as \( \{|i \in \mathbb{Z} \mid i \in R_{h+\varepsilon}^\lambda, t = t_i \| = |d^{-1}R_{h+\varepsilon}^\lambda \cap R_i^\mu| = a_{h+\varepsilon,t}. \)

We need some preparation before proving Proposition 6.2.3(2). We follow the notation used in §3.2. Thus, for \( 1 \leq i \leq r \), \( e_i = (0, \ldots, 0, 1, 0, \ldots, 0) \in \Sigma_{\Delta r} \) is the permutation sending \( i \) to \( i + r \) and \( j \) to \( j \) for all \( 1 \leq j \leq r \) with \( j \neq i \), and \( e_i = \rho s_{r+1} \cdots s_{i+1} s_i \) as seen in the proof of Proposition 3.2.1. Note that \( s_{j+1} \rho = \rho s_j \) for all \( j \in \mathbb{Z} \).

Recall also from (3.2.1.4) the sets \( R_{i+kr}^\lambda = \{ \lambda_{k,i-1} + 1, \lambda_{k,i-1} + 2, \ldots, \lambda_{k,i-1} + \lambda_i \} \) associated with \( \lambda \in \Lambda_\alpha(n, r) \), where \( \lambda_{k,i-1} := kr + \sum_{j=1}^{i-1} \lambda_j \). If \( i \in R_h^\lambda \) for some (unique) \( 1 \leq h \leq n \), then removing those simple reflections \( s_j \) from \( e_i \) indexed by the numbers \( i, i + 1, \ldots, \lambda_{0,h} - 1 \) and \( r + \lambda_{0,h-1}, r + \lambda_{0,h-1} + 1, \ldots, r + i - 2 \) yields the shortest representative \( \rho s_{r+\lambda_{0,h}^\lambda - 1} \cdots s_{\lambda_{0,h}^\lambda + 1} s_{\lambda_{0,h}^\lambda} \) of the double coset \( \Sigma_{\lambda} e_i \Sigma_{\lambda} \).

We now determine the shortest representative in the double coset \( \Sigma_{\lambda} e_i^m \Sigma_{\lambda} \) for every \( 0 \neq m \in \mathbb{Z} \), \( 1 \leq i \leq r \) and \( \lambda \in \Lambda_\alpha(n, r) \). Suppose \( i \in R_h^\lambda \) as above and define \( u_{m,i}^\lambda \in \Sigma_{\Delta r} \) by

\[
u_{m,i}^\lambda = \begin{cases} 
\rho s_{r+\lambda_{0,h}^\lambda - 1} \cdots s_{\lambda_{0,h}^\lambda + 1} s_{\lambda_{0,h}^\lambda}; & \text{if } m = 1; \\
\rho s_{r+\lambda_{0,h}^\lambda - 1} \cdots s_{i+1} s_{i}^{m-2} \rho s_{r+1} \cdots s_{\lambda_{0,h}^\lambda + 1} s_{\lambda_{0,h}^\lambda}; & \text{if } m \geq 2; \\
(u_{m,i}^\lambda)^{-1}; & \text{if } m < 0.
\end{cases}
\]

Lemma 6.4.1. Maintain the notation introduced above.

1. \( u_{m,i}^\lambda \) is the shortest element in \( \Sigma_{\lambda} e_i^m \Sigma_{\lambda} \);
2. \( \rho_{\lambda}(\lambda, u_{m,i}^\lambda, \lambda) = E_{h,h-mn}^{\lambda} + \text{diag}(\lambda - e_i^\lambda) \).
(3) \((u^\lambda_{m,i})^{-1}\Gamma_\lambda u^\lambda_{m,i} \cap \Gamma_\lambda = \Gamma_\gamma\), where

\[
\gamma = \begin{cases} 
(\lambda_1, \ldots, \lambda_{h-1}, \lambda_h - 1, \lambda_{h+1}, \ldots, \lambda_n), & \text{if } m > 0; \\
(\lambda_1, \ldots, \lambda_{h-1}, 1, \lambda_h - 1, \lambda_{h+1}, \ldots, \lambda_n), & \text{if } m < 0.
\end{cases}
\]

**Proof.** Since \(e_i^m = s_{r+i-1} \cdots s_{\lambda_0, h-1} + 2s_r + \lambda_0, h-1 + 1u^\lambda_{m,i} S\lambda_{0, h-1} \cdots s_{i+1}s_i\), \(\Gamma_\lambda e_i^m \cap \Gamma_\lambda = \Gamma_\lambda u^\lambda_{m,i} \cap \Gamma_\lambda\). If \(m > 0\), then \(u^\lambda_{m,i} \in \Gamma_{\Delta r}\) is determined by its action on \(\{1, 2, \ldots, r\}\):

\[
u^\lambda_{m,i} = \begin{pmatrix} 
\lambda_0, h-1 & 1 & \lambda_0, h-1 & 1 & \lambda_0, h & \lambda_0, h + 1 & \cdots & r \\
\lambda_0, h-1 & 1 & \lambda_0, h-1 & 1 & \lambda_0, h & \lambda_0, h + 1 & \cdots & r
\end{pmatrix}
\]

Hence,

\[
u^\lambda_{m,i} = (u^\lambda_{m,i})^{-1} = \begin{pmatrix} 
\lambda_0, h-1 & 1 & \lambda_0, h-1 & 1 & \lambda_0, h & \lambda_0, h + 1 & \cdots & r \\
\lambda_0, h-1 & 1 & \lambda_0, h-1 & 1 & \lambda_0, h & \lambda_0, h + 1 & \cdots & r
\end{pmatrix}
\]

Thus, \(u^\lambda_{m,i}(i) < u^\lambda_{m,i}(i+1)\) for any \(i\) with \(s_i \in \Gamma_\lambda\) and \(m \in \mathbb{Z}\{0\}\). Hence, by \((3.2.1.5)\), \(u^\lambda_{m,i} \in \mathcal{P}_\lambda\), proving \((1)\). The assertion \((2)\) follows from Lemma \((3.2.2)\). The assertion \((3)\) is a consequence of \((2)\) and Corollary \((3.2.3)\). \(\square\)

**Proposition 6.2.3\((2)\).** Let \(h \in [1, n]\) and \(A = (a_{i,j}) \in \Theta_\alpha(n, r)\) with \(\rho(A) = \lambda\).

If \(m \in \mathbb{Z}\{0\}\) and \(\lambda \geq e^\lambda_h\), then

\[
[A^\delta_{h+h+mn} + \text{diag}(\lambda - e^\delta_h)]_1 = \sum_{s \in \mathbb{Z}, a_{h,s} \geq 1} (a_{h,s+mn} + 1)[A + E^\delta_{h,s+mn} - E^\delta_{h,s}]_1.
\]

**Proof.** As above, let

\[
\lambda_0, h = \lambda_1 + \cdots + \lambda_h \quad (\text{and } \lambda_{0,0} = 0).
\]

Assume \(\mu = \text{co}(A)\) and \(d \in \mathcal{P}_\lambda\) such that \(\rho^\lambda(\lambda, d) = A\). By Lemma \(6.4.1\) and Corollary \((3.2.3)\) and \((6.4.0.1)\),

\[
[A^\delta_{h+h+mn} + \text{diag}(\lambda - e^\delta_h)]_1(\Gamma_\mu) = \Gamma_\lambda(u^\lambda_{m,i})^{-1}\Gamma_\lambda \cdot d \cdot \mathcal{P}\alpha \cap \Gamma_\mu
\]

where \(\mathcal{G}_\alpha = d^{-1}\Gamma_\lambda d \cap \Gamma_\mu\) and \(\mathcal{G}_\delta = u^\lambda_{m,i}\Gamma_\lambda(u^\lambda_{m,i})^{-1} \cap \Gamma_\lambda\) with

\[
\delta = \begin{cases} 
(\lambda_1, \ldots, \lambda_{h-1}, 1, \lambda_h - 1, \lambda_{h+1}, \ldots, \lambda_n), & \text{if } m > 0, \\
(\lambda_1, \ldots, \lambda_{h-1}, 1, \lambda_h - 1, \lambda_{h+1}, \ldots, \lambda_n), & \text{if } m < 0.
\end{cases}
\]
We now compute \( \mathcal{D}_\delta \cap \mathcal{G}_\lambda \). For \( m \neq 0 \) and \( \lambda_{0,h-1} + 1 \leq i \leq \lambda_{0,h} \) define \( w_{m,i} \in \mathcal{G}_\lambda \) as follows. If \( m > 0 \), then

\[
w_{m,i} := \begin{pmatrix} 1 \cdots \lambda_{0,h-1} & \lambda_{0,h-1} + 1 & \cdots & i - 1 & i & i + 1 & \cdots & \lambda_{0,h} & \cdots & r \end{pmatrix}
\]

If \( m < 0 \), then

\[
w_{m,i} := \begin{pmatrix} 1 \cdots \lambda_{0,h-1} & i - 1 & i & i + 1 & \cdots & \lambda_{0,h} & \lambda_{0,h} + 1 & \cdots & r \end{pmatrix}
\]

From the definition, it is clear that \( w_{m,\lambda_{0,h-1} + 1} = 1 \) for \( m > 0 \) and \( w_{m,\lambda_{0,h}} = 1 \) for \( m < 0 \). It is also clear that

\[
\mathcal{D}_\delta \cap \mathcal{G}_\lambda = \{ w_{m,i} | \lambda_{0,h-1} + 1 \leq i \leq \lambda_{0,h} \} \text{ for all } m \in \mathbb{Z} \setminus \{0\}.
\]

Hence, \( [E^\lambda_{h,h+mn} + \text{diag}(\lambda - e_h^\lambda)]_1[A]_1(\mathcal{G}_\mu) = \prod_{1 \leq s \leq n} \frac{1}{a_{s,t}} \sum_{i \in R^h_\delta} \Theta_{\lambda} u^\lambda_{m,i}^{-1} w_{m,i} d \mathcal{G}_\mu. \)

Let \( B^{(m,i)} = (b^{(m,i)}_{s,t}) \in \Theta_{\delta}(n,r) \) be the matrix associated with \( \lambda, \mu \) and the double coset \( \mathcal{G}_\lambda(u^\lambda_{m,i})^{-1}w_{m,i}d\mathcal{G}_\mu \), where \( m \in \mathbb{Z} \setminus \{0\} \) and \( i \in R^h_\lambda \). Since

\[
w_{m,i}^{-1} w_{\lambda,i} (R^h_\lambda) = \begin{cases} R^\lambda_s, & \text{if } 1 \leq s \leq n \text{ but } s \neq h; \\
(R^h_\lambda \setminus \{i\}) \cup \{mr+i\}, & \text{if } s = h,
\end{cases}
\]

it follows that for \( i \in R^h_\lambda \)

\[
b^{(m,i)}_{s,t} = |d^{-1}w_{m,i}^{-1}u^\lambda_{m,i} R^h_\delta \cap R^\mu_t|
\]

\[
= \begin{cases} a_{s,t}, & \text{if } 1 \leq s \leq n \text{ but } s \neq h; \\
(a_{s,t} - |\{d^{-1}(i) \cap R^\mu_t\}| + |d^{-1}(mr+i) \cap R^\mu_t|, & \text{if } s = h.
\end{cases}
\]

If \( t_i \in \mathbb{Z} \) is the unique integer such that \( d^{-1}(i) \in R^\mu_{t_i} \) (and \( a_{h,t_i} \geq 1 \)), then

\[
b^{(m,i)}_{h,t_i} = \begin{cases} a_{h,t_i}, & \text{if } t \notin \{t_i, mn + t_i\}; \\
a_{h,t_i} - 1, & \text{if } t = t_i; \\
a_{h,t_i} + 1, & \text{if } t = mn + t_i.
\end{cases}
\]

This implies that \( B^{(m,i)} = A + E^\lambda_{h, mn+t_i} - E^\lambda_{h, t_i} \) for all \( i \in R^\lambda_h \). Thus, applying Corollary 3.2.3 again yields

\[
[E^\lambda_{h, h+mn} + \text{diag}(\lambda - e_h^\lambda)]_1[A]_1(\mathcal{G}_\mu)
\]

\[
= \prod_{1 \leq s \leq n} \frac{1}{a_{s,t}} \sum_{i \in R^h_\delta} \prod_{1 \leq s \leq n} b^{(m,i)}_{s,t} \Theta_{\lambda} u^\lambda_{m,i}^{-1} w_{m,i} d \mathcal{G}_\mu
\]

\[
= \sum_{i \in R^h_\delta} \prod_{1 \leq s \leq n} b^{(m,i)}_{s,t} \frac{1}{a_{s,t}!} [B^{(m,i)}]_1(\mathcal{G}_\mu)
\]

\[
= \sum_{i \in R^h_\delta, a_{h,t_i} \geq 1} \frac{a_{h, mn+t_i} + 1}{a_{h,t_i}} [B^{(m,i)}]_1(\mathcal{G}_\mu).
\]

\(^1\text{This condition is equivalent to } i \in R^\lambda_h.\)
Therefore,
\[
\left[ E_{h,h+mn}^\triangle + \text{diag}(\lambda - e_h^\triangle) \right]_1 [A]_1
\]
\[
= \sum_{t \in \mathbb{Z}} \left| \{ i \in \mathbb{Z} \mid i \in R_h^\lambda, t = t_i \} \right| \frac{a_{h, mn+t} + 1}{a_{h, t}} [A + E_{h, mn+t}^\triangle - E_{h, t}^\triangle]_1
\]
\[
= \sum_{t \in \mathbb{Z}} (a_{h, t+mn} + 1) [A + E_{h, t+mn}^\triangle - E_{h, t}^\triangle]_1
\]
since \( a_{h, t} = d^{-1} R_h^\lambda \cap R_t^\mu = \left| \{ i \in \mathbb{Z} \mid i \in R_h^\lambda, t = t_i \} \right| \) by Lemma 3.2.2.

Proposition 6.2.3(2) is the key to the establishment of the multiplication formulas in Theorem 6.2.2, which in turn play a decisive role in the proof of the conjecture in the classical case (see Proposition 6.3.2). It would be natural to raise the following question which is the key to Problem 3.4.3.

**Problem 6.4.2.** Find the quantum version of the multiplication formulas given in Proposition 6.2.3(2) for affine quantum Schur algebras.
