Abstract

We consider Einstein Born-Infeld theory with a null fluid in Kerr-Schild Geometry. We find accelerated charge solutions of this theory. Our solutions reduce to the Plebański solution when the acceleration vanishes and to the Bonnor-Vaidya solution as the Born-Infeld parameter $b$ goes to infinity. We also give the explicit form of the energy flux formula due to the acceleration of the charged sources.

Introduction

Accelerated charge metrics in Einstein-Maxwell theory have been studied in two equivalent ways. One way is using the Robinson-Trautman metrics [1]-[4] and the other way is the Bonnor-Vaidya approach [5] using the Kerr-Schild ansatz [6], [7]. In both cases one can generalize the metrics of non-rotating charged static spherically symmetric bodies by introducing acceleration. Radiation of energy due to the acceleration is a known fact both in classical electromagnetism [8], [9] and in Einstein-Maxwell theory [5].

Recently we have given accelerated solutions of the $D$ dimensional Einstein-Maxwell field equations with a null fluid [10]. The energy flux due to acceleration in these solutions are all finite and have the same sign for all $D \geq 4$. It is highly interesting to study the same problem in nonlinear electrodynamics.

The nonlinear electrodynamics of Born-Infeld [11] shares with Maxwell theory two separate important properties. The first is that its excitations propagate without the shocks common to generic nonlinear models [12], the second is electromagnetic duality invariance [13] (see also the references therein). For this reason we consider the Einstein Born-Infeld theory in this work. We assume that space-time metric is of the Kerr-Schild form [6], [7] with an appropriate vector potential and a fluid velocity vector. We derive a complete set of conditions for the Einstein Born-Infeld theory with a null perfect fluid. We assume vanishing pressure and cosmological constant. Under such assumptions we give the complete solution. This generalizes the Plebański solution [14]. We also obtain the energy flux formula which turns out to be the same as the one obtained in Einstein-Maxwell theory. For the sake of completeness we start by some necessary tools that will be needed in the following sections. For conventions and details we refer the reader to Ref. [10].

Let $z^\mu(\tau)$ describe a smooth curve $C$ in four dimensional Minkowski manifold $\mathcal{M}$ defined by $z : I \subset \mathbb{R} \to \mathcal{M}$. Here $\tau$ is the parameter of the curve, $I$ is an interval on the real line. The distance $\Omega$ between an arbitrary point $P$ (not on the curve) with coordinates $x^\mu$ in $\mathcal{M}$ and a point $Q$ on the curve $C$ with coordinates $z^\mu$ is given by

$$\Omega = \eta_{\mu\nu}(x^\mu - z^\mu(\tau))(x^\nu - z^\nu(\tau))$$

Let $\tau = \tau_0$ define the point on the curve $C$ so that $\Omega = 0$ and $x^0 > z^0(\tau_0)$ (the retarded time). Then we find the following:
\[ \lambda_\mu \equiv \partial_\mu \tau_0 = \frac{x_\mu - z_\mu(\tau_0)}{R}, \quad (1) \]

\[ R \equiv \dot{z}^\mu(\tau_0) (x_\mu - z_\mu(\tau_0)). \quad (2) \]

From here on a dot over a letter denotes differentiation with respect to \( \tau_0 \). We then have

\[ \lambda_{\mu,\nu} = \frac{1}{R} \left[ \eta_{\mu\nu} - \dot{z}_\mu \lambda_\nu - \dot{z}_\nu \lambda_\mu - (A - \epsilon)\lambda_\mu \lambda_\nu \right], \]

\[ R_{\lambda\mu} = (A - \epsilon)\lambda_\mu + \dot{z}_\mu. \quad (3) \]

where

\[ A \equiv \dot{z}^\mu (x_\mu - z_\mu), \quad \dot{z}^\mu \dot{z}_\mu = \epsilon = 0, \pm 1 \]

For time-like curves we take \( \epsilon = -1 \). We introduce some scalars \( a_k \ (k = 0, 1, 2 \cdots) \)

\[ a_k = \lambda_\mu \frac{d^k \dot{z}_\mu}{d\tau_0^k}, \quad k = 0, 1, 2, \cdots \quad (4) \]

In what follows, we shall take \( a_0 \equiv a = \frac{A}{R} \). For all \( k \) we have the following property (see [10] for further details)

\[ \lambda^\mu a_{k,\mu} = 0. \quad (5) \]

For the flux expressions that will be needed in Section 3 we take

\[ \lambda_\mu = \epsilon \dot{z}_\mu + \epsilon \frac{n_\mu}{R} \quad (6) \]

where \( n_\mu \) is a space-like vector orthogonal to \( \dot{z}^\mu \) (see [10] for more details).

### 2 Accelerated Born-Infeld Metrics

We now consider the Einstein Born-Infeld field equations with a null fluid distribution in four dimensions. The Einstein equations

\[ G_{\mu\nu} = \kappa T_{\mu\nu} = \kappa T^{BI}_{\mu\nu} + \kappa T^f_{\mu\nu} + \Lambda g_{\mu\nu} \]
with the fluid and Maxwell equations are given by [15], [16]

\[
G_{\mu\nu} = \kappa \{ b^2 F_{\mu\alpha} F_{\nu}^{\alpha} - (b^2 + F^2/2)g_{\mu\nu} \} + b^2 g_{\mu\nu} + (p + \rho) u_\mu u_\nu + \Lambda g_{\mu\nu},
\]

(7)

\[
(p + \rho) u^\nu u_{\mu;\nu} = -u^\nu (\mu u_\mu)_;\nu + p_{;\nu} (\delta^\nu_{\mu} + u^\nu u_\mu) + F_{\mu\nu} J^\nu,
\]

(8)

\[
F_{\mu\nu} = J^\mu,
\]

(9)

where \( b \) is the Born-Infeld parameter and

\[
\Gamma \equiv b^2 \sqrt{1 + F^2/2b^2},
\]

(10)

\[
F_{\mu\nu} b^2 \equiv F_{\mu\nu} \Gamma,
\]

(11)

\[
F^2 \equiv F^{\mu\nu} F_{\mu\nu}.
\]

(12)

When \( b \to \infty \), Born-Infeld theory goes to the Maxwell theory. We assume that the metric of the four dimensional space-time is the Kerr-Schild metric. Furthermore, we take the null vector \( \lambda_\mu \) in the metric as the same null vector defined in (1). With these assumptions the Ricci tensor takes a special form.

**Proposition 1.** Let \( g_{\mu\nu} = \eta_{\mu\nu} - 2V \lambda_\mu \lambda_\nu \) and \( \lambda_\mu \) be the null vector defined in (1) and let \( V \) be a differentiable function, then the Ricci tensor and the Ricci scalar are, respectively, given by

\[
R^\alpha_{\beta} = \zeta_\beta \lambda^\alpha + \zeta^\alpha \lambda_\beta + r \delta^\alpha_{\beta} + q \lambda_\beta \lambda^\alpha,
\]

(13)

\[
R_s = -2\lambda^\alpha K_{,\alpha} - 4\theta K - \frac{4V}{R^2},
\]

(14)

where

\[
r = -2\frac{V}{R^2} - \frac{2K}{R},
\]

(15)

\[
q = \eta^{\alpha\beta} V_{,\alpha\beta} + \epsilon r + 2a (K + \theta V) - \frac{4}{R}(\dot{z}^\mu V_{,\mu} + AK - \epsilon K),
\]

(16)

\[
\zeta_\alpha = -K_{,\alpha} + \frac{2V}{R^2} \dot{z}_\alpha,
\]

(17)
and $K \equiv \lambda^\alpha V_{,\alpha}$ and $\theta \equiv \lambda^\alpha V_{,\alpha} = \frac{2}{R}$.

Let us assume that the electromagnetic vector potential $A_\mu$ is given by $A_\mu = H \lambda_\mu$ where $H$ is a differentiable function. Let $p$ and $\rho$ be, respectively, the pressure and the energy density of a perfect fluid distribution with the velocity vector field $u_\mu = \lambda_\mu$. Then the difference tensor $T_{\mu\nu} = G_{\mu\nu} - \kappa(T^{BI}_{\mu\nu} + T^f_{\mu\nu}) - \Lambda g_{\mu\nu}$ is given by the following proposition

**Proposition 2.** Let $g_{\mu\nu} = \eta_{\mu\nu} - 2V \lambda_\mu \lambda_\nu$, $A_\mu = H \lambda_\mu$, where $\lambda_\mu$ is given in (1), $V$ and $H$ be differentiable functions. Let $p$ and $\rho$ be the pressure and energy density of a perfect fluid with velocity vector field $\lambda_\mu$. Then the difference tensor becomes

$$T^\alpha_{\ eta} = \lambda^\alpha W_\beta + \lambda_\beta W^\alpha + \mathcal{P} \delta^\alpha_{\ eta} + \mathcal{Q} \lambda^\alpha \lambda_\beta$$

(18)

where

$$\mathcal{P} = \frac{2K}{R} + \lambda_\alpha K_{,\alpha} - \kappa b^2 (1 - \Gamma_0) - (\kappa p + \Lambda),$$

(19)

$$\mathcal{Q} = \eta^{\alpha\beta} V_{,\alpha\beta} - \frac{4}{R}(\dot{z}^\alpha V_{,\alpha}) - \frac{2K}{R}(A - \epsilon) + \frac{4AV}{R^2} - \frac{2\epsilon V}{R^2} - \kappa(p + \rho) - \frac{\kappa}{\Gamma_0}(\eta^{\alpha\beta} H_{,\alpha} H_{,\beta}),$$

(20)

$$W_\alpha = \frac{2V}{R^2} \dot{z}_\alpha - K_{,\alpha} + \frac{\kappa}{\Gamma_0}(\lambda^\mu H_{,\mu}) H_{,\alpha},$$

(21)

and

$$\Gamma_0 \equiv \sqrt{1 - \frac{(\lambda^\mu H_{,\mu})^2}{b^2}}.$$  

We shall now assume that the functions $V$ and $H$ depend on $R$ and on some $R$-independent functions $c_i$, ($i = 1, 2, \ldots$) such that

$$c_{i,\alpha} \lambda^\alpha = 0,$$

(22)

for all $i$. It is clear that due to the property (3) of $a_k$, all of these functions ($c_i$) are functions of the scalars $a$ and $a_k$, $(k = 1, 2, \ldots)$ and $\tau_0$. We have now:
Proposition 3. Let \( V \) and \( H \) depend on \( R \) and functions \( c_i \), \((i = 1, 2, \ldots)\) that satisfy (22), then the Einstein equations given in Proposition 2 reduce to the following set of equations

\[
\begin{align*}
\kappa p + \Lambda &= V'' + \frac{2}{R} V' - \kappa b^2 [1 - \Gamma_0], \\
\kappa \frac{(H')^2}{\Gamma_0} &= V'' - \frac{2V}{R^2}, \\
\kappa (p + \rho) &= V_{,c_i} (c_{i,\alpha} \lambda^\alpha) - \frac{4}{R} V_{,c_i} (c_{i,\alpha} \dot{z}^\alpha) \\
&- \frac{\kappa}{\Gamma_0} (H_{,c_i})^2 (c_{i,\alpha} c_{i,\alpha}) - \frac{2A}{R} (V' - \frac{2V}{R}) \\
\sum_{i=1} w_i c_{i,\alpha} &= \left[ \sum_{i=1} (w_i c_{i,\alpha} \dot{\lambda}^\alpha) \right] \lambda_\alpha,
\end{align*}
\]

where

\[
\begin{align*}
w_i &= V_{,c_i} - \frac{\kappa H'}{\Gamma_0} H_{,c_i}, \\
\Gamma_0 &= \sqrt{1 - \frac{(H')^2}{b^2}}.
\end{align*}
\]

and the prime over a letter denotes partial differentiation with respect to \( R \). Equation (3) defines the electromagnetic current vector \( J_\mu \)

\[
\begin{align*}
J^\nu &= \frac{\partial}{\partial x^\mu} \left( \frac{F^{\mu\nu}}{\Gamma_0} \right), \\
F^{\mu\nu} &= H' (\dot{z}^\mu \lambda^\nu - \dot{z}^\nu \lambda^\mu) + \sum_{i=1} [H_{,c_i} (c_{i,\mu} \lambda^\nu - c_{i,\nu} \lambda^\mu)].
\end{align*}
\]

The above equations can be described as follows. The equations (23) and (25) define, respectively, the pressure and mass density of the perfect fluid distribution with null velocity \( \lambda_\mu \). Equation (24) gives a relation between the electromagnetic and gravitational potentials \( H \) and \( V \). Since this relation is quite simple, given one of them one can easily solve the other one. Equation
implies that there are some functions $c_i$ ($i = 1, 2, \cdots$) where this equation is satisfied. The functions $c_i$ ($i = 1, 2, \cdots$) arise as integration constants (with respect to the variable $R$) while determining the $R$ dependence of the functions $V$ and $H$. Assuming the existence of such $c_i$ the above equations give the most general form of the Einstein Born-Infeld field equations with a null perfect fluid distribution under the assumptions of Proposition 2. Assuming now that the null fluid has no pressure and the cosmological constant vanishes, we have the following special case. (From now on, we set $\kappa = 8\pi$ so that one finds the correct Einstein limit as one takes $b \to \infty$ \cite{5}, \cite{10}.)

**Proposition 4.** Let $p = \Lambda = 0$. Then

\begin{align*}
V &= \frac{m}{R} - 4\pi e^2 \frac{F(R)}{R} \\
H &= \epsilon e \int_0^R \frac{dR}{\sqrt{R^4 + e^2/b^2}}
\end{align*}

where

\begin{align*}
m &= M(\tau) + 8\pi \epsilon ec, \\
F(R) &= \int_0^R \frac{dR}{R^2 + \sqrt{R^4 + e^2/b^2}}
\end{align*}

\begin{align*}
\rho &= -\frac{\dot{M}}{4\pi R^2} - \frac{(c_\alpha \omega_\alpha)}{R^2} \sqrt{R^4 + e^2/b^2} + \epsilon \frac{e}{R} (c_\alpha \omega_\alpha) - \epsilon \frac{4e}{R^2} (c_\alpha \omega_\alpha) \\
&\quad + 6\epsilon \frac{ae c}{R^2} + 3Ma \frac{3ae}{R^2} - \frac{4ae}{R^2} + \frac{ae^2}{R} dF + \frac{ae^2}{R \dot{R}} dR - \frac{2e}{R^2} \dot{e}c \\
&\quad + \frac{ae}{R^2} \int_0^R \frac{dR}{\sqrt{R^4 + e^2/b^2}}
\end{align*}

Here $e$ is assumed to be a function of $\tau$ only but the functions $m$ and $c$ which are related through the arbitrary function $M(\tau)$ (depends on $\tau$ only) do depend on the scalars $a$ and $a_k$, ($k \geq 1$). The current vector \cite{30} reduces to the following form
\[ \mathcal{J}^\mu = \left\{ \epsilon \frac{2ac,a}{R^4} \left[ \frac{e^2}{b^2 R^2 \gamma_0} + R^2 \gamma_0 \right] + 2 \epsilon \frac{ea}{R^2} - \epsilon \frac{\dot{e}}{R^2} \right. \\
\left. + \frac{\gamma_0}{R^2} c_{,a,a} (\ddot{z}^a \ddot{x}^a + e \alpha^2) \right\} \lambda^\mu + \frac{2}{R^6} \frac{e}{b^2 \gamma_0} c_{,a} (\ddot{z}^\mu - a \dot{z}^\mu) \tag{36} \]

for the simple choice \( c = c(\tau, a) \). Here \( \gamma_0 \equiv \sqrt{1 + \frac{e^2}{b^2 R^4}} \).

Notice that Equation (23) with zero pressure and (24) determine the \( R \) dependence of the potentials \( V \) and \( H \) completely. Using Proposition 3 we have chosen the integration constants (\( R \) independent functions) as the functions \( c_i \) \((i = 1, 2, 3)\) so that \( c_1 = m, c_2 = e \) and \( c_3 = c \) and

\[ c = c(\tau, a, a_k), \ e = e(\tau), \ m = M(\tau) + 8(\pi \varepsilon e)c \]

where \( a_k \) are defined in (4).

**Remark 1.** There are two limiting cases. In the first limit one obtains the Bonnor-Vaidya solutions when \( b \to \infty \). In the Bonnor-Vaidya solutions the parameters \( m \) and \( c \) (which are related through (33)) depend upon \( \tau \) and \( a \) only. In our solution, these parameters depend not only on \( \tau \) and \( a \) but also on all other scalars \( a_k, (k \geq 1) \). The scalars \( a_k \) are related to the scalar curvatures of the curve \( C \) (see [10] for further details). The second limit is the static case where the curve \( C \) is a straight line or \( a_k = 0 \) for all \( k = 0, 1, \ldots \). Our solution then reduces to the Plebański solution [14].

**Remark 2.** In the case of classical electromagnetism the Liénard-Wiechert potentials lead to the accelerated charge solutions [8], [9], [10]. In this case, due to the nonlinearity, we do not have such a solution. The current vector in (36) is asymptotically zero for the special choice \( c = -ea \) and \( e = \text{constant} \). This means that \( \mathcal{J} = O(1/R^6) \) as \( R \to \infty \). Hence the solution we found here is asymptotically pure source free Born-Infeld theory. With this special choice the current vector is identically zero in the Maxwell case [10]. Notice also that the current vector vanishes identically when \( e = \text{constant}, c = c(\tau) \) and \( a = 0 \).

**Remark 3.** It is easy to prove that the Born-Infeld field equations

\[ \partial_\mu F^{\mu\nu} = 0 \]
in flat space-time do not admit solutions with the ansatz

\[ A_\mu = H(R, \tau, a, a_k) \lambda_\mu. \]

Furthermore the ansatz \( A_\mu = H(R, \tau) \dot{z}_\mu \) is also not admissible.

**Remark 4.** Note that \( \rho = 0 \) only when the curve \( C \) is a straight line in \( M \) (static case). This means that there are no accelerated vacuum Born-Infeld solutions.

### 3 Radiation due to Acceleration

In this Section we give the energy flux due to the acceleration of charged sources in the case of the solution given in Proposition 4. The solutions described by the functions \( c, e, \) and \( M \) give the energy density \( \rho \) in (35). Remember that at this point \( c = c(\tau, a, a_k) \) and arbitrary. Asymptotically (as \( b \) goes to infinity) our solution approaches the Einstein-Maxwell solutions. With the special choice \( e = \text{constant} \), \( c = -ea \) our solution is asymptotically (as \( R \) goes to infinity) gauge equivalent to the flat space Liénard-Wiechert solution and reduces to the (as \( b \) goes to infinity) Bonnor-Vaidya solution [5]. Hence we shall use this choice in our flux expressions. The flux of null fluid energy is then given by

\[ N_f = -\int_{S^2} T_f^{\alpha \beta} \dot{z}_\alpha n^\beta R d\Omega \quad (37) \]

and since \( T_f^{\alpha \beta} = \rho \lambda^\alpha \lambda_\beta \) for the special case \( p = \Lambda = 0 \) that we are examining, one finds that

\[ N_f = \int_{S^2} \rho R^2 d\Omega \quad (38) \]

where \( \rho \) is given in (35). The flux \( N_{BI} \) of Born-Infeld energy is similarly given by

\[ N_{BI} = -\int_{S^2} T_{BI}^{\alpha \beta} \dot{z}_\alpha n^\beta R d\Omega \quad (39) \]

and for the solution we are examining, one finds that (as \( R \to \infty \))
\[ N_{BI} = \epsilon e^2 \int_{S^2} d\Omega \left[ a^2 + \epsilon (\ddot{z}^\alpha \ddot{z}_\alpha) \right]. \]  

(40)

Here we took \( \epsilon = \text{constant} \) and \( c = -ea \). The total energy flux is given by

\[ N = N_{BI} + N_f = \epsilon \int_{S^2} \left[ -\frac{\epsilon}{4\pi} \dot{M} + \frac{3\epsilon}{4\pi} aM + 2e^2a_1 - 8e^2a^2 \right] d\Omega \]

(41)

for \( R \) large enough. For a charge with acceleration \( |\ddot{z}_\alpha| = \kappa_1 \), we have (see Ref. [10])

\[ N = -\dot{M} - \epsilon \frac{8\pi}{3} e^2(\kappa_1)^2 \]

(42)

where \( \kappa_1 \) is the first curvature scalar of \( C \). This is exactly the result of Bonnor-Vaidya in [3]. Hence with the choice of \( c = -ea \) the linear classical electromagnetism and the Born-Infeld theories give the same energy flux for the accelerated charges. This, however, should not be surprising considering the fact that Born-Infeld theory was originally introduced to solve the classical self-energy problem of an electron described by the Maxwell theory in the short distance limit [11]. For other choices of \( c = c(\tau, a, a_k) \) one obtains different expressions for the energy flux.

4 Conclusion

We have found exact solutions of the Einstein Born-Infeld field equations with a null fluid source. Physically these solutions describe electromagnetic and gravitational fields of a charged particle moving on an arbitrary curve \( C \). The metric and the electromagnetic vector potential arbitrarily depend on a scalar, \( c(\tau_0, a, a_k) \) which can be related to the curvatures of the curve \( C \). When the Born-Infeld parameter \( b \) goes to infinity our solution reduces to the Bonnor-Vaidya solution of the Einstein-Maxwell field equations [3], [10]. On the other hand when the curve \( C \) is a straight line in \( M \), our solution matches with the Plebański solution [14]. We have also studied the flux of Born-Infeld energy due to the acceleration of charged particles. We observed that the energy flux formula depends on the choice of the scalar \( c \) in terms of the functions \( a, a_k \) (or the curvature scalars of the curve \( C \)).
