Background: Let-7d has been reported to serve as a tumor suppressor in numerous cancers, however, the function in rectum adenocarcinoma has not been illuminated. In this study, we aimed to explore whether let-7d functions in rectum adenocarcinoma and its functional significance links to ATP binding cassette subfamily C member 2 (ABCC2).

Methods: The expression patterns of let-7d and ABCC2 were gained from TCGA database. Then, cell proliferation, invasion and migration assays were conducted to detect the influence on rectum adenocarcinoma cells behaviors after over-expression of let-7d. Subsequently, the potential target gene of let-7d was predicted and identified through bioinformatics prediction analysis and luciferase reporter assay. Analyses against prognostic value and independent predictor were acquired from Kaplan-Meier, Univariate and Multivariate analysis of Cox regression. Finally, con-transfection experiments were performed to investigate let-7d/ABCC2 pairs function on rectum adenocarcinoma cells after co-transfected with let-7d mimic and si-ABCC2. mRNA and protein levels were assessed by reverse transcription quantitative polymerase chain reaction (qRT-PCR) and western blot.

Results: The data from TCGA indicated that let-7d was down-regulated in rectum adenocarcinoma samples, whilst ABCC2 was showed a trend of high expression and its overexpression hinted to worse overall survival of rectum adenocarcinoma patients. Cells proliferation, invasion and migration properties were restrained after over-expression of let-7d in SW837 cells. Further investigations showed that over-expression of let-7d induced the inhibitory effect on SW837 cells proliferative, migrant and invasive capacities was augmented by silencing ABCC2.

Conclusions: All results in this study indicated that up-regulation of let-7d could suppress SW837 cells growth, invasion and migration abilities by reducing ABCC2 expression, providing a new insight into molecular mechanism of let-7d/ABCC2 as a significant mediator for tumor progression and development of rectum adenocarcinoma.

Keywords: ATP binding cassette subfamily C member 2 (ABCC2); let-7d; rectum adenocarcinoma

Introduction

Rectum adenocarcinoma is one of the most common malignant tumors in the digestive tract (1). In present, the pathogeny of rectum adenocarcinoma is still enigmatic, its occurrence mainly related to social environment, dietary habits and genetic factors (2). Up to now, substantial progresses have been made in diagnosis and treatment of rectum adenocarcinoma (3). However, because of its deep position in the pelvic cavity, the surgery is not easy to be complete, resulting in a high postoperative recurrence rate (4). In recent years, molecular therapies directing at rectum adenocarcinoma have attracted increasing attentions, while to date none molecular biomarkers have yet reached the clinic (5). Therefore, it is urgent to explore accurate targeted molecules for diagnosis and prognosis of rectum adenocarcinoma.

MicroRNA (miRNA) is a kind of naturally generated and highly conserved small non-coding RNA with a length of about 22 nucleotides, which can interact with 3’ untranslation region (UTR) of target mRNA according to sequence complementarity, leading to degradation or translation inhibition of mRNA (6). Meanwhile, miRNA regulates proliferation, invasion and apoptosis of cancer cells in different up or down regulated ways, and also affects the expression of genes involved in signal transduction of cancer cells (7). Let-7d, widely considered to be a tumor suppressor of miRNA, has been found to be highly conserved in many species, including humans (8). Childs et al. found that let-7d was low expressed in head and neck squamous cell carcinoma (HNSCC) patients, and easily led to poor survival (9). Shell et al. demonstrated that loss of let-7d was more likely to result in unfavorable prognosis with the patients in ovarian cancer (10). Similarly, down-regulation of let-7d was also found in other cancers including prostate cancer (11), breast cancer (12), colorectal cancer (13), etc. However, the function of let-7d in rectum adenocarcinoma has not been described.

In this research, we explored that let-7d was down-regulated both in rectum adenocarcinoma tissues and cells. The vitro experiment proved that over-expression of let-7d could suppress the proliferation, invasion and migration of SW837 cells. Then, the direct interaction between let-7d and ATP binding cassette subfamily C member 2 (ABCC2) was confirmed by the dual luciferase assay. Moreover, we found that ABCC2 was highly expressed in patients with rectum adenocarcinoma, and its high expression easily led to worse overall survival. Co-transfection assay testified that silencing ABCC2 suppressed the proliferation, invasion and migration of SW837 cells, meanwhile accentuated the inhibitory effect of let-7d on SW837 cells. Herein, all results of this study showed that let-7d regulated ABCC2 as a crucial modulator in the progression of rectum adenocarcinoma, which may provide a new insight for the treatment of rectum adenocarcinoma.

Methods

Data collection

The differential expression analysis of let-7d (including 162 human tumor tissues and 3 normal tissues) and ABCC2 (including 167 human tumor tissues and 10 normal tissues) were got from TCGA database (https://cancergenome.nih.gov/). And then the overall survival rate was plotted and Cox regression analyze was performed.

Cell culture and transfection

Rectum adenocarcinoma cell lines SW837 and normal cell line Hs680.Rec were purchased from the Shanghai cell bank of the Chinese academy of medical sciences. All the cells were incubated in Dulbecco’s Eagle medium with 10% fetal bovine serum (FBS), under the condition of 37 ℃, 5% CO2. When cells came into the logarithmic phase, the let-7d mimic/mimic NC (RIBOBIO, Guangzhou, China), si-ABCC2 and si-con (Gene-Pharma, Shanghai, China) were transfected into the cells using the Lipofectamine 2000 transfection kit according to the supplier’s protocol. The siRNAs sequences were presented as follows: si-ABCC2: 5’-GCACCATCTTAGAGAAGGGAT-3’, si-con: 5’-AATTCTCCGAACGTGTCACGT-3’.

Reverse transcription quantitative polymerase chain reaction (qRT-PCR)

To get the relative RNA expression of let-7d and ABCC2, total RNA was isolated from the transfected cells by TRIzol solution (Invitrogen, Carlsbad, CA, USA) and then qRT-PCR has been taken. Subsequently, the RNA was reverse transcribed into cDNA using SuperScript III reverse transcriptase (Invitrogen; Carlsbad, CA, USA). qRT-PCR was performed using SsoFast™ EvaGreen Supermix (Bio-Rad, Hercules, CA, USA) according to the manufacturer’s procedure and in a real-time thermal cycler: 40 cycles including 95 ℃ for 5 min, 95 ℃ for 30 s,
Western blot

Total protein was extracted from the transfected cells using RIPA regent (Beyotime, Shanghai, China) with 1% protease inhibitor, quantified through BCA Protein Assay Kit (Thermo Fisher Scientific, Inc., Waltham, MA, USA), separated by 12% SDS-PAGE and electrotransferred onto PVDF membranes. Subsequently, the membranes were blocked with 5% skimmed milk powder for 1 h and against with primary antibodies (Abcam, Cambridge, MA, USA), ABCC2 (ab203397, 1:1,000), GAPDH (ab9485, 1:1,000) overnight while incubated with secondary antibody (Abcam, Cambridge, MA, USA, ab150077, 1:2,000) for 1 h. Finally, added ECL reagent (Beyotime, Jiangsu, China) to detect the signals, and scanned with QUANTITY ONE.

CCK-8 assay

The transfected cells were prepared for cell suspension, seeded into 96-well plates at the standard of 1,000 cells per well and cultured in a carbon dioxide incubator. Cell activity was detected at 0 h, 24 h, 48 h and 72 h, added 10 μL of CCK-8 reagent into each well and cultured in 37 ℃ incubator for 1.5 h before each detection. Using microplate reader (Bio-Rad, Hercules, CA, USA) to evaluate the optical density (OD) value and draw the proliferation curve.

Transwell assay

Transwell assay was used to measure the cells migration and invasion abilities. Put the transfected cells into suspension and added it into the upper chamber. Meanwhile, 500 μL of complete medium was filled into the under chamber. Overnight, swabbed remaining cells in upper chamber, washed by PBS, fixed with 4% paraformaldehyde for 30 min, dyed through 0.1% crystal violet for 20 min and captured via microscope. It is worth noting that the upper chamber of the invasive detection needs to be pre-coated with Matrigel (BD Sciences, Franklin Lakes, NJ, USA) while migratory experiment was not. Furthermore, the invasion (1×10⁵) density of inoculated cells was different from migration (5×10⁵).

Luciferase reporter assay

Dual luciferase report was further confirmed the prediction results from the bioinformatics software, and dual luciferase reporting kit was used with Dual Luciferase™ reporting system. A reporter plasmid wild-type ABCC2 (WT ABCC2) was conducted by inserting pmirGLO Vector (Promega, USA) with ABCC2 sequences, which includes the target site of let-7d. The target site was mutated and inserted to form a negative control for reporter plasmid, which was called mutated-type ABCC2 (MUT ABCC2). The let-7d mimic/NC and vector were co-transfected into the cells through Lipofectamine 2000 transfection kit according to the supplier's instruction. After 48 h, the proteins in the cells were extracted for luciferase detection. In the end, using a Dual Luciferase™ reporting system to detect the firefly luciferin to Marine luciferin intensity, assess the relative luciferase activity and reflect the effect of let-7d on ABCC2 level.

Statistical analysis

To analyze the experiment data using SPSS 22.0 and GraphPad Prism 5.0 Software. The comparison between the two groups was used Student’s t-test and ANOVA analysis followed by Dunnet’s (compare all groups vs. control group) and Bonferroni’s post hoc test for multiple groups (compare selected pairs of groups). The overall survival was analyzed through Kaplan-Meier method and log-rank test. The independent prognostic analysis was performed using Cox regression. P<0.05 was considered statistically significant.

Results

Let-7d is down-regulated in rectum adenocarcinoma

The data from the TCGA database showed that the expression of let-7d was significantly decreased in tumor tissues compared with the normal (Figure 1A, P=1.95E-181). To further explore the function of let-7d, we examined its expression in rectum adenocarcinoma cell line SW837. The results indicated that let-7d was down-regulated in rectum adenocarcinoma cell line SW837 in contrast with normal...
cell line Hs680.Rec (Figure 1B, **P<0.01). So, SW837 cells were used for the subsequent experiments. The lower expression of let-7d in rectum adenocarcinoma samples insinuated that let-7d served on an important role in the progression of rectum adenocarcinoma.

**Let-7d suppresses the proliferation and mobility of rectum adenocarcinoma cells**

To investigate the effects of let-7d on rectum adenocarcinoma, let-7d mimic was used to up-regulate let-7d in rectum adenocarcinoma cell. Results of qRT-PCR analysis showed that the relative expression of let-7d was remarkably improved after transfected with let-7d mimic (Figure 2A, **P<0.01) compared with the control and let-7d mimic NC groups. Then, CCK-8 assay demonstrated that high expression of let-7d significantly reduced the rectum adenocarcinoma cells OD values (Figure 2B, **P<0.01) and transwell assay exhibited that overexpression of let-7d obviously decreased the migrated and invaded cells number in contrast with let-7d mimic NC and control groups (Figure 2C,D, **P<0.01). The findings manifested that up-regulation of let-7d could repress rectum adenocarcinoma cells proliferative, invasive and migratory capacities.

**ABCC2 is an immediate target of let-7d**

According to research reports, miRNAs performed their function via restraining the expression of their target genes. Therefore, in order to further explore let-7d molecular mechanism, miRNA target analysis tools TargetScan, MiRanda, miRDB and miRWalk were used to predict the possible binding site to ABCC2. As bioinformatics results shown, a diffusely-conserved binding site between 3’ UTR of ABCC2 and let-7d was be found and confirmed by luciferase reporter assay in HEK293T cells, meanwhile the mutant ABCC2 sequence was cloned into luciferase reporter vectors (Figure 3A). Subsequently, let-7d mimic and control were transfected into HEK293T cells, compared with the control, we found that the luciferase reporter activity was obviously declined with high-expression of let-7d in WT ABCC2 group. But the luciferase reporter activity was almost unchanged in MUT ABCC2 group (Figure 3B, **P<0.01). Finally, let-7d mimic and si-ABCC2 were transfected into SW837 cells to explore the effect on ABCC2. As the Figure 3C,D,E shown, qRT-PCR and western blot indicated that ABCC2 expression was significantly down-regulated after transfected with let-7d mimic + si-con, si-ABCC2, or let-7d mimic + si-ABCC2 compared with control, especially down-regulated in let-7d mimic + si-ABCC2 group (**P<0.01, #P<0.05, ##P<0.01). Taken together, the findings provided an evident testimony indicating that ABCC2 was a special target of let-7d and negatively regulated by let-7d.

**High expression of ABCC2 easily leads to worse overall survival in rectum adenocarcinoma**

To further explore the function of ABCC2 in rectum adenocarcinoma, a comprehensive study was performed.
The data from TCGA database and Kaplan Meier-plotter websites showed that ABCC2 was significantly over-expressed in tumor tissues (Figure 4A, P=1.11E-0.5) and overexpression of ABCC2 was more easily led to poor overall survival with the patients in rectum adenocarcinoma (Figure 4B, P=0.03). Moreover, as shown in Table 1, the Cox regression analysis showed that the prognostic significance of rectum adenocarcinoma patients was correlated with several parameters, in addition to ABCC2 expression. Univariate analysis found that ABCC2 expression (high/low), clinical-stage, pathologic-M/N and age (<60/≥60) were involved in the prognosis of rectum adenocarcinoma. Then, these elements were studied again in multivariate analysis, and indicated that only age (<60/≥60) can be used as an independent prognostic indicator of patient with rectum adenocarcinoma. The consequence indicated that up-regulation of ABCC2 was observed in rectum adenocarcinoma patients and its elevation resulted in worse prognosis.

### Deleted expression of ABCC2 enhanced the inhibitory effect of let-7d on SW837 cells

Based on the above research, we speculated that the repressive role of let-7d overexpression on proliferation, invasion and migration of rectum adenocarcinoma cells was correlated with ABCC2 involvement. Initially, let-7d mimic and si-ABCC2 were transfected into SW837 cells to detect the effect of let-7d/ABCC2 on rectum adenocarcinoma development. The data from CCK-8 assay showed that the
Figure 3 Let-7d directly targeted ABCC2. (A) The predicted binding site of let-7d to ABCC2 and its mutation sequence. (B) Luciferase reporter assay showed that let-7d was directly bound to the wild-type ABCC2, but no binding in the mutant sequence, *P<0.05. The results from qRT-PCR (C) and Western blot (D) demonstrated the expression of ABCC2 was significantly reduced after transfected with let-7d mimic + si-con, si-ABCC2, or let-7d mimic + si-ABCC2, especially reduced in let-7d mimic + si-ABCC2 group. (E) Quantified of C, **P<0.01 represented vs. control group, *P<0.05, ***P<0.01 represented vs. let-7d mimic + si-ABCC2 group.

OD value was obviously declined in let-7d mimic + si-con, si-ABCC2, and let-7d mimic + si-ABCC2 groups compared with the control, especially declined in let-7d mimic + si-ABCC2 group, indicating that down-regulation of ABCC2 can accelerate the suppression effect of let-7d on the proliferation of SW837 cells (Figure 5A, *P<0.05, **P<0.01, ***P<0.01). Transwell assay discovered that the number of invaded and migrated cells were significantly reduced in let-7d mimic + si-con, si-ABCC2, and let-7d mimic + si-ABCC2 groups compared with the control, especially reduced in let-7d mimic + si-ABCC2 group, suggesting that loss ABCC2 increased the inhibitory effect of let-7d on SW837 cells invasion and migration (Figure 5B,C, *P<0.05, **P<0.01, ***P<0.01). In conclusion, the data indicated that down-regulation of ABCC2 increased the restraining of SW837 cells proliferation, invasion and migration caused by let-7d, demonstrated that let-7d acted as a potential suppressor in rectum adenocarcinoma by targeting ABCC2 (**P represented vs. control group, *P and ***P represented vs. let-7d mimic + si-ABCC2 group).

Discussion

Our data showed that let-7d was down-regulated in rectum adenocarcinoma. The suppression effect of let-7d on ABCC2 expression indicated that let-7d acted as a potential suppressor in rectum adenocarcinoma through targeting ABCC2.
Liu et al. Let-7d/ABCC2 pairs function on rectum adenocarcinoma

adenocarcinoma samples, CCK-8 and transwell assays indicated that over-expression of let-7d positively suppressed SW837 cells proliferation, invasion and migration. We also testified that ABCC2 was a direct functional target of let-7d through prediction software and dual luciferase reporter assay. The analysis from TCGA investigated that ABCC2 was highly expressed in rectum adenocarcinoma tissues and its high expression level tended to poor overall survival. Co-transfection assay found that knockdown ABCC2 could emphasize the inhibitory effect of let-7d on SW837 cells. Taken together, the study indicated that over-expression of let-7d repressed rectum adenocarcinoma progression through targeting with ABCC2.

Emerging evidence pointed that let-7d was down-regulated in numerous cancers and acted as a tumor-inhibiting factor (8). For instance, let-7d was found to be reduced in oral squamous cell carcinoma (14), ovarian cancer (15) and down-regulation of let-7d could suppress proliferation, invasion and migration of renal cell carcinoma (16). These findings were consistent with our research in rectum adenocarcinoma. In our study, we found that let-7d was obviously reduced in rectum adenocarcinoma samples and up-regulation of let-7d could repress SW837 cells proliferation, invasion and migration. Let-7d has been reported to be involved in the pathogenesis of some cancers (17), for example, let-7d was found to have anti-tumor

Figure 4 ABCC2 was highly expressed in rectum adenocarcinoma tissues and led to poor prognosis. The data from TCGA database showed that the expression (A) of ABCC2 was up-regulated in rectum adenocarcinoma tissues (P=1.11E-0.5) and highly expression (B) of ABCC2 easily tended to poor overall survival.

and carcinogenic effects in osteosarcoma (18). In addition, let-7d can also directly target CCL7, COL3A1 (19), HMGA2 and PBX3, and suppress cell proliferation, invasion and metastasis. These evidence not only provide strong supports for the influence of let-7d in rectum adenocarcinoma in our research, but also provide new strategy for the treatment of rectum adenocarcinoma.

The modulation of let-7d by downstream target genes acted as a crucial role in exhibiting its anti-cancer mechanism. Therefore, multiple bioinformatics prediction software was used to analyze the downstream gene of let-7d and confirmed it with dual luciferase reporter assay. The results showed that ABCC2 was a vital downstream target gene of let-7d. ABCC2, as a member of the ATP binding cassette superfamily, also known as multidrug resistance-associated protein 2 (MRP2), encodes human canalicular multi-specific organic anion transporter (20). In addition to being expressed in normal human tissues, ABCC2 was also detected in numerous tumors, including hepatocellular (21), ovarian (22), lung (23), breast (24), gastric (25) and colorectal carcinomas (26). For instance, ABCC2 is also shown to increase cisplatin resistance through targeting let-7c in non-small cell lung cancer (27) and low expression of ABCC2 was related to longer overall survival in ovarian carcinoma (28). While, the function of this gene in rectum adenocarcinoma has been poorly studied. The results exhibited that ABCC2 was over expressed in rectum adenocarcinoma tissues and led to worse prognosis.

Figure 5 Silencing ABCC2 increased the adverse effect of let-7d on SW837 cells. (A) The CCK-8 assay investigated that knockdown ABCC2 obviously repressed the SW837 cells proliferation ability compared with the control, let-7d + si-con, and si-ABCC2, strengthened the inhibitory of let-7d, *P<0.05, **P<0.01, ***P<0.01. (B) The transwell assay demonstrated that the capacity of SW837 cells invasion and migration was remarkably decreased after transfected with let-7d mimic + si-ABCC2 in contrast with control, let-7d + si-con, and si-ABCC2, further enhanced the suppression effect induced by let-7d, *P<0.05, **P<0.01, ***P<0.01. (C) Quantified of B (**P<0.01 represented vs. control group, *P<0.05, **P<0.01 represented vs. let-7d mimic + si-ABCC2 group).
Meanwhile, the study also found that ABCC2, as the downstream target gene, interacted with let-7d to suppress the rectum adenocarcinoma cells growth and movement.

In conclusion, to the best of our knowledge, this is the first time to discover that let-7d repressed rectum adenocarcinoma development through targeting ABCC2. The study indicated that let-7d was lower expression in rectum adenocarcinoma tissues and cells, and in vitro experiments showed that up-regulation of let-7d could significantly inhibit SW837 cells proliferation, invasion and migration. While, ABCC2 was found highly expressed in rectum adenocarcinoma tissues and easily led to poor prognosis. The potential anti-cancer function of let-7d was mediated by declining the ABCC2 as its target gene. However, every miRNA may regulate many target genes in different ways, affecting the occurrence and progression of cancer, thus more detailed studies on the molecular and cellular mechanism of let-7d target were required.

Conclusions

This study provides a novel insight for the treatment of rectum adenocarcinoma.
