Abstract

Starting with the first-order singular Lagrangian, the problem of the quantization of a dynamical system constrained to a submanifold embedded in the higher-dimensional Euclidean space is investigated within the framework of operatorial quantization formalism. Through the projection operator method (POM) with the constraint star-products, it is shown that both of the constraint quantum system with the usual constraint and that with the derivative-type constraint are naturally constructed from one Lagrangian. It is proved that the system with the usual constraint is the sub-system of that with the derivative-type one. Furthermore, the quantum corrections in the resultant Hamiltonians are discussed.

1 Introduction

The problem of the quantization of a dynamical system constrained to a submanifold embedded in the higher-dimensional Euclidean space has been extensively investigated as one of the quantum theories on a curved space until now[1,2,3,4]. In order to avoid the unnecessary troublesomeness, the submanifold $M^{N-1}$ specified by $G(x) = 0$ ($G(x) \in C^\infty$) in an $N$-dimensional Euclidean space $R^N$ has been considered in many studies, where $x = (x_1, \cdots, x^i, \cdots, x_N) \in R^N$. As the dynamical system constrained to $M^{N-1}$, then, the dynamical system subject to the constraint $G(x) = 0$ and that subject to $\dot{G}(x) = 0$† have been presented with the Lagrangians

$L = L_0 + \mu G(x), =L_0 + \mu \dot{G}(x)$, where $L_0$ is the usual second-order nonsingular Lagrangian and $\mu$, an additional dynamical variable[3,4]. In this paper, we shall call the system subject to $G(x) = 0$ the static constraint system, and the system subject to $\dot{G}(x) = 0$, the dynamical constraint system.

In the quantization of constraint systems, alternative approach of the first-order singular Lagrangian formalism has been proposed by Faddeev and Jackiw[5]. Starting with the first-order singular Lagrangian containing the term associated to the dynamical constraint, in this paper, we shall accomplish the quantization of the system.

---

†We shall call the constraint $G(x) = 0$ the static constraint, and $\dot{G}(x) = 0$, the dynamical one.
constrained to $M^{N-1}$ within the framework of operatorial quantization formalism\[6\].

Through the projection operator method (POM) with the constraint star-products\[7\],
then, it is shown that the resultant constraint quantum systems corresponding to
these two constraints, the static constraint quantum system and the dynamical constraint quantum system,
are naturally constructed with one Lagrangian, and it is proved, with the alternative approach to Ref.\[3\],
that the static constraint quantum system is the sub-system of the dynamical constraint quantum system. Furthermore,
we shall discuss the quantum correction terms due to the projections of operators
and the re-ordering of operators in the resultant Hamiltonian.

The program of this paper is the following. In Sect.2, we propose the Lagrangian
with the dynamical constraint and construct the initial unconstraint quantum system,
which we denote $S$. In Sect.3, we construct the the static constraint quantum system,
which we denote $S^*_1$, and that the dynamical constraint quantum system,
which is denoted by $S^*_2$. Then, it is proved that $S^*_1$ is the sub-system of $S^*_2$, and the
quantum correction terms in the final Hamiltonians are discussed. In Sect.4, the
discussion and the some concluding remarks are given.

2 Initial Hamiltonian System

Consider the dynamical system described by the first-order singular Lagrangian
$L$
\[ L = L(x, \dot{x}, v, \dot{v}, \lambda, \dot{\lambda}) = \dot{x}^i v_i - \lambda \dot{G}(x) - \frac{1}{2} v_i v_i - V(x), \]
(2.1)
where $x = (x^1, \ldots, x^i, \ldots, x^N)$, $v = (v_1, \ldots, v_i, \ldots, v_N)$ and $\dot{G}(x) = \dot{x}^i G_i(x)$.\[8\]

Following the canonical quantization formulation for constraint systems\[8, 9\],
then, the initial unconstraint quantum system $S = (C, \mathcal{A}(C), H(C), \mathcal{K})$ is obtained
as follows:

i) Initial canonically conjugate set $C$

\[ C = \{ (x^i, p^i_v), (v_i, p^i_v), (\lambda, p_\lambda) | i = 1, \ldots, N \}, \]
(2.2)
which obeys the commutator algebra $\mathcal{A}(C)$:
\[ [x^i, p^j_v] = i \hbar \delta^i_j, \quad [v_i, p^j_v] = i \hbar \delta^i_j, \quad [\lambda, \pi_\lambda] = i \hbar, \quad \text{(the others)} = 0, \]
(2.3)

ii) Initial Hamiltonian $H$
\[ H = \{ \mu^{(1)}_i, \phi^{(1)}_i \} + \{ \mu^{(2)}_i, \phi^{(2)}_i \} + \{ \mu^{(3)}_i, \phi^{(3)}_i \} + \frac{1}{2} v_i v_i + V(x), \]
(2.4)
\[ ^1 \text{Here, } G_{i\cdots j}(x) \text{ stands for } \partial^x_i \cdots \partial^x_j G(x) \text{ with } \partial^x_i = \partial/\partial x^i. \]
where $\phi^{(n)}$, ($n = 1, \cdots, 3$) are the constraint operators corresponding to the primary constraints $\phi^{(n)} \approx 0$ due to the singularity of the Lagrangian $L$, which are given by

$$
\phi^{(1)}_i = p^i - v_i + \lambda G_i(x),
$$

$$
\phi^{(2)}_i = p^i_v,
$$

$$
\phi^{(3)} = p_\lambda,
$$

and $\mu^{(1)}_i$, $\mu^{(2)}_i$ and $\mu^{(3)}$ are the Lagrange multiplier operators.

iii) Consistent set of constraints

From the consistency conditions for the time evolutions of constraint operators, the consistent set of constraints, $\mathcal{K}$, is given by

$$
\mathcal{K} = \{\phi^{(1)}_i, \phi^{(2)}_i, \phi^{(3)}, \psi^{(1)}\},
$$

where

$$
\psi^{(1)} = G_i(x)v_i,
$$

which is the constraint operator corresponding to the secondary constraint.

Then, the Lagrange multiplier operators are determined as

$$
\mu^{(1)}_i = v_i,
$$

$$
\mu^{(2)}_i = -\mathcal{G}^{-1}(x)G_i(x)G_{kl}(x)v_k v_l - P_{ij}V_j(x),
$$

$$
\mu^{(3)} = \mathcal{G}^{-1}(x)(V_i(x)G_i(x) - G_{ij}(x)v_i v_j),
$$

where

$$
\mathcal{G}(x) = G_i(x)G_i(x),
$$

$$
P_{ij} = \delta_{ij} - \mathcal{G}^{-1}(x)G_i(x)G_j(x),
$$

which satisfies

$$
P_{ij}P_{jk} = P_{ik}, \quad P_{ij}G_j(x) = G_i(x)P_{ij} = 0.
$$

iv) Commutator algebra of $\mathcal{K}$

The constraint set $\mathcal{K}$ obeys the commutator algebra $\mathcal{A}(\mathcal{K})$:

$$
\mathcal{A}(\mathcal{K}) : \quad \lbrack \phi_i^{(1)}, \phi_j^{(2)} \rbrack = -i\hbar \delta_{ij},
$$

$$
\lbrack \phi_i^{(1)}, \phi_j^{(3)} \rbrack = i\hbar G_{ij}(x),
$$

$$
\lbrack \psi^{(1)}, \phi_i^{(1)} \rbrack = i\hbar G_{ij}(x)v_j,
$$

$$
\lbrack \psi^{(1)}, \phi_i^{(2)} \rbrack = i\hbar G_i(x), \quad \text{(the others)} = 0.
$$
3 The Constraint Quantum System $S^*$

Starting with the initial system $S$, we shall construct the constraint quantum system $S^*$, which satisfies $K = 0$, through the star-product quantization formalism of POM\[7\].

For this purpose, we first classify $K$ into the following two subsets:

$$K = K^{(A)} \oplus K^{(B)} \quad \text{with} \quad K^{(A)} = \{ \phi^{(1)}, \phi^{(2)} \}, \quad K^{(B)} = \{ \phi^{(3)}, \psi^{(1)} \}. \quad (3.1)$$

As well as the Dirac bracket formalism, the POM satisfies the iterative property\[9\]. Therefore, the constraint quantum system $S^*$ can be constructed through the successive projections of $S$\[7\].

3.1 Successive Projections of $S$

From the structure of the commutator algebra (2.10), the successive projections of $S$ can be uniquely carried out through the following diagram:

$$\hat{P}^{(1)} K^{(1)} = 0 \rightarrow \hat{P}^{(2)} K^{(2)} = 0, \quad (3.2)$$

where

$$K^{(1)} = K^{(A)}, \quad K^{(2)} = K^{(B)}, \quad (3.3)$$

and $\hat{P}^{(n)}$ is the projection operator associated to the subset $K^{(n)}$, that is, $\hat{P}^{(n)} K^{(n)} = 0$ ($n = 1, 2$). Then, the successive projections of the operators of the system by $\hat{P}^{(n)}$ ($n = 1, 2$) are carried out through the program designated by the following diagram:

$$\mathcal{C} \xrightarrow{\hat{P}^{(1)}} \mathcal{C}^{(1)} \xrightarrow{\hat{P}^{(2)}} \mathcal{C}^{(2)}, \quad (3.4)$$

where

$$\mathcal{C}^{(n)} = \hat{P}^{(n)} \mathcal{C}^{(n-1)} \quad (n = 1, 2) \quad (3.5)$$

with $\mathcal{C}^{(0)} = \mathcal{C}$, which satisfy the projection conditions

$$K^{(n)} (\mathcal{C}^{(n)}) = 0 \quad (n = 1, 2). \quad (3.6)$$

Then, the ACCS (associated canonically conjugate set) $Z^{(n)}$\[7\] for the subsets $K^{(n)}$ ($n = 1, 2$) consist of the operators in $\mathcal{C}^{(n-1)}$,

$$Z^{(n)} = Z^{(n)} (\mathcal{C}^{(n-1)}). \quad (3.7)$$

From (3.7), therefore, the projection operators $\hat{P}^{(n)}$ are also represented as

$$\hat{P}^{(n)} = \hat{P}^{(n)} (\mathcal{C}^{(n-1)}) \quad (n = 1, 2). \quad (3.8)$$
Now, The ACCS $Z_a^{(n)}$ of the projection operators $\hat{P}^{(n)}$ ($n = 1, 2$) are given, respectively, as follows:

\[
(1) \quad Z_a^{(1)} = Z_a^{(1)}(C) = \begin{cases} 
\xi_i^{(1)} = -\phi_i^{(1)} = v_i - p_x^i - \lambda G_i(x) & (\alpha = i), \\
\pi_i^{(1)} = \phi_i^{(2)} = p_v^i & (\alpha = i + N), \\
(\alpha = 1, \cdots, 2N ; \ i = 1, \cdots, N),
\end{cases}
\]

\[
(2) \quad Z^{(2)} = Z^{(2)}(C^{(1)}) = \begin{cases} 
\xi^{(2)} = \{G^{-1}(x), \ \psi^{(1)}\} = \{G^{-1}(x)G_i(x), \ v_i\} & (\alpha = 1), \\
\pi^{(2)} = \phi^{(3)} = p_\lambda & (\alpha = 2).
\end{cases}
\]

The hyper-operators $\hat{\Omega}_{\eta}^{(n)}$ for $K^{(n)}$ ($n = 1, 2$) in the star-product formulation are given as follows\footnote{For any operator $O$, $O^{(-)} \bullet = \frac{1}{i\hbar}[O, \ \bullet]$ and $O^{+} \bullet = \{O, \ \bullet\} = \frac{1}{2}(O \bullet + \bullet O)$.}

\[
\hat{\Omega}_{\eta}^{(1)} = J_{\alpha\beta} \hat{Z}_a^{(1)(-)}(\eta) \hat{Z}_\beta^{(1)(-)}(\zeta) = \hat{\xi}_\gamma^{(1)(-)}(\eta) \hat{\pi}_i^{(1)(-)}(\zeta) - \hat{\pi}_i^{(1)(-)}(\eta) \hat{\xi}_\gamma^{(1)(-)}(\zeta),
\]

\[
\hat{\Omega}_{\eta}^{(2)} = J_{\alpha\beta} \hat{Z}_a^{(2)(-)}(\eta) \hat{Z}_\beta^{(2)(-)}(\zeta) = \hat{\xi}_\gamma^{(2)(-)}(\eta) \hat{\pi}_i^{(2)(-)}(\zeta) - \hat{\pi}_i^{(2)(-)}(\eta) \hat{\xi}_\gamma^{(2)(-)}(\zeta).
\]

The operations of $\hat{\xi}^{(n)(-)}$ and $\hat{\pi}^{(n)(-)}$ on $C^{(n)}$ are presented in Appendix A.

3.1.1 Projected CCS $C^{(2)}$ and commutator algebra of $C^{(2)}$

Let $\hat{P}$ be $\hat{P} = \hat{P}^{(2)} \hat{P}^{(1)}$. From the projection conditions (3.6), then, $C^{(2)}$ becomes as follows:

\[
C^{(2)} = \{\hat{P}x, \hat{P}p_x, \hat{P}v, \hat{P}p_v, \hat{P}\lambda, \hat{P}\pi_\lambda\} = \{x^i, p_x^i, p_v^i, \lambda | i = 1, \cdots, N\},
\]

where the projection conditions are represented as

\[
\begin{align*}
\hat{P}\phi_i^{(1)} &= p_x^i - v_i + \{\lambda, G_i(x)\} = 0, \\
\hat{P}\phi_i^{(2)} &= p_v^i = 0, \quad \hat{P}\phi^{(3)} = p_\lambda = 0, \\
\hat{P}\psi^{(1)} &= \{G_i(x), v_i\} = 0.
\end{align*}
\]
Then, the commutator algebra $\mathcal{A}(\mathcal{C}^{(2)})$ is represented as

$$[x^i, p^j_x] = i\hbar \delta^i_j, \quad [x^i, v_j] = i\hbar P_{ij}(x), \quad [\lambda, x^i] = i\hbar \mathcal{G}^{-1}(x)G_i(x),$$

$$[v_i, v_j] = i\hbar \{ \mathcal{G}^{-1}(G_{ik}G_j(x) - G_i(x)G_{jk}(x)), v_k \},$$

$$[v_i, p^j_x] = i\hbar \{ \lambda, P_{ik}G_{kj}(x) \} - i\hbar \{ \mathcal{G}^{-1}(x)G_i(x)G_{jk}(x), v_k \},$$

$$[p^i_x, \lambda] = i\hbar \{ \mathcal{G}^{-1}(x)G_{ik}(x), v_k \} + i\hbar \{ \lambda, \mathcal{G}^{-1}(x)G_{ik}(x)G_i(x) \},$$

$$[v_i, \lambda] = i\hbar \{ \mathcal{G}^{-1}(x)G_{ik}, v_k \}, \quad \text{(the others) = 0},$$

### 3.1.2 Projected Hamiltonian $H^{(2)}$

According to the projection formulas of symmetrized product\[7\], the projected Hamiltonian $H^{(2)}$ is obtained in the following way:

$$H^{(2)} = \hat{\mathcal{P}}H = \hat{\mathcal{P}}^{(2)}\hat{\mathcal{P}}^{(1)}H = \frac{1}{2} \{ v_i, v_i \} + V(x) + V^{(1)}_c(x) + V^{(2)}_c(x),$$

where $V^{(1)}_c(x)$ is the quantum correction term due to the projection of $\frac{1}{2} \{ v_i, v_i \}$,

$$V^{(1)}_c(x) = \frac{\hbar^2}{8} \mathcal{G}^{-2}(x)G_{ik}(x)G_{kl}(x)G_{il}(x)G_{ij}(x) - \frac{\hbar^2}{4} \mathcal{G}^{-1}(x)G_{ik}(x)P_{kl}G_{ii},$$

and $V^{(2)}_c(x)$, that due to the projection of $\{ \mu_i, \phi^{(3)} \}$,

$$V^{(2)}_c(x) = \frac{\hbar^2}{4} \mathcal{G}^{-1}(x)G_{ij}(x)G_{ij}(x).$$

Substituting $P_{ij} = \delta_{ij} - \mathcal{G}^{-1}(x)G_i(x)G_j(x)$ into (3.15), then, one obtains

$$H^{(2)} = \frac{1}{2} \{ v_i, v_i \} + V(x) + \frac{3\hbar^2}{8} \mathcal{G}^{-2}(x)G_{ik}(x)G_{kl}(x)G_{il}(x)G_{ij}(x).$$

Thus, we have obtained the final projected quantum system due to the sequential projection $\hat{\mathcal{P}} = \hat{\mathcal{P}}^{(2)}\hat{\mathcal{P}}^{(1)}$,

$$\mathcal{S}^{(2)} = (\mathcal{C}^{(2)}, \mathcal{A}(\mathcal{C}^{(2)}), H^{(2)}).$$

### 3.2 Constraint Quantum System $\mathcal{S}^*$

From the structure of the commutator algebra $\mathcal{A}(\mathcal{C}^{(2)})$, we can consider two constraint quantum systems, one of which is represented in terms of $\{ x, v \}$, and the other, in terms of $\{ x, p^x \}$.
3.2.1 Constraint Quantum System $S_i^*$

Let $\{x, v\}$ be the CCS $\mathcal{C}_i^*$ in $S_i^*$,

$$\mathcal{C}_i^* = \{x^i, v_i | i = 1, \ldots, N\}. \quad (3.19)$$

From the projection conditions (3.12), $\mathcal{C}_i^*$ satisfies

$$\{P_{ij}, p_j^x\} = v_i, \quad \lambda = \{G^{-1}(x)G_i(x), \ p_i\}, \quad (3.20)$$

$$p_i^x = 0, \quad p_\lambda = 0.$$

Let $n_i(x), n_{i;k}(x)$ be $n_i(x) = G^{-1/2}G_i(x), \ n_{i;k}(x) = \partial_k^n n_i(x)$, respectively. Then, the commutator algebra $\mathcal{A}(\mathcal{C}_i^*)$ is defined as follows:

$$\mathcal{A}(\mathcal{C}_i^*) : [x^i, x^j] = 0,$$

$$[x^i, v_j] = i\hbar P_{ij} = i\hbar (\delta_{ij} - n_i(x)n_j(x)), \quad (3.21)$$

$$[v_i, v_j] = i\hbar \{n_{i;k}(x)n_j(x) - n_i(x)n_{j;k}(x), \ v_k\},$$

which is just equivalent to the commutator algebra of the static constraint quantum system [1, 3, 4]. From the projection conditions (3.20), however, $\mathcal{A}(\mathcal{C}_i^*)$ does not reproduce the commutator algebra with respect to $p_i^x$ and $\lambda$.

The Hamiltonian $H_i^*$ in $S_i^*$ is given by the projected Hamiltonian $H^{(2)}$, which is also expressed in the following form:

$$H_i^* = H^{(2)} = \frac{1}{2} \{v_i, \ v_i\} + V(x) + \frac{3}{32} \hbar^2 G^{-2}(x)G_{,i}(x)G_{,i}(x), \quad (3.22)$$

where

$$G_{,i}(x) = \partial_i^n G(x). \quad (3.23)$$

Thus, the quantum system $S_i^*$ is defined with

$$S_i^* = (\mathcal{C}_i^*, \mathcal{A}(\mathcal{C}_i^*), H_i^*). \quad (3.24)$$

Following $\mathcal{A}(\mathcal{C}_i^*)$, then, it is obvious that $\dot{G}(x) = 0$, that is,

$$\dot{G}(x) = \frac{1}{i\hbar} [G(x), H_i^*] = \{P_{ij}G_j(x), \ v_i\} = 0. \quad (3.25)$$

In the quantum system $S_i^*$, thus, $G(x)$ is the constant of motion and $G(x) = 0$ is conserved through the time evolution of system under the operatorial formalism. Because of the projection conditions (3.20), on the other hand, $\mathcal{A}(\mathcal{C}_i^*)$ is not complete.
with respect to $p^x_i, \lambda$. The commutator algebra of these operators is defined by $A(C^{(2)})$, which shows that $C^*_i$ is the subset of $C^{(2)}$,

$$C^*_i \subset C^{(2)}, \quad (3.26)$$

and, therefore, $S^*_i$ is the sub-system of $S^{(2)}$,

$$S^*_i \subset S^{(2)} \quad (3.27)$$

### 3.2.2 Constraint Quantum System $S^{*_2}_I$

The alternative final CCS is given by $\{x, p^x\}$:

$$C^{*_2}_I = \{x^i, p^x_i | i = 1, \cdots, N\}. \quad (3.28)$$

From $A(C^{(2)})$, the commutator algebra $A(C^{*_2}_I)$ is defined by the canonically conjugate commutation relations

$$A(C^{*_2}_I) : [x^i, x^j] = 0, \quad [x^i, p^x_j] = i\hbar\delta^i_j, \quad [p^x_i, p^x_j] = 0, \quad (3.29)$$

which is just identical to the commutator algebra in the dynamical constraint quantum system $[3, 4]$. According to the projection conditions (3.12), then, $v_i, \lambda$ are represented in terms of $x^i, p^x_i$ as follows:

$$v_i = \{P_{ij}, p^x_j\}, \quad \lambda = \{G^{-1}(x)G_i(x), p^x_i\}, \quad (3.30)$$

and the commutator algebra with respect to $v_i$ and $\lambda$ is completely reproduced by $A(C^{*_2}_I)$. Therefore, $C^{(2)}$ is represented as

$$C^{(2)} = \{x, p^x, v, \lambda\} = \{x, p^x, v(x, p^x), \lambda(x, p^x)\}, \quad (3.31)$$

which shows that $C^{*_2}_I$ is just equivalent to $C^{(2)}$,

$$C^{(2)} = C^{*_2}_I. \quad (3.32)$$

From (3.22) and (3.30), the Hamiltonian $H^{*_2}_I$ is represented as

$$H^{*_2}_I = \frac{1}{2} \{\{P_{ik}, \ p^x_k\}, \ \{P_{il}, \ p^x_l\}\} + V(x) + \frac{3}{32}\hbar^2 G^{-2}(x)G_{i}(x)G_{j}(x), \quad (3.33)$$

which contains the products of operators noncommutatable with each other. So, the re-ordering of operators also yields the quantum correction terms in $H^{*_2}_I$.

We shall rewrite $\frac{1}{2} \{\{P_{ik}, \ p^x_k\}, \ \{P_{il}, \ p^x_l\}\}$ as follows:

$$\frac{1}{2} \{\{P_{ik}, \ p^x_k\}, \ \{P_{il}, \ p^x_l\}\} = \frac{1}{2} p^x_i P_{ij} p^x_j + U_c(x), \quad (3.34)$$
where $U_c(x)$ is the quantum correction term associated to the re-ordering of operators,

$$U_c(x) = \frac{\hbar^2}{4} (n_{k;kl}(x)n_{l}(x)+n_{k;il}(x)n_{i;k}(x)+\frac{\hbar^2}{8} (n_{k;kl}(x)n_{l;i}(x)+n_{k}(x)n_{i;k}(x)n_{i;l}(x)n_{l}(x)).$$

Then, $H^*_u$ is rewritten in the following form:

$$H^*_u = \frac{1}{2} p^x_i P_{ij} p^x_j + V(x) + \frac{3}{32} \hbar^2 G^{-2}(x) G_{,ij}(x) G_{,ij}(x) + U_c(x).$$

Thus, the quantum system $S^*_u$ is given by

$$S^*_u = (C^*_u, A(S^*_u), H^*_u),$$

and it is easily shown that $\dot{G}(x) = 0$ holds in $S^*_u$ also, that is,

$$\dot{G}(x) = \frac{1}{i\hbar} [G(x), H^*_u] = \{p^x_i, P_{ij} G_j(x)\} = 0.$$

## 4 Discussion and Concluding remarks

We have investigated the quantization of the dynamical system constrained to the submanifold $M^{N-1}$ specified by $G(x) = 0$ in an $N$-dimensional Euclidean space $R^N$ through the POM with the constraint star-products. Then, we have obtained the following results:

1. The projected quantum system $S^{(2)}$ includes two constraint quantum systems, one of which is $S^*_i$ with the static constraint, and the other of which, $S^*_u$ with the dynamical one, where

$$S^*_i \subset S^{(2)} = S^*_u.$$ 

Thus, it has been shown that $S^*_u$ is complete, and $S^*_i$ incomplete.

2. The commutator algebras (3.21) and (3.29) in the constraint quantum systems are identical with the corresponding commutator ones obtained through the Dirac-bracket quantization formulation with the ordinaly second-order Lagrangians.

3. The Hamiltonians in the constraint quantum systems contain the quantum correction terms due to the sequential projections of $\frac{1}{2} \{v_i, v_i\}$ and $\{\mu^{(3)}, \phi^{(3)}\}$, which are completely missed in the usual approach with Dirac-bracket quantization. In $S^*_u$, further, the Hamiltonian contains the additional correction terms associated to the re-ordering of operators in $\frac{1}{2} \{v_i(x, p^x), v_i(x, p^x)\}$, which will be obtained in the usual Dirac-bracket quantization procedure.

\footnote{In the operatorial approach, Lagrange multipliers are also operators at the first step.}
The approach based on first-order singular Lagrangians is considered to be one of the most available procedures for the investigation of noncommutative quantum system. Then, our next task is to extend our approach to noncommutative quantum systems.

Appendix

A Operations of ACCS

A.1 Operations of $\hat{\xi}^{(1)}(\cdot)$, $\hat{\pi}^{(1)}(\cdot)$ on $C^{(0)}$

\[
\begin{align*}
\hat{\xi}^{(1)}(\cdot) x_i &= \delta_{ki}, & \hat{\pi}^{(1)}(\cdot) x^i &= 0, \\
\hat{\xi}^{(1)}(\cdot) p_i &= -\lambda G_{ki}(x), & \hat{\pi}^{(1)}(\cdot) p_i &= 0, \\
\hat{\xi}^{(1)}(\cdot) v_i &= 0, & \hat{\pi}^{(1)}(\cdot) v_i &= -\delta_{ki}, \\
\hat{\xi}^{(1)}(\cdot) p_v &= \delta_{ki}, & \hat{\pi}^{(1)}(\cdot) v_i &= 0, \\
\hat{\xi}^{(1)}(\cdot) \lambda &= 0, & \hat{\pi}^{(1)}(\cdot) \lambda &= 0, \\
\hat{\xi}^{(1)}(\cdot) p_\lambda &= -G_k(x), & \hat{\pi}^{(1)}(\cdot) p_\lambda &= 0.
\end{align*}
\]

(A1)

A.2 Operations of $\hat{\xi}^{(2)}(\cdot)$, $\hat{\pi}^{(2)}(\cdot)$ on $C^{(1)}$

\[
\begin{align*}
\hat{\xi}^{(2)}(\cdot) x_i &= -\mathcal{G}^{-1}(x)G_i(x), \\
\hat{\xi}^{(2)}(\cdot) p_i &= -2\hat{\xi}^{(2)}(\cdot) G^{-1}(x)G_{ij}(x)G_j(x) + \{G^{-1}(x)G_{ij}(x), \, v_j\} \\
&+ \lambda \mathcal{G}^{-1}(x)G_{ij}(x)G_j(x), \\
\hat{\xi}^{(2)}(\cdot) v_i &= -2\hat{\xi}^{(2)}(\cdot) G^{-1}(x)G_{ij}(x)G_j(x) + \{G^{-1}(x)G_{ij}(x), \, v_j\}, \\
\hat{\xi}^{(2)}(\cdot) \lambda &= 0, \\
\hat{\xi}^{(2)}(\cdot) p_\lambda &= 1, \\
\hat{\pi}^{(2)}(\cdot) v_i &= -G_i(x), & (\hat{\pi}^{(2)}(\cdot))^n v_i &= 0 \quad (n \geq 2), \\
\hat{\pi}^{(2)}(\cdot) \lambda &= -1, \\
&\quad (\text{the others}) = 0.
\end{align*}
\]
