General Considerations. All manipulations were carried out using standard Schlenk or glovebox techniques under a N₂ atmosphere. Unless otherwise noted, solvents were deoxygenated and dried by thoroughly sparging with Ar gas followed by passage through an activated alumina column in the solvent purification system by SG Water, USA LLC. Non-halogenated solvents were tested with a standard purple solution of sodium benzophenone ketyl in tetrahydrofuran in order to confirm effective oxygen and moisture removal. HSiP₃,¹ HSiPPr₃,¹ and H(OEt₂)₂[B(3,5-(CF₃)₂-C₆H₃)₄]²,³ were prepared according to literature procedures. All reagents were purchased from commercial vendors and used without further purification unless otherwise stated. Elemental analyses were performed by Columbia Analytical Services, Inc. (Desert Analytics/Transwest Geochem), Tucson, AZ or Midwest Microlab, LLC., Indianapolis, IN. Deuterated solvents were purchased from Cambridge Isotope Laboratories, Inc., degassed, and dried over activated 3-Å molecular sieves prior to use.

X-ray Crystallography Procedures. X-ray diffraction studies were carried out at the MIT Department of Chemistry X-Ray Diffraction Facility on a Bruker three-circle Platform diffractometer, equipped with a CCD detector. Data was collected at 100 K using Mo Kα (λ = 0.71073 Å) or Cu Kα (λ = 1.54178 Å) radiation and solved using SHELX version 6.14.⁴ X-ray quality crystals were grown as described in the experimental procedures. The crystals were mounted on a glass fiber or nylon loop with Paratone N oil. Structures were determined using direct methods with standard Fourier techniques using the Bruker AXS software package. N-H hydrogens were located on the Fourier difference map and allowed to refine freely in the cases of 6a•B(ArF)₄, 6b•OTf,
9a, 9b, and N₂H₄B(C₆F₅)₃.

**Spectroscopic measurements.** Varian Mercury-300, Inova-500 and Brüker AVANCE-400 spectrometers were used to record ¹H, ¹¹B, ¹³C, ¹⁵N, ¹⁹F, ²⁹Si, and ³¹P NMR spectra at ambient temperature unless otherwise indicated. ¹H and ¹³C chemical shifts were referenced to the residual solvent peaks. ¹¹B chemical shifts were referenced to external boron trifluoride-diethyl etherate (δ = 0 ppm). ¹⁵N chemical shifts were referenced to external ¹⁵N-nitrobenzene (δ = 370.4 ppm). ¹⁹F chemical shifts were referenced to external hexafluorobenzene (δ = -165 ppm). ²⁹Si chemical shifts were referenced to external tetramethylsilane, TMS (δ = 0 ppm). ³¹P chemical shifts were referenced to external phosphoric acid (δ = 0 ppm). Solution magnetic moments were determined by the method of Evans. Optical spectroscopy measurements were taken on a Cary 50 UV-Vis spectrophotometer using a 1-cm two-window quartz cell sealed with a standard closed cap purchased from Starna Cells, Inc (Catalog number: 1-Q-10-GL14-C). Infrared spectra were recorded on a BioRad FTS 3000 EXCALIBUR series FT-IR spectrometer. Agilent 5973N Gas Chromatograph/Mass Spectrometer was used for detecting aniline byproduct during the synthesis of (SiPPh₃)Fe(N₂C₆H₅) (10). **Electrochemistry.** Electrochemical measurements were carried out in a glovebox under a dinitrogen atmosphere in a one-compartment cell using a CH Instruments 600B electrochemical analyzer. A glassy carbon electrode was used as the working electrode and platinum wire was used as the auxiliary electrode. The reference electrode was Ag/AgNO₃ in THF. The ferrocene couple Fe⁺/Fc was used as an external reference. Solutions (THF) of electrolyte (0.3 M tetra-n-butylammonium hexafluorophosphate) and analyte were also prepared under an inert atmosphere. **DFT Calculations.** Single-point calculations on 5 and 12 were run on the
Gaussian03\textsuperscript{vii} suite of programs with the RB3LYP level of theory with the 6-31++G** basis set for all atoms.

\textbf{(SiP}_3\textbf{)}\textbf{Fe(CH}_3\textbf{)} \textbf{(1a).} HSiP\textsubscript{3} (2.43 g, 2.99 mmol) and ferrous chloride (0.379 g, 2.93 mmol) were combined in THF (100 mL) and cooled to –78 °C. CH\textsubscript{3}MgCl (2.1 mL of 3.0 M solution in THF, 6.3 mmol) was added dropwise with vigorous stirring for 20 min, causing an immediate darkening of the solution. The reaction mixture was slowly warmed to room temperature overnight, resulting in a dark red solution. The solution was introduced into the dry-box, 1,4-dioxane (15 mL) was added, and the mixture was stirred at room temperature for 2 hr. The solution was filtered through Celite and was concentrated to 10 mL. Red colored crystalline product was obtained from a benzene solution (20 mL) layered with pentane at room temperature. The resulting product (SiP\textsubscript{3})Fe(CH\textsubscript{3}) \textbf{(1a),} 1.66 g, 1.88 mmol, 64%) was collected on a sintered glass frit, washed with additional portions of benzene, THF, and pentane and dried by vacuum. \textsuperscript{1}H-NMR (C\textsubscript{6}D\textsubscript{6}, ppm): 13.1, 5.5, 4.5, 3.8, 0.67, –5.5. \( \mu_{\text{eff}} \) (C\textsubscript{6}D\textsubscript{6}, 20\textdegree C): 2.84 \( \mu \)B. [(SiPPh3)Fe(THF)][B(3,5-(CF3)2-C6H3)4] (2a). (SiPPh3)Fe(CH3) (0.200 g, 0.226 mmol) was dissolved in THF (20 mL) and cooled to –35 °C. H(OEt2)2[B(3,5-(CF3)2-C6H3)4] (0.229 g, 0.226 mmol) was added and the solution was vigorously stirred for 1 hr at room temperature. After filtration through Celite the resulting dark red solution was concentrated to 5 mL. The product was obtained as a red powder by layering pentane over the solution and letting the solution stand overnight. [(SiPPh3)Fe(THF)][B(3,5-(CF3)2-C6H3)4] (2a, 0.361 g, 0.200 mmol, 88.5%) was collected on a sintered glass frit (M), washed with additional portions of pentane and dried by vacuum. The identity of the
product was established by comparison of its $^1$H-NMR spectrum with its published $^1$H-

$[(SiP^tPr_3)Fe(N_2)][Na(THF)_3]$ (5). A dark green solution of sodium naphthalide was prepared by stirring a naphthalene solution (28 mg, 0.218 mmol) in THF (10 mL) over excess sodium metal (28 mg, 1.22 mmol) for 3 hr at RT. The resulting sodium naphthalide solution was filtered away from any remaining sodium and added dropwise at $-35 \, ^\circ C$ to the red solution of $(SiP^tPr_3)Fe(N_2)$ (4b, 0.146 g, 0.211 mmol) in THF (10 mL), causing a color change to dark purple over a period of several minutes. The reaction mixture was stirred overnight at RT, filtered through Celite. Volatiles were removed under vacuum to give a dark purple powder. The solid was collected on a medium porosity glass-frit and washed with pentane (5 mL x 2), benzene/pentane (1/5; 6 mL) and pentane (5 mL x 2). The resulting product $[(SiP^tPr_3)Fe(N_2)][Na(THF)_3]$ (5, 0.177 g, 0.19 mmol, 90%) was obtained as a dark purple powder after drying under vacuum. $^1$H-NMR (THF-d$_8$, ppm): 7.8 (d, $J = 6.8$ Hz, 3H), 7.1 (d, $J = 7.6$ Hz, 3H), 6.9 (t, $J = 7$ Hz, 3H), 6.8 (t, $J = 7.2$ Hz, 3H), 3.6 (THF), 2.5 (bs, 6H), 1.8 (THF), 1.1 (d, $J = 5.6$ Hz, 18H), 0.57 (bs, 18H). $^{31}$P- NMR (THF-d$_8$, ppm; $-70 \, ^\circ C$): 81.72. **Alternative synthesis of 5.** A dark green solution of sodium naphthalide was prepared by stirring a naphthalene solution (30 mg, 0.234 mmol) in THF (10 mL) over excess sodium...
metal (30 mg, 1.30 mmol) for 3 hr at RT. The resulting sodium naphthalide solution was filtered away from any remaining sodium and added dropwise to the pre-cooled red solution of (SiP\textsubscript{iPr\textsubscript{3}})Fe(Cl) (0.080 g, 0.114 mmol) in THF (10 mL), causing the solution color to change to dark purple over a period of several minutes. The reaction mixture was stirred overnight at RT and then filtered through Celite. Volatiles were removed under vacuum to give a dark purple powder. The solid was collected on a medium porosity glass-frit and washed with pentane (5 mL x 2), benzene/pentane (1/5; 6 mL) and pentane (5 mL x 2). Resulting product 5 (0.090 g, 0.097 mmol, 85%) was obtained as a dark purple powder after drying under vacuum. The identity of the product [(SiP\textsubscript{iPr\textsubscript{3}})Fe(N\textsubscript{2})][Na(THF)\textsubscript{3}] (5) was confirmed by its \textsuperscript{1}H-NMR spectrum.

[(SiP\textsubscript{iPr\textsubscript{3}})Fe(\textsuperscript{15}N\textsubscript{2})][Na(THF)\textsubscript{3}] (5-\textsuperscript{15}N\textsubscript{2}). A dark green solution of sodium naphthalide was prepared by stirring a naphthalene solution (24 mg, 0.189 mmol) in THF (10 mL) over excess sodium metal (24 mg, 1.04 mmol) for 3 hr at RT. The resulting naphthalide solution was filtered away from sodium and layered on top of the frozen red solution of (SiP\textsubscript{iPr\textsubscript{3}})Fe(Cl) (0.066 g, 0.095 mmol) in THF (10 mL) which was degassed prior to addition by three freeze-pump-thaw cycles. The frozen reaction mixture was taken out of the glovebox, degassed while keeping the (SiP\textsubscript{iPr\textsubscript{3}})Fe(Cl) solution partially frozen and then exposed to \textsuperscript{15}N\textsubscript{2} gas (98\%, Cambridge Isotope Laboratories, Inc). The reaction mixture was stirred overnight at RT, filtered through Celite. Volatiles were removed under vacuum to give a dark purple powder. The solid was collected on a glass-frit and washed with pentane (5 mL x 2), benzene/pentane (1/5; 6 mL) and pentane (5 mL x 2). The resulting \textsuperscript{15}N-labeled product 5-\textsuperscript{15}N (0.075 g, 0.080 mmol, 85%) was obtained as a
dark purple powder after drying under vacuum. Spectroscopic features in the $^1$H-NMR were identical for 5. $^{31}$P-NMR (THF-d$_8$, ppm; –95 °C): 81.36. $^{15}$N-NMR (THF-d$_8$, ppm, RT): 340.3, 309.7. IR (KBr pellet; cm$^{-1}$): 1829.

\((\text{SiPPh}_3)\text{Fe(N}_2\text{C}_6\text{H}_5)\) (10). \( \text{N}_2\text{H}_4\text{C}_6\text{H}_5\cdot\text{CF}_3\text{SO}_3 \) (0.059 g, 0.228 mmol) was added to an orange THF solution (50 mL) of \((\text{SiPPh}_3)\text{Fe(CH}_3)\) (1b, 0.200 g, 0.227 mmol) at \(-35\) °C, and slowly warmed to room temperature. The solution was vigorously stirred for 30 min. After addition of Phenylhydrazine (0.05 g, 0.46 mmol) the resulting dark red solution was stirred for 3 days at 70 °C. The reaction mixture was brought into a dry-box and all volatiles were removed under vacuum. The dark brown crude material was dissolved in benzene (30 mL) and stirred for 30 min at room temperature. Pentane was added slowly, resulting in a cloudy solution that was filtered through Celite and concentrated under vacuum. \((\text{SiPPh}_3)\text{Fe(N}_2\text{C}_6\text{H}_5)\) (10, 0.166 g, 0.171 mmol, 75%) was obtained as a dark brown solid after washing with additional portions of pentane (3 x 3 mL) and drying under vacuum. The pentane supernatant was concentrated and dried under vacuum. The
resulting brown oil (44 mg) was analyzed by $^1$H- and $^{13}$C-NMR spectroscopy and GC/MS. The major organic product (>50%) was identified as aniline. $^1$H-NMR (C$_6$D$_6$, ppm): 6.0, −0.8, −3.7, −4.8. $\mu_{\text{eff}}$ (THF-d$_8$, 20 °C): 3.0 $\mu_B$. Dark brown X-ray quality crystals were grown by diffusion of pentane vapors into a benzene solution of 10; TBP ($\tau$ = 0.89). Anal. Calcd. The initial red solution (30 min) was taken out and dried after washing with pentane to eliminate excess phenylhydrazine. $^1$H-NMR and IR data of the red species reveal it to be the phenylhydrazine adduct $\left[(\text{SiP}^{\text{Ph}}_3)\text{Fe(N}_2\text{H}_3\text{C}_6\text{H}_5)\right][\text{B(3,5-(CF}_3)_2\text{C}_6\text{H}_3)_4]$. $^1$H-NMR ($\text{C}_6\text{D}_6$, ppm): 13.3, 8.7, 8.6, 8.1, 7.7, 4.9, –4.1, –5.6. IR (KBr; cm$^{-1}$): 3346, 3271, 3203. The hydrazine product was slowly converted to the ammonia adduct $5a$ by storing the NMR tube at RT overnight, or by heating it at 60 °C for 2 hrs. The reaction was monitored by $^1$H-NMR.

Trace amount of $4b$ can be seen from $^1$H-NMR. Currently, we were not able to quantify the amount of impurity.
